Seismic Susceptibility Analysis
Methodology and Calculation

Figure D1 Susceptibility Criteria Chart

Figure D2 Liquefaction Potential Index and Settlement Chart

Cliq Output Files

3-CPT-11 Calculation Packet

6486.200.601
November 24, 2008

Susceptibility of the on-site soil to seismic deformation was evaluated. Classic liquefaction of sands, as well as the susceptibility of silts and clays under seismic loading were evaluated based on papers by, Bray and Sancio (2006), Idriss and Boulanger, 2004 and Seed et al, 2003 and others. The literature suggests that "transition" material that are classified as low-plasticity silts and clays may be susceptible to seismic softening. As a result, we have divided our evaluation of liquefaction into soils exhibiting "sand-like" behavior and those exhibiting "clay-like" behavior. We have assessed the seismic susceptibility and deformation potential at the site based on material properties from laboratory testing and in-situ CPT data as discussed in the following section.

Analyses Based on Material Properties. We have evaluated the susceptibility of silts and clays using the methods described in Bray and Sancio (2006) and criteria proposed by Idriss and Boulanger (2004). Utilizing laboratory test data of soil collected during our exploration, the seismic susceptibility of the on site soil is evaluated and presented on D 1. Chart B presents the project data and criteria proposed by Bray and Sancio. In general, the in-situ water content and plasticity of the subsurface material are classified as "moderately susceptible" or "not susceptible" with the exception of the sandy material encountered directly below the waste water treatment pond which is classified as potentially liquefiable. This sandy deposit is approximately 11-feet thick and is localized within the immediate area of the wastewater treatment pond. Also provided on D 1- Chart A is a plot of plasticity indices and Liquid limits of on site soil with "Transition Zone" between sand-like and clay-like behavior during seismic loading as proposed by Idriss and Boulanger. As shown, the material properties of the on-site soil lies above the transition zone and will exhibit a clay-like behavior and susceptible to seismic softening during seismic loading. The water contents used to evaluate susceptibility are based on existing water contents as measured from samples from the borings.

As discussed in this report, surcharging is proposed to mitigate potential static consolidation settlements at the site. Surcharging will reduce in-situ water contents and consequently reduce the water contents as a percentage of the liquid limit. As a result, following surcharging the clayey soils will have properties that plot outside of the susceptible range.

Analyses of In-situ CPT Data. We have evaluated liquefaction resistance and related settlement of the CPT data was performed in accordance procedures developed by Robertson & Wride (1998) using the computer software Cliq. The procedure used in the software is largely based on procedures originally published in NCEER-97-002. The software employs methodology discussed by Youd and Idriss, (2001) to assess seismically induced deformation for sand-like behavior and Boulanger and Idriss, (2008) for clay-like behavior. For our analysis we have used a design surface acceleration PGA of 0.484 (S_{DS}/2.5) in accordance with Chapter 16 of the California Building Code and CGS Note 48. A moment magnitude of 7.26 was selected based on controlling events at the Rodgers Creek fault.

To assess liquefaction hazard, we have expressed using the Liquefaction Potential Index (LPI) for each CPT, as defined by Iwasaki (1982). LPI is a relative hazard index, calculated on a point-by-point basis using the factor of safety against liquefaction, as a function of depth. LPI has been correlated to observed damage in existing liquefaction case studies and is a more appropriate indicator of risk than factor of safety alone. The computed discrete factors of safety with depth, from which the LPI values for each CPT are derived, are summarized on the attached Cliq Output File. Also included in the summary are output files of all CPTs presenting Cyclic Stress Ratio (CSR), Cyclic Resistance Ratio (CRR) and conservative estimates of post liquefaction settlement both considering “sand-like” and “clay-like” soil behavior. Figure D 2 shows a graphic depiction LPI and potential seismic settlement considering combination of both sand-like and clay-like behavior (Chart A & C) and for sand-like behavior alone (Chart B& D). We have provided detail calculation performed by Cliq for assessing seismic susceptibility utilizing CPT data for 3-CPT11 (maximum settlement calculated) in the attached Calculation Packet Section of this report.

Assuming that the site is surcharged to mitigate static consolidation settlement, the contribution of the clayey soil to LPI and seismic settlement will be mitigated as well. As discussed by Boulanger and Idriss the susceptibility of clayey soils is a function of the undrained shear strength. Since undrained shear strength of the clayey soil will be increased by surcharging, the potential for seismic softening and the consequential volumetric strains will be reduced, As a result, the post-construction liquefaction and seismic settlement risk is best characterized by the charts which present sand-like behavior alone. As discussed in this report, generally following surcharging, seismically induced liquefaction settlements within the surcharged areas are expected to be very minimal across the site, with localized areas within the site that may observe settlements of up to 1½ inch during a seismic event. In area that are not surcharged liquefaction settlements could be on the order of 1½ to 2 inches.

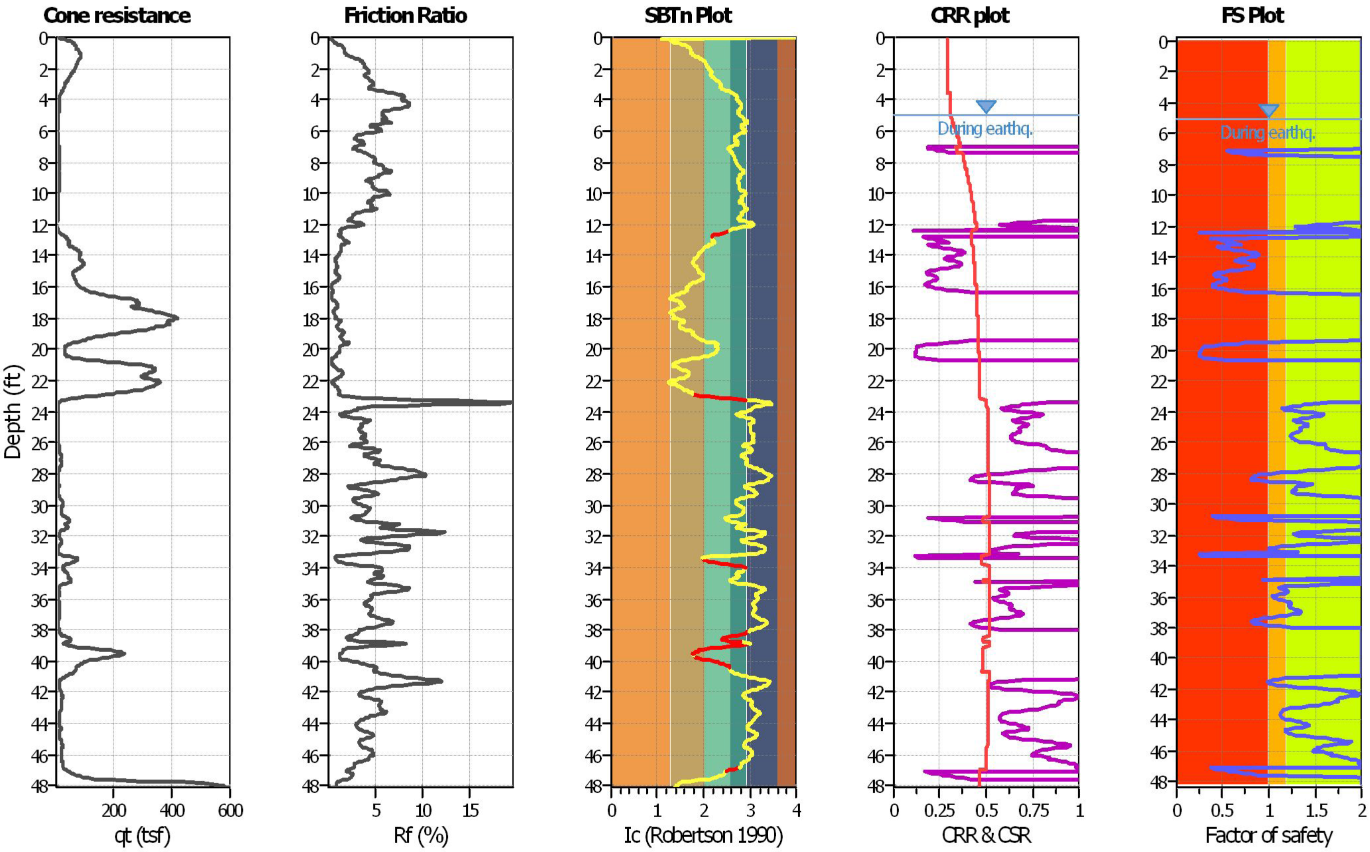
LIQUEFACTION ANALYSIS REPORT

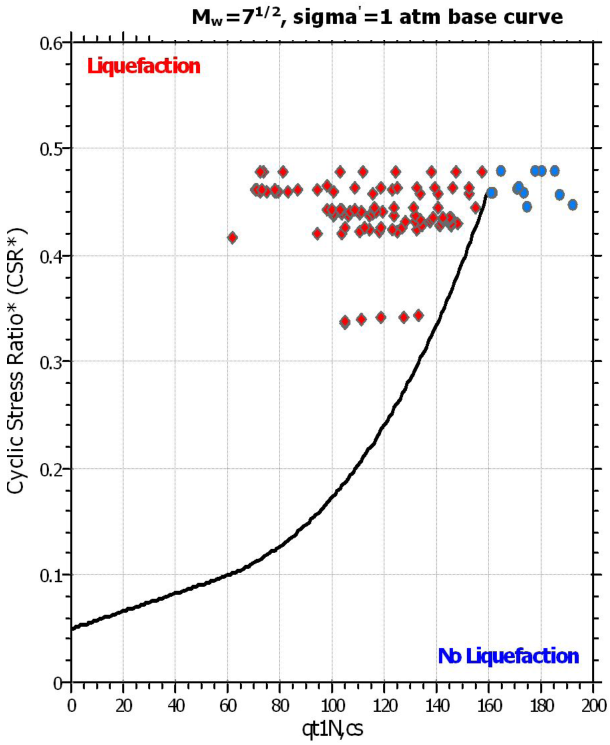
Project title : Sutter Medical Center Santa Rosa **Location : Santa Rosa**

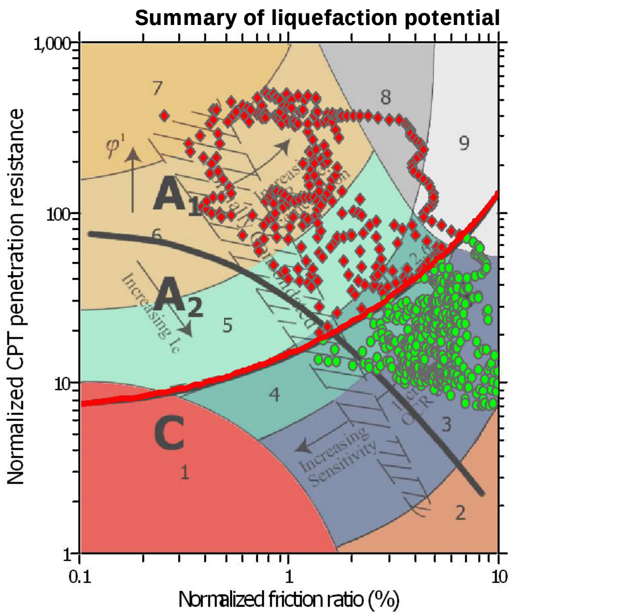
CPT file : 3-CPT-11

Input parameters and analysis data

Analysis method:	NCEER 1998	G.W.T. (in-situ):	5.00 ft	Use fill:	No	Clay like behavior applied:	Yes
Fines correction method:	Robertson & Wride	G.W.T. (earthq.):	5.00 ft	Fill height:	N/A	Limit depth applied:	No
Points to test:	Based on Ic value	Average results interval:	3	Fill weight:	N/A	Limit depth:	N/A
Earthquake magnitude M_w:	7.26	Ic cut-off value:	2.60	Trans. detect. applied:	Yes		
Peak ground acceleration:	0.48	Unit weight calculation:	Based on SBT	K_σ applied:	Yes		

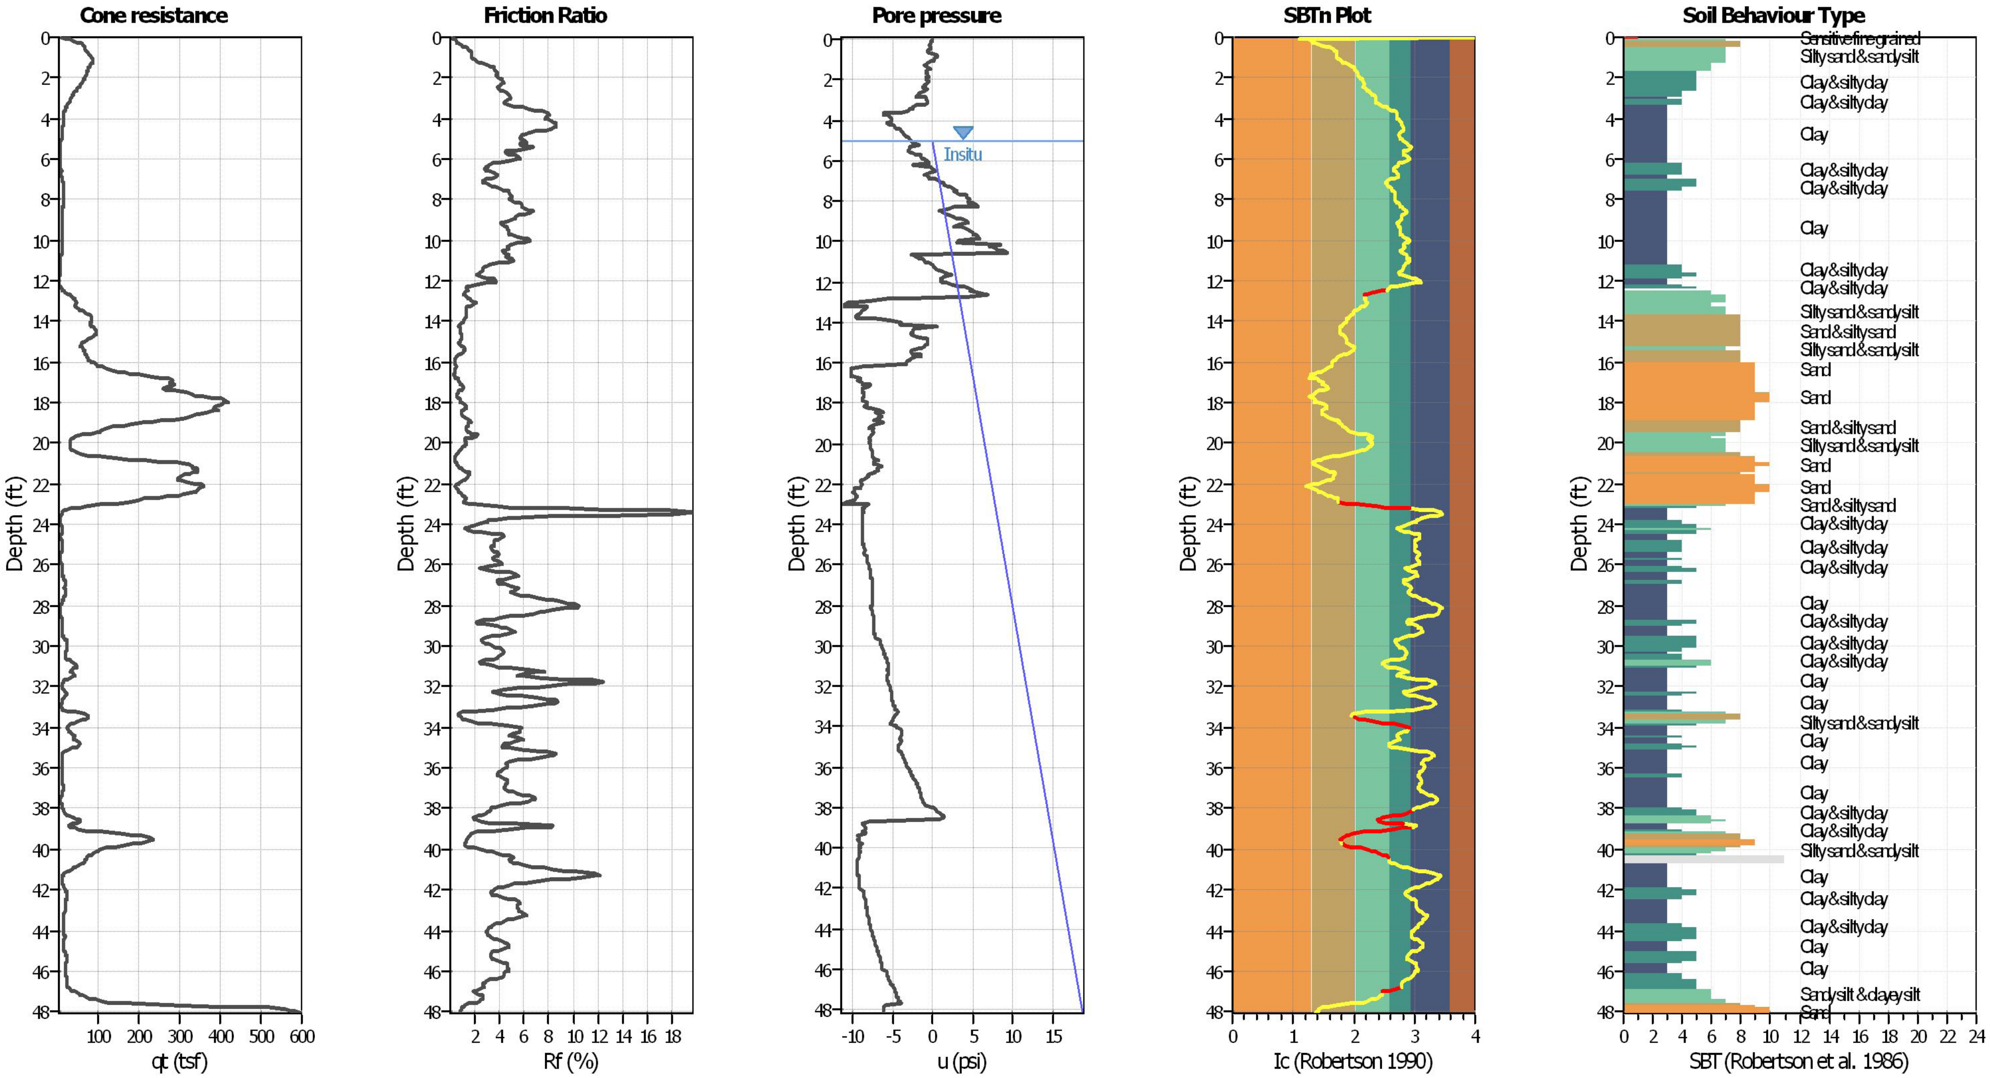






Zone A_1: Cyclic liquefaction likely depending on size and duration of cyclic loading
Zone A_2: Cyclic liquefaction and strength loss likely depending on loading and ground geometry
Zone B: Liquefaction and post-earthquake strength loss unlikely, check cyclic softening
Zone C: Cyclic liquefaction and strength loss possible depending on soil plasticity, brittleness/sensitivity, strain to peak undrained strength and ground geometry

CPT basic interpretation plots



Input parameters and analysis data

Analysis method:	NCEER 1998	Depth to water table (erthq.):	5.00 ft	Fill weight:	N/A
Fines correction method:	Robertson & Wride	Average results interval:	3	Transition detect. applied:	Yes
Points to test:	Based on Ic value	Ic cut-off value:	2.60	K_σ applied:	Yes
Earthquake magnitude M_w:	7.26	Unit weight calculation:	Based on SBT	Clay like behavior applied:	Yes
Peak ground acceleration:	0.48	Use fill:	No	Limit depth applied:	No
Depth to water table (insitu):	5.00 ft	Fill height:	N/A	Limit depth:	N/A

SBT legend

- 1. Sensitive fine grained
- 2. Organic material
- 3. Clay
- 4. Clay & silty clay
- 5. Clay & silty clay
- 6. Sandy silt & clayey silt
- 7. Silty sand & sandy
- 8. Sand & silty sand
- 9. Sand
- 10. Sand
- 11. Very dense/stiff soil
- 12. Very dense/stiff soil

Abbreviations

Depth: Depth from free surface, at which CPT was performed (ft)
q_c: Measured cone resistance (tsf)
f_s: Sleeve friction resistance (tsf)
u: Pore pressure (psi)
Fines content: Percentage of fines in soil (%)
Unit weight: Bulk soil unit weight (pcf)

Abbreviations

Depth:	Depth from free surface, at which CPT was performed (ft)
σ_v:	Total overburden pressure at test point (tsf)
u:	Water pressure at test point (psi)
σ_v':	Effective overburden pressure based on GWT during earthquake (tsf)
r_d:	Nonlinear shear mass factor
CSR:	Cyclic Stress Ratio
MSF:	Magnitude Scaling Factor
CSR_{eq}:	CSR adjusted for M=7.5
K_σ:	Effective overburden stress factor
CSR^*:	CSR fully adjusted

Abbreviations

q_t: Total cone resistance
I_c: Soil behavior type index
Fr: Normalized friction ratio (%)
n: Stress exponent
q_{t1N}: Normalized cone resistance
K_c: Cone resistance correction factor due to fines
$q_{t1N,cs}$: Normalized and adjusted cone resistance
$CRR_{7.5}$: Cyclic resistance ratio for M_w=7.5

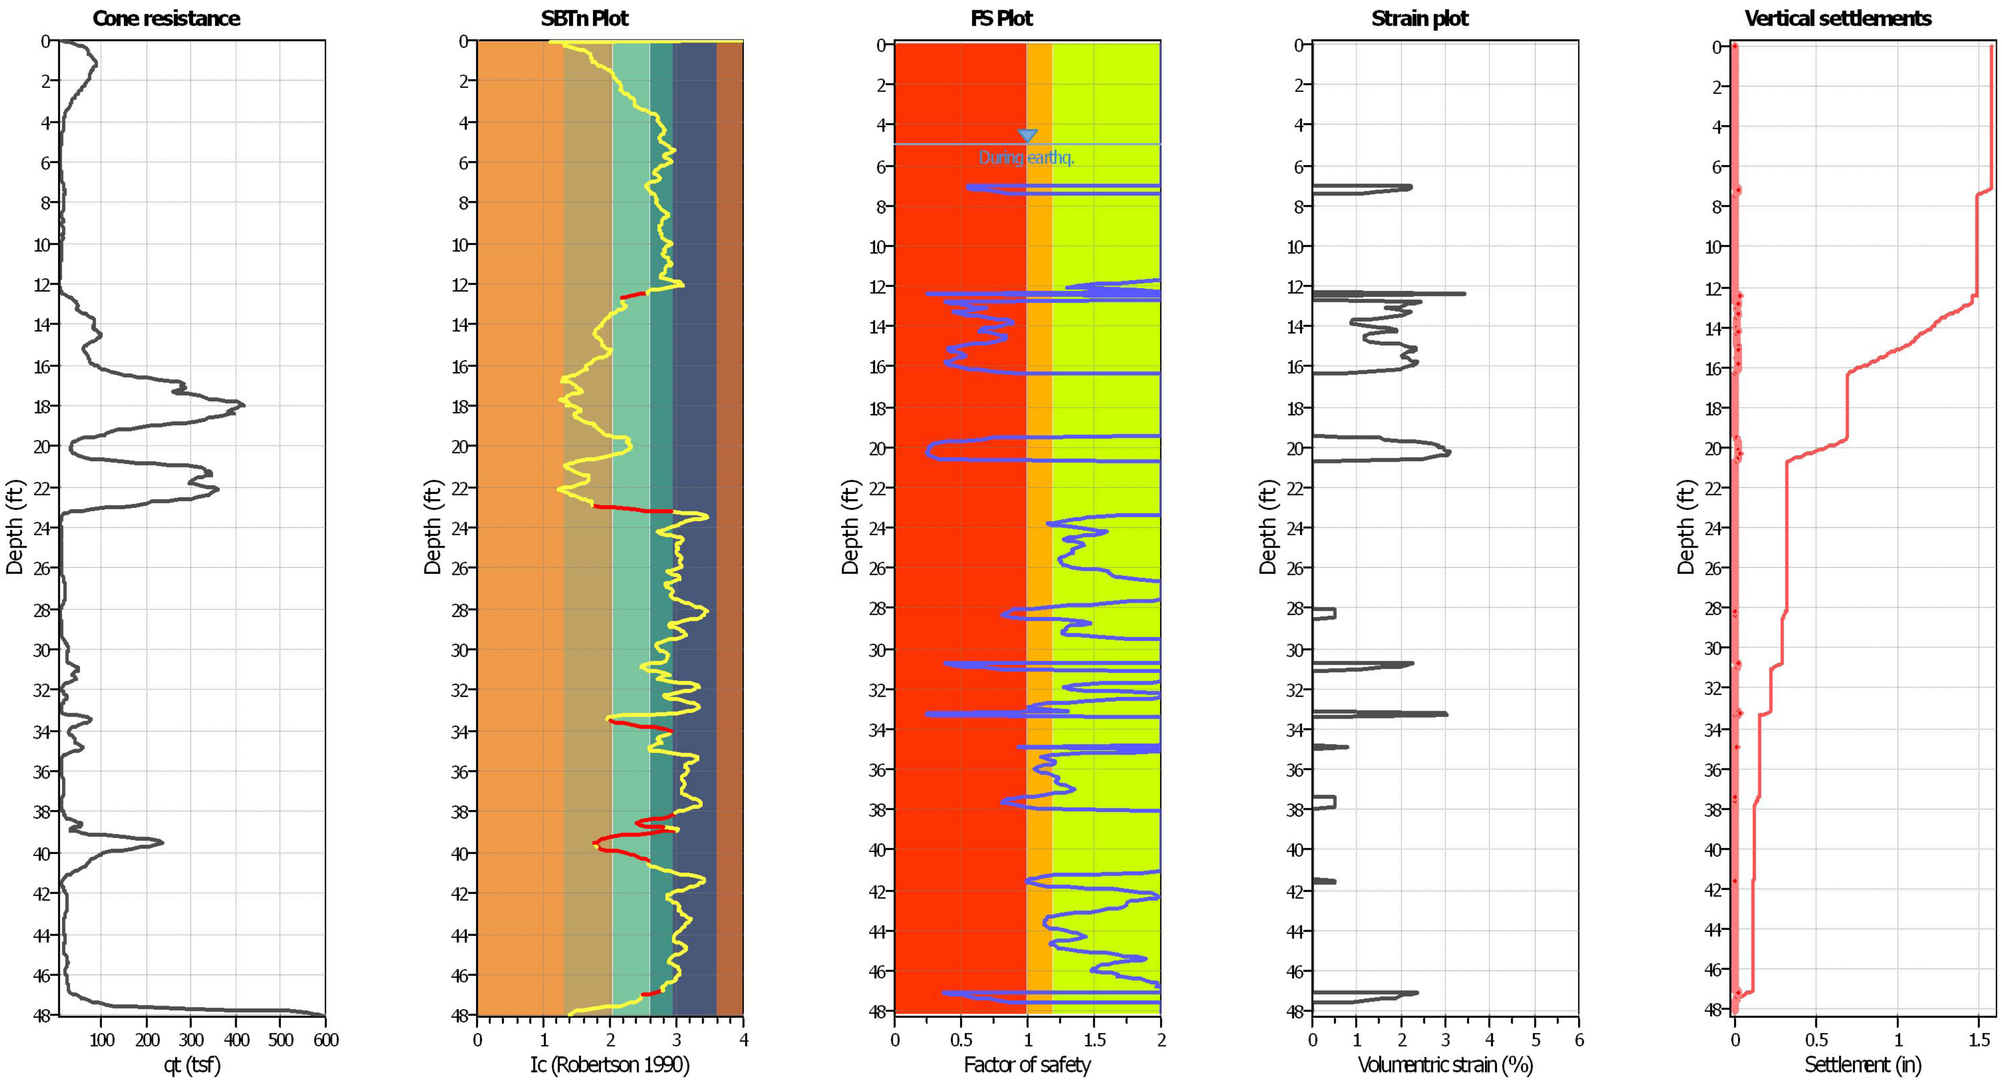
Overall liquefaction potential: 6.24

LPI = 0.00 - Liquefaction risk very low
LPI between 0.00 and 5.00 - Liquefaction risk low
LPI between 5.00 and 15.00 - Liquefaction risk high
LPI > 15.00 - Liquefaction risk very high

Abbreviations

F_s: Calculated factor of safety for test point
F_L: F_L:
w_z: Function value of the extend of soil liquefaction according to depth
d_z: Layer thickness (ft)

Estimation of liquefaction-induced ground settlements



Abbreviations

q_t:	Total cone resistance (cone resistance q_c corrected for pore water effects)
I_c:	Soil Behaviour Type Index
FS:	Calculated Factor of Safety against liquefaction
Volumentric strain:	Post-liquefaction volumentric strain

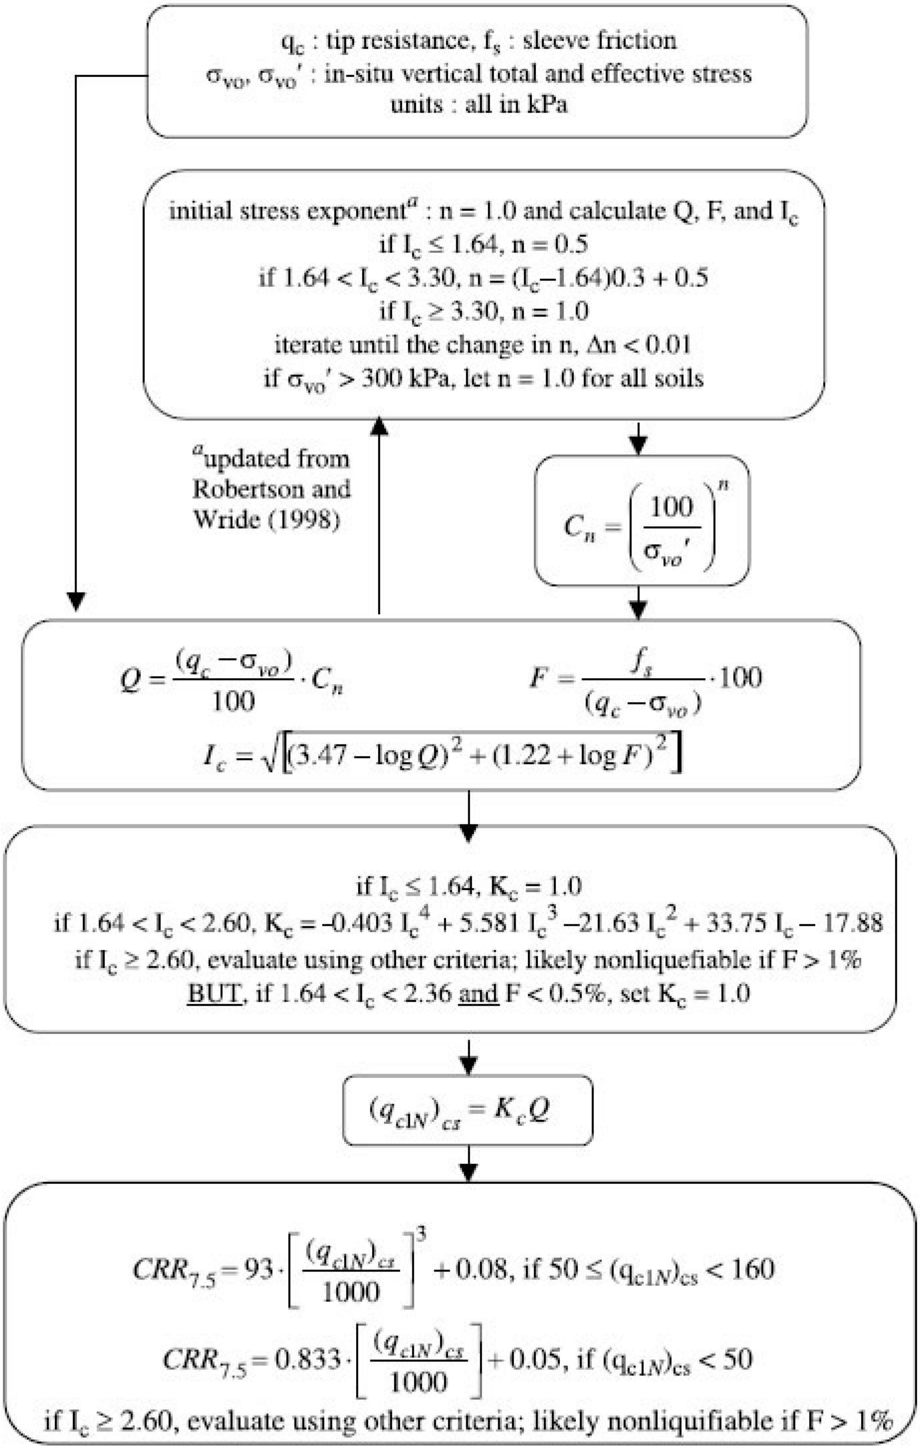
Total estimated settlement: 1.58

Abbreviations

$q_{c1N,cs}$: Equivalent clean sand normalized cone reistance
F_s: Factor of safety against liquefaction
e_v: Post-liquefaction volumentric strain
Settlement: Calculated settlement

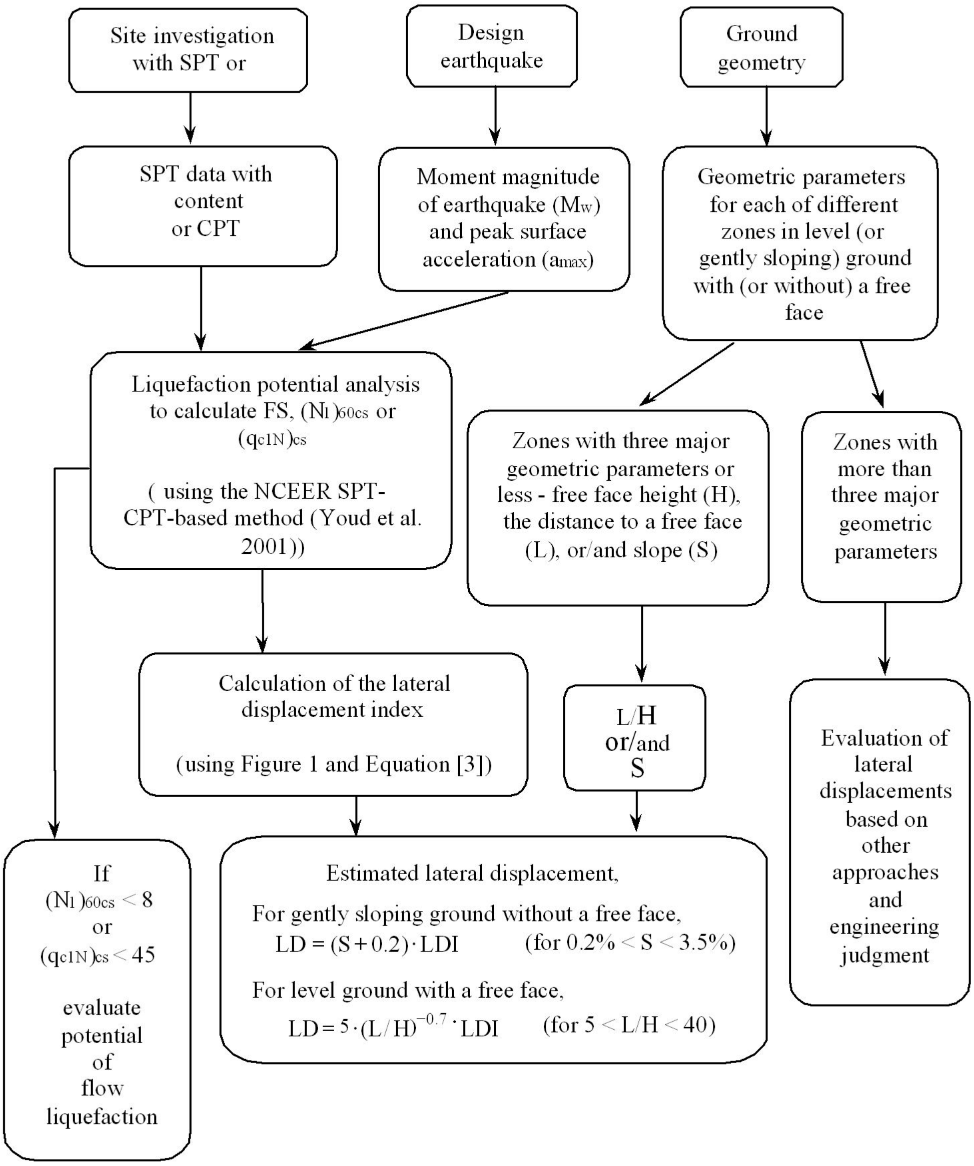
Procedure for the evaluation of soil liquefaction resistance

Calculation of soil resistance against liquefaction is performed according to the Robertson & Wride (1998) procedure. This procedure used in the software, slightly differs from the one originally published in NCEER-97-0022 (Proceedings of the NCEER Workshop on Evaluation of Liquefaction Resistance of Soils). The revised procedure is presented below in the form of a flowchart[1]:

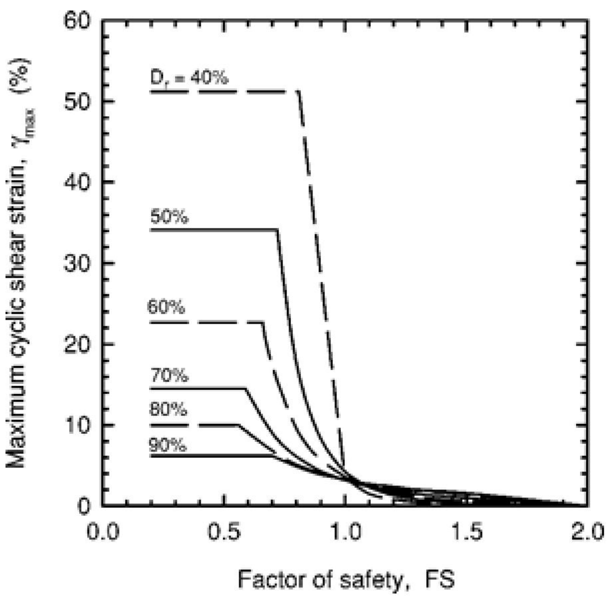


[1] "Estimating liquefaction-induced ground settlements from CPT for level ground", G. Zhang, P.K. Robertson, and R.W.I. Brachman

Procedure for the evaluation of liquefaction-induced lateral spreading displacements



Flow chart illustrating major steps in estimating liquefaction-induced lateral spreading displacements using the proposed approach



[1] **Figure 1**

$$\mathrm{LDI} = \int_0^{Z_{\max}} \gamma_{\max}\, dz$$

[1] **Equation [3]**

[1] "Estimating liquefaction-induced ground settlements from CPT for level ground", G. Zhang, P.K. Robertson, and R.W.I. Brachman

Liquefaction Potential Index (LPI) calculation procedure

Calculation of the Liquefaction Potential Index (LPI) is used to interpret the liquefaction assessment calculations in terms of severity over depth. The calculation procedure is based on the methology developed by Iwasaki (1982) and is adopted by AFPS.

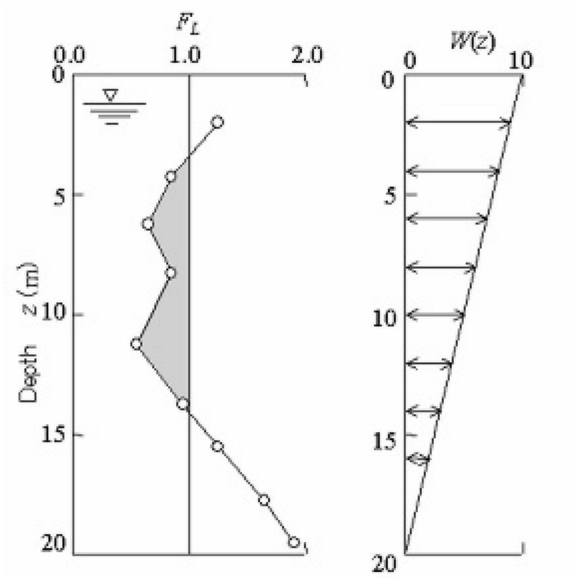
To estimate the severity of liquefaction extent at a given site, LPI is calculated based on the following equation:

$$\textbf{LPI} = \int_0^{20} (10 - 0{,}5_z) \times F_L \times d_z$$

where:
F_L = 1 - F.S. when F.S. less than 1
F_L = 0 when F.S. greater than 1
z depth of measurment in meters

Values of LPI range between zero (0) when no test point is characterized as liquefiable and 100 when all points are characterized as susceptible to liquefaction. Iwasaki proposed four (4) discrete categories based on the numeric value of LPI:

- LPI = 0 : Liquefaction risk is very low
- 0 < LPI <= 5 : Liquefaction risk is low
- 5 < LPI <= 15 : Liquefaction risk is high
- LPI > 15 : Liquefaction risk is very high



Graphical presentation of the LPI calculation procedure

Sutter Medical Center of Santa Rosa

California Geological Survey - Note 48 Checklist	
Project Location	**Section of ENGEO Report Where This Information is Located**
1. Site Location Map, Street Address, County Name	Discussed on Page 2 of report and shown in Figures 1 and 2
2. Plot Plan with Exploration Data with Building Footprint	Shown on Figure 3
3. Site Coordinates	Discussed on Page 2 of report and shown in Figure 1
Engineering Geology / Site Characterization	**Section of ENGEO Report Where This Information is Located**
4. Regional Geology and Regional Fault Maps	Discussed on Pages 7 and 8 of report and shown on Figures 4 and 5
5. Geologic Map of Site	Shown on Figure 3
6. Subsurface Geology	Discussed on Pages 7 and 8 of report
7. Geologic Cross Sections	Shown on Figure 7
8. Active Faulting and Coseismic Deformation Across Site	Shown on Figure 5A
9. Geologic Hazard Zones (Liquefaction and Landslides)	Shown on Figure 6
10. Geotechnical Testing of Representative Samples	Appendices B1 and B2
11. Geologic Consideration of Grading Plans and Foundation Plans	Discussed on Pages 14 through 24 of report
Seismology and Calculation of Earthquake Ground Motion	**Section of ENGEO Report Where This Information is Located**
12. Evaluation of Historical Seismicity	Discussed on Pages 8 and 9 of Report and shown on Figure 8
13. Mapped Spectral Acceleration Parameters	Discussed on Page 10 and 11 of the Report and Site Specific Design Spectra shown on Figure 9
14. Classify the Geologic Subgrade (Site Class)	Discussed on Page 10
15. Site Coefficients and Adjusted Maximum Considered Earthquake (MCE) Spectral Response Acceleration Parameters	Discussed on Pages 10 and 11 of report
16. Design Spectral Acceleration Parameters	Discussed on Pages 10 and 11 of the report
17. Seismic Design Category	Discussed on Pages 10 and 11 of the report
18. Deaggregated Seismic Source Parameters	Discussed on Pages 10 and 11 of the report
19. Site-Specific Ground Motion Analysis	Discussed on Pages 10 and 11 of the report
20. Time-Histories of Earthquake Ground Motion	Discussed on Pages 10 and 11 of the report

California Geological Survey - Note 48

Checklist for the Review of Engineering Geology and Seismology Reports for California Public Schools, Hospitals, and Essential Services Buildings
October 2007

Note 48 is used by the California Geological Survey (CGS) to review the geology, seismology, and geologic hazards evaluated in reports that are prepared under California Code of Regulations (CCR), Title 24, California Building Code. CCR Title 24 applies to California Public Schools, Hospitals, Skilled Nursing Facilities, and Essential Services Buildings. The Building Official for public schools is the Division of the State Architect (DSA). Hospitals and Skilled Nursing Facilities in California are under the jurisdiction of the Office of Statewide Health Planning & Development (OSHPD). The California Geological Survey serves under contract with these two state agencies.

Project Name: ____________________________ Location: ____________________________________

OSHPD or DSA File #: ____________________ Reviewed By: ________________________________

Date Reviewed: __________________________ California Certified Engineering Geologist #: _______

Checklist Item or Topic Within Consulting Report **NA = not applicable** **NR = not addressed by consultant and therefore not reviewed at this time**	Adequately Described; Satisfactory	Additional Data Needed; Not Satisfactory

Project Location

1. Site Location Map, Street Address, County Name: Correctly plot site on a 7½-minute USGS quadrangle base-map.		
2. Plot Plan with Exploration Data with Building Footprint: 1 boring or exploration shaft per 5000 ft^2, with minimum of 2 for any one building. Exploratory trench locations.		
3. Site Coordinates: (Latitude & Longitude)		

Engineering Geology/Site Characterization

4. Regional Geology and Regional Fault Maps: Concise page-sized illustrations with site plotted.		
5. Geologic Map of Site: Detailed (large-scale) geologic map with proper symbols and geologic legend.		
6. Subsurface Geology: Engineering geology description summarized from boreholes or trench logs. Summarize ground water conditions.		
7. Geologic Cross Sections: Two or more detailed geologic sections with pertinent foundations and site grading.		
8. Active Faulting & Coseismic Deformation Across Site: Prepare page-sized extract map of Alquist-Priolo Earthquake Fault Zones and/or any potential fault rupture hazard identified from the Safety Element of the local agency (city or county); show location of fault investigation trenches; 50-foot setbacks perpendicular from fault plane and proposed building footprints.		
9. Geologic Hazard Zones (Liquefaction & Landslides): (*If applicable*) Prepare page-sized extract of CGS official map showing zones of required investigation for liquefaction and landslide, and/or any pertinent geologic map from the Safety Element of the local agency (city or county).		
10. Geotechnical Testing of Representative Samples: Broad suite of appropriate geotechnical tests.		
11. Geologic Consideration of Grading Plans and Foundation Plans: (*If applicable*) Discussion of engineering geologic aspects of excavation/grading/fill activities, foundation and support structures, and deep foundations. Include geologic and geotechnical inspections and problems anticipated during grading. Special design and construction provisions for footings or foundations founded on expansive soils. Consideration of seismic compression of fills; cut/fill differential settlement.		

Seismology & Calculation of Earthquake Ground Motion

12. Evaluation of Historical Seismicity: Prepare a short description of how historical earthquakes have affected the site.		
13. Mapped Spectral Acceleration Parameters: S_S, S_1. Maps found at http://earthquake.usgs.gov/research/hazmaps/design/ recommended for establishing design values.		
14. Classify the Geologic Subgrade (Site Class): 2007 CBC Table 1613A.5.2 and Section 1613A.5.5.		
15. Site Coefficients and Adjusted Maximum Considered Earthquake (MCE) Spectral Response Acceleration Parameters: F_a, F_v and S_{MS}, S_{M1}.		
16. Design Spectral Acceleration Parameters: S_{DS} and S_{D1}.		

Checklist Item or Topic Within Consulting Report **NA = not applicable NR = not addressed by consultant and therefore not reviewed at this time**	Adequately Described; Satisfactory	Additional Data Needed; Not Satisfactory
17. Seismic Design Category: Report if $S_1 > 0.75$.		
18. Deaggregated Seismic Source Parameters: (*If applicable*) Provide modal magnitude (M_w), and modal distance (km) to fault.		
19. Site-Specific Ground Motion Analysis: (*If applicable*) Required for sites where conditions described in 2007 CBC § 1614A.1.2 apply. Provide probabilistic MCE, deterministic MCE and deterministic lower limit, and design response spectra. Justify analytical choices.		
20. Time-Histories of Earthquake Ground Motion: (*If applicable*) Compute target spectra, justify selected earthquake records, scale to target, and show initial and scaled records.		

Liquefaction/Seismic Settlement Analysis

21. Geologic Setting for Occurrence of Seismically Induced Liquefaction: Perform screening analysis to exclude areas where liquefaction investigation not required. ♦ applicable where ground water surface <50 ft. depth; use historical high ground water for calculations. ♦ low-density, non-plastic alluvium, typically *SPT* $(N_1)_{60}$<30.		
22. Liquefaction Calculations: Based on several detailed geologic cross-sections. Provide calculations (no estimates) including all input parameters.		
23. Seismic Settlement of Entire Soil Column: For two or more locations within the site, evaluate both saturated and unsaturated layers of the entire soil column. Provide calculations (no estimates) including all input parameters. Evaluated with peak ground acceleration based on site-specific study or peak ground acceleration equal to $S_{DS}/2.5$.		
24. Potential for Lateral Spreading		
25. Mitigation Options for Liquefaction: Discuss effectiveness of options to mitigate liquefaction effects. Acceptance criteria for ground-improvement schemes.		

Slope Stability Analyses

26. Landslide Mapping: Characterize the potential for landsliding both on and off-site affecting proposed project.		
27. Determination of Static And Dynamic Strength Parameters: Conduct appropriate laboratory tests to determine material strength considering both static and dynamic conditions.		
28. Determination of Pseudo-Static Coefficient (K_{eq}): Recommended procedure available from http://www.scec.org/resources/catalog/hazardmitigation.html.		
29. Identify Critical Slip Surfaces for Static and Dynamic Analyses: Failure surfaces should be modeled to include existing slip surfaces, discontinuities, geologic structure and stratigraphy; include appropriate ground water conditions.		
30. Dynamic Site Conditions: Site response analysis and topographic effects should be considered, if appropriate.		
31. Mitigation Options for Landsliding/Other Slope Failure: Discuss effectiveness of options to mitigate landsliding/slope failure effects. Acceptance criteria for ground-improvement schemes.		

Other Geologic Hazards or Adverse Site Conditions

These exceptional geologic hazards do not occur statewide. However, they may be pertinent to a particular site. Use prudent analysis to avoid predicaments and expensive delays in construction. This list will help to avoid misunderstandings and back-checks when additional information is required by the reviewing agency.

32. Expansive Soils		
33. Corrosive/Reactive Geochemistry of Geologic Subgrade: Soluble sulfates and corrosive soils.		
34. Conditional Geologic Assessment: Including but not limited to - **A. Hazardous materials** (methane gas, hydrogen-sulfide gas, tar seeps); **B. Volcanic eruption**; **C. Flooding** FEMA FIRM's for 100-year flood, is the site protected by a levee; **D. Tsunami and seiche inundation**; **E. Radon-222 gas** (typically within organic-rich marine-shale of the California Coast Ranges); **F. Naturally occurring asbestos** (in geologic formations associated with serpentine; refer to CGS SP 124); **G. Hydrocollapse** of alluvial fan soils due to anthropic use of water; **H. Regional subsidence**; **I. Clays and cyclic softening.**

APPENDIX G

Guide Contract Specifications

6486.200.601
November 24, 2008

GUIDE CONTRACT SPECIFICATIONS

PART I - EARTHWORK

PREFACE

These specifications are intended as a guide for the earthwork performed at the subject development project. If there is a conflict between these specifications (including the recommendations of the geotechnical report) and agency or code requirements, it should be brought to the attention of ENGEO and Owner prior to contract bidding.

PART 1 - GENERAL

1.01 WORK COVERED

A. Grading, excavating, filling and backfilling, including trenching and backfilling for utilities as necessary to complete the Project as indicated on the Drawings.

B. Subsurface drainage as indicated on the Drawings.

1.02 CODES AND STANDARDS

A. Excavating, trenching, filling, backfilling, and grading work shall meet the applicable requirements of the Uniform Building Code and the standards and ordinances of state and local governing authorities.

1.03 SUBSURFACE SOIL CONDITIONS

A. The Owners' Geotechnical Exploration report is available for inspection by bidder or Contractor. The Contractor shall refer to the findings and recommendations of the Geotechnical Exploration report in planning and executing his work.

1.04 DEFINITIONS

A. Fill: All soil, rock, or soil-rock materials placed to raise the grades of the site or to backfill excavations.

B. Backfill: All soil, rock or soil-rock material used to fill excavations and trenches.

C. On-Site Material: Soil and/or rock material which is obtained from the site.

D. Imported Material: Soil and/or rock material which is brought to the site from off-site areas.

E. Select Material: On-site and/or imported material which is approved by ENGEO as a specific-purpose fill.

F. Engineered Fill: Fill upon which ENGEO has made sufficient observations and tests to confirm that the fill has been placed and compacted in accordance with specifications and requirements.

G. Degree of Compaction or Relative Compaction: The ratio, expressed as a percentage, of the in-place dry density of the fill and backfill material as compacted in the field to the maximum dry density of the same material as determined by ASTM D-1557 or California 216 compaction test method.

H. Optimum Moisture: Water content, percentage by dry weight, corresponding to the maximum dry density as determined by ASTM D-1557.

I. ENGEO: The project geotechnical engineering consulting firm, its employees or its designated representatives.

J. Drawings: All documents, approved for construction, which describe the Work.

1.05 OBSERVATION AND TESTING

A. All site preparation, cutting and shaping, excavating, filling, and backfilling shall be carried out under the observation of ENGEO, employed and paid for by the Owners. ENGEO will perform appropriate field and laboratory tests to evaluate the suitability of fill material, the proper moisture content for compaction, and the degree of compaction achieved. Any fill that does not meet the specification requirements shall be removed and/or reworked until the requirements are satisfied.

B. Cutting and shaping, excavating, conditioning, filling, and compacting procedures require approval of ENGEO as they are performed. Any work found unsatisfactory or any work disturbed by subsequent operations before approval is granted shall be corrected in an approved manner as recommended by ENGEO.

C. Tests for compaction will be made in accordance with test procedures outlined in ASTM D-1557, as applicable. Field testing of soils or compacted fill shall conform with the applicable requirements of ASTM D-2922.

D. All authorized observation and testing will be paid for by the Owners.

1.06 SITE CONDITIONS

A. Excavating, filling, backfilling, and grading work shall not be performed during unfavorable weather conditions. When the work is interrupted by rain, excavating, filling, backfilling, and grading work shall not be resumed until the site and soil conditions are suitable.

B. Contractor shall take the necessary measures to prevent erosion of freshly filled, backfilled, and graded areas until such time as permanent drainage and erosion control measures have been installed.

PART 2 - PRODUCTS

2.01 GENERAL

A. Contractor shall furnish all materials, tools, equipment, facilities, and services as required for performing the required excavating, filling, backfilling, and grading work, and trenching and backfilling for utilities.

2.02 SOIL MATERIALS

A. Fill

1. Material to be used for engineered fill and backfill shall be free from organic matter and other deleterious substances, and of such quality that it will compact thoroughly without excessive voids when watered and rolled. Excavated on-site material will be considered suitable for engineered fill and backfill if it contains no more than 3 percent organic matter, is free of debris and other deleterious substances and conforms to the requirements specified above. Rocks of maximum dimension in excess of two-thirds of the lift thickness shall be removed from any fill material to the satisfaction of ENGEO.

2. Excavated earth material which is suitable for engineered fill or backfill, as determined by ENGEO, shall be conditioned for reuse and properly stockpiled as required for later filling and backfilling operations. Conditioning shall consist of spreading material in layers not to exceed 8 inches and raking free of debris and rubble. Rocks and aggregate exceeding the allowed largest dimension, and deleterious material shall be removed from the site and disposed off site in a legal manner.

3. ENGEO shall be immediately notified if potential hazardous materials or suspect soils exhibiting staining or odor are encountered. Work activities shall be discontinued within the area of potentially hazardous materials. ENGEO

environmental personnel will conduct an assessment of the suspect hazardous material to determine the appropriate response and mitigation. Regulatory agencies may also be contacted to request concurrence and oversight. *ENGEO will rely on the Owner, or a designated Owner's representative, to make necessary notices to the appropriate regulatory agencies. The Owner may request ENGEO's assistance in notifying regulatory agencies, provided ENGEO receives Owner's written authorization to expand its scope of services.*

4. ENGEO shall be notified at least 48 hours prior to the start of filling and backfilling operations so that it may evaluate samples of the material intended for use as fill and backfill. All materials to be used for filling and backfilling require the approval of ENGEO.

B. Import Material: Where conditions require the importation of fill material, the material shall be an inert, nonexpansive soil or soil-rock material free of organic matter and meeting the following requirements unless otherwise approved by ENGEO.

Gradation (ASTM D-421):	Sieve Size	Percent Passing
	2-inch	100
	#200	15 - 70
Plasticity (ASTM D-4318):	Liquid Limit	Plasticity Index
	< 30	< 12
Swell Potential (ASTM D-4546B): (at optimum moisture)	Percent Heave	Swell Pressure
	< 2 percent	< 300 psf
Resistance Value (ASTM D-2844):	Minimum 25	
Organic Content (ASTM D-2974):	Less than 2 percent	

A sample of the proposed import material should be submitted to ENGEO for evaluation prior to delivery at the site.

2.03 SAND

A. Sand for sand cushion under slabs and for bedding of pipe in utility trenches shall be a clean and graded, washed sand, free from clay or organic material, suitable for the intended purpose with 90 to 100 percent passing a No. 4 U.S. Standard Sieve, not more than 5 percent passing a No. 200 U.S. Standard Sieve, and generally conforming to ASTM C33 for fine aggregate.

2.04 AGGREGATE DRAINAGE FILL

A. Aggregate drainage fill under concrete slabs and paving shall consist of broken stone, crushed or uncrushed gravel, clean quarry waste, or a combination thereof. The aggregate shall be free from fines, vegetable matter, loam, volcanic tuff, and other deleterious substances. It shall be of such quality that the absorption of water in a saturated surface dry condition does not exceed 3 percent of the oven dry weight of the samples.

B. Aggregate drainage fill shall be of such size that the percentage composition by dry weight as determined by laboratory sieves (U. S. Series) will conform to the following grading:

Sieve Size	Percentage Passing Sieve
1½-inches	100
1-inch	90 - 100
#4	0 - 5

2.05 SUBDRAINS

A. Perforated subdrain pipe of the required diameter shall be installed as shown on the drawings. The pipe(s) shall also conform to these specifications unless otherwise specified by ENGEO in the field.

Subdrain pipe shall be manufactured in accordance with one of the following requirements:

Design depths less than 30 feet

- Perforated ABS Solid Wall SDR 35 (ASTM D-2751)
- Perforated PVC Solid Wall SDR 35 (ASTM D-3034)
- Perforated PVC A-2000 (ASTM F949)
- Perforated Corrugated HDPE double-wall (AASHTO M-252 or M-294, Caltrans Type S, 50 psi minimum stiffness)

Design depths less than 50 feet

- Perforated PVC SDR 23.5 Solid Wall (ASTM D-3034)
- Perforated Sch. 40 PVC Solid Wall (ASTM-1785)

- Perforated ABS SDR 23.5 Solid Wall (ASTM D-2751)
- Perforated ABS DWV/Sch. 40 (ASTM D-2661 and D-1527)
- Perforated Corrugated HDPE double-wall (AASHTO M-252 or M-294, Caltrans Type S, 70 psi minimum stiffness)

Design depths less than 70 feet

- Perforated ABS Solid Wall SDR 15.3 (ASTM D-2751)
- Perforated Sch. 80 PVC (ASTM D-1785)
- Perforated Corrugated Aluminum (ASTM B-745)

B. Permeable Material (Class 2): Class 2 permeable material for filling trenches under, around, and over subdrains, behind building and retaining walls, and for pervious blankets shall consist of clean, coarse sand and gravel or crushed stone, conforming to the following grading requirements:

Sieve Size	Percentage Passing Sieve
1-inch	100
¾-inch	90 - 100
⅜-inch	40 - 100
#4	25 - 40
#8	18 - 33
#30	5 - 15
#50	0 - 7
#200	0 - 3

C. Filter Fabric: All filter fabric shall meet the following Minimum Average Roll Values unless otherwise specified by ENGEO.

Grab Strength (ASTM D-4632)..180 lbs
Mass Per Unit Area (ASTM D-4751).................................6 oz/yd^2
Apparent Opening Size (ASTM D-4751)...........................70-100 U.S. Std. Sieve
Flow Rate (ASTM D-4491)..80 gal/min/ft^2
Puncture Strength (ASTM D-4833)...................................80 lbs

D. Vapor Retarder: Vapor Retarders shall consist of PVC, LDPE or HDPE impermeable sheeting at least 10 mils thick.

2.06 PERMEABLE MATERIAL (Class 1; Type A)

A. Class 1 permeable material to be used in conjunction with filter fabric for backfilling of subdrain excavations shall conform to the following grading requirements:

Sieve Size	Percentage Passing Sieve
¾-inch	100
½-inch	95 - 100
⅜-inch	70 - 100
#4	0 - 55
#8	0 - 10
#200	0 - 3

PART 3 - EXECUTION

3.01 STAKING AND GRADES

A. Contractor shall lay out all his work, establish all necessary markers, bench marks, grading stakes, and other stakes as required to achieve design grades.

3.02 EXISTING UTILITIES

A. Contractor shall verify the location and depth (elevation) of all existing utilities and services before performing any excavation work.

3.03 EXCAVATION

A. Contractor shall perform excavating as indicated and required for concrete footings, drilled piers, foundations, floor slabs, concrete walks, and site leveling and grading, and provide shoring, bracing, underpinning, cribbing, pumping, and planking as required. The bottoms of excavations shall be firm undisturbed earth, clean and free from loose material, debris, and foreign matter.

B. Excavations shall be kept free from water at all times. Adequate dewatering equipment shall be maintained at the site to handle emergency situations until concrete or backfill is placed.

C. Unauthorized excavations for footings shall be filled with concrete to required elevations, unless other methods of filling are authorized by ENGEO.

D. Excavated earth material which is suitable for engineered fill or backfill, as determined by ENGEO, shall be conditioned for reuse and properly stockpiled for later filling and backfilling operations as specified under Section 2.02, "Soil Materials."

E. Abandoned sewers, piping, and other utilities encountered during excavating shall be removed and the resulting excavations shall be backfilled with engineered fill as required by ENGEO.

F. Any active utility lines encountered shall be reported immediately to the Owner's Representative and authorities involved. The Owner and proper authorities shall be permitted free access to take the measures deemed necessary to repair, relocate, or remove the obstruction as determined by the responsible authority or Owner's Representative.

3.04 SUBGRADE PREPARATION

A. All brush and other rubbish, as well as trees and root systems not marked for saving, shall be removed from the site and legally disposed of.

B. Any existing structures, foundations, underground storage tanks, or debris must be removed from the site prior to any building, grading, or fill operations. Septic tanks, including all drain fields and other lines, if encountered, must be totally removed. The resulting depressions shall be properly prepared and filled to the satisfaction of ENGEO.

C. Vegetation and organic topsoil shall be removed from the surface upon which the fill is to be placed and either removed and legally disposed of or stockpiled for later use in approved landscape areas. The surface shall then be scarified to a depth of at least eight inches until the surface is free from ruts, hummocks, or other uneven features which would tend to prevent uniform compaction by the equipment to be used.

D. After the foundation for the fill has been cleared and scarified, it shall be made uniform and free from large clods. The proper moisture content must be obtained by adding water or aerating. The foundation for the fill shall be compacted at the proper moisture content to a relative compaction as specified herein.

3.05 ENGINEERED FILL

A. Select Material: Fill material shall be "Select" or "Imported Material" as previously specified.

B. Placing and Compacting: Engineered fill shall be constructed by approved and accepted methods. Fill material shall be spread in uniform lifts not exceeding 8 inches in uncompacted thickness. Each layer shall be spread evenly, and thoroughly blade-mixed to obtain uniformity of material. Fill material which does not contain sufficient moisture as specified by ENGEO shall be sprinkled with water; if it contains excess moisture it shall be aerated or blended with drier material to achieve the proper water content. Select material and water shall then be thoroughly mixed before being compacted.

C. Unless otherwise specified in the Geotechnical Exploration report, each layer of spread select material shall be compacted to at least 90 percent relative compaction at a moisture content of at least three percentage points above the optimum moisture content. Minimum compaction in all keyways shall be a minimum of 95 percent with a minimum moisture content of at least 1 percentage point above optimum.

D. Unless otherwise specified in the Geotechnical Exploration report or otherwise required by the local authorities, the upper 6 inches of engineered fill in areas to receive pavement shall be compacted to at least 95 percent relative compaction with a minimum moisture content of at least 3 percentage points above optimum.

E. Testing and Observation of Fill: The work shall consist of field observation and testing to determine that each layer has been compacted to the required density and that the required moisture is being obtained. Any layer or portion of a layer that does not attain the compaction required shall be reworked until the required density is obtained.

F. Compaction: Compaction shall be by sheepsfoot rollers, multiple-wheel steel or pneumatic-tired rollers or other types of acceptable compaction equipment. Rollers shall be of such design that they will be able to compact the fill to the specified compaction. Rolling shall be accomplished while the fill material is within the specified moisture content range. Rolling of each layer must be continuous so that the required compaction may be obtained uniformly throughout each layer.

G. Fill slopes shall be constructed by overfilling the design slopes and later cutting back the slopes to the design grades. No loose soil will be permitted on the faces of the finished slopes.

H. Strippings and topsoil shall be stockpiled as approved by Owner, then placed in accordance with ENGEO's recommendations to a minimum thickness of 6 inches and a maximum thickness of 12 inches over exposed open space cut slopes which are 3:1 or flatter, and track walked to the satisfaction of ENGEO.

I. Final Prepared Subgrade: Finish blading and smoothing shall be performed as necessary to produce the required density, with a uniform surface, smooth and true to grade.

3.06 BACKFILLING

A. Backfill shall not be placed against footings, building walls, or other structures until approved by ENGEO.

B. Backfill material shall be Select Material as specified for engineered fill.

C. Backfill shall be placed in 6-inch layers, leveled, rammed, and tamped in place. Each layer shall be compacted with suitable compaction equipment to 90 percent relative compaction at a moisture content of at least 3 percent above optimum.

3.07 TRENCHING AND BACKFILLING FOR UTILITIES

A. Trenching:

1. Trenching shall include the removal of material and obstructions, the installation and removal of sheeting and bracing and the control of water as necessary to provide the required utilities and services.

2. Trenches shall be excavated to the lines, grades, and dimensions indicated on the Drawings. Maximum allowable trench width shall be the outside diameter of the pipe plus 24 inches, inclusive of any trench bracing.

3. When the trench bottom is a soft or unstable material as determined by ENGEO, it shall be made firm and solid by removing said unstable material to a sufficient depth and replacing it with on-site material compacted to 90 percent minimum relative compaction.

4. Where water is encountered in the trench, the contractor must provide materials necessary to drain the water and stabilize the bed.

B. Backfilling:

1. Trenches must be backfilled within 2 days of excavation to minimize desiccation.

2. Bedding material shall be sand and shall not extend more than 6 inches above any utility lines.

3. Backfill material shall be select material.

4. Trenches shall be backfilled as indicated or required and compacted with suitable equipment to 90 percent minimum relative compaction at the required moisture content.

3.08 SUBDRAINS

A. Trenches for subdrain pipe shall be excavated to a minimum width equal to the outside diameter of the pipe plus at least 12 inches and to a depth of approximately 2 inches below the grade established for the invert of the pipe, or as indicated on the Drawings.

B. The space below the pipe invert shall be filled with a layer of Class 2 permeable material, upon which the pipe shall be laid with perforations down. Sections shall be joined as recommended by the pipe manufacturer.

C. Rocks, bricks, broken concrete, or other hard material shall not be used to give intermediate support to pipes. Large stones or other hard objects shall not be left in contact with the pipes.

D. Excavations for subdrains shall be filled as required to fill voids and prevent settlement without damaging the subdrain pipe. Alternatively, excavations for subdrains may be filled with Class 1 permeable material (as defined in Section 2.06) wrapped in Filter Fabric (as defined in Section 2.05).

3.09 AGGREGATE DRAINAGE FILL

A. ENGEO shall approve finished subgrades before aggregate drainage fill is installed.

B. Pipes, drains, conduits, and any other mechanical or electrical installations shall be in place before any aggregate drainage fill is placed. Backfill at walls to elevation of drainage fill shall be in place and compacted.

C. Aggregate drainage fill under slabs and concrete paving shall be the minimum uniform thickness after compaction of dimensions indicated on Drawings. Where not indicated, minimum thickness after compaction shall be 4 inches.

D. Aggregate drainage fill shall be rolled to form a well-compacted bed.

E. The finished aggregate drainage fill must be observed and approved by ENGEO before proceeding with any subsequent construction over the compacted base or fill.

3.10 SAND CUSHION

A. A sand cushion shall be placed over the vapor retarder membrane under concrete slabs on grade. Sand cushion shall be placed in uniform thickness as indicated on the Drawings. Where not indicated, the thickness shall be 2 inches.

3.11 FINISH GRADING

A. All areas must be finish graded to elevations and grades indicated on the Drawings. In areas to receive topsoil and landscape planting, finish grading shall be performed to a uniform 6 inches below the grades and elevations indicated on the Drawings, and brought to final grade with topsoil.

3.12 DISPOSAL OF WASTE MATERIALS

A. Excess earth materials and debris shall be removed from the site and disposed of in a legal manner. Location of dump site and length of haul are the Contractor's responsibility.

PART II - GEOGRID SOIL REINFORCEMENT

1. DESCRIPTION:

Work shall consist of furnishing geogrid soil reinforcement for use in construction of reinforced soil slopes and retention systems.

2. GEOGRID MATERIAL:

2.1 The specific geogrid material shall be preapproved by ENGEO.

2.2 The geogrid shall be a regular network of integrally connected polymer tensile elements with aperture geometry sufficient to permit significant mechanical interlock with the surrounding soil or rock. The geogrid structure shall be dimensionally stable and able to retain its geometry under construction stresses and shall have high resistance to damage during construction, to ultraviolet degradation, and to all forms of chemical and biological degradation encountered in the soil being reinforced.

2.3 The geogrids shall have an Allowable Strength (T_a) and Pullout Resistance, for the soil type(s) indicated, as listed in Table I.

2.4 Certifications: The Contractor shall submit a manufacturer's certification that the geogrids supplied meet the respective index criteria set when geogrid was approved by ENGEO, measured in full accordance with all test methods and standards specified. In case of dispute over validity of values, the Contractor will supply test data from an ENGEO-approved laboratory to support the certified values submitted.

3. CONSTRUCTION:

3.1 Delivery, Storage, and Handling: Contractor shall check the geogrid upon delivery to ensure that the proper material has been received. During all periods of shipment and storage, the geogrid shall be protected from temperatures greater than 140 °F, mud, dirt, dust, and debris. Manufacturer's recommendations in regard to protection from direct sunlight must also be followed. At the time of installation, the geogrid will be rejected if it has defects, tears, punctures, flaws, deterioration, or damage incurred during manufacture, transportation, or storage. If approved by ENGEO, torn or punctured sections may be repaired by placing a patch over the damaged area. Any geogrid damaged during storage or installation shall be replaced by the Contractor at no additional cost to the owner.

3.2 On-Site Representative: Geogrid material suppliers shall provide a qualified and experienced representative on site at the initiation of the project, for a minimum of three days, to assist the Contractor and ENGEO personnel at the start of construction. If there is more than one slope on a project, this criterion will apply to construction of the initial slope only. The representative shall also be available on an as-needed basis, as requested by ENGEO, during construction of the remaining slope(s).

3.3 Geogrid reinforcement may be joined with mechanical connections or overlaps as recommended and approved by the Manufacturer. Joints shall not be placed within 6 feet of the slope face, within 4 feet below top of slope, nor horizontally or vertically adjacent to another joint.

3.4 Geogrid Placement: The geogrid reinforcement shall be installed in accordance with the manufacturer's recommendations. The geogrid reinforcement shall be placed within the layers of the compacted soil as shown on the plans or as directed.

The geogrid reinforcement shall be placed in continuous longitudinal strips in the direction of main reinforcement. However, if the Contractor is unable to complete a required length with a single continuous length of geogrid, a joint may be made with the Manufacturer's approval. Only one joint per length of geogrid shall be allowed. This joint shall be made for the full width of the strip by using a similar material with similar strength. Joints in geogrid reinforcement shall be pulled and held taut during fill placement.

Adjacent strips, in the case of 100 percent coverage in plan view, need not be overlapped. The minimum horizontal coverage is 50 percent, with horizontal spacings between reinforcement no greater than 40 inches. Horizontal coverage of less than 100 percent shall not be allowed unless specifically detailed in the construction drawings.

Adjacent rolls of geogrid reinforcement shall be overlapped or mechanically connected where exposed in a wrap around face system, as applicable.

The Contractor may place only that amount of geogrid reinforcement required for immediately pending work to prevent undue damage. After a layer of geogrid reinforcement has been placed, the next succeeding layer of soil shall be placed and compacted as appropriate. After the specified soil layer has been placed, the next geogrid reinforcement layer shall be installed. The process shall be repeated for each subsequent layer of geogrid reinforcement and soil.

Geogrid reinforcement shall be placed to lay flat and pulled tight prior to backfilling. After a layer of geogrid reinforcement has been placed, suitable means, such as pins or small piles of soil, shall be used to hold the geogrid reinforcement in position until the subsequent soil layer can be placed.

Under no circumstances shall a track-type vehicle be allowed on the geogrid reinforcement before at least six inches of soil have been placed. Turning of tracked vehicles should be kept to a minimum to prevent tracks from displacing the fill and the geogrid reinforcement. If approved by the Manufacturer, rubber-tired equipment may pass over the geosynthetic reinforcement at slow speeds, less than 10 mph. Sudden braking and sharp turning shall be avoided.

During construction, the surface of the fill should be kept approximately horizontal. Geogrid reinforcement shall be placed directly on the compacted horizontal fill surface. Geogrid reinforcements are to be placed within three inches of the design elevations and extend the length as shown on the elevation view unless otherwise directed by ENGEO. Correct orientation of the geogrid reinforcement shall be verified by ENGEO.

Table I
Allowable Geogrid Strength
With Various Soil Types
For Geosynthetic Reinforcement In
Mechanically Stabilized Earth Slopes

(Geogrid Pullout Resistance and Allowable Strengths vary with reinforced backfill used due to soil anchorage and site damage factors. Guidelines are provided below.)

SOIL TYPE	MINIMUM ALLOWABLE STRENGTH, T_a (lb/ft)*		
	GEOGRID Type I	GEOGRID Type II	GEOGRID Type III
A. Gravels, sandy gravels, and gravel-sand-silt mixtures (GW, GP, GC, GM & SP)**	2400	4800	7200
B. Well graded sands, gravelly sands, and sand-silt mixtures (SW & SM)**	2000	4000	6000
C. Silts, very fine sands, clayey sands and clayey silts (SC & ML)**	1000	2000	3000
D. Gravelly clays, sandy clays, silty clays, and lean clays (CL)**	1600	3200	4800

* All partial Factors of Safety for reduction of design strength are included in listed values. Additional factors of safety may be required to further reduce these design strengths based on site conditions.

** Unified Soil Classifications.

PART III - GEOTEXTILE SOIL REINFORCEMENT

1. DESCRIPTION:

   Work shall consist of furnishing geotextile soil reinforcement for use in construction of reinforced soil slopes.

2. GEOTEXTILE MATERIAL:

   2.1 The specific geotextile material and supplier shall be preapproved by ENGEO.

   2.2 The geotextile shall have a high tensile modulus and shall have high resistance to damage during construction, to ultraviolet degradation, and to all forms of chemical and biological degradation encountered in the soil being reinforced.

   2.3 The geotextiles shall have an Allowable Strength (T_a) and Pullout Resistance, for the soil type(s) indicated as listed in Table II.

   2.4 Certification: The Contractor shall submit a manufacturer's certification that the geotextiles supplied meet the respective index criteria set when geotextile was approved by ENGEO, measured in full accordance with all test methods and standards specified. In case of dispute over validity of values, the Contractor will supply the data from an ENGEO-approved laboratory to support the certified values submitted.

3. CONSTRUCTION:

   3.1 Delivery, Storage and Handling: Contractor shall check the geotextile upon delivery to ensure that the proper material has been received. During all periods of shipment and storage, the geotextile shall be protected from temperatures greater than 140 °F, mud, dirt, dust, and debris. Manufacturer's recommendations in regard to protection from direct sunlight must also be followed. At the time of installation, the geotextile will be rejected if it has defects, tears, punctures, flaws, deterioration, or damage incurred during manufacture, transportation, or storage. If approved by ENGEO, torn or punctured sections may be repaired by placing a patch over the damaged area. Any geotextile damaged during storage or installation shall be replaced by the Contractor at no additional cost to the owner.

3.2 On-Site Representative: Geotextile material suppliers shall provide a qualified and experienced representative on site at the initiation of the project, for a minimum of three days, to assist the Contractor and ENGEO personnel at the start of construction. If there is more than one slope on a project, this criterion will apply to construction of the initial slope only. The representative shall also be available on an as-needed basis, as requested by ENGEO, during construction of the remaining slope(s).

3.3 Geotextile Placement: The geotextile reinforcement shall be installed in accordance with the manufacturer's recommendations. The geotextile reinforcement shall be placed within the layers of the compacted soil as shown on the plans or as directed.

The geotextile reinforcement shall be placed in continuous longitudinal strips in the direction of main reinforcement. Joints shall not be used with geotextiles.

Adjacent strips, in the case of 100 percent coverage in plan view, need not be overlapped. The minimum horizontal coverage is 50 percent, with horizontal spacings between reinforcement no greater than 40 inches. Horizontal coverage of less than 100 percent shall not be allowed unless specifically detailed in the construction drawings.

Adjacent rolls of geotextile reinforcement shall be overlapped or mechanically connected where exposed in a wrap around face system, as applicable.

The Contractor may place only that amount of geotextile reinforcement required for immediately pending work to prevent undue damage. After a layer of geotextile reinforcement has been placed, the succeeding layer of soil shall be placed and compacted as appropriate. After the specified soil layer has been placed, the next geotextile reinforcement layer shall be installed. The process shall be repeated for each subsequent layer of geotextile reinforcement and soil.

Geosynthetic reinforcement shall be placed to lay flat and be pulled tight prior to backfilling. After a layer of geotextile reinforcement has been placed, suitable means, such as pins or small piles of soil, shall be used to hold the geotextile reinforcement in position until the subsequent soil layer can be placed.

Under no circumstances shall a track-type vehicle be allowed on the geotextile reinforcement before at least six inches of soil has been placed. Turning of tracked vehicles should be kept to a minimum to prevent tracks from displacing the fill and the geotextile reinforcement. If approved by the Manufacturer, rubber-tired equipment may pass over the geotextile reinforcement as slow speeds, less than 10 mph. Sudden braking and sharp turning shall be avoided.

During construction, the surface of the fill should be kept approximately horizontal. Geotextile reinforcement shall be placed directly on the compacted horizontal fill surface.

Geotextile reinforcements are to be placed within three inches of the design elevations and extend the length as shown on the elevation view unless otherwise directed by ENGEO. Correct orientation of the geotextile reinforcement shall be verified by ENGEO.

Table II

* All partial Factors of Safety for reduction of design strength are included in listed values. Additional factors of safety may be required to further reduce these design strengths based on site conditions.

** Unified Soil Classifications.

PART IV - EROSION CONTROL MAT OR BLANKET

1. DESCRIPTION:

   Work shall consist of furnishing and placing a synthetic erosion control mat and/or degradable erosion control blanket for slope face protection and lining of runoff channels.

2. EROSION CONTROL MATERIALS:

   2.1 The specific erosion control material and supplier shall be pre-approved by ENGEO.

   2.2 Certification: The Contractor shall submit a manufacturer's certification that the erosion mat/blanket supplied meets the criteria specified when the material was approved by ENGEO. The manufacturer's certification shall include a submittal package of documented test results that confirm the property values. In case of a dispute over validity of values, the Contractor will supply property test data from an ENGEO-approved laboratory, to support the certified values submitted. Minimum average roll values, per ASTM D 4759, shall be used for conformance determinations.

3. CONSTRUCTION:

   3.1 Delivery, Storage, and Handling: Contractor shall check the erosion control material upon delivery to ensure that the proper material has been received. During all periods of shipment and storage, the erosion mat shall be protected from temperatures greater than 140 °F, mud, dirt, and debris. Manufacturer's recommendations in regard to protection from direct sunlight must also be followed. At the time of installation, the erosion mat/blanket shall be rejected if it has defects, tears, punctures, flaws, deterioration, or damage incurred during manufacture, transportation, or storage. If approved by ENGEO, torn or punctured sections may be removed by cutting OUT a section of the mat. The remaining ends should be overlapped and secured with ground anchors. Any erosion mat/blanket damaged during storage or installation shall be replaced by the Contractor at no additional cost to the Owner.

   3.2 On-Site Representative: Erosion control material suppliers shall provide a qualified and experienced representative on site, for a minimum of one day, to assist the Contractor and ENGEO personnel at the start of construction. If there is more than one slope on a project, this criteria will apply to construction of the initial slope only. The representative shall be available on an as-needed basis, as requested by ENGEO, during construction of the remaining slope(s).

3.3 Placement: The erosion control material shall be placed and anchored on a smooth graded, firm surface approved by the Engineer. Anchoring terminal ends of the erosion control material shall be accomplished through use of key trenches. The material in the trenches shall be anchored to the soil on maximum 1½ foot centers. Topsoil, if required by construction drawings, placed over final grade prior to installation of the erosion control material shall be limited to a depth not exceeding 3 inches.

3.4 Erosion control material shall be anchored, overlapped, and otherwise constructed to ensure performance until vegetation is well established. Anchors shall be as designated on the construction drawings, with a minimum of 12 inches length, and shall be spaced as designated on the construction drawings, with a maximum spacing of 4 feet.

3.5 Soil Filling: If noted on the construction drawings, the erosion control mat shall be filled with a fine grained topsoil, as recommended by the manufacturer. Soil shall be lightly raked or brushed on/into the mat to fill the mat voids or to a maximum depth of 1 inch.

PART V - GEOSYNTHETIC DRAINAGE COMPOSITE

1. DESCRIPTION:

   Work shall consist of furnishing and placing a geosynthetic drainage system as a subsurface drainage medium for reinforced soil slopes.

2. DRAINAGE COMPOSITE MATERIALS:

   2.1 The specific drainage composite material and supplier shall be preapproved by ENGEO.

   2.2 The drain shall be of composite construction consisting of a supporting structure or drainage core material surrounded by a geotextile. The geotextile shall encapsulate the drainage core and prevent random soil intrusion into the drainage structure. The drainage core material shall consist of a three dimensional polymeric material with a structure that permits flow along the core laterally. The core structure shall also be constructed to permit flow regardless of the water inlet surface. The drainage core shall provide support to the geotextile. The fabric shall meet the minimum property requirements for filter fabric listed in Section 2.05C of the Guide Earthwork Specifications.

   2.3 A geotextile flap shall be provided along all drainage core edges. This flap shall be of sufficient width for sealing the geotextile to the adjacent drainage structure edge to prevent soil intrusion into the structure during and after installation. The geotextile shall cover the full length of the core.

   2.4 The geocomposite core shall be furnished with an approved method of constructing and connecting with outlet pipes or weepholes as shown on the plans. Any fittings shall allow entry of water from the core but prevent intrusion of backfill material into the core material.

   2.5 Certification and Acceptance: The Contractor shall submit a manufacturer's certification that the geosynthetic drainage composite meets the design properties and respective index criteria measured in full accordance with all test methods and standards specified. The manufacturer's certification shall include a submittal package of documented test results that confirm the design values. In case of dispute over validity of design values, the Contractor will supply design property test data from an ENGEO-approved laboratory, to support the certified values submitted. Minimum average roll values, per ASTM D 4759, shall be used for determining conformance.

3. CONSTRUCTION:

3.1 Delivery, Storage, and Handling: Contractor shall check the geosynthetic drainage composite upon delivery to ensure that the proper material has been received. During all periods of shipment and storage, the geosynthetic drainage composite shall be protected from temperatures greater than 140 °F, mud, dirt, and debris. Manufacturer's recommendations in regards to protection from direct sunlight must also be followed. At the time of installation, the geosynthetic drainage composite shall be rejected if it has defects, tears, punctures, flaws, deterioration, or damage incurred during manufacture, transportation, or storage. If approved by ENGEO, torn or punctured sections may be removed or repaired. Any geosynthetic drainage composite damaged during storage or installation shall be replaced by the Contractor at no additional cost to the Owner.

3.2 On-Site Representative: Geosynthetic drainage composite material suppliers shall provide a qualified and experienced representative on site, for a minimum of one half day, to assist the Contractor and ENGEO personnel at the start of construction with directions on the use of drainage composite. If there is more than one application on a project, this criterion will apply to construction of the initial application only. The representative shall also be available on an as-needed basis, as requested by ENGEO, during construction of the remaining applications.

3.3 Placement: The soil surface against which the geosynthetic drainage composite is to be placed shall be free of debris and inordinate irregularities that will prevent intimate contact between the soil surface and the drain.

3.4 Seams: Edge seams shall be formed by utilizing the flap of the geotextile extending from the geocomposite's edge and lapping over the top of the fabric of the adjacent course. The fabric flap shall be securely fastened to the adjacent fabric by means of plastic tape or non-water-soluble construction adhesive, as recommended by the supplier. Where vertical splices are necessary at the end of a geocomposite roll or panel, an 8-inch-wide continuous strip of geotextile may be placed, centering over the seam and continuously fastened on both sides with plastic tape or non-water-soluble construction adhesive. As an alternative, rolls of geocomposite drain material may be joined together by turning back the fabric at the roll edges and interlocking the cuspidations approximately 2 inches. For overlapping in this manner, the fabric shall be lapped and tightly taped beyond the seam with tape or adhesive. Interlocking of the core shall always be made with the upstream edge on top in the direction of water flow. To prevent soil intrusion, all exposed edges of the geocomposite drainage core edge must be covered. Alternatively, a 12-inch-wide strip of fabric may be utilized in the same manner, fastening it to the exposed fabric 8 inches in from the edge and folding the remaining flap over the core edge.

3.5 Soil Fill Placement: Structural backfill shall be placed immediately over the geocomposite drain. Care shall be taken during the backfill operation not to damage the geotextile surface of the drain. Care shall also be taken to avoid excessive settlement of the backfill material. The geocomposite drain, once installed, shall not be exposed for more than seven days prior to backfilling.

PHASE ONE ENVIRONMENTAL SITE ASSESSMENT

Dear Mr. Minard:

ENGEO Incorporated is pleased to present our Phase One Environmental Site Assessment of the Sutter Medical Center of Santa Rosa/Luther Burbank Center for the Arts Property located in Sonoma County, California. The attached report includes a description of the site assessment activities along with ENGEO's findings regarding the property.

We are pleased to be of service to you on this project. If you have any questions concerning the contents of our report, please contact us.

Very truly yours,

ENGEO INCORPORATED

1.0 INTRODUCTION

Sutter Medical Center of Santa Rosa retained ENGEO Incorporated to perform a Phase One Environmental Site Assessment on the Luther Burbank Center for the Arts and Sutter Foundation properties (Property). The Property is comprised of four parcels that bear the following street addresses: 18 Mark West Springs Road, 50 Mark West Springs Road and 100 Mark West Springs Road, in Santa Rosa, California (Figures 1 and 2). The Property encompasses a total of approximately 54 acres, which are identified as Assessor's Parcel Numbers (APN) 058-040-023, 058-040-026, 058-040-027, and 058-040-045. Although APN 058-040-050 has common ownership with the Property identified for this study, the 24.4 acres of vineyards within that parcel were not included in this assessment.

A review of aerial photographs and historical database research found that the Property and surrounding properties have historically been used for rural residences and agricultural production, and more recently, a performing arts center, and residential subdivisions.

ENGEO Incorporated has performed this Phase One Environmental Site Assessment for the Property in general conformance with the scope and limitations of ASTM 1527-00 and our proposal dated September 13, 2004. Based on the findings of the assessment, we have identified one Recognized Environmental Condition (REC) and four items of concern within the Property. A discussion of these findings can be found in Section 7.0 of this report.

2.0 PURPOSE AND SCOPE

2.1 Purpose of Phase One Environmental Site Assessment

The purpose of this Phase One Environmental Site Assessment is to identify recognized environmental conditions associated with the property. As defined in the American Society for Testing and Materials (ASTM) Standard Practice E 1527-00, a Recognized Environmental Condition (REC) is "the presence or likely presence of any hazardous substances or petroleum products on a Property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the Property or into the ground, groundwater, or surface water of the property".

2.2 Detailed Scope of Services

The scope of services performed included the following:

- A review of publicly available and practically reviewable standard local, state and federal environmental record sources.
- A review of publicly available and practically reviewable standard historical sources, aerial photographs, fire insurance maps and physical setting sources.
- A reconnaissance of the Property to review site use and current conditions. The reconnaissance was conducted to check for the storage, use, production or disposal of hazardous or potentially hazardous materials.
- Interviews with public and private individuals with specific knowledge of the Property.
- Preparation of this report with our findings and conclusions.

2.3 Significant Assumptions

The following significant assumptions were made during preparation of this report as well as the opinions and conclusions contained herein:

1. This study assumes that shallow and regional groundwater flow follows the topographic gradient in the vicinity of the Property, which is generally to toward the southwest.

2. This study did not include a detailed evaluation of hydrogeologic conditions beneath the Property.

3. The waste water treatment system currently in operation within the Property will be decommissioned and removed with oversight by the North Coast Regional Water Quality Control Board as a part of the proposed site development under the Master Plan.

4. The existing structures present within APN 058-040-023 and 058-040-026 will be removed prior to site development.

2.4 Limitations and Exceptions of Assessment

The professional staff at ENGEO Incorporated strives to perform its services in a proper and professional manner with reasonable care and competence but is not infallible. The recommendations and conclusions presented in this report were based on the findings of our study, which were developed solely from the contracted services. The findings of the report are based in part on contracted database research, out-of-house reports and personal communications. ENGEO Incorporated assumes no liability for the validity of the materials relied upon in the preparation of this report.

This document must not be subject to unauthorized reuse; that is, reuse without written authorization of ENGEO Incorporated. Such authorization is essential because it requires ENGEO to evaluate the document's applicability given new circumstances, not the least of which is passage of time. The findings from a phase one environmental site assessment are typically valid for 180 days after completion of the report, particularly with regard to the regulatory database files. In some instances the shelf life of the report can be less.

This Phase One Environmental Site Assessment is not intended to represent a complete soil or groundwater characterization. This assessment does not define the depth or extent of soil or groundwater contamination. It is intended to provide an evaluation of potential environmental concerns associated with the use of the property. A more extensive assessment that would include a subsurface exploration with laboratory testing of soil and groundwater samples could provide more definitive information concerning site-specific conditions. If additional assessment activities are considered for the Property and if other entities are retained to provide such services, ENGEO cannot be held responsible for any and all claims arising from or resulting from the performance of such services by other persons or entities, and from any and all claims arising or resulting from clarifications, adjustments, modifications, discrepancies or other changes necessary to reflect changed field or other conditions.

2.5 Special Terms and Conditions

ENGEO Incorporated has prepared this report for the exclusive use of our client, Sutter Medical Center of Santa Rosa. It is recognized and agreed that ENGEO has assumed responsibility only for undertaking the study for the client. The responsibility for disclosures or reports to a third party and for remedial or mitigative action shall be solely that of the Client. Laboratory testing of soil or groundwater samples was not within the scope of the contracted services. The assessment did not include an asbestos survey, an evaluation of lead-based paint, an inspection of light ballasts for PCBs, or a mold survey.

This report is based upon field and other conditions discovered at the time of preparation of ENGEO's work. Visual observations referenced in this report are intended only to represent site conditions at the time of the site visit. ENGEO would not be aware of site contamination, such as dumping and/or accidental spillage that occurred subsequent to the site reconnaissance conducted by ENGEO personnel.

3.0 SITE DESCRIPTION

3.1 Location and Legal Description

The subject Property (Property) consists of five parcels located on the south side of Mark West Springs Road, between Old Redwood Highway and Highway 101, in Sonoma County, California (Figure 2). The Property consists of a total of approximately 54 acres, and is identified as Assessor's Parcel Numbers (APN) 058-040-023, 058-040-026, 058-040-027, and 058-040-045. APN 058-040-050 is not a part of this study.

3.2 Site and Vicinity Characteristics

The site is relatively flat at an elevation of approximately 155 feet above mean sea level (msl). Review of the Regional Geologic Map of the Santa Rosa Quadrangle, State of California, Department of Conservation, Division of Mines and Geology 1982, compiled by D.L. Wagner, E.J. Bortugno, found that the underlying geologic formation at the Property is un-named quaternary alluvium.

We reviewed the State of California, Department of Water Resources web site for groundwater level data in the vicinity of the Property. Well Number 07N08W03L001M shows that groundwater in the vicinity of the Property is approximately 10 feet below the ground surface. This well is mapped approximately ¼-mile southeast of the Property.

3.3 Current Use of Property/Description of Site Improvements

The current uses of the Property includes the existing 85,000-square-foot Luther Burbank Center for the Arts (APN 058-040-045), a rural residence with barn, out buildings and undeveloped pasture land (APN 058-040-026 and 058-040-027), and a single-family home that is currently used as law offices (APN 058-040-023). The Luther Burbank Center For The Arts (LBC) occupies the center of the Property and is utilized as a cultural and performing arts event center. A part of the LBC Property is leased to the Sonoma Academy, an independent college-preparatory high school. This portion of the Property includes approximately 38.8 acres that are occupied by asphalt-covered parking areas, an athletic field, and a waste water treatment facility ponds. The vineyard occupies the south and southeast portions of the Property that include approximately 24.4 acres. The rural residential homestead property occupies the western portion of the Property that includes approximately 13.6 acres. This parcel is utilized in part by the Luther Burbank Center as a maintenance and storage area. The single-family home that is currently used as law offices occupies the northeast corner of the Property that includes approximately 1.3 acres. This parcel also contains an asphalt parking area which can accommodate approximately 10 vehicles, an undeveloped dirt parking area that occupies the southwest ¼ of the parcel, and two small out buildings.

3.4 Current and Past Use of Adjoining Properties

Adjoining properties to the east consist of a residential subdivision and a Sonoma County Park site. Adjoining properties to the north consist of residential subdivisions and commercial properties. Adjoining properties to the south and west consist of rural residential and agricultural properties. Highway 101 and State of California Right-of-Way are located along the west boundary of the Property.

4.0 RECORDS REVIEW

4.1 Historical Record Sources

The purpose of the historical record review is to develop a history of the previous uses or occupancies of the Property and surrounding area in order to identify those uses or occupancies that are likely to have led to recognized environmental conditions on the property.

4.1.1 Historical Topographic Maps

Historical USGS 7.5' and 15' Topographic Maps were reviewed to determine if discernible changes in topography or improvements pertaining to the Property had been recorded. We reviewed the USGS 7.5' Santa Rosa Quadrangle Maps dated 1954, 1968, 1973, and 1980; USGS 7.5' Sebastopol Quadrangle Maps dated 1954, 1968, and 1980; and USGS 15' Santa Rosa Quadrangle Maps dated 1944 and 1954.

1944 15' Map – The Property is mapped as relatively flat, undeveloped land. There are no structures mapped on the Property. Redwood Highway is mapped <¼ mile east of the site. Three small structures are mapped along the west side of the Redwood Highway, near the east boundary of the Property.

1954 15' Map – The Property is mapped as being covered with an orchard. No structures are mapped within the Property. A small structure is mapped at the southwest corner of Mark West Springs Road and Redwood Highway.

1954 7.5' Maps – Conditions within the Property are similar to those shown of the 1954 15' map. East Fulton Road is mapped along the northern boundary of the Property. A single power line is mapped running east-west, ¼ mile north of the Property. A second power line is mapped running east from the intersection of East Fulton Road and Redwood Highway. The Northwestern Pacific Railroad is shown approximately 1 mile west of the Property.

<u>1968 7.5' Maps</u> – Conditions within the Property are similar to those in the 1954 7.5' maps. Highway 101 is mapped along the west boundary of the Property. Several new, small to large structures are mapped on adjoining properties on the north side of East Fulton Road. A new residential subdivision mapped east of the intersection of East Fulton Road and Redwood Highway. Ursuline High School is mapped on the east side of the intersection of Mark West Road and Redwood Highway.

<u>1973 7.5' Map</u> – Conditions within the Property are similar to those in the 1968 7.5' maps. A residential subdivision is mapped on the east side of Redwood Highway between Mark West Road and East Fulton Road.

<u>1980 7.5' Maps</u> – The Luther Burbank Center and surrounding roadways are mapped within the Property. The western portion of the Property is still mapped as being developed as an orchard.

<u>4.1.2 Chain of Title/Ownership</u>

The Title Report lists recorded land title detail, ownership fees, leases, land contracts, easements, liens, deficiencies, and other encumbrances attached to or recorded against a subject property. However, laws and regulations pertaining to land trusts vary from state to state and the detail of information presented in a Title Report can vary greatly by jurisdiction. As a result, ENGEO utilizes a Title Report, when provided to us, as a supplement to other historical record sources. We did not receive Title Reports for any of the subject Properties.

4.1.3 Fire Insurance Maps

Environmental Data Resources, Inc. (EDR) prepared a Sanborn Fire insurance map search for the subject site and surrounding properties. No maps were located by EDR pertaining to the subject Property or adjacent properties (Appendix A).

4.1.4 Aerial Photographs

The following aerial photographs were reviewed for information regarding past conditions and land use at the subject site and in the immediate vicinity.

PHOTO NUMBER	SCALE	SOURCE	DATE
NONE	1" = 833'	Cartwright	1952
NONE	1" = 333'	Cartwright	1965
NONE	1" = 690'	WSA	1982
NONE	1" = 666'	USGS	1993

1952 Photograph – The Property is developed as an orchard. Three structures are visible within the Property. Two of the structures are within the ranch Property on the south side of East Fulton Road at the present location of the main entrance to the Luther Burbank Center. The third structure is located approximately 1,000 feet south of the ranch property. Several north-south and east-west running agriculture roads are visible within the Property. Several small to medium sized structures are visible on adjoining properties. The Redwood Highway is visible to the east of the Property.

1965 Photograph – Orchards are still present within the majority of the Property. Five structures are visible within the Property, four within the ranch Property along the north boundary of the Property, and one approximately 1,000 feet south of the ranch property. Highway 101 is visible along the west boundary of the Property. East Fulton Road (Mark

West Springs Road) has been realigned near the northeast corner of the Property to its present configuration. A small residential subdivision is visible on the west side of Redwood Highway approximately 300 feet north of Mark West springs Road. Several large buildings are visible to the north of the subdivision. Adjoining properties to the east and west beyond Highway 101 remain as agricultural land.

1982 Photograph – The Luther Burbank Center with associated parking lots and waste water treatment ponds are visible within the Property. Several residential subdivisions are visible to the north and east of the Property. Agricultural land is still present at the northeast corner of Redwood Highway and Mark West Springs Road.

1993 Photograph – Conditions within the Property appear similar to those in the 1982 photograph. A residential subdivision is now present at the northeast corner of Redwood Highway and Mark West Springs Road.

4.1.5 Building/Planning Department Records

The following agencies were contacted pertaining to possible past development and other historical data regarding the Property:

- Sonoma County Planning/Building Department

We conducted a file search of existing documents held by the Sonoma County Building Department for APN 058-040-026 (homestead Property at 100 Mark West Springs Road), and APN 058-040-045 (Luther Burbank Center at 50 Mark West Springs Road). Our file search revealed the following:

- No well or septic permits are on file for APN 058-040-045.
- No as-built plans are on file for the LBC facilities.

- No building permits are on file for the original construction of the LBC facilities.

- The Land Use Permit currently issued to the LBC parcel (APN 058-040-045) was originally issued to the Christian Life Center for 'Religious Institutional Use'.

- The LBC parcel was acquired by the Luther Burbank Memorial Foundation in October 1981.

- According to Resolution #10032 from the Sonoma County Board of Zoning Adjustments dated April 11, 1985, the Land Use Permit for the LBC parcel was changed to allow 'Cultural & Performing Arts Institutional Use'.

- The LBC complex is part of the Larkfield-Wikiup Specific Plan.

- The waste water treatment system on the LBC parcel is operated under permit by the North Coast Regional Water Quality Control Board.

4.2 Environmental Record Sources

Environmental Data Resources Inc. (EDR) performed a search of local, state and federal agency databases regarding the Property and known contaminated sites in the immediate vicinity. The EDR listed the Property in two of the databases searched. The EDR also reported eleven locations within a 1-mile radius of the Property were hazardous materials are stored, used, or have been released to the environment. Each of these locations is described below:

1. Luther Burbank Memorial Foundation (Property), 50 Mark West Springs Rd, (HAZNET). This site is listed as the location of 1.29 tons of polychlorinated biphenyls and material containing PCBs. The disposal method is not reported.

2. Luther Burbank Center for The Arts (Property), 50 Mark West Springs Rd, (CA WDS). This site is listed as the location of a domestic facility that treats sewage or a mixture of predominantly sewage and or privately owned systems (excluding individual subsurface

leaching systems disposing of less than 1,000 gallons per day). The site status is listed as active, with a moderate threat to water quality.

3. Unocal #5142, 4605 Old Redwood Highway, (LUST, Cortese). This site is located less than $^1/_8$ mile from the Property and is listed as the location of a leaking underground storage tank. No additional site status information is provided.

4. Texaco, 4601 Old Redwood Highway, (LUST, Cortese). This site is located less than $^1/_8$ mile from the Property and is listed as the location of a leaking underground storage tank. No additional site status information is provided.

5. Larkfield Auto Center, 601 Larkfield CTR, (RCRIS-SQG, FINDS, HAZNET). This site is located from $^1/_8$ to $^1/_4$ mile from the Property and is listed as a location of a small quantity generator. No violations have been found in relation to the generator. This site is also listed as the location of an aqueous solution with less than 10 percent total organic residues. The disposal method is listed to be a transfer station and a recycler.

6. Larkfield Chevron, 668 Larkfield Center, (CA FID UST). This site is located from $^1/_8$ to $^1/_4$ mile from the Property and is listed as a location of an active underground storage tank location. No additional site status information is provided.

7. 98270, 668 Larkfield Center, (HIST UST). This site is located from $^1/_8$ to $^1/_4$ mile from the Property and is listed as a location of a hazardous substance storage container. The container is noted to contain waste from a gas station. No additional site status information is provided.

8. Texaco, 4601 Old Redwood Highway, (CA FID UST, LUST). This site is located from $^1/_4$ to $^1/_2$ mile from the Property and is listed as a location of a leaking underground storage tank. It is noted that the aquifer has been affected. The status of the site is listed as undergoing

remediation. It is noted that MTBE was tested for and detected in the groundwater. The maximum concentration of MTBE found was 6.81 parts per billion. No additional site status information is provided.

9. Union 76 #5142, 4605 Old Redwood Highway, (LUST). This site is located from $^1/_4$ to $^1/_2$ mile from the Property and is listed as a location of a leaking underground storage tank which contains gasoline. It is noted that the aquifer has been affected. The status of the site is listed as case closed. It is noted that MTBE was tested for and detected in the groundwater. The maximum concentration of MTBE found was 10 parts per billion. No additional site status information is provided.

10. BP, Larkfield/Redwood Oil, 4856 Old Redwood Highway, (LUST, Cortese). This site is located from ¼ to ½ mile from the Property and is listed as the location of a leaking underground storage tank. No additional site status information is provided.

11. Davis, May L., 105 Eton, (Cortese). This site is located from $^1/_4$ to $^1/_2$ mile from the Property and is listed as the location of hazardous waste or substances. No additional site status information is provided.

12. Larkfield Chevron #98270, 4840 Old Redwood Highway, (LUST). This site is located from $^1/_4$ to ½ mile from the Property and is listed as the location of a leaking underground storage tank. It is noted that the aquifer has been affected. The status of the site is listed as "leak being confirmed". It is noted that MTBE was tested for and detected in the groundwater. The maximum concentration of MTBE found was 820 parts per billion. No additional site status information is provided.

13. Larkfield BP, 4856 Old Redwood Highway, (Notify 65, LUST). This site is located from ¼ to ½ mile from the Property and is listed as the location of a leaking underground gasoline

storage tank. It is noted that the aquifer has been affected. The status of the site is listed as "remedial action (cleanup) underway". It is noted that MTBE was tested for and detected in the groundwater. The maximum concentration of MTBE found was 49 parts per billion. No additional site status information is provided. This site is listed in the Notify 65 database, which contains facility notifications regarding facilities with known releases that could impact drinking water and thereby expose the public to a potential health risk.

The databases searched are presented and described below.

4.2.1 Federal Record Sources

The following is a summary of federal databases reviewed by EDR:

- NPL – National Priority List – The National Priority List (Superfund) identifies over 1,200 sites for priority cleanup under the Superfund program.

- Proposed NPL Sites – Provides a list of sites that are under consideration for inclusion on the NPL.

- CERCLIS – Comprehensive Environmental Response, Compensation, and Liability Information System – CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies, and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to be or are on the National Priority List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

- CERCLIS-NFRAP – CERCLIS No Further Remedial Action Planned – As of February 1995, CERCLIS sites designated "No Further Remedial Action Planned" (NFRAP) have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require Federal Superfund action or NPL consideration.

- CORRACTS – Corrective Action Report – CORRACTS identifies hazardous waste handlers with RCRA corrective action activity.

- RCRIS – Resource Conservation and Recovery Information System – RCRIS includes selective information on sites that generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA).

- ERNS – Emergency Response Notification System – ERNS records and stores information on reported releases of oil and hazardous substances.

- BRS – Biennial Reporting System – A national system administered by the EPA that collects data on the generation and management of hazardous waste. BRS captures detailed data from two groups: Large Quantity Generators (LQG) and Treatment, Storage, and Disposal Facilities.

- CONSENT – Superfund (CERCLA) Consent Decrees – Major legal settlements that establish responsibility and standards for cleanup at NPL sites.

- ROD – Records of Decision – ROD documents mandate a permanent remedy at an NPL site containing technical and health information to aid in the cleanup.

- DELISTED NPL – National Priority List Deletions – Sites deleted by EPA in accordance with 40 CFR 300.425.(e) where no further response is appropriate.

- FINDS – Facility Index System/Facility Identification Initiative Program Summary Report – FINDS contains both facility information and "pointers" to other sources that contain more detailed information.

- HMIRS – Hazardous Materials Information Reporting System – HMIRS contains hazardous material spill incidents reported to the Department of Transportation (DOT).

- MLTS – Material Licensing Tracking System – MLTS is maintained by the Nuclear Regulatory Commission and contains a list of approximately 8,100 sites that possess or use radioactive materials and are subject to NRC licensing requirements.

- MINES – Mines Master Index File – Provides a list of sites that have been subjected to mining activity.

- NPL Liens – Under authority granted by the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) of 1980, USEPA has the authority to file liens against real Property in order to recover remedial action expenditures or when the Property owner receives notification of potential liability.

- PADS – PCB Activity Database System – PADS identifies generators, transporters, commercial storers and/or brokers and disposers of PCBs who are required to notify the EPA of such activities.

- RAATS – RCRA Administrative Action Tracking System – RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. Please note data entry of administrative actions was discontinued after September 30, 1995.

- TRIS – Toxic Chemical Release Inventory System – TRIS identifies facilities that release chemicals to the air, water and land in reportable quantities under SARA Title III Section 313.

- TSCA – Toxic Substances Control Act – TSCA identifies manufacturers and importers of chemical substances included on the SCA Chemical Substance Inventory List.

- FTTS – FIFRA/TSCA Tracking System, and FTTS INSP – FTTS tracks administrative cases and pesticide enforcement actions and compliance related to FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act), TSCA, and EPCRA (Emergency Planning and Community Right-to Know Act).

4.2.1.1 Subject Property

The Property is not listed on the above databases.

4.2.1.2 Other Properties

The EDR report identified one facility included on the above databases within the designated ASTM search radii. The database(s) with listed facilities are indicated below with the number of facilities listed in parenthesis.

- FINDS – Resource Conservation and Recovery Act Information System (1)

4.2.2 State Record Sources

The following is a summary of state databases reviewed by EDR:

- AWP – Annual Workplan Sites – Identifies known hazardous substance sites targeted for cleanup.
- CAL-SITES – Contains potential or confirmed hazardous substance release properties.
- CHMIRS – California Hazardous Materials Information Reporting System – Contains information on reported hazardous materials incidents.
- CORTESE – "Cortese" Hazardous Waste and Substances Sites List – Listed sites are designated by the State Water Resources Control Board (LUST), the Integrated Waste Board (SWF/LF), and the Department of Toxic Substances Control (Cal-Sites).
- NOTIFY 65 – Proposition 65 Records – Contains facility notifications regarding known releases that could impact drinking water and thereby expose the public to a potential health risk.
- TOXIC PITS – Toxic Pits Cleanup Act Sites – Identifies sites suspected of containing hazardous substances where cleanup has not yet been completed.
- SWF/LF (SWIS) – Solid Waste Information System – Active, closed and inactive landfills.
- WMUDS/SWAT – Waste Management Unit Database – Used by State Water Resources Control Board staff and Regional Water Quality Control Boards for program tracking and inventory of waste management units.
- LUST – Leaking Underground Storage Tank Information System – Contains an inventory of reported leaking underground storage tank incidents.
- CA BOND EXP. PLAN – Bond Expenditure Plan – A site-specific expenditure plan used as the basis for an appropriation of Hazardous Substance Cleanup Bond Act funds. This has been superceded by the Annual Work Plan (AWP).
- CA UST – Active UST Facilities – A list of active UST facilities gathered from local regulatory agencies.
- *C*A FID UST – Facility Inventory Database – An historical listing of active and inactive underground storage tank locations from the State Water Resource Control Board.

- HIST UST – Hazardous Substance Storage Container Database – A historical listing of UST sites.

- AST – Above-ground Petroleum Storage Tank Facilities – Registered above-ground storage tanks.

- CLEANERS – Dry Cleaner Facilities – A list of dry cleaner facilities that have EPA ID numbers. Specific criteria for the subject facilities warrant inclusion on this database.
- CA WDS – Waste Discharge System – Sites that have been issued waste discharge requirements.

- HAZNET – Hazardous Waste Information System – Facility and manifest data regarding hazardous waste shipments.

4.2.2.1 Subject Property

The Property is listed on two of the above databases. The databases on which the Property is listed are indicated below.

- CA WDS

- HAZNET

4.2.2.2 Other Properties

The EDR report identified 13 facilities included on the above databases within the designated ASTM search radii. The database(s) with listed facilities are indicated below with the number of facilities listed in parenthesis.

- CORTESE (4)
- Notify 65 (1)
- LUST (7)
- CA FID UST (2)
- HIST UST (1)

4.2.3 Local Record Sources

The following is a summary of the local database reviewed by EDR.

- Sonoma County - Leaking Underground Storage Tank Sites

4.2.3.1 Subject Property

The Property is not listed on the above local database.

4.2.3.2 Other Properties

No properties were reported on the above database.

5.0 SITE RECONNAISSANCE

5.1 Methodology

ENGEO conducted a site reconnaissance of the Property on October 5, 2004. The Property was viewed for hazardous materials storage, surficial staining or discoloration, debris, stressed vegetation, or other conditions that may be indicative of potential sources of soil or groundwater contamination. The site was also reviewed for evidence of fill/ventilation pipes, ground subsidence, or other evidence of existing or preexisting underground storage tanks. The portion of the Property occupied by APN 058-040-023 was viewed only from the boundaries of this parcel. Photographs taken during the site reconnaissance are presented in Appendix B.

5.2 General Site Setting

The Property consists of a total of approximately 54 acres located at the southeast corner of Mark West Springs Road and Highway 101 in Sonoma County, California. This Phase I ESA focuses on approximately 54 acres identified by APN 058-040-023, 058-040-026, 058-040-027, and 058-040-045. The Property is bounded by Mark West Springs Road on the north, Highway 101 on the west, rural residential properties on the south, and Old Redwood Highway, a residential subdivision, and a park on the east. An approximately 24.4 acre vineyard parcel (APN 058-040-050) occupies the south and southeast portions of the Property, and is not included as a part of this study.

5.3 Exterior Observations

Hazardous Substances and Petroleum Products in Connection with Identified Uses. We observed hazardous substances and petroleum products in connection with the identified uses in three locations within the Property. These are discussed below in the section 'Hazardous Substance and Petroleum Product Containers'

Storage Tanks. No storage tanks were observed on the Property during our reconnaissance.

Odors. No odors were detected at the time of our reconnaissance.

Pools of Potentially Hazardous Liquid. No pools of potentially hazardous liquids were observed within the Property at the time of our reconnaissance.

Drums. We observed seven drums (30 to 55-gallon) adjacent to the LBC physical plant building. These drums consisted of four metal 55-gallon drums, one plastic 55-gallon drum, and two plastic 30-gallon drums. Labeling on all of these drums was either illegible or not visible.

Hazardous Substance and Petroleum Product Containers. We observed chemical storage containers in one location within the Property. These containers consisted of eight compressed chlorine gas bottles located within a small wooded shed on the west side of the northern waste water treatment pond. These chlorine gas bottles are used as part of the waste water treatment system.

We observed petroleum product containers in two locations within the Property. These containers were observed in a storage area within the barn, and outside of the Physical Plant building of the LBC. These containers consisted of five, two-gallon metal gasoline containers within the storage area of the barn; several small plastic containers with motor oil, brake fluid and other automotive fluids stored on a shelf within the barn storage area; two, 5-gallon motor oil containers stored on the concrete slab outside of the LBC physical plant building.

Polychlorinated Biphenyls (PCBs). One pad-mounted electrical transformer was observed within the Property, and one pole mounted transformer was observed near the northeast corner of the Property. We observed no signage on either transformer indicating whether or not they contained PCBs.

Pits, Ponds and Lagoons. We observed two waste water treatment ponds within the Property. These ponds are part of the on-site waste water treatment system operated by the Luther Burbank Center for the Arts, and were observed to be enclosed by chain link fences and locked gates. The northern pond functions as an influent aeration pond. The southern pond functions as a percolation pond for treated waste water effluent.

Stained Soil/Pavement. We observed minor staining on the concrete slab outside of the Physical Plant building. This staining appeared to be the result of spillage from a 5-gallon motor oil container and was restricted to an area of less than 1 square foot.

Stressed Vegetation. We observed no areas of stressed vegetation within the Property at the time of our reconnaissance.

Solid Waste. We observed several piles of solid waste in the vicinity of the barn structure within the homestead area of the Property. This solid waste consisted of several empty chlorine liquid bottles, five discarded lead-acid batteries, broken concrete, miscellaneous wood debris, and a pile of green waste.

Wastewater. The waste water treatment system operated by the LBC consists of a closed-sump located within a separate building, and two open ponds that act as aeration and percolation ponds. We understand that the water treatment facility was constructed circa 1980.

The occupied residence within the homestead parcel is equipped with two septic disposal systems, as discussed below. Additionally, it is believed that waste water disposal for the law office parcel (APN 058-040-023) at the northeast corner of the property, is via an individual septic disposal system.

Wells. One well is reported to be located on the LBC parcel (APN 058-040-045). Our research indicates that this well is used solely for landscape irrigation purposes. Data provided by Brelje & Race Consulting Engineers indicates that this well is constructed to a depth of 400 feet, and is currently equipped with a submersible pump capable of delivering approximately 200 gallons per minute (gpm). The domestic water supplies to the LBC and homestead parcels (APN 058-040-045 and 058-040-026 respectively) are provided by the Cal American Water Company. No wells were observed or reported within the homestead parcel. The water supply for the law office parcel was not observed during our reconnaissance and is unknown, however based on information reported by others it is possible that a well exists at this site and this may provide water for this parcel.

Septic Systems. We were informed that there are two active septic systems located within the homestead parcel of the property; reportedly these systems are located on the west and east sides of the residence within the homestead parcel of the property. Additional as noted above, another septic system is believed be located on the law office parcel (APN 058-040-023); however, our site reconnaissance did not observe a septic system at this parcel.

5.4 Asbestos-Containing Materials (ACM) and Lead-Based Paint

An asbestos and lead-based paint survey was not conducted as part of this assessment. Given the age of the existing structures within the homestead parcel and the parcel occupied by the law offices, it is likely that asbestos-containing materials (ACM) and lead-based paint were used for the construction of these structures.

5.5 Indoor Air Quality

An evaluation of indoor air quality, mold, or radon was not included as part of the contracted scope of services. The USEPA and CAL - EPA have conducted studies of radon risks throughout the state. Results of the studies indicate that average statistical radon concentrations in Sonoma County are less than the current EPA action level.

6.0 INTERVIEWS

We interviewed Mr. Mark Silva, Director of Operations with the Luther Burbank Center, and Mr. Jim Bailey, Maintenance Supervisor with the Luther Burbank Center regarding the history of the facility, operation of the on-site waste water treatment facility, and general information on site use within the LBC and subject parcels within the Property.

Mr. Silva and Mr. Bailey stated that the facilities occupied by LBC were originally constructed in approximately 1975 as a church complex. Prior to this time, most of the Property was used historically as prune and walnut orchards. Mr. Bailey stated that residence, garage, barn, and other buildings within the homestead Property were most likely built prior to 1940. The exact dates of construction are unknown. Mr. Bailey stated that the garage and barn are used by the LBC as storage and workshop space. Mr. Bailey also stated that all of the landscaping within the LBC grounds is maintained by an outside landscaping contractor.

Mr. Silva stated that the waste water treatment system operates by aeration and percolation with no effluent discharge outside of the Property. Mr. Silva stated that the sump pit for the waste water treatment system is pumped out periodically by a septic service, but has not been pumped for more than 3 years. Mr. Silva also stated that he is uncertain of the lining material used at the base of the north pond. Mr. Silva also stated that to his knowledge, no closure plan has been developed for the waste water treatment system.

Mr. Silva stated that the domestic water supply to the Luther Burbank Center is provided through the ‘City’ water system. Our research indicates that this system is operated by the California-American Water Company. Mr. Silva also stated that there is also an irrigation well located near the mechanical building of the LBC that is used solely for landscape watering.

We interviewed Mr. John Short of the North Coast Regional Water Quality Control Board regarding the construction and operation of the waste water treatment facility at the Luther Burbank Center. Mr. Short stated that to his knowledge, there are no construction drawings or documents available for the waste water treatment ponds. Mr. Short stated that many older waste water ponds of this nature rely on the natural clay content of the native soil to prevent leakage of untreated influent water into the surrounding groundwater. Mr. Short stated that the Luther Burbank Center has been cited in the past for minor violations related to the operation of the waste water treatment system, but was not aware of any outstanding or current violations. Mr. Short also stated that there has never been a groundwater monitoring program or monitoring wells installed to measure the impact to groundwater by the waste water treatment system.

On several occasions we contacted the Law Offices of Monte Hanson, which occupies the single-family home structure on APN 058-040-023, to inquire about the existence of water wells and septic tanks on this parcel. We did not receive a response from Mr. Hanson, however, on one occasion, we were able to speak with Ms. Pat Schiettekat, paralegal for Mr. Hanson. Ms. Schiettekat stated that to her knowledge, the water supply to the parcel and the office was from an on-site well. Ms. Schiettekat also stated however, that she was unsure about the existence of a septic system on the parcel.

We interviewed Mr. Andrew Jenson with the North Coast Regional Water Quality Control Board (RWQCB) regarding the violations that the LBC has been cited for in the past. Mr. Jenson stated that the LBC has been cited for elevated fecal coliform levels in the percolation pond water on a number of occasions following large events. Mr. Jenson also provided us with a copy of the *Waste Discharge Requirements for Luther Burbank Center for the Arts*. This document is included in Appendix C of this report.

Mr. Jenson also stated that no closure plan has been submitted to or approved by the North Coast RWQCB for the waste water treatment system at the Luther Burbank Center for the Arts.

We interviewed Mr. Tom Hail with the state Office of State Health Planning and Development - Facilities Development Division (OSHPD-FDD), regarding specific requirements in the preparation of a Phase I Environmental Site Assessments for proposed hospital facility sites. Mr. Hail stated that he was unaware of any guidelines for the preparation of such documents. Mr. Hale also stated that to his knowledge, separate studies such as a Safety Risk Analysis or other hazard studies are generally performed after the submittal of architectural design plans for the proposed development.

We interviewed Ms. Deborah Fudge, Senior Environmental Specialist with PG&E in Santa Rosa, California regarding the presence of PCB containing electrical transformers within the Property. Ms. Fudge stated that to her knowledge, all pole-mounted transformers in the vicinity of the Property would have been upgraded to non-PCB models in the 1980s. Ms. Fudge also stated that PG&E records indicate that the pad-mounted transformer located within the Luther Burbank Center is known to have been manufactured in 1973, and installed on the Property in 1974. Ms. Fudge stated that this transformer is “most likely non-PCB; however, PG&E records can not confirm this”.

7.0 CONCLUSIONS

The site reconnaissance and records research did not find documentation or physical evidence of soil or groundwater impairments associated with the use of the Property. A review of regulatory databases maintained by county, state and federal agencies found no documentation of hazardous materials violations or discharge on the Property, however hazardous materials are documented as being present on the Property. No documented soil or groundwater contamination associated with abutting properties was found from the records reviewed, however soil and groundwater contamination is documented in association with current or past uses of nearby properties.

ENGEO Incorporated has performed a phase one environmental site assessment in general conformance with the scope and limitations of ASTM 1527-00. Based on the findings of the site assessment, we identified one Recognized Environmental Condition as listed below:

- The historic Property use as an orchard may indicate that pesticides were applied according the regulations governing the application of agricultural chemical. We found no evidence indicating pesticides may have been improperly applied, spilled or disposed within the Property. However, there is a potential that residues of the agricultural chemicals may remain in shallow soil. The potential threat posed to human health and the environment by such residues is dependent on the future Property use, and exposure pathway and receptor. It is recommended that soil sampling should be considered if human exposure to shallow soil that was historically occupied by orchard will occur as a result of the future land use.

Based on the observations made during the site assessment, we have identified four items of concern within the Property as listed below:

1. The operation of the on-site waste water treatment facility has included the use of chlorine gas to treat effluent water. This may have resulted in the production of trihalomethane (THM)

compounds such as chloroform in the soil beneath the waste water treatment ponds. Currently, there is no Closure Plan in place for the decommissioning and removal of this facility. As such, it is recommended that a "Closure Plan" be developed, approved and implemented for this facility in accordance with requirements of North Coast Regional Water Quality Control Board and the Sonoma County Permit and Resource Management Department (PRMD). As required by the regulatory agencies, further environmental characterization and site assessment may be necessary to comply with decommissioning and closure requirements. We understand that closure of this facility will follow re-direction of wastewater sewer servicing this Property to another off-site facility, at which time closure and decommissioning can be performed.

2. The structures located within the homestead parcel of the Property were constructed at a time when asbestos containing building materials (ACBM) and lead based paints may have been used during their construction. It is recommended that a Cal-OSHA Certified ACBM, and lead based paint contractor, be retained to assess the structures prior to any renovation or demolition activities. Removal and disposal of ACBM, if encountered, should be performed by the asbestos abatement contractor in accordance with regulatory requirements.

3. Discarded batteries observed within the homestead Property represent a potential source of soil contamination. We recommend this debris be properly disposed of and the surrounding soil be assessed for evidence of contamination. Local removal and disposal of soils impacted with hazardous materials from the batteries should be performed in accordance with regulatory requirements.

4. Any septic systems and related leach fields located within the homestead and the law office parcels at the site should be removed and disposed of in accordance with permitting requirements of Sonoma County, once these are no longer in use, and backfill requirements conform to recommendations of the Geotechnical Engineer.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc. (EDR). The report meets the government records search requirements of ASTM Standard Practice for Environmental Site Assessments, E 1527-00. Search distances are per ASTM standard or custom distances requested by the user.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

FEDERAL ASTM STANDARD

RCRIS: Resource Conservation and Recovery Information System. RCRIS includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs): generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month. Small quantity generators (SQGs): generate between 100 kg and 1,000 kg of hazardous waste per month. Large quantity generators (LQGs): generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste from the generator off-site to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

A review of the RCRIS-SQG list, as provided by EDR, and dated 06/15/2004 has revealed that there is 1 RCRIS-SQG site within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

STATE ASTM STANDARD

CORTESE: This database identifies public drinking water wells with detectable levels of contamination, hazardous substance sites selected for remedial action, sites with known toxic material identified through the abandoned site assessment program, sites with USTs having a reportable release and all solid waste disposal facilities from which there is known migration. The source is the California Environmental Protection Agency/Office of Emergency Information.

A review of the Cortese list, as provided by EDR, has revealed that there are 4 Cortese sites within approximately 0.5 miles of the target property.

NOTIFY 65: Notify 65 records contain facility notifications about any release that could impact drinking water and thereby expose the public to a potential health risk. The data come from the State Water Resources Control Board's Proposition 65 database.

A review of the Notify 65 list, as provided by EDR, has revealed that there is 1 Notify 65 site within approximately 1 mile of the target property.

Design Flow:	0 Million Gal/Day	Baseline Flow:	0 Million Gal/Day

Facility Type: Municipal/Domestic - Facility that treats sewage or a mixture of predominantly sewage and other waste from districts, municipalities, communities, hospitals, schools, and publicly or privately owned systems (excluding individual subsurface leaching systems disposing of less than 1,000 gallons per day).

Facility Status: Active - Any facility with a continuous or seasonal discharge that is under Waste Discharge Requirements.

Agency Type: Private

Waste Type: Domestic Sewage - Designated/Influent or Solid Wastes that pose a significant threat to water quality because of their high concentrations (E.G., BOD, Hardness, TRF, Chloride). 'Manageable' hazardous wastes (E.G., inorganic salts and heavy metals) are included in this category.

Threat to Water: Moderate Threat to Water Quality. A violation could have a major adverse impact on receiving biota, can cause aesthetic impairment to a significant human population, or render unusable a potential domestic or municipal water supply. Awsthetic impairment would include nuisance from a waste treatment facility.

Complexity: Category B - Any facility having a physical, chemical, or biological waste treatment system (except for septic systems with subsurface disposal), or any Class II or III disposal site, or facilities without treatment systems that are complex, such as marinas with petroleum products, solid wastes, and sewage pump out facilities.

Reclamation: Producer-User: Reclamation requirements that have been issued to a producer of reclaimed water who also uses the product.

POTW: The facility is not a POTW.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Elapsed ASTM days: Provides confirmation that this EDR report meets or exceeds the 90-day updating requirement of the ASTM standard.

FEDERAL ASTM STANDARD RECORDS

NPL: National Priority List
Source: EPA
Telephone: N/A
National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 07/30/04
Date Made Active at EDR: 09/09/04
Database Release Frequency: Semi-Annually
Date of Data Arrival at EDR: 08/03/04
Elapsed ASTM days: 37
Date of Last EDR Contact: 08/03/04

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System
Source: EPA
Telephone: 703-413-0223
CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 05/17/04
Date Made Active at EDR: 08/10/04
Database Release Frequency: Quarterly
Date of Data Arrival at EDR: 06/23/04
Elapsed ASTM days: 48
Date of Last EDR Contact: 06/23/04

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned
Source: EPA
Telephone: 703-413-0223
As of February 1995, CERCLIS sites designated "No Further Remedial Action Planned" (NFRAP) have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require Federal Superfund action or NPL consideration. EPA has removed approximately 25,000 NFRAP sites to lift the unintended barriers to the redevelopment of these properties and has archived them as historical records so EPA does not needlessly repeat the investigations in the future. This policy change is part of the EPA's Brownfields Redevelopment Program to help cities, states, private investors and affected citizens to promote economic redevelopment of unproductive urban sites.

Date of Government Version: 05/17/04
Date Made Active at EDR: 08/10/04
Database Release Frequency: Quarterly

CORRACTS: Corrective Action Report
Source: EPA
Telephone: 800-424-9346
CORRACTS identifies hazardous waste handlers with RCRA corrective action activity.

Date of Government Version: 06/15/04
Date Made Active at EDR: 08/10/04
Database Release Frequency: Semi-Annually
Date of Data Arrival at EDR: 06/25/04
Elapsed ASTM days: 46
Date of Last EDR Contact: 06/07/04

RCRIS: Resource Conservation and Recovery Information System
Source: EPA
Telephone: 800-424-9346
Resource Conservation and Recovery Information System. RCRIS includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs): generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month. Small quantity generators (SQGs): generate between 100 kg and 1,000 kg of hazardous waste per month. Large quantity generators (LQGs): generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month. Transporters are individuals or entities that move hazardous waste from the generator off-site to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Date of Government Version: 06/15/04
Date Made Active at EDR: 07/20/04
Database Release Frequency: Varies
Date of Data Arrival at EDR: 06/23/04
Elapsed ASTM days: 27
Date of Last EDR Contact: 08/24/04

ERNS: Emergency Response Notification System
Source: National Response Center, United States Coast Guard
Telephone: 202-260-2342
Emergency Response Notification System. ERNS records and stores information on reported releases of oil and hazardous substances.

Date of Government Version: 12/31/03
Date Made Active at EDR: 03/12/04
Database Release Frequency: Annually
Date of Data Arrival at EDR: 01/26/04
Elapsed ASTM days: 46
Date of Last EDR Contact: 07/26/04

FEDERAL ASTM SUPPLEMENTAL RECORDS

BRS: Biennial Reporting System
Source: EPA/NTIS
Telephone: 800-424-9346
The Biennial Reporting System is a national system administered by the EPA that collects data on the generation and management of hazardous waste. BRS captures detailed data from two groups: Large Quantity Generators (LQG) and Treatment, Storage, and Disposal Facilities.

Date of Government Version: 12/01/01
Database Release Frequency: Biennially
Date of Last EDR Contact: 06/22/04
Date of Next Scheduled EDR Contact: 09/13/04

CONSENT: Superfund (CERCLA) Consent Decrees
Source: Department of Justice, Consent Decree Library
Telephone: Varies
Major legal settlements that establish responsibility and standards for cleanup at NPL (Superfund) sites. Released periodically by United States District Courts after settlement by parties to litigation matters.

Date of Government Version: 03/05/04
Database Release Frequency: Varies
Date of Last EDR Contact: 07/30/04
Date of Next Scheduled EDR Contact: 10/25/04

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

ROD: Records Of Decision
Source: EPA
Telephone: 703-416-0223
Record of Decision. ROD documents mandate a permanent remedy at an NPL (Superfund) site containing technical and health information to aid in the cleanup.

Date of Government Version: 06/07/04
Database Release Frequency: Annually
Date of Last EDR Contact: 07/07/04
Date of Next Scheduled EDR Contact: 10/04/04

DELISTED NPL: National Priority List Deletions
Source: EPA
Telephone: N/A
The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 07/30/04
Database Release Frequency: Quarterly
Date of Last EDR Contact: 08/03/04
Date of Next Scheduled EDR Contact: 11/01/04

FINDS: Facility Index System/Facility Identification Initiative Program Summary Report
Source: EPA
Telephone: N/A
Facility Index System. FINDS contains both facility information and 'pointers' to other sources that contain more detail. EDR includes the following FINDS databases in this report: PCS (Permit Compliance System), AIRS (Aerometric Information Retrieval System), DOCKET (Enforcement Docket used to manage and track information on civil judicial enforcement cases for all environmental statutes), FURS (Federal Underground Injection Control), C-DOCKET (Criminal Docket System used to track criminal enforcement actions for all environmental statutes), FFIS (Federal Facilities Information System), STATE (State Environmental Laws and Statutes), and PADS (PCB Activity Data System).

Date of Government Version: 04/08/04
Database Release Frequency: Quarterly
Date of Last EDR Contact: 07/06/04
Date of Next Scheduled EDR Contact: 10/04/04

HMIRS: Hazardous Materials Information Reporting System
Source: U.S. Department of Transportation
Telephone: 202-366-4555
Hazardous Materials Incident Report System. HMIRS contains hazardous material spill incidents reported to DOT.

Date of Government Version: 02/17/04
Database Release Frequency: Annually
Date of Last EDR Contact: 04/20/04
Date of Next Scheduled EDR Contact: 07/19/04

MLTS: Material Licensing Tracking System
Source: Nuclear Regulatory Commission
Telephone: 301-415-7169
MLTS is maintained by the Nuclear Regulatory Commission and contains a list of approximately 8,100 sites which possess or use radioactive materials and which are subject to NRC licensing requirements. To maintain currency, EDR contacts the Agency on a quarterly basis.

Date of Government Version: 07/15/04
Database Release Frequency: Quarterly
Date of Last EDR Contact: 07/06/04
Date of Next Scheduled EDR Contact: 10/04/04

MINES: Mines Master Index File

Telephone: 303-231-5959

Date of Government Version: 06/04/04
Database Release Frequency: Semi-Annually
Date of Last EDR Contact: 06/30/04
Date of Next Scheduled EDR Contact: 09/27/04

NPL LIENS: Federal Superfund Liens
Source: EPA
Telephone: 202-564-4267
Federal Superfund Liens. Under the authority granted the USEPA by the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner receives notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/91 | Date of Last EDR Contact: 08/23/04
Database Release Frequency: No Update Planned | Date of Next Scheduled EDR Contact: 11/22/04

PADS: PCB Activity Database System
Source: EPA
Telephone: 202-564-3887
PCB Activity Database. PADS Identifies generators, transporters, commercial storers and/or brokers and disposers of PCB's who are required to notify the EPA of such activities.

Date of Government Version: 06/29/04 | Date of Last EDR Contact: 08/10/04
Database Release Frequency: Annually | Date of Next Scheduled EDR Contact: 11/08/04

DOD: Department of Defense Sites
Source: USGS
Telephone: 703-692-8801
This data set consists of federally owned or administered lands, administered by the Department of Defense, that have any area equal to or greater than 640 acres of the United States, Puerto Rico, and the U.S. Virgin Islands.

Date of Government Version: 10/01/03 | Date of Last EDR Contact: 08/12/04
Database Release Frequency: Semi-Annually | Date of Next Scheduled EDR Contact: 11/08/04

STORMWATER: Storm Water General Permits
Source: Environmental Protection Agency
Telephone: 202-564-0746
A listing of all facilities with Storm Water General Permits.

Date of Government Version: 02/04/04 | Date of Last EDR Contact: 07/06/04
Database Release Frequency: Quarterly | Date of Next Scheduled EDR Contact: 10/04/04

INDIAN RESERV: Indian Reservations
Source: USGS
Telephone: 202-208-3710
This map layer portrays Indian administered lands of the United States that have any area equal to or greater than 640 acres.

Date of Government Version: 10/01/03 | Date of Last EDR Contact: 08/12/04
Database Release Frequency: Semi-Annually | Date of Next Scheduled EDR Contact: 11/08/04

US BROWNFIELDS: A Listing of Brownfields Sites
Source: Environmental Protection Agency
Telephone: 202-566-2777
Included in the listing are brownfields properties addresses by Cooperative Agreement Recipients and brownfields properties addressed by Targeted Brownfields Assessments. Targeted Brownfields Assessments-EPA's Targeted Brownfields Assessments (TBA) program is designed to help states, tribes, and municipalities--especially those without EPA Brownfields Assessment Demonstration Pilots--minimize the uncertainties of contamination often associated with brownfields. Under the TBA program, EPA provides funding and/or technical assistance for environmental assessments at brownfields sites throughout the country. Targeted Brownfields Assessments supplement and work with other efforts under EPA's Brownfields Initiative to promote cleanup and redevelopment of brownfields. Cooperative Agreement Recipients-States, political subdivisions, territories, and Indian tribes become BCRLF cooperative agreement recipients when they enter into BCRLF cooperative agreements with the U.S. EPA. EPA selects BCRLF cooperative agreement recipients based on a proposal and application process. BCRLF cooperative agreement recipients must use EPA funds provided through BCRLF cooperative agreement for specified brownfields-related cleanup activities.

Date of Government Version: 07/06/04 | Date of Last EDR Contact: 06/14/04
Database Release Frequency: Semi-Annually | Date of Next Scheduled EDR Contact: 09/13/04

RMP: Risk Management Plans
Source: Environmental Protection Agency
Telephone: 202-564-8600
When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

Date of Government Version: 05/27/04 | Date of Last EDR Contact: 08/23/04
Database Release Frequency: Varies | Date of Next Scheduled EDR Contact: 11/22/04

FUDS: Formerly Used Defense Sites
Source: U.S. Army Corps of Engineers
Telephone: 202-528-4285
The listing includes locations of Formerly Used Defense Sites properties where the US Army Corps of Engineers is actively working or will take necessary cleanup actions.

Date of Government Version: 12/31/03 | Date of Last EDR Contact: 07/06/04
Database Release Frequency: Varies | Date of Next Scheduled EDR Contact: 10/04/04

ODI: Open Dump Inventory
Source: Environmental Protection Agency
Telephone: 800-424-9346
An open dump is defined as a disposal facility that does not comply with one or more of the Part 257 or Part 258 Subtitle D Criteria.

Date of Government Version: 06/30/85 | Date of Last EDR Contact: 05/23/95
Database Release Frequency: No Update Planned | Date of Next Scheduled EDR Contact: N/A

UMTRA: Uranium Mill Tailings Sites
Source: Department of Energy
Telephone: 505-845-0011
Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized. In 1978, 24 inactive uranium mill tailings sites in Oregon, Idaho, Wyoming, Utah, Colorado, New Mexico, Texas, North Dakota, South Dakota, Pennsylvania, and on Navajo and Hopi tribal lands, were targeted for cleanup by the Department of Energy.

Date of Government Version: 04/22/04 | Date of Last EDR Contact: 06/21/04
Database Release Frequency: Varies | Date of Next Scheduled EDR Contact: 09/20/04

RAATS: RCRA Administrative Action Tracking System
Source: EPA
Telephone: 202-564-4104
RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

Date of Government Version: 04/17/95 | Date of Last EDR Contact: 06/07/04
Database Release Frequency: No Update Planned | Date of Next Scheduled EDR Contact: 09/06/04

TRIS: Toxic Chemical Release Inventory System
Source: EPA
Telephone: 202-566-0250
Toxic Release Inventory System. TRIS identifies facilities which release toxic chemicals to the air, water and land in reportable quantities under SARA Title III Section 313.

Date of Government Version: 12/31/02 | Date of Last EDR Contact: 06/22/04
Database Release Frequency: Annually | Date of Next Scheduled EDR Contact: 09/20/04

TSCA: Toxic Substances Control Act
Source: EPA
Telephone: 202-260-5521
Toxic Substances Control Act. TSCA identifies manufacturers and importers of chemical substances included on the TSCA Chemical Substance Inventory list. It includes data on the production volume of these substances by plant site.

Date of Government Version: 12/31/02
Database Release Frequency: Every 4 Years

Date of Last EDR Contact: 06/21/04
Date of Next Scheduled EDR Contact: 09/20/04

SSTS: Section 7 Tracking Systems
Source: EPA
Telephone: 202-564-5008
Section 7 of the Federal Insecticide, Fungicide and Rodenticide Act, as amended (92 Stat. 829) requires all registered pesticide-producing establishments to submit a report to the Environmental Protection Agency by March 1st each year. Each establishment must report the types and amounts of pesticides, active ingredients and devices being produced, and those having been produced and sold or distributed in the past year.

Date of Government Version: 12/31/01
Database Release Frequency: Annually
Date of Last EDR Contact: 07/20/04
Date of Next Scheduled EDR Contact: 10/18/04

FTTS: FIFRA/ TSCA Tracking System - FIFRA (Federal Insecticide, Fungicide, & Rodenticide Act)/TSCA (Toxic Substances Control Act)
Source: EPA/Office of Prevention, Pesticides and Toxic Substances
Telephone: 202-564-2501
FTTS tracks administrative cases and pesticide enforcement actions and compliance activities related to FIFRA, TSCA and EPCRA (Emergency Planning and Community Right-to-Know Act). To maintain currency, EDR contacts the Agency on a quarterly basis.

Date of Next Scheduled EDR Contact: 09/20/04

STATE OF CALIFORNIA ASTM STANDARD RECORDS

AWP: Annual Workplan Sites
Source: California Environmental Protection Agency
Telephone: 916-323-3400
Known Hazardous Waste Sites. California DTSC’s Annual Workplan (AWP), formerly BEP, identifies known hazardous substance sites targeted for cleanup.

Date of Government Version: 06/01/04
Date Made Active at EDR: 06/25/04
Database Release Frequency: Annually
Date of Data Arrival at EDR: 06/04/04
Elapsed ASTM days: 21
Date of Last EDR Contact: 06/04/04

CAL-SITES: Calsites Database
Source: Department of Toxic Substance Control
Telephone: 916-323-3400
The Calsites database contains potential or confirmed hazardous substance release properties. In 1996, California EPA reevaluated and significantly reduced the number of sites in the Calsites database.

Date of Government Version: 06/01/04
Date Made Active at EDR: 06/25/04
Database Release Frequency: Quarterly
Date of Data Arrival at EDR: 06/04/04
Elapsed ASTM days: 21
Date of Last EDR Contact: 06/04/04

CHMIRS: California Hazardous Material Incident Report System
Source: Office of Emergency Services
Telephone: 916-845-8400
California Hazardous Material Incident Reporting System. CHMIRS contains information on reported hazardous material incidents (accidental releases or spills).

Date of Government Version: 12/31/03
Date Made Active at EDR: 06/25/04
Database Release Frequency: Varies
Date of Data Arrival at EDR: 05/18/04
Elapsed ASTM days: 38
Date of Last EDR Contact: 08/23/04

CORTESE: "Cortese" Hazardous Waste & Substances Sites List
Source: CAL EPA/Office of Emergency Information
Telephone: 916-323-9100
The sites for the list are designated by the State Water Resource Control Board (LUST), the Integrated Waste Board (SWF/LS), and the Department of Toxic Substances Control (Cal-Sites). This listing is no longer updated by the state agency.

Date of Government Version: 04/01/01
Date Made Active at EDR: 07/26/01
Database Release Frequency: No Update Planned
Date of Data Arrival at EDR: 05/29/01
Elapsed ASTM days: 58
Date of Last EDR Contact: 07/29/04

NOTIFY 65: Proposition 65 Records
Source: State Water Resources Control Board
Telephone: 916-445-3846
Proposition 65 Notification Records. NOTIFY 65 contains facility notifications about any release which could impact drinking water and thereby expose the public to a potential health risk.

Date of Government Version: 10/21/93
Date Made Active at EDR: 11/19/93
Database Release Frequency: No Update Planned
Date of Data Arrival at EDR: 11/01/93
Elapsed ASTM days: 18
Date of Last EDR Contact: 07/20/04

TOXIC PITS: Toxic Pits Cleanup Act Sites
Source: State Water Resources Control Board
Telephone: 916-227-4364
Toxic PITS Cleanup Act Sites. TOXIC PITS identifies sites suspected of containing hazardous substances where cleanup has not yet been completed.

Date of Government Version: 07/01/95
Date Made Active at EDR: 09/26/95
Database Release Frequency: No Update Planned
Date of Data Arrival at EDR: 08/30/95
Elapsed ASTM days: 27
Date of Last EDR Contact: 08/02/04

SWF/LF (SWIS): Solid Waste Information System
Source: Integrated Waste Management Board
Telephone: 916-341-6320
Active, Closed and Inactive Landfills. SWF/LF records typically contain an inve ntory of solid waste disposal facilities or landfills. These may be active or i nactive facilities or open dumps that failed to meet RCRA Section 4004 criteria for solid waste landfills or disposal sites.

Date of Government Version: 06/14/04
Date Made Active at EDR: 07/26/04
Database Release Frequency: Quarterly
Date of Data Arrival at EDR: 06/16/04
Elapsed ASTM days: 40
Date of Last EDR Contact: 06/16/04

WMUDS/SWAT: Waste Management Unit Database
Source: State Water Resources Control Board
Telephone: 916-227-4448
Waste Management Unit Database System. WMUDS is used by the State Water Resources Control Board staff and the Regional Water Quality Control Boards for program tracking and inventory of waste management units. WMUDS is composed of the following databases: Facility Information, Scheduled Inspections Information, Waste Management Unit Information, SWAT Program Information, SWAT Report Summary Information, SWAT Report Summary Data, Chapter 15 (formerly Subchapter 15) Information, Chapter 15 Monitoring Parameters, TPCA Program Information, RCRA Program Information, Closure Information, and Interested Parties Information.

Date of Government Version: 04/01/00
Date Made Active at EDR: 05/10/00
Database Release Frequency: Quarterly
Date of Data Arrival at EDR: 04/10/00
Elapsed ASTM days: 30
Date of Last EDR Contact: 06/07/04

LUST: Leaking Underground Storage Tank Information System
Source: State Water Resources Control Board
Telephone: 916-341-5752
Leaking Underground Storage Tank Incident Reports. LUST records contain an inventory of reported leaking underground storage tank incidents. Not all states maintain these records, and the information stored varies by state.

Date of Government Version: 07/12/04
Date Made Active at EDR: 07/30/04
Database Release Frequency: Quarterly
Date of Data Arrival at EDR: 07/12/04
Elapsed ASTM days: 18
Date of Last EDR Contact: 07/12/04

CA BOND EXP. PLAN: Bond Expenditure Plan
Source: Department of Health Services
Telephone: 916-255-2118
Department of Health Services developed a site-specific expenditure plan as the basis for an appropriation of Hazardous Substance Cleanup Bond Act funds. It is not updated.

Date of Government Version: 01/01/89
Date Made Active at EDR: 08/02/94
Database Release Frequency: No Update Planned
Date of Data Arrival at EDR: 07/27/94
Elapsed ASTM days: 6
Date of Last EDR Contact: 05/31/94

CA UST:

UST: Active UST Facilities
Source: SWRCB
Telephone: 916-341-5752
Active UST facilities gathered from the local regulatory agencies

Date of Government Version: 07/12/04
Date Made Active at EDR: 08/06/04
Database Release Frequency: Semi-Annually
Date of Data Arrival at EDR: 07/12/04
Elapsed ASTM days: 25
Date of Last EDR Contact: 07/12/04

VCP: Voluntary Cleanup Program Properties
Source: Department of Toxic Substances Control
Telephone: 916-323-3400
Contains low threat level properties with either confirmed or unconfirmed releases and the project proponents have request that DTSC oversee investigation and/or cleanup activities and have agreed to provide coverage for DTSC's costs.

Date of Government Version: 06/01/04
Date Made Active at EDR: 06/25/04
Database Release Frequency: Quarterly
Date of Data Arrival at EDR: 06/04/04
Elapsed ASTM days: 21
Date of Last EDR Contact: 06/04/04

INDIAN LUST: Leaking Underground Storage Tanks on Indian Land
Source: Environmental Protection Agency
Telephone: 415-972-3372
LUSTs on Indian land in Arizona, California, New Mexico and Nevada

Date of Government Version: 06/18/04
Date Made Active at EDR: 07/26/04
Database Release Frequency: Varies
Date of Data Arrival at EDR: 06/21/04
Elapsed ASTM days: 35
Date of Last EDR Contact: 08/23/04

INDIAN LUST: Leaking Underground Storage Tanks on Indian Land
Source: EPA Region 10
Telephone: 206-553-2857
LUSTs on Indian land in Alaska, Idaho, Oregon and Washington.

Date of Government Version: 06/23/04
Date Made Active at EDR: 07/26/04
Database Release Frequency: Varies
Date of Data Arrival at EDR: 06/23/04
Elapsed ASTM days: 33

Date Made Active at EDR: 07/26/04
Database Release Frequency: Varies
Date of Data Arrival at EDR: 06/21/04
Elapsed ASTM days: 35
Date of Last EDR Contact: 08/23/04

CA FID UST: Facility Inventory Database
Source: California Environmental Protection Agency
Telephone: 916-445-6532
The Facility Inventory Database (FID) contains a historical listing of active and inactive underground storage tank locations from the State Water Resource Control Board. Refer to local/county source for current data.

Date of Government Version: 10/31/94
Date Made Active at EDR: 09/29/95
Database Release Frequency: No Update Planned
Date of Data Arrival at EDR: 09/05/95
Elapsed ASTM days: 24
Date of Last EDR Contact: 12/28/98

HIST UST: Hazardous Substance Storage Container Database
Source: State Water Resources Control Board
Telephone: 916-341-5700
The Hazardous Substance Storage Container Database is a historical listing of UST sites. Refer to local/county source for current data.

Date of Government Version: 10/15/90
Date Made Active at EDR: 02/12/91
Database Release Frequency: No Update Planned
Date of Data Arrival at EDR: 01/25/91
Elapsed ASTM days: 18
Date of Last EDR Contact: 07/26/01

STATE OF CALIFORNIA ASTM SUPPLEMENTAL RECORDS

AST: Aboveground Petroleum Storage Tank Facilities
Source: State Water Resources Control Board
Telephone: 916-341-5712
Registered Aboveground Storage Tanks.

Date of Government Version: 12/01/03
Database Release Frequency: Quarterly
Date of Last EDR Contact: 08/02/04
Date of Next Scheduled EDR Contact: 11/01/04

CLEANERS: Cleaner Facilities
Source: Department of Toxic Substance Control
Telephone: 916-225-0873
A list of drycleaner related facilities that have EPA ID numbers. These are facilities with certain SIC codes: power laundries, family and commercial; garment pressing and cleaner's agents; linen supply; coin-operated laundries and cleaning; drycleaning plants, except rugs; carpet and upholster cleaning; industrial launderers; laundry and garment services.

Date of Government Version: 04/21/04
Database Release Frequency: Annually
Date of Last EDR Contact: 07/06/04
Date of Next Scheduled EDR Contact: 10/04/04

CA WDS: Waste Discharge System
Source: State Water Resources Control Board
Telephone: 916-341-5227
Sites which have been issued waste discharge requirements.

Date of Government Version: 06/18/04
Database Release Frequency: Quarterly
Date of Last EDR Contact: 06/23/04
Date of Next Scheduled EDR Contact: 09/20/04

DEED: List of Deed Restrictions
Source: Department of Toxic Substances Control
Telephone: 916-323-3400
The use of recorded land use restrictions is one of the methods the DTSC uses to protect the public from unsafe exposures to hazardous substances and wastes.

Date of Government Version: 07/06/04 | Date of Last EDR Contact: 07/07/04
Database Release Frequency: Semi-Annually | Date of Next Scheduled EDR Contact: 10/04/04

NFA: No Further Action Determination
Source: Department of Toxic Substances Control
Telephone: 916-323-3400
This category contains properties at which DTSC has made a clear determination that the property does not pose a problem to the environment or to public health.

Date of Government Version: 06/01/04 | Date of Last EDR Contact: 06/04/04
Database Release Frequency: Quarterly | Date of Next Scheduled EDR Contact: 08/30/04

EMI: Emissions Inventory Data
Source: California Air Resources Board
Telephone: 916-322-2990
Toxics and criteria pollutant emissions data collected by the ARB and local air pollution agencies.

Date of Government Version: 12/31/02 | Date of Last EDR Contact: 07/22/04
Database Release Frequency: Varies | Date of Next Scheduled EDR Contact: 10/18/04

REF: Unconfirmed Properties Referred to Another Agency
Source: Department of Toxic Substances Control
Telephone: 916-323-3400
This category contains properties where contamination has not been confirmed and which were determined as not requiring direct DTSC Site Mitigation Program action or oversight. Accordingly, these sites have been referred to another state or local regulatory agency.

Date of Government Version: 06/01/04 | Date of Last EDR Contact: 06/04/04
Database Release Frequency: Quarterly | Date of Next Scheduled EDR Contact: 08/30/04

SCH: School Property Evaluation Program
Source: Department of Toxic Substances Control
Telephone: 916-323-3400
This category contains proposed and existing school sites that are being evaluated by DTSC for possible hazardous materials contamination. In some cases, these properties may be listed in the CalSites category depending on the level of threat to public health and safety or the environment they pose.

Date of Government Version: 06/01/04 | Date of Last EDR Contact: 06/04/04
Database Release Frequency: Quarterly | Date of Next Scheduled EDR Contact: 08/30/04

NFE: Properties Needing Further Evaluation
Source: Department of Toxic Substances Control
Telephone: 916-323-3400
This category contains properties that are suspected of being contaminated. These are unconfirmed contaminated properties that need to be assessed using the PEA process. PEA in Progress indicates properties where DTSC is currently conducting a PEA. PEA Required indicates properties where DTSC has determined a PEA is required, but not currently underway.

Date of Government Version: 06/01/04 | Date of Last EDR Contact: 06/04/04
Database Release Frequency: Quarterly | Date of Next Scheduled EDR Contact: 08/30/04

SLIC: Statewide SLIC Cases
Source: State Water Resources Control Board
Telephone: 916-341-5752
The Spills, Leaks, Investigations, and Cleanups (SLIC) listings includes unauthorized discharges from spills and leaks, other than from underground storage tanks or other regulated sites.

Date of Government Version: 08/03/04 | Date of Last EDR Contact: 08/03/04
Database Release Frequency: Varies | Date of Next Scheduled EDR Contact: 10/11/04

HAZNET: Facility and Manifest Data
Source: California Environmental Protection Agency
Telephone: 916-255-1136
Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method.

EDR PROPRIETARY HISTORICAL DATABASES

Former Manufactured Gas (Coal Gas) Sites: The existence and location of Coal Gas sites is provided exclusively to EDR by Real Property Scan, Inc. ©Copyright 1993 Real Property Scan, Inc. For a technical description of the types of hazards which may be found at such sites, contact your EDR customer service representative.

Disclaimer Provided by Real Property Scan, Inc.

The information contained in this report has predominantly been obtained from publicly available sources produced by entities other than Real Property Scan. While reasonable steps have been taken to insure the accuracy of this report, Real Property Scan does not guarantee the accuracy of this report. Any liability on the part of Real Property Scan is strictly limited to a refund of the amount paid. No claim is made for the actual existence of toxins at any site. This report does not constitute a legal opinion.

BROWNFIELDS DATABASES

VCP: Voluntary Cleanup Program Properties
Source: Department of Toxic Substances Control
Telephone: 916-323-3400
Contains low threat level properties with either confirmed or unconfirmed releases and the project proponents have request that DTSC oversee investigation and/or cleanup activities and have agreed to provide coverage for DTSC's costs.

Date of Government Version: 06/01/04 | Date of Last EDR Contact: 06/04/04
Database Release Frequency: Quarterly | Date of Next Scheduled EDR Contact: 08/30/04

US BROWNFIELDS: A Listing of Brownfields Sites
Source: Environmental Protection Agency
Telephone: 202-566-2777
Included in the listing are brownfields properties addresses by Cooperative Agreement Recipients and brownfields properties addressed by Targeted Brownfields Assessments. Targeted Brownfields Assessments-EPA's Targeted Brownfields Assessments (TBA) program is designed to help states, tribes, and municipalities--especially those without EPA Brownfields Assessment Demonstration Pilots--minimize the uncertainties of contamination often associated with brownfields. Under the TBA program, EPA provides funding and/or technical assistance for environmental assessments at brownfields sites throughout the country. Targeted Brownfields Assessments supplement and work with other efforts under EPA's Brownfields Initiative to promote cleanup and redevelopment of brownfields. Cooperative Agreement Recipients-States, political subdivisions, territories, and Indian tribes become BCRLF cooperative agreement recipients when they enter into BCRLF cooperative agreements with the U.S. EPA. EPA selects BCRLF cooperative agreement recipients based on a proposal and application process. BCRLF cooperative agreement recipients must use EPA funds provided through BCRLF cooperative agreement for specified brownfields-related cleanup activities.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

Oil/Gas Pipelines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines.

Electric Power Transmission Line Data
Source: PennWell Corporation
Telephone: (800) 823-6277
This map includes information copyrighted by PennWell Corporation. This information is provided on a best effort basis and PennWell Corporation does not guarantee its accuracy nor warrant its fitness for any particular purpose. Such information has been reprinted with the permission of PennWell.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on private school locations in the United States.

Daycare Centers: Licensed Facilities
Source: Department of Social Services
Telephone: 916-657-4041

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 1999 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 from the U.S. Fish and Wildlife Service.

STREET AND ADDRESS INFORMATION

GEOCHECK ®- PHYSICAL SETTING SOURCE ADDENDUM

TARGET PROPERTY ADDRESS

SUTTER MEDICAL CENTER OF SANTA ROSA
50 MARK WEST SPRINGS ROAD
SANTA ROSA, CA 95403

TARGET PROPERTY COORDINATES

Latitude (North):	38.495098 - 38˚ 29' 42.4''
Longitude (West):	122.752296 - 122˚ 45' 8.3''
Universal Tranverse Mercator:	Zone 10
UTM X (Meters):	521600.9
UTM Y (Meters):	4260572.0
Elevation:	157 ft. above sea level

EDR's GeoCheck Physical Setting Source Addendum has been developed to assist the environmental professional with the collection of physical setting source information in accordance with ASTM 1527-00, Section 7.2.3. Section 7.2.3 requires that a current USGS 7.5 Minute Topographic Map (or equivalent, such as the USGS Digital Elevation Model) be reviewed. It also requires that one or more additional physical setting sources be sought when (1) conditions have been identified in which hazardous substances or petroleum products are likely to migrate to or from the property, and (2) more information than is provided in the current USGS 7.5 Minute Topographic Map (or equivalent) is generally obtained, pursuant to local good commercial or customary practice, to assess the impact of migration of recognized environmental conditions in connection with the property. Such additional physical setting sources generally include information about the topographic, hydrologic, hydrogeologic, and geologic characteristics of a site, and wells in the area.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata. EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

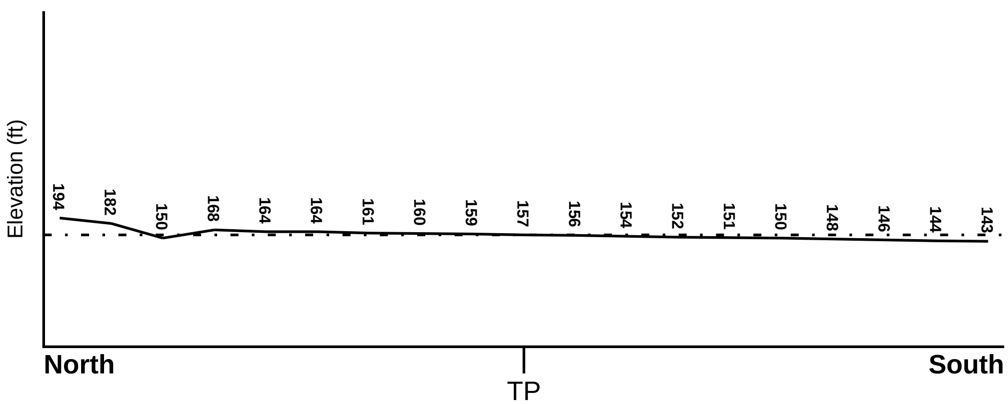
TOPOGRAPHIC INFORMATION

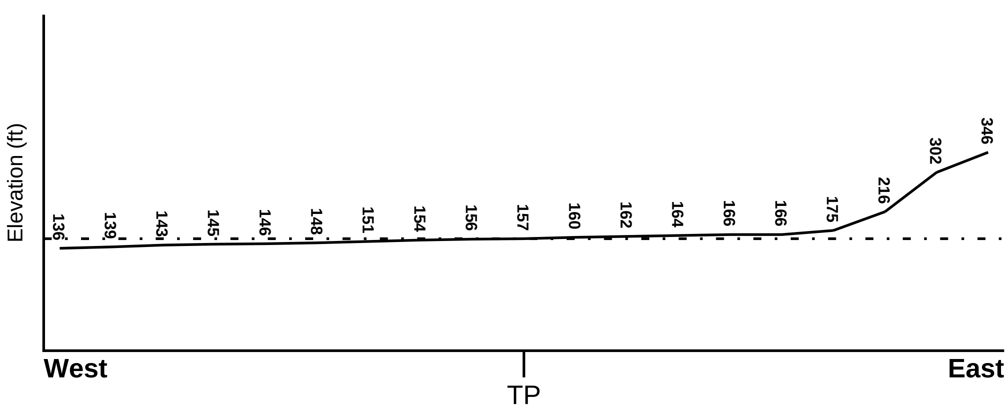
Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

USGS Topographic Map: 38122-D7 SEBASTOPOL, CA
General Topographic Gradient: General SW
Source: USGS 7.5 min quad index

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES





Target Property Elevation: 157 ft.

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Target Property County	FEMA Flood Electronic Data
SONOMA, CA	YES - refer to the Overview Map and Detail Map

Flood Plain Panel at Target Property: 0603750685B

Additional Panels in search area: 0603750545B
0603750565B
0603750725B
0603810005B

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
SEBASTOPOL	Not Available

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius: 1.25 miles
Status: Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
22	1/2 - 1 Mile West	Varies

For additional site information, refer to Physical Setting Source Map Findings.

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT

Era:	Cenozoic
System:	Tertiary
Series:	Pliocene volcanic rocks
Code:	Tpv *(decoded above as Era, System & Series)*

GEOLOGIC AGE IDENTIFICATION

Category: Volcanic Rocks

Geologic Age and Rock Stratigraphic Unit Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - a digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture’s (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

Soil Component Name:	ZAMORA
Soil Surface Texture:	silty clay loam
Hydrologic Group:	Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.
Soil Drainage Class:	Well drained. Soils have intermediate water holding capacity. Depth to water table is more than 6 feet.

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel:	HIGH
Depth to Bedrock Min:	> 60 inches
Depth to Bedrock Max:	> 60 inches

Soil Layer Information							
	Boundary			Classification			
Layer	**Upper**	**Lower**	**Soil Texture Class**	**AASHTO Group**	**Unified Soil**	**Permeability Rate (in/hr)**	**Soil Reaction (pH)**
1	0 inches	10 inches	silty clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 0.60 Min: 0.20	Max: 7.30 Min: 6.10
2	10 inches	40 inches	clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 0.60 Min: 0.20	Max: 7.80 Min: 6.60
3	40 inches	51 inches	silt loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay. FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 2.00 Min: 0.60	Max: 8.40 Min: 6.60
4	51 inches	60 inches	gravelly - loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand. COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 2.00 Min: 0.60	Max: 8.40 Min: 6.60

OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service STATSGO data, the following additional subordinant soil types may appear within the general area of target property.

Soil Surface Textures: loam
clay
silt loam
clay loam
sandy loam
very gravelly - sand

Surficial Soil Types: loam
clay
silt loam
clay loam
sandy loam

	very gravelly - sand
Shallow Soil Types:	fine sandy loam loam
Deeper Soil Types:	cemented sandy clay loam clay silt loam fine sandy loam loam stratified very gravelly - clay loam

ADDITIONAL ENVIRONMENTAL RECORD SOURCES

According to ASTM E 1527-00, Section 7.2.2, "one or more additional state or local sources of environmental records may be checked, in the discretion of the environmental professional, to enhance and supplement federal and state sources... Factors to consider in determining which local or additional state records, if any, should be checked include (1) whether they are reasonably ascertainable, (2) whether they are sufficiently useful, accurate, and complete in light of the objective of the records review (see 7.1.1), and (3) whether they are obtained, pursuant to local, good commercial or customary practice." One of the record sources listed in Section 7.2.2 is water well information. Water well information can be used to assist the environmental professional in assessing sources that may impact groundwater flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002. 7.5-Minute DEMs correspond to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps.

HYDROLOGIC INFORMATION

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 1999 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 from the U.S. Fish and Wildlife Service.

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

ADDITIONAL ENVIRONMENTAL RECORD SOURCES

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

Environmental Data Resources, Inc.
City Directory Abstract

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist professionals in evaluating potential liability on a target property resulting from past activities. ASTM E 1527-00, Section 7.3 on Historical Use Information, identifies the prior use requirements for a Phase I environmental site assessment. The ASTM standard requires a review of *reasonably ascertainable standard historical sources. Reasonably ascertainable means information that is publicly available, obtainable from a source with reasonable time and cost constraints, and practically reviewable.*

To meet the prior use requirements of ASTM E 1527-00, Section 7.3.4, the following *standard historical sources* may be used: aerial photographs, fire insurance maps, property tax files, land title records (although these cannot be the sole historical source consulted), topographic maps, city directories, building department records, or zoning/land use records. ASTM E 1527-00 requires *"All obvious uses of the property shall be identified from the present, back to the property's obvious first developed use, or back to 1940, whichever is earlier. This task requires reviewing only as many of the standard historical sources as are necessary, and that are reasonably ascertainable and likely to be useful."* (ASTM E 1527-00, Section 7.3.2, page 12.)

EDR's City Directory Abstract includes a search and abstract of available city directory data.

City Directories
City directories have been published for cities and towns across the U.S. since the 1700s. Originally a list of residents, the city directory developed into a sophisticated tool for locating individuals and businesses in a particular urban or suburban area. Twentieth century directories are generally divided into three sections: a business index, a list of resident names and addresses, and a street index. With each address, the directory lists the name of the resident or, if a business is operated from this address, the name and type of business (if unclear from the name). While city directory coverage is comprehensive for major cities, it may be spotty for rural areas and small towns. ASTM E 1527-00 specifies that a *"review of city directories (standard historical sources) at less than approximately five year intervals is not required by this practice." (ASTM E 1527-00, Section 7.3.2.1, page 12.)*

NAICS (North American Industry Classification System) Codes
NAICS is a unique, all-new system for classifying business establishments. Adopted in 1997 to replace the prior Standard Industry Classification (SIC) system, it is the system used by the statistical agencies of the United States. It is the first economic classification system to be constructed based on a single economic concept. To learn more about the background, the development and difference between NAICS and SIC, visit the following Census website: http://www.census.gov/epcd/www/naicsdev.htm.

Thank you for your business!

4. SUMMARY

- ***City Directories:***

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1957 through 1999. (These years are not necessarily inclusive.) A summary of the information obtained is provided in the text of this report.

Waste Discharge Permit

F

California Regional Water Quality Control Board
North Coast Region

ORDER NO. 96-40
ID NO. 1B820120SON

WASTE DISCHARGE REQUIREMENTS

FOR

LUTHER BURBANK CENTER FOR THE ARTS

Sonoma County

The California Regional Water Quality Control Board, North Coast Region, (hereinafter the Regional Water Board) finds that:

1. On April 12, 1996, Mark Morrisette, Director of Operations, submitted on behalf of the Luther Burbank Memorial Foundation, a report of waste discharge for revision of waste discharge requirements for the Luther Burbank Center for the Arts. The Luther Burbank Memorial Foundation shall hereinafter be referred to as the discharger.

2. The wastewater treatment and disposal facilities at the Luther Burbank Center for the Arts are owned and operated by the discharger to provide wastewater treatment and disposal for the Luther Burbank Center. The Luther Burbank Wastewater Treatment and Disposal Facilities are located approximately two miles north of Santa Rosa and one mile east of Fulton near the interchange of Highway 101 and River Road as shown on Attachment A to this Order.

Mark West Creek

3. The Luther Burbank Wastewater Treatment System is designed to provide secondary treatment for up to 25,000 gallons of wastewater per day, average dry weather flow. Treatment consists of an aeration pond followed by disinfection, prior to being discharged into an evaporation/percolation pond. A process flow schematic of the Luther Burbank Wastewater Treatment System is shown on Attachment B to this Order.

4. The Water Quality Control Plan for the North Coast Region (Basin Plan) includes water quality objectives, implementation plans for point source and nonpoint source discharges and statewide plans and policies.

11. The Regional Water Board, in a public meeting, heard and considered all comments pertaining to the discharge.

THEREFORE, IT IS HEREBY ORDERED that Waste Discharge Requirements, Order No. 82-12 are rescinded and the discharger, in order to meet the provisions contained in Division 7 of the California Water Code and regulations adopted thereunder, shall comply with the following:

A. DISCHARGE PROHIBITIONS

1. The discharge of any waste not specifically regulated by this Order is prohibited.

2. Creation of a pollution, contamination, or nuisance, as defined by Section 13050 of the California Water Code (CWC), is prohibited. [Health and Safety Code, Section 5411]

3. The discharge of domestic waste to surface waters is prohibited.

4. The discharge of untreated waste from anywhere within the collection, treatment, or disposal facility is prohibited.

5. The discharge of waste to the Russian River and its tributaries is prohibited.

B. EFFLUENT LIMITATIONS

1. Wastes discharged to the evaporation/percolation ponds shall not contain constituents in excess of the following limits:

Constituent	Unit	30-Day Average[1]	Daily Maximum
BOD(20°C, 5-day)	mg/l	50	80
Nonfilterable Residue	mg/l	50	80
Total Coliform Organisms	MPN/100 ml	23[2]	230
Hydrogen Ion	pH	Not less than 6.0 nor greater than 9.0	

---

[1] The arithmetic mean of the values for effluent samples collected in a period of 30 consecutive days

[2] Monthly median

2. The mean daily dry weather flow of waste to the Luther Burbank Wastewater Treatment System shall not exceed 25,000 gallons per day averaged over a period of 30 consecutive days.

C. SOLIDS DISPOSAL

1. Collected screenings, sludges, and other solids removed from liquid wastes shall be disposed of at a legal point of disposal, and in accordance with the provisions of Title 23, Division 3, Chapter 15 of the California Code of Regulations.

D. PROVISIONS

1. A copy of this Order shall be maintained at the discharge facility and be available at all times to operating personnel.

2. Severability

   Provisions of these waste discharge requirements are severable. If any provision of these requirements is found invalid, the remainder of these requirements shall not be affected.

3. Operation and Maintenance

   The discharger must maintain in good working order and operate as efficiently as possible any facility or control system installed by the discharger to achieve compliance with these waste discharge requirements.

4. Change in Discharge

   The discharger must promptly report to the Regional Water Board any material change in the character, location, or volume of the discharge.

5. Change in Ownership

   In the event of any change in control or ownership of land or waste discharge facilities presently owned or controlled by the discharger, the discharger must notify the succeeding owner or operator of the existence of this Order by letter, a copy of which must be forwarded to the Regional Water Board.

6. Vested Rights

This Order does not convey any property rights of any sort or any exclusive privileges. The requirements prescribed herein do not authorize the commission of any act causing injury to persons or property, nor protect the discharger from his liability under federal, State, or local laws, nor create a vested right for the discharger to continue the waste discharge.

7. Monitoring

The discharger must comply with the Contingency Planning and Notification Requirements Order No. 74-151 and the Monitoring and Reporting Program No. 96-40 and any modifications to these documents as specified by the Executive Officer. Such documents are attached to this Order and incorporated herein. Chemical, bacteriological, and bioassay analyses must be conducted at a laboratory certified for such analyses by the State Department of Health Services. In the event a certified laboratory is not available to the discharger, analyses performed by a noncertified laboratory will be accepted provided:

a. A quality assurance/quality control program is instituted by the laboratory. A manual containing the steps followed in this program must be kept in the laboratory and available for inspection by staff of the Regional Water Board. The quality assurance/quality control program must conform to EPA guidelines or procedures approved by the Regional Water Board.

b. The laboratory will become certified within the shortest practicable time if the State Certification Program is resumed.

8. Inspections

The discharger shall permit authorized staff of the Regional Water Board:

a. entry upon premises in which an effluent source is located or in which any required records are kept;
b. access to copy any records required to be kept under terms and conditions of this Order;
c. inspection of monitoring equipment or records; and
d. sampling of any discharge.

9. Noncompliance

In the event the discharger is unable to comply with any of the conditions of this Order due to:

a. breakdown of waste treatment equipment;
b. accidents caused by human error or negligence; or
c. other causes such as acts of nature;

the discharger must notify the Executive Officer by telephone as soon as he or his agents have knowledge of the incident and confirm this notification in writing within two weeks of the telephone notification. The written notification shall include pertinent information explaining reasons for the noncompliance and shall indicate what steps are being taken to prevent the problem from recurring.

10. Revision of Requirements

The Regional Water Board requires the discharger to file a report of waste discharge at least 120 days before making any material change or proposed change in the character, location, or volume of the discharge.

11. Operator Certification

Supervisors and operators of municipal wastewater treatment plants shall possess a certificate of appropriate grade in accordance with Title 23, California Code of Regulations, Section 3680. The State Water Board may accept experience in lieu of qualification training. In lieu of a properly certified wastewater treatment plant operator, the State Water Board may approve use of a water treatment plant operator of appropriate grade certified by the State Department of Health Services where reclamation is involved.

12. Adequate Capacity

Whenever a publicly owned wastewater treatment plant will reach capacity within four years, the discharger shall notify the Regional Water Board. A copy of such notification shall be sent to appropriate local elected officials, local permitting agencies, and the press. The discharger must demonstrate that adequate steps are being taken to address the capacity problem. The discharger shall submit a technical report to the Regional Water

Board showing how flow volumes will be prevented from exceeding capacity, or how capacity will be increased, within 120 days after providing notification to the Regional Water Board, or within 120 days after receipt of Regional Water Board notification, that the POTW will reach capacity within four years. The time for filing the required technical report may be extended by the Regional Water Board. An extension of 30 days may be granted by the Executive Officer, and longer extensions may be granted by the Regional Water Board itself. (CCR Title 23, Section 2232)

Certification

I, Benjamin D. Kor, Executive Officer, do hereby certify that the foregoing is a full, true, and correct copy of an Order adopted by the California Regional Water Quality Control Board, North Coast Region, on June 27, 1996.

Benjamin D. Kor
Executive Officer

MONITORING AND REPORTING PROGRAM NO. 96-40

FOR

LUTHER BURBANK CENTER FOR THE ARTS

Sonoma County

MONITORING

Influent Monitoring

Constituent	Units	Type of Sample	Sampling Frequency
Flow (Mean and Peak)	mgd	Continuous	Daily

Monitoring the Discharge to the Evaporation/Percolation Pond

Treated wastewater shall be sampled at a point prior to its entrance into the evaporation/percolation pond. The following shall constitute the monitoring program:

Constituent	Units	Type of Sample	Sampling Frequency
BOD (20°C, 5-day)	mg/l	Grab	Weekly
Nonfilterable Residue	mg/l	Grab	Weekly
Total Coliform Organisms	MPN/100 ml	Grab	Weekly
Hydrogen Ion	pH	Grab	Weekly
Chlorine Residual	mg/l	Grab	Daily
Mean Daily Flow	mgd	Continuous	Daily

The discharger shall measure and record the depth of water and remaining freeboard in feet and inches in the evaporation/percolation pond on a weekly basis.

REPORTING

Monitoring reports shall be submitted monthly by the 15th day of the following month. In reporting the monitoring data, the discharger shall arrange the data in tabular form to clearly illustrate compliance with the waste discharge requirements.

In addition to the above, the discharger shall have all flow measuring devices tested annually and their accuracy certified. This certification shall be submitted with the annual monitoring report which is to be submitted by January 30, each year.

ENVIRONMENTAL SITE ASSESSMENT QUESTIONNAIRE

To evaluate the potential for environmentally related concerns associated with the property in question, we require the following information prior to the site walkover. In most cases, this information is crucial to the formulation of a competent site assessment plan so your prompt cooperation is appreciated.

1. Contact person at law, lending or insurance firm and telephone number. MELISSA MOSSI, ABD INSURANCE (707) 773-1859

2. Contact person at property in question (if appropriate) and telephone number. Is there a local contractor we should contact? MARK SILVA (707) 527-7006

3. Present property owner, date of acquisition, deed number and those known to be in the chain of title. Is a chain-of-title available? If so, from whom? LUTHER BURBANK MEMORIAL FOUNDATION, 1981

4. Property acreage and lot numbers (if appropriate), including tax map identification.
APN # 058 040 045 – 38.75 AC.
APN # 058 040 026 – 1.80 AC.
APN # 058 040 027 – 11.82 AC.

5. Are site plans, as-builts, or other property maps available? If so, from whom?
SOME SITE PLANS, NO ASBUILTS. MARK SILVA

6. Present use of property and intended use.
ARTS CENTER

7. Knowledge of past use of property.
CHURCH / CHRISTIAN CENTER

8. Neighboring property uses.
AGRICULTURE, RESIDENTIAL.

ENVIRONMENTAL SITE ASSESSMENT QUESTIONNAIRE

9. Is the *property* or any *adjoining property* used for an industrial use?	Yes	No	Unknown
10. To the best of your knowledge, has the *property* or any *adjoining property* been used for an industrial use in the past?	Yes	No	Unknown
11. Is the *property* or any *adjoining property* used as a gasoline station, motor repair facility, commercial printing facility, dry cleaners, photo developing laboratory, junkyard or landfill, or as a waste treatment, storage, disposal, processing, or recycling facility?	Yes	No	Unknown
12. To the best of your knowledge has the *property* or any *adjoining property* been used as a gasoline station, motor repair facility, commercial printing facility, dry cleaners, photo developing laboratory, junkyard or landfill, or as a waste treatment, storage, disposal, processing, or recycling facility?	Yes	No	Unknown
13. Are there currently, or to the best of your knowledge have there been previously, any damaged or discarded automotive or industrial batteries, or pesticides, paints, or other chemicals in individual containers of greater than 5 gal in volume or 50 gal in the aggregate, stored on or used at the *property* or at the facility?	Yes	No	Unknown
14. Are there currently, or to the best of your knowledge have been previously, any industrial *drums* (typically 55 gal) or sacks of chemicals located on the property or at the facility?	Yes	No	Unknown
15. Has *fill dirt* been brought onto the property that originated from a contaminated site or that is of an unknown origin?	Yes	No	Unknown
16. Are there currently, or to the best of you knowledge have there been previously, any *pits, ponds, or lagoons* located on the *property* in connection with waste treatment or waste disposal?	Yes	No	Unknown
17. Is there currently, or to the best of your knowledge has there been previously, any stained soil on the *property*?	Yes	No	Unknown
18. Are there currently, or to the best of your knowledge have there been previously, any registered or unregistered storage tanks (above or underground) located on the *property*?	Yes	No	Unknown
19. Are there currently, or to the best of your knowledge have there been previously, any vent pipes, fill pipes, or access ways indicating a fill pipe protruding from the ground on the *property* or adjacent to any structure located on the *property*?	Yes	No	Unknown
20. Are there currently, or to the best of your knowledge have there been previously, any flooring, drains, or walls located within the facility that are stained by substances other than water or are emitting foul odors?	Yes	No	Unknown
21. Are there any domestic, irrigation or monitoring wells on the property?	Yes	No	Unknown
22. If the *property* is served by a private well or non-public water system, have contaminants been identified in the well or system that exceed guidelines applicable to the water system or has the well been designated as contaminated by any government environmental/health agency?	Yes	No	Unknown

ENVIRONMENTAL SITE ASSESSMENT QUESTIONNAIRE

23. Does the *owner* or *occupant* of the *property* have any knowledge of *environmental liens* or governmental notification relating to past or recurrent violations of environmental laws with respect to the *property* or any facility located on the *property*?	Yes	No	Unknown
24. Has the *owner* or *occupant* of the *property* been informed of the past or current existence of *hazardous substances* or *petroleum products* or environmental violations with respect to the *property* or any facility located on the *property*?	Yes	No	Unknown
25. Does the *owner* or *occupant* of the *property* have any knowledge of any *environmental site assessment* of the *property* or facility that indicated the presence of *hazardous substances* or *petroleum products* on, or contamination of, the *property* or recommended further assessment of the *property*?	Yes	No	Unknown
26. Does the *owner* or *occupant* of the *property* know of any past, threatened, or pending lawsuits or administrative proceedings concerning a release or threatened release of any *hazardous substance* or *petroleum products* involving the *property* by any owner or occupant of the *property*?	Yes	No	Unknown
27. Is there an active or abandoned on-site septic system in place?	Yes	No	Unknown
28. Does the *property* discharge waste water on or adjacent to the *property* other than storm water into a sanitary sewer system?	Yes	No	Unknown
29. To the best of your knowledge, have any *hazardous substances* or *petroleum products*, unidentified waste materials, tires, automotive or industrial batteries or any other waste materials been dumped above grade, buried and/or burned on the *property*?	Yes	No	Unknown
30. Is there a transformer, capacitor, or any hydraulic equipment for which there are any records indicating the presence of PCBs?	Yes	No	Unknown

PHASE TWO ENVIRONMENTAL SITE ASSESSMENT REPORT

Dear Ms. Sponamore:

ENGEO Incorporated is pleased to present our Phase Two Environmental Site Assessment of the Sutter Medical Center of Santa Rosa/Luther Burbank Center for the Arts Property located in Sonoma County, California. A site location map is shown on Figure 1. Sampling of shallow soil was conducted to evaluate whether the orchard activities and storage of lead acid battery casings have impacted shallow soil.

The Phase II activities do not address conditions arising from the operation of the Luther Burbank Waste Water Treatment Plant (WWTP) because the WWTP remains in operation according to the conditions of its operating permit.

We propose to perform the following tasks to characterize shallow soil within the undeveloped areas of the property. Our scope of work does not include sampling within the existing pavement areas of the property. Although there are plans to expand the area of the existing parking lots, we understand that grading is not required for the expansion. We also understand that the existing parking lot lie on approximately three feet of imported engineered fill. We concluded that sampling beneath the parking areas would be proposed only if laboratory results for the undisturbed soil that previously supported orchard operations showed residues of pesticides present at high concentrations.

The following briefly describe procedures used to collect shallow soil samples:

- Sample locations were marked for utility clearance at least 48-hours prior to the start of sampling activities.
- Shallow soil samples were collected from the following two areas of the Property. Sample locations are shown on Figure 1.
  - Approximately 12 acres that historically supported orchard activities and has not be disturbed by grading activities (Area 1).

- Two samples were collected from each of the 24 locations (S-1 through S-24) from Area 1 that were composited at a ratio of 6:1 for a total of eight composite samples submitted for laboratory analysis.

- Four composite samples were comprised of samples collected from depths of 0 to 6 inches below ground surface (bgs) (S-1-6A, S-7-12A, S-13-18A, and S-19-24A).

- Four composite samples were comprised of samples collected from depths of 24 to 30 inches bgs (S-1-6B, S-7-12B, S-13-18B, and S-19-24B).

o Approximately 10 acres that historically supported orchard activities and was later covered by approximately 3 feet of imported engineered fill (Area 2).

- Two samples were collected from each of the 10 samples from Area 2 that were composited at a ratio of 10:1 for a total for two composite samples submitted for laboratory analysis.

- One composite sample was comprised of samples collected from the northern 5 acres of Area 2 (S-25A-29B) including five samples from depths of 0 to 6 bgs and five samples from depths of 24 to 30 inches bgs.

- One composite sample was comprised of samples collected from the southern 5 acres of Area 2 (S-30A-34B) including five samples from depths of 0 to 6 bgs and five samples from depths of 24 to 30 inches bgs.

o Samples were submitted to McCambell Analytical, Inc. of Pacheco, California (McCambell) for analysis of organochlorine pesticides by EPA Method 8081B, CAM 17 metals by EPA Method 6010C, and Mercury by EPA Method 6020A.

Shallow soil samples were also collected from the homestead parcel of the Property as shown on Figure 1.

o A small area near the residential structures where surface soil may be impacted due to the improper storage of lead acid battery casings (Area 3).

- Two samples were collected from the area west of the barn including one sample from a depth of 0 to 6 bgs (S-35A) and one sample from depth of 24 to 30 inches bgs (S-35B).

o Samples were submitted to McCambell for analysis of the cadmium, chromium, copper, lead, zinc, and pH.

RESULTS

The soil sampling results for organochlorine pesticides and metals are shown on Tables 1 and 2, respectively. The concentrations from composite shallow samples from Area 1 (S-1-6A, S-7-12A, S-13-18A, and S-19-24A) and the composite sample from the northern 5 acres of Area 2 exceeded the laboratory detection limit for the following pesticides: Dichlorodiphenyltrichloroethane (DDT), Dichlorodiphenyldichloroethylene (DDE), and Dichlorodiphenyldichloroethane (DDD). The low detections of pesticides can be attributed to the orchard activities. All composite samples from Areas 1 and 2 exhibited concentrations exceeding laboratory detection limits for the following metals: barium, chromium, cobalt, copper, lead, nickel, vanadium, zinc, and mercury.

The two samples from Area 3 exhibited concentrations exceeding laboratory detection limits for the following metals: chromium, copper, lead, zinc. Table 1 shows that metal concentrations were slightly greater in the S-35A sample that was collected from 0 to 6 inches bgs than in the S-35B sample that was collected from 24 to 30 inches bgs. Table 1 also shows that soil pH was slightly lower in sample S-35A (pH = 6.16) than in sample S-35B (pH = 6.44). The metals concentrations from the Area 3 samples were generally present in greater concentrations than found in soil samples collected from other locations within the Property. Even though results for samples S-35A and S-35B suggest that a limited quantity of battery acid may have been released to soil, the metal concentrations are relatively low and are below cancer and hazard thresholds that are discussed in the following section.

RISK ANALYSIS

A risk analysis was evaluated for each soil composite sample to determine the potential carcinogenic and hazard risk of exposure to the soil. The evaluation was performed using the following equation, presented in the California Department of Toxic Substances Control document entitled, "*Preliminary Endangerment Assessment Guidance Manual*" dated January 1994.

$$Risk_{soil} = (SF_o \times C_s \times (1.57 \times 10^{-6})) + (SF_o \times C \times (1.87 \times 10^{-5}) \times ABS) \quad (1)$$

$$Hazard_{soil} = (C_s/RfD_o \times (1.28 \times 10^{-5})) + (C_s/RfD_o \times (1.28 \times 10^{-4}) \times ABS) \quad (2)$$

Where:

$Risk_{soil}$	=	Cancer risk
$Hazard_{soil}$	=	Hazard quotient
SF_o	=	oral cancer slope factor, (mg/kg-day)$^{-1}$
RfD_o	=	oral risk reference dose, mg/kg-day
C_s	=	concentration in soil, mg/kg
ABS	=	absorption fraction, dimensionless

Results from these calculations are presented for each soil composite sample on Tables 1 and 2. Both risk and hazard were calculated as the sum derived for each compound present in each sample. Calculated cancer risks and hazard quotients were well below the acceptable risk levels of one in a million (10^{-6}) ranged and a quotient of one. This indicates that the current soils at the site do not pose an unacceptable risk to human health.

We appreciate the opportunity to work with you on this project. If you have any questions, please do not hesitate to contact us.

Very truly yours,

ENGEO Incorporated

ENGEO Incorporated
2010 Crow Canyon Place, Ste 250
San Ramon, CA 94583-4634

Description	TAT	Matrix	Qty	Mult	Unit Price	Test Total
Tests:						
ICP Metals (TTLC)	5 days	Soil	2	1	$65.00	$130.00
pH	5 days	Soil	2	1	$11.00	$22.00
					SubTotal:	$152.00

Invoice Total: $152.00

If paid by**03/24/05** Prompt Pay Invoice Total = $136.80

*** ALL FAXED INVOICES ARE FOR YOUR INFORMATION ONLY - PLEASE PAY OFF ORIGINAL**

Please include the invoice number with your check and remit to Accounts Receivable at the letter head address. MAI also accepts credit card (Visa/Master Card/Discover/American Express) payment. Please call Account Receivable for details on this service.

MAI's EDF charge does not include the EDF charge for subcontracted analyses. The minimum EDF charge per workorder is $25.00. For invoice total greater than $5000.00, EDF will be 2% of the total invoice. The EDF charge for subcontracted analyses will be identical to Subcontractor's fee.

Terms are net 30 days from the invoice date. After this period 1.5% interest per month will be charged. Overdue accounts are responsible for all legal and collection fees. If you have any questions about billing, please contact Accounts Receivable at McCampbell Analytical.

RECEIVED
FEB 07 2005
ENGEO

Dear Keith:

Enclosed are:

1). the results of **10** analyzed samples from your **#6468.2.002.01; Sutter MC--Santa Rosa project,**

2). a QC report for the above samples

3). a copy of the chain of custody, and

4). a bill for analytical services.

All analyses were completed satisfactorily and all QC samples were found to be within our control limits.

If you have any questions please contact me. McCampbell Analytical Laboratories strives for excellence in quality, service and cost. Thank you for your business and I look forward to working with you again.

Yours truly,

Angela Rydelius, Lab Manager

%SS:	104	250	110	112	1.55	98	99	1.30	80 - 120	80 - 120

All target compounds in the Method Blank of this extraction batch were ND less than the method RL with the following exceptions:

NONE

MS = Matrix Spike; MSD = Matrix Spike Duplicate; LCS = Laboratory Control Sample; LCSD = Laboratory Control Sample Duplicate; RPD = Relative Percent Deviation.

% Recovery = 100 * (MS-Sample) / (Amount Spiked); RPD = 100 * (MS - MSD) / ((MS + MSD) / 2).

* Acceptance Criteria for MS / MSD is between 70% and 130%. MS / MSD spike recoveries and / or %RPD may fall outside of laboratory acceptance criteria due to one or more of the following reasons: a) the sample is inhomogenous AND contains significant concentrations of analyte relative to the amount spiked, or b) the spiked sample's matrix interferes with the spike recovery.

N/A = not applicable to this method.

NR = analyte concentration in sample exceeds spike amount for soil matrix or exceeds 2x spike amount for water matrix or sample diluted due to high matrix or analyte content.

PHASE ONE ENVIRONMENTAL SITE ASSESSMENT

Dear Ms. Sponamore:

ENGEO Incorporated is pleased to present our phase one environmental site assessment of the subject property, located in Sonoma County, California. The attached report includes a description of the site assessment activities, along with ENGEO's findings, opinions, and conclusions regarding the Property.

ENGEO has the specific qualifications based on education, training, and experience to assess the nature, history, and setting of the Property, and has developed and performed all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312. We declare that, to the best of our professional knowledge and belief, the responsible charge for this study meets the definition of Environmental Professional as defined in Section 312.10 of 40 CFR 312 and ASTM 1527-05.

We are pleased to be of service to you on this project. If you have any questions concerning the contents of our report, please contact us.

Sincerely,

ENGEO Incorporated

Shawn Munger, CHG, REAII

EXECUTIVE SUMMARY

ENGEO Incorporated (ENGEO) conducted a phase one environmental site assessment for the subject property located at the southeast intersection of Highway 101 and Mark West Springs Road in Sonoma County, California (Property) (Figure 1). The Property is approximately 53 acres in area and is identified by Assessor's Parcel Numbers (APN) 058-040-058, 058-040-059, 058-040-060, and 058-040-061 (Figure 2). Two parcels were reported by Assessor's Office personnel to have physical addresses: 50 Mark West Springs Road (APN 058-040-060) and 100 Mark West Springs Road (APN 058-040-058).

The Property consists of a commercial building, a barn, an out-structure and a shed. A private wastewater treatment plant (WWTP) services the commercial building. The commercial building, the Wells Fargo Center for the Arts (WFC), is a modular 85,000-square-foot structure operated by the Luther Burbank Memorial Foundation (LBMF). The WFC is a cultural and performing arts event center. A school, the Santa Rosa Christian School, occupies a portion of the WFC. The barn is used by the WFC for material and chemical storage and as a workshop. The Property includes metal storage container units used for special events material storage, athletic fields, graded open space used for special events, and an undeveloped field.

Review of historical records indicate that the WFC and associated WWTP facilities were developed in the late 1970s and early 1980s. Previous land use was as an orchard with a ranch site consisting of a residence and several out-buildings. The barn is the only remaining structure from the former ranch compound. Portions of the Property have been occupied by an orchard since prior to 1953 until circa 1980.

Two reports (ENGEO 2004 and ENGEO 2005) which were prepared for the Property were reviewed for this phase one assessment. ENGEO Incorporated (ENGEO) prepared a Phase One Environmental Site Assessment dated December 28, 2004, for the Sutter Medical Center of Santa Rosa/Luther Burbank Center for the Arts. Based on the findings of the 2004 site assessment, ENGEO identified one Recognized Environmental Condition and four items of concern within the Property.

In order to address the REC identified in the 2004 phase one assessment, ENGEO performed a limited phase two environmental study of the site (2005 - Reference 2). The phase two study was comprised of an agrichemical study and an impact evaluation associated with the improper storage of lead acid battery casings.

The result of the soil sample analysis for organochlorine pesticides and metals identified the presence of DDT, DDE, and DDD and metals including barium, chromium, cobalt, copper, lead, nickel, vanadium, zinc, and mercury.

A risk analysis was evaluated for each soil composite sample to determine the potential carcinogenic and hazard risk of exposure to the soil. The evaluation was performed in accordance with the procedures presented in the California Department of Toxic Substances Control (DTSC) document entitled, "*Preliminary Endangerment Assessment Guidance Manual*" dated January 1994. The 2005 ENGEO Phase Two report concluded the low levels of pesticides could be attributed to the orchard activity and that a limited quantity of battery acid may have been released to soil; however, the metal concentrations are relatively low and are below cancer and hazard thresholds.

ENGEO recently performed a supplemental agrichemical assessment concurrent with this phase one assessment (ENGEO 2009A). The study was performed in accordance with the current DTSC per the *Interim Guidance for Sampling Agricultural Properties (Third Revision); August 7, 2008*. A total of 32 soil samples were recovered from the 22-acre study area for laboratory analysis. The 32 soil samples were submitted as eight 4-point composite samples for OCPs. One selected discrete sample from each of the eight composites was analyzed for arsenic.

Sixteen of the soil samples were recovered from the open field located in the western portion of the Property (Area 1). The samples were collected from the interval of 0 to 6 inches below the ground surface. Sixteen of the soil samples were recovered from the open fields located in the eastern portion of the Property (Area 2). The sample locations were excavated with the use of a backhoe. A determination of the thickness of fill was made in the field with the samples collected from the interval of 0 to 6 inches below the base of the fill. Three OCPs, DDT, DDE, and DDD, were reported at the Property at levels above the laboratory reporting limit. The reported levels of DDT, DDE and DDD in the soil samples recovered at the Property are well below the California Human Health Screening Levels (CHHSLs) established by Cal/EPA.

Arsenic concentrations for the composite samples ranged from 4.4 mg/kg to 12 mg/kg with a mean of 6.3 mg/kg. Natural background concentrations of arsenic in California are often above the health-based, direct-exposure goals in soil of 0.07 mg/kg for residential land use. The reported arsenic levels are within the anticipated background concentrations and would not be from an anthropomorphic source.

This phase one assessment included a review of local, state, tribal, and federal environmental record sources, standard historical sources, aerial photographs, fire insurance maps and physical setting sources. A reconnaissance of the Property was conducted to review site use and current conditions to check for the storage, use, production or disposal of hazardous or potentially hazardous materials. Interviews were also conducted with persons knowledgeable about current and past site use of the Property.

The site reconnaissance and records review did not find documentation or physical evidence of soil or groundwater impairments associated with the use of the Property. A review of regulatory databases maintained by county, state, tribal, and federal agencies found no documentation of hazardous materials violations or discharge on the Property and did not identify contaminated facilities within the appropriate American Society for Testing and Materials (ASTM) search distances that would reasonably be expected to impact the Property.

Based on the findings of this assessment, no Recognized Environmental Conditions (RECs) and no historical RECs were identified for the Property.

Based on the review of regulatory databases and site reconnaissance, we present information on features of potential environmental concern that were either contained in the databases or observed on the Property. These features were not considered to be RECs. We briefly discuss each feature below:

- The operation of the on-site wastewater treatment facility has included the use of chlorine gas to treat effluent water. This may have resulted in the production of trihalomethane (THM) compounds such as chloroform in the soil and groundwater beneath the WWTP ponds.

- Property structures were constructed at a time when asbestos-containing building materials (ACBM) and lead-based paints may have been used in building materials.

- Batteries and an assortment of containers were viewed in the vicinity of the barn. Improper material storage may lead to release of contents by spillage or structural failure of the container.

- A septic system was reported to be located in the vicinity of the barn.

ENGEO has performed a phase one environmental site assessment of the Property in general conformance with the scope and limitations of ASTM E 1527-05 "Standard Practice for Environmental Site Assessments" and USEPA "Standards and Practices for All Appropriate Inquires", 40 CFR Part 312. Based on the findings of this assessment, ENGEO provides the following recommendations:

- The operation of the on-site wastewater treatment facility has included the use of chlorine gas to treat effluent water. ENGEO understands a Closure Plan for the plant decommissioning and removal is under development. Environmental characterization, including the testing for trihalomethane compounds, should be conducted in accordance with Regional Water Quality Control Board requirements. We understand this work is currently in progress.

- Property structures should be evaluated for the presence of asbestos-containing building materials (ACBM) and lead-based paints prior to their renovation of demolition. The evaluation should be conducted by a Cal-OSHA Certified ACBM and lead-based paint contractor.

- We recommend materials no longer in use be properly disposed. Disposal of batteries in the barn area should be performed in accordance with regulatory requirements.

- Empty containers for paint and chlorine should be property disposed.

- Any septic systems and related leach fields located within the Property should be removed in accordance with permitting requirements of Sonoma County, once these are no longer in use, and backfill requirements conform to recommendations of the Geotechnical Engineer.

- Areas of the Property were not viewed due to the presence of structures or dense vegetation. These areas should be viewed by an environmental professional should the structures or vegetation be removed.

1.0 INTRODUCTION

ENGEO Incorporated (ENGEO) conducted a phase one environmental site assessment for the Property located at the southeast intersection of US Highway 101 and Mark West Springs Road in Sonoma County, California (Figure 1). The Property is approximately 53 acres in area and is identified by Assessor's Parcel Numbers (APN) 058-040-058, 058-040-059, 058-040-060, and 058-040-061 (Figure 2). The four parcels include the following street addresses: 50 Mark West Springs Road and 100 Mark West Springs Road.

The Property consists of a commercial building, a barn, an out-structure and shed, and a private wastewater treatment plant (WWTP). The commercial building, the Wells Fargo Center for the Arts (WFC), is an 85,000-square-foot structure operated by the Luther Burbank Memorial Foundation (LBMF). The WFC is a cultural and performing arts event center. A school, the Santa Rosa Christian School, occupies a portion of the WFC building. The barn is used by the WFC as a workshop and for material and chemical storage. The Property includes metal storage container units used for special events material storage, athletic fields, graded open space used for special events, and an undeveloped field.

1.1 PURPOSE OF PHASE ONE ENVIRONMENTAL SITE ASSESSMENT

This assessment was performed at the request of Sponamore Associates for the purpose of environmental due diligence. The objective of this phase one environmental site assessment is to identify recognized environmental conditions associated with the Property. As defined in the ASTM Standard Practice E 1527-05, a REC is "the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, groundwater, or surface water of the property."

1.2 DETAILED SCOPE OF SERVICES

The scope of services performed included the following:

- A review of publicly available and practically reviewable standard local, state, tribal, and federal environmental record sources.
- A review of publicly available and practically reviewable standard historical sources, aerial photographs, fire insurance maps and physical setting sources.
- A reconnaissance of the Property to review site use and current conditions. The reconnaissance was conducted to check for the storage, use, production or disposal of hazardous or potentially hazardous materials.
- Interviews with owners/occupants and public sector officials.

- Preparation of this report with our findings, opinions, and conclusions.

1.3 LIMITATIONS AND EXCEPTIONS OF ASSESSMENT

The professional staff at ENGEO strives to perform its services in a proper and professional manner with reasonable care and competence but is not infallible. The recommendations and conclusions presented in this report were based on the findings of our study, which were developed solely from the contracted services. The findings of the report are based in part on contracted database research, out-of-house reports and personal communications. The opinions formed by ENGEO are based on the assumed accuracy of the relied upon data in conjunction with our relevant professional experience related to such data interpretation. ENGEO assumes no liability for the validity of the materials relied upon in the preparation of this report.

This document must not be subject to unauthorized reuse; that is, reuse without written authorization of ENGEO. Such authorization is essential because it requires ENGEO to evaluate the document's applicability given new circumstances, not the least of which is passage of time. The findings from a phase one environmental site assessment are valid for one year after completion of the report. Updates of portions of the assessment may be necessary after a period of 180 days after completion.

This phase one environmental site assessment is not intended to represent a complete soil or groundwater characterization, nor define the depth or extent of soil or groundwater contamination. It is intended to provide an evaluation of potential environmental concerns associated with the use of the Property. A more extensive assessment that would include a subsurface exploration with laboratory testing of soil and groundwater samples could provide more definitive information concerning site-specific conditions. If additional assessment activities are considered for the Property and if other entities are retained to provide such services, ENGEO cannot be held responsible for any and all claims arising from or resulting from the performance of such services by other persons or entities. ENGEO can also not be held responsible from any and all claims arising or resulting from clarifications, adjustments, modifications, discrepancies or other changes necessary to reflect changed field or other conditions.

1.4 SPECIAL TERMS AND CONDITIONS

Laboratory testing of soil or groundwater samples was not within the scope of the contracted services. The assessment did not include an asbestos survey, an evaluation of lead-based paint, an inspection of light ballasts for polychlorinated biphenyls (PCBs), a radon evaluation, or a mold survey.

This report is based upon field and other conditions discovered at the time of preparation of ENGEO's assessment. Visual observations referenced in this report are intended only to represent conditions at the time of the reconnaissance. ENGEO would not be aware of site contamination, such as dumping and/or accidental spillage that occurred subsequent to the reconnaissance conducted by ENGEO personnel.

2.0 PROPERTY INFORMATION

2.1 SITE LOCATION

The Property is located at 50 Mark West Springs Road and 100 Mark West Springs Road, in unincorporated Sonoma County, California (Figure 1). The approximately 53-acre Property is identified as APN 058-040-058, 058-040-059, 058-040-060, and 058-040-061 (Figure 2).

2.2 SITE AND VICINITY CHARACTERISTICS

According to published topographic maps, the Property is relatively level at an elevation of approximately 155 feet above mean sea level (msl) (Figure 3). Review of the Regional Geologic Map of the Santa Rosa Quadrangle, State of California, Department of Conservation, Division of Mines and Geology 1982, compiled by D.L. Wagner and E.J. Bortugno found that the Property is underlain by un-named Quaternary (Holocene) alluvium. No earthquake faults are mapped crossing the Property; however, an Alquist Priolo special studies zone for the active Rodgers Creek fault is located approximately 3,300 feet northeast of the Property.

Geocheck – Physical Setting Source Summary of the Environmental Resources Data report (Appendix A) indicated five Federal United States Geological Survey (USGS) wells are located within one mile of the Property. Well Number USGS3236471 is mapped within the Property and one groundwater level measurement is reported for this well. Groundwater in this well was measured at 15 feet below the ground surface (bgs). The well is also identified as Well 8409 in the State well database.

The Physical Setting Source Summary also provided hydrogeologic information for use as an indicator of groundwater flow direction in the immediate area. The Summary indentified four wells approximately ¼ mile north-to-northeast of the Property. Information gathered from this site indicates the groundwater flow direction ranged to the north-northeast and the depth to groundwater is approximately 9 feet.

Groundwater flow measurements at nearby existing and former service station sites found groundwater generally flows to the north and northwest in the vicinity of the Property.

The site-specific depth to groundwater and direction of groundwater flow was not determined as part of this assessment. Groundwater measurements performed in conjunction with a concurrent geotechnical investigation (ENGEO 2009B) indicated groundwater was between 10 feet and 15 feet bgs. Fluctuations in groundwater levels may occur seasonally and over a period of years due to variations in precipitation, temperature, irrigation and other factors.

2.3 CURRENT USE OF PROPERTY/DESCRIPTION OF SITE IMPROVEMENTS

Site improvements include the existing 85,000-square-foot Wells Fargo Center (WFC), a barn, an out-building, and a storage shed. The WFC occupies the center of the Property and is utilized as a cultural and performing arts event center. The WFC is a modular structure having several pods or wing-buildings that are linked by interior corridors. A part of the WFC Property is leased to the Santa Rosa Christian School. The WFC operates a central cooling system. The machinery for the cooling system is located in a separate pod, referred herein as the physical plant building. The room containing the natural-gas-fired boiler is located in a separate room of the physical plant. An exterior pressurized water tank is located adjacent to the physical plant. The WFC includes asphalt-paved parking areas, an athletic field, and a wastewater treatment facility.

The WWTP is operated by the WFC for the treatment of domestic effluent. The WWTP consists of a closed-sump located within a separate building, and two open ponds - one for aeration and one for percolation. A shed located along the western edge of the northern pond is used for chemical storage. A barn is located in the north-central area of the Property, near Mark West Springs Road. The barn and vicinity is utilized in part by the WFC as a workshop and storage area. A small out-building is located east of the WFC along the eastern property boundary. Graded dirt lots south and east of the WFC building are used for special events and additional parking. The WFC is serviced by municipal water (Cal-American). Power to the site is provided by PG&E. Except for the overhead electric lines servicing the barn, natural gas and electricity is conveyed through underground utilities.

2.4 CURRENT USE OF ADJOINING PROPERTIES

Adjoining properties to the east consist of a residential subdivision and a Sonoma County Park site. Adjoining properties to the north consist of residential subdivisions and commercial properties. Adjoining properties to the south and west consist of rural residential and agricultural properties. U. S. Highway 101 and State of California Right-of-Way are located along the west boundary of the Property. Mark West Springs Road forms the northern Property boundary.

3.0 RECORDS REVIEW

3.1 PREVIOUS ENVIRONMENTAL REPORTS

Two reports (Referenced) prepared for the Property were reviewed for this phase one assessment. ENGEO Incorporated (ENGEO) prepared a Phase One Environmental Site Assessment dated December 28, 2004, for the Sutter Medical Center of Santa Rosa/Luther Burbank Center for the Arts. The 2004 Phase One Environmental Site Assessment identified the Study area as a 54-acre property consisting of five parcels identified as APN 058-040-023, 058-040-026, 058-040-027, 058-040-045 and a portion of APN 058-040-050.

Site development and land use was described as the Luther Burbank Center For The Arts (LBC), an 85,000-square-foot cultural and performing arts event center (APN 058-040-045), a rural residence with barn, out buildings and undeveloped pasture land (APN 058-040-026 and 058-040-027), and a single-family home that was used as law offices (APN 058-040-023). A part of the LBC Property was reported as leased to the Sonoma Academy, an independent college-preparatory high school. A portion of the study area was reported to include approximately 38.8 acres that are occupied by asphalt-covered parking areas, an athletic field, and wastewater treatment facility ponds. The rural residential portion of the site consists of approximately 13.6 acres in the western portion of the Property. The homestead parcel was utilized in part by the LBC as a maintenance and storage area.

During the site reconnaissance, chemical storage was noted in one location, a small wooded shed on the west side of the northern wastewater treatment pond. These containers consisted of eight compressed chlorine gas bottles used as part of the wastewater treatment. Seven drums (30- to 55-gallon), consisting of four metal 55-gallon drums, one plastic 55-gallon drum, and two plastic 30-gallon drums, were found adjacent to the LBC physical plant building. Labeling on all of these drums was either illegible or not visible.

Petroleum product containers were observed in two locations within the Property. These containers were found in a storage area within the barn and outside of the Physical Plant building of the LBC. These containers consisted of five 2-gallon metal gasoline containers within the storage area of the barn; several small plastic containers with motor oil, brake fluid and other automotive fluids stored on a shelf within the barn storage area; two 5-gallon motor oil containers stored on the concrete slab outside of the LBC physical plant building. Minor staining (less than 1 square foot) was noted on the concrete slab outside of the Physical Plant building.

No areas of stressed vegetation were observed within the Property at the time of the reconnaissance. Several piles of solid waste were observed near the barn structure within the homestead area of the Property. This solid waste consisted of several empty chlorine liquid bottles, five discarded lead-acid batteries, broken concrete, miscellaneous wood debris, and a pile of green waste. No storage tanks were observed on the Property during the reconnaissance.

The report indicated that there were two active septic systems located within the homestead parcel of the Property located on the west and east sides of the residence. One well was reportedly located on the LBC parcel. An asbestos and lead-based paint survey was not conducted as part of the assessment. The report included a statement that, given the age of the structures, it is likely that asbestos-containing materials (ACM) and lead-based paint were used for the construction of these structures.

A review of aerial photographs and database research found no off-site facilities that would be expected to significantly impact the Property.

Based on the findings of the 2004 site assessment, ENGEO identified one Recognized Environmental Condition and four items of concern within the Property. The REC and items of concern are listed below:

- The historic Property use as an orchard may indicate that pesticides were applied according the regulations governing the application of agricultural chemical. We found no evidence indicating pesticides may have been improperly applied, spilled or disposed within the Property. However, there is a potential that residues of the agricultural chemicals may remain in shallow soil. The potential threat posed to human health and the environment by such residues is dependent on the future Property use, exposure pathways and receptors. It is recommended that soil sampling should be considered if human exposure to shallow soil that was historically occupied by orchard will occur as a result of the future land use.

The four items of concern within the Property were identified as follows:

1. The operation of the on-site wastewater treatment facility has included the use of chlorine gas to treat effluent water. This may have resulted in the production of trihalomethane (THM) compounds such as chloroform in the soil beneath the wastewater treatment ponds. Currently, there is no Closure Plan in place for the decommissioning and removal of this facility. As such, it is recommended that a “Closure Plan” be developed, approved and implemented for this facility in accordance with requirements of North Coast Regional Water Quality Control Board and the Sonoma County Permit and Resource Management Department (PRMD). As required by the regulatory agencies, further environmental characterization and site assessment may be necessary to comply with decommissioning and closure requirements. We understand that closure of this facility will follow re-direction of wastewater sewer servicing this Property to another off-site facility, at which time closure and decommissioning can be performed.

2. The structures located within the homestead parcel of the Property were constructed at a time when asbestos-containing building materials (ACBM) and lead-based paints may have been used during their construction. It is recommended that a Cal-OSHA Certified ACBM, and lead-based paint contractor, be retained to assess the structures prior to any renovation or demolition activities. Removal and disposal of ACBM, if encountered, should be performed by the asbestos abatement contractor in accordance with regulatory requirements.

3. Discarded batteries observed within the homestead area of the Property represent a potential source of soil contamination. We recommend this debris be properly disposed of and the surrounding soil be assessed for evidence of contamination. Local removal and disposal of soils impacted with hazardous materials from the batteries should be performed in accordance with regulatory requirements.

4. Any septic systems and related leach fields located within the homestead and the law office parcels at the site should be removed and disposed of in accordance with permitting requirements of Sonoma County, once these are no longer in use, and backfill requirements conform to recommendations of the Geotechnical Engineer.

In order to address the REC identified in the 2004 phase one assessment, ENGEO performed a limited phase two environmental study of the site (Reference 2). The phase two study was comprised of an agrichemical study and included an impact evaluation associated with the improper storage of lead acid battery casings. The agrichemical study evaluated two areas for the presence of persistent organochlorine pesticides and CAM 17 metals. Area 1 was identified as an approximately 12-acre area that historically supported orchard activities but was not disturbed by grading activities. For the Area 1 evaluation, two samples were collected from each of 24 locations (S-1 through S-24) and were composited at a ratio of 6:1 for a total of eight composite samples submitted for laboratory analysis. Four of the composite samples were comprised of samples collected from depths of 0 to 6 inches below ground surface (bgs) and four composite samples were comprised of samples collected from depths of 24 to 30 inches bgs.

Area 2, an approximately 10-acre area, historically supported orchard activities that was identified as later covered by approximately 3 feet of imported engineered fill. For the Area 2 evaluation, two samples were collected from each of 10 samples and were composited at a ratio of 10:1 for a total for two composite samples submitted for laboratory analysis. One composite sample was comprised of samples collected from the northern 5 acres of Area 2, including five samples from depths of 0 to 6 inches bgs and five samples from depths of 24 to 30 inches bgs. One composite sample was comprised of samples collected from the southern 5 acres of Area 2, consisting of five samples from depths of 0 to 6 inches bgs and five samples from depths of 24 to 30 inches bgs.

The lead acid battery impact evaluation was performed in a small area near the residential structures where improper storage of lead acid battery casings was observed. The battery impact evaluation area was referred to as Area 3 in the phase two assessment. The scope of the battery impact evaluation consisted of the recovery of two samples from an area west of the barn, including one sample from a depth of 0 to 6 bgs and one sample from depth of 24 to 30 inches bgs. The samples were submitted for analysis of the cadmium, chromium, copper, lead, zinc, and pH.

The result of the soil sample analysis for organochlorine pesticides and metals identified the presence of Dichlorodiphenyltrichloroethane (DDT), Dichlorodiphenyldichloroethylene (DDE), and Dichlorodiphenyldichloroethane (DDD) in the four composite shallow samples from Area 1 and from the composite sample from the northern 5 acres of Area 2. Concentrations of DDT were reported in three composite samples a levels ranging from 0.0015 milligram per kilogram (mg/kg) to 0.022 mg/kg. Concentrations of DDD were reported in two composite samples at 0.0038 mg/kg and 0.0043 mg/kg. Levels of DDE were reported in five composite samples at levels ranging from 0.0015 mg/kg to 0.047 mg/kg. All composite samples from Areas 1 and 2 were found to have concentrations exceeding laboratory detection limits for the metals barium, chromium, cobalt, copper, lead, nickel, vanadium, zinc, and mercury.

The two samples from Area 3 exhibited concentrations exceeding laboratory detection limits for the following metals: chromium, copper, lead, zinc. The laboratory reported slightly greater metal concentrations in the sample collected from 0 to 6 inches bgs than in the sample collected from 24 to 30 inches bgs. The soil pH was slightly lower in 0 to 6 inches bgs sample (pH = 6.16) than in sample collected from 24 to 30 inches bgs (pH = 6.44). The metals concentrations from the Area 3 samples were generally present in greater concentrations than found in soil samples collected from other locations within the Property.

A risk analysis was evaluated for each soil composite sample to determine the potential carcinogenic and hazard risk of exposure to the soil. The evaluation was performed using the equations presented in the California Department of Toxic Substances Control document entitled, "*Preliminary Endangerment Assessment Guidance Manual*" dated January 1994. The report stated that both risk and hazard were calculated as the sum derived for each compound present in each sample. The calculated cancer risks and hazard quotients were well below the acceptable risk levels of one in a million (10^{-6}) ranged and a quotient of one, indicating that the soils at the site did not pose an unacceptable risk to human health. The 2005 ENGEO Phase Two report concluded that the low detections of pesticides could be attributed to the orchard and that the Area 3 samples suggest that a limited quantity of battery acid may have been released to soil; however, the metal concentrations are relatively low and are below cancer and hazard thresholds.

3.2 PROPERTY RECORDS

3.2.1 Environmental Liens

The Sonoma County Recorders Office was contacted for information related to environmental liens associated with the Property. No environmental liens associated with the Property APN(s) were identified. In addition, a questionnaire completed by the Client or authorized representative indicated that they are not aware of any environmental cleanup liens recorded against the Property.

3.2.2 Title Report/Ownership

The Title Report lists recorded land title detail, ownership fees, leases, land contracts, easements, liens, deficiencies, and other encumbrances attached to or recorded against a subject property. Laws and regulations pertaining to land trusts vary from state to state and the detail of information presented in a Title Report can vary greatly by jurisdiction. As a result, ENGEO utilizes a Title Report, when provided to us, as a supplement to other historical record sources. A Preliminary Title Report was not provided by the time of report preparation.

3.3 HISTORICAL RECORD SOURCES

The purpose of the historical record review is to develop a history of the previous uses or occupancies of the Property and surrounding area in order to identify those uses or occupancies that are likely to have led to recognized environmental conditions on the Property.

3.3.1 Historical Topographic Maps

Historical USGS topographic maps were reviewed to determine if discernible changes in topography or improvements pertaining to the Property had been recorded. The Property straddles two adjoining topographic maps- the Santa Rosa and the Sebastopol quadrangle maps. The adjacent northern quadrangles are the Mark West Springs and the Healdsburg 7.5-minute maps. The following maps were provided to us through an EDR Historical Topographic Map Report, presented in Appendix C.

QUAD	YEAR	SERIES	SCALE
Santa Rosa	1944	15’	1:62,500
Santa Rosa	1954	15’	1:62,500
Santa Rosa	1954	7.5’	1:24,000
Sebastopol	1954	7.5’	1:24,000
Santa Rosa	1968	7.5’	1:24,000
Sebastopol	1968	7.5’	1:24,000
Santa Rosa	1973	7.5’	1:24,000
Santa Rosa	1980	7.5’	1:24,000
Sebastopol	1980	7.5’	1:24,000

<u>1944 Santa Rosa Map</u> – The Property is viewed as relatively level at an elevation of 155 feet above msl. A structure is depicted on the Property along Mark West Springs Road. No land use is evident.

<u>1954 – 1973 Santa Rosa and 1954 – 1968 Sebastopol Maps</u> – No structures are shown on the Property. Land use of the Property is depicted as orchard. No changes to site topography are discerned.

<u>1980 Santa Rosa and 1980 Sebastopol Maps</u> – Structures having the shape and in the location of the Wells Fargo Center for the Arts, access roads, and the WWTP ponds are shown on the Property. A pond is depicted in the center of the WFC parcel. Land use of the western portion of the Property is depicted as orchard. No changes to site topography are discerned.

3.3.2 Aerial Photographs

The following aerial photographs, provided by EDR, were reviewed for information regarding past conditions and land use at the Property and in the immediate vicinity. These photographs are presented in Appendix E.

FLYER	YEAR	SCALE
Pacific Air	1953	1" = 555'
Cartwright	1965	1" = 333'
NASA	1974	1" = 541'
USGS	1982	1" = 666'
USGS	1993	1" = 666'
USGS	1998	1" = 666'
EDR	2005	1" = 484'

1953 – 1965 Photographs –The Property is developed as an orchard. Several structures are visible within the Property. A ranch compound, including two middle-sized and a few smaller structures, are visible on the south side of a primary road in the location of the existing Mark West Springs Road. The ranch compound is situated at the present location of the main entrance to the WFC. A larger structure is located approximately 1,100 feet south of the ranch property. Two smaller outbuildings are visible on the eastern portion of the Property, approximately 1,000 feet south of Mark West Springs Road. Several north-south and east-west trending secondary roads are visible within the Property. The surrounding properties are developed as orchards. Several small- to medium-sized structures are visible on adjoining properties. A main road in the location of Old Redwood Highway is visible to the east of the Property. Highway 101 is viewed on the 1965 and later aerial photographs at the current location. Commercial development is visible to the north and east across Mark West Springs Road on the 1965 photograph.

1974 – 1982 Photographs –The western portion of the Property is viewed as an orchard on the 1974 aerial photograph and as an open field on the 1982 and later photographs. Structures within the ranch compound are visible. Development of structures, parking, and access roads are viewed at the approximate location of the WFC. Two rectangular basins are visible to the north of the WFC on the 1982 and later photographs. The eastern portions of the Property appear undeveloped. A small southwest-trending drainage swale is visible in the central-eastern Property area. Rural residential home sites abut the northeastern portion of the Property. Lands to the west, south and southeast are visible as orchards on the 1974 photograph, with decreasing areas under cultivation viewed to the south on the 1982 photograph. Increased residential and commercial development is viewed to the north and northeast.

1993 – 2005 Photographs –The Property appears as currently developed, with the addition of structures visible on the field south of the WFC. No structures are viewed on the south field on the 2005 photograph. Lands to the south, west and southeast are viewed as agriculturally developed or open space. Rural residential home sites continue to abut the northeastern portion of the Property, with residential development beyond. Lands to the north are residential and commercial developments.

3.3.3 Fire Insurance Maps

EDR prepared a Sanborn Fire insurance map search for the Property and surrounding properties. EDR reported that no maps were available for the Property and surrounding properties.

3.3.4 City Directory

City Directories, published since the 18th century for major towns and cities, lists the name of the resident or business associated with each address. A city directory search conducted by EDR is located in Appendix F. The EDR city directory search resulted in address listings for the Property or vicinity for the years 1965 through 2006. The following listings were located for the Property addresses:

3.3.5 Government Agencies

The following agencies were contacted pertaining to possible past development and/or activity at the Property.

- Sonoma County Assessor's Office
- Sonoma County Building/Planning Departments
- Sonoma County Department of Environmental Health
- Sonoma County Department of Emergency Services
- California Regional Water Quality Control Board
- Department of Toxic Substances Control
- California Environmental Protection Agency

Sonoma County Assessor's Office personnel identified the physical addresses and size of the four parcels comprising the Property and confirmed the parcel owners for the Property. The Assessor's Office information is provided in the following table:

APN	PHYSICAL ADDRESS	PARCEL SIZE (AC)	PARCEL OWNER
058-040-058	100 Mark West Springs Road	15	Sutter Medical Center
058-040-059	Mark West Springs Road	10	Sutter Medical Center
058-040-060	50 Mark West Springs Road	25.01	Luther Burbank Memorial Foundation
058-040-061	Mark West Springs Road	3.01	Luther Burbank Memorial Foundation

Sonoma County Department of Emergency Services was contacted for information pertaining to hazardous materials use, storage, unauthorized releases, and incident responses at the Property. The Department of Emergency Services includes the County Fire Department, whose files would include hazardous materials inventories, locations, and the presence of underground storage tanks. In addition, the Department would respond to incidents pertaining to leaks or releases of hazardous materials. Department personnel indicated no information was on file regarding hazardous materials or underground storage tanks at the subject Property.

Sonoma County Building/Planning Departments were contacted for information pertaining to property development. The WFC & SMC properties are part of the Larkfield-Wikiup Specific Plan. Recent permit listings include items related to the operation of the Wells Fargo Center, primarily for tenant improvements and specials event zoning, and items related to the Sutter Medical Center project, such as EIR, lot line adjustments, geotechnical studies and demolition permits associated with the removal of ranch compound structures. Environmentally related permits include a septic tank removal at the ranch compound and asbestos removal associated with the ranch compound structures and for remodeling at the WFC.

Sonoma County Department of Environmental Health (DEH) was contacted for information pertaining to the Property. Information in the DEH would include underground storage tank files. The DEH responded verbally that their files for the Property only included food preparation-related permits.

3.4 ENVIRONMENTAL RECORD SOURCES

EDR performed a search of federal, tribal, state, and local databases regarding the Property and nearby properties. Details regarding the databases searched by EDR are provided in Appendix A. A list of the facilities documented by EDR within the approximate minimum search distance of the Property is provided below:

3.4.1 Federal ASTM Standard/Supplemental Sources

3.4.1.1 Subject Property

The Property is not listed on the Federal ASTM Standard or supplemental sources.

3.4.1.2 Other Properties

No database listing within the appropriate ASTM search distances of the Property on Federal ASTM Standard or supplemental sources were identified.

3.4.2 State ASTM Standard/Supplemental Sources

3.4.2.1 Subject Property

The Property is listed on the following State ASTM Standard or supplemental source databases:

- CA WDS: Waste Discharge System for Sites - sites which have been issued waste discharge requirements. The list is maintained by the State Water Resources Control Board. The listing is for the WWTP operated on the Property. No violations were listed in the EDR CA WDS database review.

- HAZNET: Facility and Manifest Data - The data is extracted from copies of hazardous waste manifests received each year by the DTSC. There are two Property listings, both for the 50 Mark West Springs Road address, for this database. One listing is associated with the removal of 1.2915 tons of Polychlorinated biphenyls (PCBs) and material containing PCBs. The second listing is for the removal/disposal of 1.6 tons of asbestos-containing waste. According to Mr. Marc Hagenlocher, WFC Operations Director, the asbestos listing is for remodeling activities at the Center. Mr. Hagenlocher has been associated with the Property for 22 years. He was unaware of the PCB-related listing. ENGEO contacted CAL-EPA for additional information regarding the PCB disposal. A uniform Hazardous Waste Manifest dated September 29, 1998, was located which documents the removal of four drums of light ballasts removed from overhead light fixtures. The ballasts were removed for processing by a licensed disposal/recycling facility. A copy of the CAL-EPA profile and the 1998 manifest are provided in Appendix G.

3.4.2.2 Other Properties

The following databases include facilities listed within the appropriate ASTM search distances of the Property on State ASTM Standard or supplemental sources (the number of facilities is reported in parentheses). Details regarding the listings are provided in Appendix A.

- HIST Cal-Sites (1)
- LUST (10)

- CA FID UST (3)
- UST (2)
- HIST UST (5)
- SWEEPS UST (3)
- NOTIFY 65 (2)
- RESPONSE (1)
- ENVIROSTOR (1)

3.4.3 Local ASTM Supplemental Sources

3.4.3.1 Subject Property

The Property is not listed on Local ASTM supplemental databases.

3.4.3.2 Other Properties

The following databases include facilities listed within the appropriate ASTM search distances of the Property on Local ASTM Standard or supplemental sources (the number of facilities is reported in parentheses). Details regarding the listings are provided in Appendix A.

- SONOMA COUNTY Leaking Underground Storage Tank Sites (5)

Two leaking underground storage tank sites are identified within the immediate vicinity of the Property.

A former Texaco station was located at 4601 Old Redwood Highway at the southwest corner of the intersection of the Old Redwood Highway and Mark West Springs Road. The facility location was across East Fulton Road near the northeast corner of the Property. The Texaco service station operated four 6,000-gallon fuel tanks and a 550-gallon waste oil tank from the mid-1960s through 1990. The facility was identified as a leaking underground tank (LUST) site in 1986. Cleanup for fuel leakage at the facility included the excavation of about 10,400 cubic yards of soil during the period of 1990 through 1997, and the removal of almost 2.1 million gallons of groundwater between 1993 and 1995. A total of 22 groundwater monitoring wells were installed for the impact study associated with the LUST facility, which underwent verification monitoring from 2003 through 2006. Groundwater movement was reported to be variable, but with a westward component. The subject Property is located in the reported downgradient to cross-gradient direction of groundwater movement. Two of the monitoring wells were located adjacent to the Property near the intersection of Mark West Springs Road and East Fulton Road. These wells were not reported to contain detectable levels of petroleum hydrocarbons. The wells were destroyed after several years of monitoring. The cleanup of the facility was deemed complete and the facility granted closure - no further action - in May 2007. The site is currently the location of a small retail strip complex. The water well at the subject Property (50 Mark West Springs Road) was sampled in 2003 for the presence of petroleum fuel and fuel components. The fuel and fuel components concentrations were below the laboratory reporting limit. The former Texaco site would not be expected to affect the subject Property, or impact future use of the Property.

An active UNOCAL gas station is located at 4605 Old Redwood Highway at the northwest corner of the intersection of the Old Redwood Highway and Mark West Springs Road. The facility was identified as a LUST site in 1988 and was remediated through the early 1990s. The case was closed in 1997, re-opened in 2001, and closed again in 2003. This facility is in the cross-gradient to down-gradient direction of reported groundwater direction. The UNOCAL site would not be expected to affect the subject Property or impact future use of the Property.

Based on the distances to the identified database sites, regional topographic gradient, and the EDR findings, it is unlikely that the other above-stated database sites pose an environmental risk to the Property. Properties that are on the "Orphan Summary" list within the ASTM search distances are unlikely to pose an environmental risk or appear to be located beyond the ASTM recommended radius search criteria.

4.0 SITE RECONNAISSANCE

4.1 METHODOLOGY

ENGEO conducted a reconnaissance of the Property on April 20, 2009. Mr. Marc Hagenlocher, Operations Director for the Wells Fargo Center, accompanied ENGEO personnel during a portion of the reconnaissance. The Property was viewed for hazardous materials storage, superficial staining or discoloration, debris, stressed vegetation, or other conditions that may be indicative of potential sources of soil or groundwater contamination. The site was also checked for evidence of fill/ventilation pipes, ground subsidence, or other evidence of existing or preexisting underground storage tanks. Photographs taken during the site reconnaissance are presented in Figures 4 though 6.

Portions of the site were inaccessible due the presence of dense vegetation. Access to the roof and the eastern modules WFC occupied by the Santa Rosa Christian School were unavailable at the time of the site reconnaissance. The physical plant module of the WFC was the only portion of the interior of the WFC available for viewing.

4.2 GENERAL SITE SETTING

The Property consists of a total of approximately 53 acres located at the southeast corner of Mark West Springs Road and Highway 101 in Sonoma County, California. The Property is bounded by Mark West Springs Road on the north, Highway 101 on the west, rural residential properties on the south, residential development and a park on the east. The relatively level Property is accessed from the north via two paved driveways, one connecting with Mark West Springs Road and one with East Fulton Road. Site development consists of a barn, storage shed, and two WWTP ponds on the eastern portion of the 058-040-058 parcel and the Wells Fargo Center for the Arts (WFC) on the northwestern area of the 058-040-060 parcel. Paved parking areas are located to the northwest and east of the WFC. A manicured athletic field is located on the northern portion of the 058-040-059 parcel. Parcel 058-040-061 and the southern area of 058-040-060 are graded areas used for event parking and special event staging areas. The western area of parcel 058-040-058 is an undeveloped field.

4.3 EXTERIOR OBSERVATIONS

4.3.1 Structures

Four structures were observed during the site reconnaissance. The structures are the WFC, a modular 85,000-square-foot cultural and performing arts center, an approximately 2,400-square-foot barn/storage building, a 220-square-foot out-building, and a storage shed. The WFC appears as a masonry block and stucco structure. The barn and shed are both wood-framed wood-sided structures. The western third of the barn has a concrete floor while the eastern section is on a raised wood floor. The barn roof is corrugated metal. The shed has a concrete floor. The out-building is a masonry block structure with a concrete floor. It appears unmaintained and has no roof. Several locked metal storage containers were observed on the Property. Site personnel identified the units as used for special events materials storage. The units are not used to store chemicals or perishable items.

4.3.2 Hazardous Substances and Petroleum Products in Connection with Identified Uses

Hazardous substances or petroleum products were observed within the Property during the site reconnaissance. The materials were observed in eastern and western barn areas, the storage shed the physical plant module of the WFC, and in a utility closet adjacent to the physical plant module. The barn is used for material storage, office space and equipment maintenance.

Hazardous substances or petroleum products observed in the eastern portion of the barn include approximately 200 gallons of assorted paints in assorted pail and can sizes, approximately 30 pounds and 2 gallons of insecticide, 5 gallons of flooring adhesive, 3 gallons of sealer/primer, less than 1 gallon each of herbicide, PVC cement, and alcohol. Hazardous substances or petroleum products viewed in the western barn area include less than 15 gallons of gasoline stored in a metal flammable storage cabinet, less than 15 gallons of assorted vehicle lubricants, less than 10 gallons each of hydraulic fluid and paint (including aerosols),approximately 2 gallons of liquid labeled waste oil, less than 1 gallon of penetrating solvents, and two welding gas tanks - one for oxygen and one containing acetylene.

Six lead-acid batteries were observed in the covered storage area adjacent to the barn. Four additional batteries were noted in weeds about 20 feet west of the barn structure. Six cylinders of chlorine gas were noted in the storage shed adjacent to the WWTP ponds. Materials observed in the WFC physical plant module include three 30-gallon plastic drums of *multisolve* light degreaser and approximately 40 gallons of foam agent for water treatment. Materials observed in the utility closet adjacent to the physical plant module included approximately 30 gallons of paint and less than 10 gallons of gasoline. The gasoline was stored in appropriate fuel containers within a metal flammable storage cabinet.

4.3.3 Storage Tanks

Two above-ground storage tanks (AGTs) were observed on the Property. One AGT was adjacent to the WFC physical plant module. The tank, having an estimated capacity of between 2,000 and 5,000 gallons, is a pressurized tank used for water storage. A pad-mounted AGT used for the storage of diesel fuel was observed as the basal unit of a backup generator. The generator is located in the vicinity of the WFC physical plant. No evidence of existing underground storage tanks was observed during the site reconnaissance.

4.3.4 Odors

No odors indicative of hazardous materials or petroleum material impacts were noted at the time of the reconnaissance.

4.3.5 Pools of Potentially Hazardous Liquid

No pools of potentially hazardous liquid were observed within the Property at the time of our reconnaissance.

4.3.6 Drums

Two metal drums were observed on the Property at the time of the reconnaissance. One empty 55-gallon drum was located in the covered storage area adjacent to the barn. A 30-gallon drum was located in the weeds approximately 30 feet west-northwest of the barn structure. The three 30-gallon aforementioned plastic drums of *multisolve* light degreaser were observed in the WFC physical plant.

4.3.7 Hazardous Substance and Petroleum Product Containers

Three empty fuel containers were viewed on the flammable materials cabinet in the barn. Two plastic containers, typically associated with waste oil storage and each having a capacity of about 2 gallons, were observed in weeds approximately 30 feet west-northwest of the barn structure. Approximately 20 unlabeled white one-gallon containers were noted in the weeds about 20 feet west of the barn structure. The white containers were reported to be spent chlorine bottles. Two dozen empty paint cans south of the barn were situated on a sheet of plywood. No spillage or runoff from the plywood was noted.

4.3.8 Polychlorinated Biphenyls (PCBs)

Three electrical transformers were observed on the Property during our site reconnaissance. One transformer, a pad-mounted Cutler-Hammer V48M28E75B, indicated it was a dry-type. A fence-post-mounted transformer, a Vista Professional Outdoor Lighting CT600, appeared to be a dry type. A PG&E pad-mounted transformer, T-1166, was observed near the west wing entrance to the WFC. No evidence of leakage was noted from the unit.

As noted in Section 3.4.2.1, ENGEO contacted CAL-EPA for additional information regarding the PCB disposal. A uniform Hazardous Waste Manifest dated September 29, 1998, was located which documents the removal of four drums of light ballasts from overhead light fixtures. A total of 1.2915 tons of Polychlorinated biphenyls (PCBs) was removed for processing by a licensed disposal/recycling facility. A copy of the CAL-EPA profile and the 1998 manifest are provided in Appendix G.

4.3.9 Pits, Ponds and Lagoons

One pit and two ponds were observed within the Property at the time of our reconnaissance. The pit, approximately 4 feet by 10 feet by 5 feet deep, was between the barn and Mark West Springs Road. Piping was observed at two ends of the pit. The pit is in the approximate location of a removed septic tank. Two open ponds associated with the WFC WWTP are located south of the barn. One pond serves as an aeration pond and one as a percolation pond. The ponds are enclosed by chain link fences and locked gates.

4.3.10 Stained Soil/Pavement

Minor localized staining from vehicle drippage was noted in the paved parking areas. No stained soil was visible within the Property at the time of our reconnaissance. Twelve stormwater catch basins were observed in the parking areas. Eleven of the basins appeared clear of debris. One basin contained a significant amount of pine needles. None of the catch basins exhibited staining characteristic of dumping.

4.3.11 Stressed Vegetation

No signs of stressed vegetation were observed on the Property at the time of our reconnaissance.

4.3.12 Solid Waste/Debris

Dumpsters were observed in a paved fenced compound. The compound was used for the storage of solid waste pending disposal. Several trash receptacles were observed on the Property, including the perimeter of the WFC and inside the barn. Several piles of solid waste were observed in the vicinity of the barn structure. This waste consisted of broken concrete and miscellaneous wood and metal debris. Empty containers were previously discussed.

4.3.13 Wastewater

A wastewater treatment system operated by the WFC consists of a closed-sump located within a separate building, and two open ponds that act as aeration and percolation ponds. We understand that the water treatment facility was constructed circa 1980.

Two septic disposal systems are believed to have serviced former structures in the vicinity of the barn. One septic system was removed at the time of the structure demolition in 2008.

4.3.14 Wells

One well was found within the Property during our site reconnaissance. Data provided by Brelje & Race Consulting Engineers indicates that this well is constructed to a depth of 400 feet, and is equipped with a submersible pump capable of delivering approximately 200 gallons per minute (gpm).

4.3.15 Septic Systems

No evidence of a septic system was observed during the site reconnaissance. Two septic disposal systems are believed to have serviced structures in the vicinity of the barn. One system was removed at the time of the 2008 demolition of a residence and two outbuildings.

4.4 INTERIOR OBSERVATIONS

The interiors of four site structures were observed during the reconnaissance. The barn has a raised wood floor and much of the interior walls were sided with sheet rock. The raised floor appeared in good condition. The western portion of the barn is a slab-on-grade concrete floor. No significant cracking, staining, or through floor drains were evident in/on the concrete floor.

The chiller room portion of the WFC and an adjacent utility closet were entered for viewing. The chiller room, housing the air conditioning equipment, has a concrete slab-on-grade floor. The floor was in good condition with no significant cracking or staining. No through-floor drains were observed in the room. Most of the piping in the room appeared to be insulated with a fibrous blanket wrapping. The utility closet adjacent to the physical plant building was used to store paints, grounds maintenance equipment, and gasoline. No through-floor drains were observed in the room. Some dried spilled paint was noted on the concrete floor of the utility closet.

The interiors of two small outbuildings were viewed: a shed in the vicinity of the aeration pond and a structure along the eastern property boundary, east of the WFC. The shed is a wood-walled structure and the eastern building a roof-less masonry-wall structure. Both structures are on a concrete slab-on-grade foundation.

4.5 ASBESTOS-CONTAINING MATERIALS AND LEAD-BASED PAINT

An asbestos and lead-based paint survey was not conducted as part of this assessment. No obvious asbestos-containing material was observed on the Property. Permits for the removal of asbestos were issued for tenant improvement/interior remodeling of the WFC and for the demolition of the structures in the vicinity of the barn. Given the age of the existing structures, it is conceivable that asbestos-containing materials and lead-based paint materials may exist within the structures.

4.6 INDOOR AIR QUALITY

An evaluation of indoor air quality, mold, or radon was not included as part of the contracted scope of services. The California Department of Health Services has conducted studies of radon risks throughout the state, sorted by zip code. Results of the studies indicate that nine tests were conducted within the Property zip code, with no tests exceeding the current EPA action level of 4 picocuries per liter [pCi/L]1).

5.0 INTERVIEWS

Mr. Marc Hagenlocher, Director of Operations for the Wells Fargo Center, completed two environmental site assessment questionnaires pertaining to user-related applicable environmental information regarding the Property. In the questionnaire, Mr. Hagenlocher did not identify potential environmentally related issues with the Property. The questionnaire is presented in its entirety in Appendix F.

Mr. Marc Hagenlocher was also interviewed in person during the course of the site reconnaissance. Mr. Hagenlocher identified himself as a person having been associated with the Property for approximately 22 years. Mr. Hagenlocher was aware that asbestos containing material was encountered during a bathroom renovation at the WFC building. He was unaware of the reason for HAZNET listing documenting 1.2915 tons of PCB and material containing PCBs. Mr. Hagenlocher was not aware of previous use of the out-building located east of the WFC. He stated the structure was always roof-less and was not used since he was associated with the Property. Mr. Hagenlocher was familiar with the presence of one water well on the Property, and he thought two septic systems were located in the vicinity of the former ranch compound.

Pacific Gas and Electric Company personnel were contacted for information regarding pad-mounted transformer, T-1166. PG&E had not responded to our request by the time of report preparation.

[1] California Department of Health Services – Division of Drinking Water and Environmental Management – Radon (http://ww2.cdph.ca.gov/HealthInfo/environhealth/Documents/Radon/CaliforniaRadonDatabase.pdf).

6.0 FINDINGS

The reconnaissance and records research did not find documentation or physical evidence of soil or groundwater impairments associated with the current or past use of the Property. A review of regulatory databases maintained by county, state and federal agencies found no documentation of hazardous materials violations or discharge on the Property. No documentation of significant soil or groundwater contamination associated with abutting properties, which could be expected to affect the subject Property was found from the records research.

The orchard occupying parts of the Property in the 1950s through 1980s was previously identified as a historical REC. Two agrichemical studies were performed at the Property, one in 2005 and another concurrent with this assessment. Based on the findings of the studies, there is no evidence of significant impacts associated with the historical orchard.

7.0 OPINIONS AND DATA GAPS

It is our opinion that the findings of this study are based on a sufficient level of information obtained during our contracted scope of services to render a conclusion as to whether additional appropriate investigation is required to identify the presence or likely presence of a REC. The following data gaps were identified for the Property:

- The Property straddles two topographic maps. Two map years, 1944 and 1973, do not have both sets of maps for full Property coverage.
- Pacific Gas & Electric Company was contacted for transformer and PCB information at the Property. PG&E has not responded to our request for information.
- Access to interior of the WFC was incomplete.
- The WFC roof was inaccessible.
- A Preliminary Title Report was not provided for review.

The data gaps identified during this process do not affect the conclusions as to the presence or lack of presence of RECs at the Property.

8.0 CONCLUSIONS

The study included a review of local, state and federal environmental record sources, standard historical sources, aerial photographs, fire insurance maps and physical setting sources, a reconnaissance of the Property to review site use and current conditions to check for the storage, use, production or disposal of hazardous or potentially hazardous materials and interview with persons knowledgeable about current and past site use.

The site reconnaissance and records review did not find documentation or physical evidence of soil or groundwater impairments associated with the use of the Property. A review of regulatory databases maintained by county, state, and federal agencies found no documentation of hazardous materials violations or discharge on the Property. A review of regulatory agency records and available databases did not identify contaminated facilities within the appropriate ASTM search distances that would be expected to impact the Property.

Based on the findings of this assessment, no Recognized Environmental Conditions (RECs) and no historical RECs were identified for the Property.

Based on the review of regulatory databases and site reconnaissance, we present information on features of potential environmental concern that were either contained in the databases or observed on the Property. These features were not considered to be RECs. We briefly discuss each feature below:

- The operation of the on-site wastewater treatment facility has included the use of chlorine gas to treat effluent water. This may have resulted in the production of trihalomethane (THM) compounds such as chloroform in the soil and groundwater beneath the WWTP ponds.

- Property structures were constructed at a time when asbestos-containing building materials (ACBM) and lead-based paints may have been used in building materials.

- Batteries and an assortment of containers were viewed in the vicinity of the barn. Improper material storage may lead to release of contents by spillage or structural failure of the container.

- A remnant septic system was reported to be located in the vicinity of the barn.

ENGEO has performed a phase one environmental site assessment of the Property in general conformance with the scope and limitations of ASTM E 1527-05 "Standard Practice for Environmental Site Assessments" and USEPA "Standards and Practices for All Appropriate Inquires", 40 CFR Part 312. Based on the findings of this assessment, ENGEO provides the following recommendations:

- The operation of the on-site wastewater treatment facility has included the use of chlorine gas to treat effluent water. ENGEO understands a Closure Plan for the plant decommissioning and removal is under development. Environmental characterization, including the testing for trihalomethane compounds should be conducted in accordance with Regional Water Quality Control Board requirements. We understand this work is currently in progress.

- Prior to structure demolition, the property structures should be evaluated for the presence of asbestos-containing building materials (ACBM) and lead-based paints prior to their renovation of demolition. The evaluation should be conducted by a Cal-OSHA Certified ACBM and lead-based paint contractor.

- We recommend materials no longer in use be properly disposed. Batteries located near the barn should be disposed of in accordance with regulatory requirements.

- Empty containers for paint and chlorine should be property disposed.

- Any septic systems and related leach fields located within the Property should be removed in accordance with permitting requirements of Sonoma County, once these are no longer in use. Backfill requirements should conform to recommendations of the Geotechnical Engineer.

- Areas of the Property were not viewed due to the presence of structures or dense vegetation. These areas should be viewed by an environmental professional should the structures or vegetation be removed.

with any questions or comments.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-05) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

TARGET PROPERTY INFORMATION

ADDRESS

50 MARK WEST SPRINGS ROAD
SANTA ROSA, CA 95403

COORDINATES

Latitude (North):	38.494500 - 38˚ 29' 40.2''
Longitude (West):	122.750000 - 122˚ 45' 0.0''
Universal Tranverse Mercator:	Zone 10
UTM X (Meters):	521801.7
UTM Y (Meters):	4260506.0
Elevation:	159 ft. above sea level

TARGET PROPERTY SEARCH RESULTS

The target property was identified in the following records. For more information on this property see page 7 of the attached EDR Radius Map report:

Site	Database(s)	EPA ID
LUTHER BURBANK CENTER 50 MARK WEST SPRINGS RD SANTA ROSA, CA 95401	CA WDS	N/A
LUTHER BURBANK MEMORIAL FOUNDATIO 50 MARK WEST SPRINGS RD SANTA ROSA, CA 95403	HAZNET	N/A

EXECUTIVE SUMMARY

DATABASES WITH NO MAPPED SITES

No mapped sites were found in EDR's search of available ("reasonably ascertainable ") government records either on the target property or within the search radius around the target property for the following databases:

EDR PROPRIETARY RECORDS

EDR Proprietary Records

Manufactured Gas Plants ..... EDR Proprietary Manufactured Gas Plants

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

State- and tribal - equivalent NPL

EXECUTIVE SUMMARY

RESPONSE: Identifies confirmed release sites where DTSC is involved in remediation, either in a lead or oversight capacity. These confirmed release sites are generally high-priority and high potential risk.

A review of the RESPONSE list, as provided by EDR, and dated 02/23/2009 has revealed that there is 1 RESPONSE site within approximately 1 mile of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page
FOUNTAINGROVE PLAZA SITE	***3975 OLD REDWOOD HIGHWA***	***SE 1/2 - 1 (0.755 mi.)***	***22***	***25***

State- and tribal - equivalent CERCLIS

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 02/23/2009 has revealed that there is 1 ENVIROSTOR site within approximately 1 mile of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page
FOUNTAINGROVE PLAZA SITE	***3975 OLD REDWOOD HIGHWA***	***SE 1/2 - 1 (0.755 mi.)***	***22***	***25***
Status: Certified / Operation & Maintenance				

State and tribal leaking storage tank lists

LUST: The Leaking Underground Storage Tank Incident Reports contain an inventory of reported leaking underground storage tank incidents. The data come from the State Water Resources Control Board Leaking Underground Storage Tank Information System.

A review of the LUST list, as provided by EDR, and dated 01/06/2009 has revealed that there are 10 LUST sites within approximately 0.5 miles of the target property.

State and tribal registered storage tank lists

UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the State Water Resources Control Board's Hazardous Substance Storage Container Database.

A review of the UST list, as provided by EDR, and dated 01/06/2009 has revealed that there are 2 UST sites within approximately 0.25 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page

ADDITIONAL ENVIRONMENTAL RECORDS

Local Lists of Hazardous waste / Contaminated Sites

HIST Cal-Sites: Formerly known as ASPIS, this database contains both known and potential hazardous substance sites. The source is the California Department of Toxic Substance Control. No longer updated by the state agency. It has been replaced by ENVIROSTOR.

A review of the HIST Cal-Sites list, as provided by EDR, and dated 08/08/2005 has revealed that there is 1 HIST Cal-Sites site within approximately 1 mile of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page
FOUNTAINGROVE PLAZA SITE	***3975 OLD REDWOOD HIGHWA***	***SE 1/2 - 1 (0.755 mi.)***	***22***	***25***

Local Lists of Registered Storage Tanks

CA FID UST: The Facility Inventory Database contains active and inactive underground storage tank locations. The source is the State Water Resource Control Board.

A review of the CA FID UST list, as provided by EDR, and dated 10/31/1994 has revealed that there are 3 CA FID UST sites within approximately 0.25 miles of the target property.

Site 1 of 2 in cluster A

Actual:
159 ft.

CA WDS:

Facility ID:	North Coastal 82012OSON
Facility Type:	Municipal/Domestic - Facility that treats sewage or a mixture of predominantly sewage and other waste from districts, municipalities, communities, hospitals, schools, and publicly or privately owned systems (excluding individual subsurface leaching systems disposing of less than 1,000 gallons per day).
Facility Status:	Active - Any facility with a continuous or seasonal discharge that is under Waste Discharge Requirements.
NPDES Number:	Not reported
Subregion:	1
Facility Telephone:	Not reported
Facility Contact:	MARK MORRISETTE
Agency Name:	LUTHER BURBANK CENTER
Agency Address:	50 MARK WEST SPRINGS RD
Agency City,St,Zip:	SANTA ROSA 95403
Agency Contact:	DAN BARR
Agency Telephone:	Not reported
Agency Type:	Private
SIC Code:	8641
SIC Code 2:	Not reported
Primary Waste:	Domestic Sewage
Primary Waste Type:	Designated/Influent or Solid Wastes that pose a significant threat to water quality because of their high concentrations (E.G., BOD, Hardness, TRF, Chloride). 'Manageable' hazardous wastes (E.G., inorganic salts and heavy metals) are included in this category.
Secondary Waste:	Not reported
Secondary Waste Type:	Not reported
Design Flow:	0
Baseline Flow:	0
Reclamation:	Producer-User: Reclamation requirements that have been issued to a producer of reclaimed water who also uses the product.
POTW:	The facility is not a POTW.
Treat To Water:	Moderate Threat to Water Quality. A violation could have a major adverse impact on receiving biota, can cause aesthetic impairment to a significant human population, or render unusable a potential domestic or municipal water supply. Awsthetic impairment would include nuisance from a waste treatment facility.
Complexity:	Category B - Any facility having a physical, chemical, or biological waste treatment system (except for septic systems with subsurface disposal), or any Class II or III disposal site, or facilities without treatment systems that are complex, such as marinas with petroleum products, solid wastes, and sewage pump out facilities.

Comments:	Approved 5 Year Review.Approved PEA documenting PCE contamination.Approved Public Participation Plan.Report approved with modifications and requirements for subsequent reports.Report accepted, SCS will submit proposal for repair/replacement of damaged well.DTSC reviewed the responses to our comments sent via email by G. Suemnicht and determined that they addressed our comments.Report approved with modifications.Workplan for inspecting wells noted as being damaged approved for implementation with modifications.Workplan to repair damaged wells is being implemented. All wells except one should be available for sounding as part of September sounding event.Report includes the information required in a monthly report. However, the groundwater extraction system has not yet been restarted.Insufficient information and analysis has been submitted to support the document's conclusion that the Site has achieved asymptotic levels. The groundwater extraction system has not

FOUNTAINGROVE PLAZA SITE (Continued) **S102564485**

operated continuously over the past year within the operating paraApproved Implementation Report. Approximately 3 to 6 gallons per minute of groundwater removed fom the extraction trench and disposed to the sanitary sewer under permit from the City.Approved RAP requiring installation of groundwater extraction from a trench and direct discharge to sanitary sewer under a permit from the City of Santa Rosa.Signed Expedited Remedial Action Enforceable Agreement with Fountaingrove Plaza Associates.Plan concluded an Allocation of Liability allocating 26 to Fountaingrove Plaza and 74 to Orphan Share.Signed O&M Agreement with Fountaingrove Plaza Associates for operation, maintenance and monitoring of the groundwater extraction system.Three comments sent via email. 1. Table 2, Cumulative Groundwater Treatment System Results. Subsequent reports including this table should include the restart date for the groundwater extraction and treatment system in the notes for 10/27/2006.The groundwater elevation in Table 1A for MW-24 is correct (139.34 feet MSL). This groundwater elevation was usd to determine the isopleths and flow directions on Figure 3. SCS staff indicated that the groundwater elevation for MW-24 shown on FiguInvestigation found the TCE plume was contained on-site. TCE found in shallow groundwater at concentrations up to 1300 parts per billion (ug/L).Site Screening noted VOCs problem.Report submitted late. Comment letter combined with comments on other documents. Report indicates that required capture zone has not been achieved.Report submitted late. Comment letter combined with comments on other documents. Report indicates that required capture zone has not been achieved.Report approved with requirements for subsequent reportsComments to be addressed in subsequent reports.Report reviewed. No significant comments.Installation of an additional monitoring well approved. Work Plan approved with modifications and comments.Report approved with modifications. Work Plan to achieve required capture zone was required on 12/5/2006.DTSC received notification that project manager for SCS Engineers changed from Gene Suemnicht, CEG, to Karin Fresnel, CEG #2264.Consultant notified on 3/13 via email that sampling event would occur on 3/15/07.Designated for ERAP pilot project.2. Figure 3, Site Plan with Groundwater Elevation Contours for April 2007. The capture zone for the groundwater extraction trench is required on this figure. I am going to need a revised figure showing this in next month’s monthly report. 3.re 4 is a typographical error that was not caught during internal QA/QC.meters outlined in the RAP. Therefore, recommendations not approved.It looks like SCS is consistently conducting the sounding events in the middle of the month. Therefore, would it make sense to revise the existing requirement to require sounding in the middle of the month instead of during the first full week of the month?

Alternate Address:	3975 OLD REDWOOD HIGHWAY
Alternate City,St,Zip:	SANTA ROSA, CA 95403
Background Info:	The site consists of approximately 9 acres of flat vacant land and located on the outskirts of the City of Santa Rosa. Based on a review of historical records, it was determined that a gasoline service station operated at the site from at least the 1950's - 1964. Stevenson Equipment Company, Inc. owned the property from 1962 - 1986. Stevenson Equipment was in the business of repairing heavy equipment and selling new equipment and is no longer in business.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 02/02/2009

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Federal Delisted NPL site list

DELISTED NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Federal CERCLIS list

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Data Release Frequency: Quarterly

Federal CERCLIS NFRAP site List

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned

Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Transporters, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

Data Release Frequency: Quarterly

State- and tribal - equivalent CERCLIS

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Included in the listing are brownfields properties addresses by Cooperative Agreement Recipients and brownfields properties addressed by Targeted Brownfields Assessments. Targeted Brownfields Assessments-EPA's Targeted Brownfields Assessments (TBA) program is designed to help states, tribes, and municipalities--especially those without EPA Brownfields Assessment Demonstration Pilots--minimize the uncertainties of contamination often associated with brownfields. Under the TBA program, EPA provides funding and/or technical assistance for environmental assessments at brownfields sites throughout the country. Targeted Brownfields Assessments supplement and work with other efforts under EPA's Brownfields Initiative to promote cleanup and redevelopment of brownfields. Cooperative Agreement Recipients-States, political subdivisions, territories, and Indian tribes become Brownfields Cleanup Revolving Loan Fund (BCRLF) cooperative agreement recipients when they enter into BCRLF cooperative agreements with the U.S. EPA. EPA selects BCRLF cooperative agreement recipients based on a proposal and application process. BCRLF cooperative agreement recipients must use EPA funds provided through BCRLF cooperative agreement for specified brownfields-related cleanup activities.

Local Lists of Hazardous waste / Contaminated Sites

CDL: Clandestine Drug Labs
A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

Other Ascertainable Records

RCRA-NonGen: RCRA - Non Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

Date of Government Version: 11/12/2008

Data Release Frequency: Annually

UMTRA: Uranium Mill Tailings Sites
Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006

Data Release Frequency: Quarterly

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method.

EDR PROPRIETARY RECORDS

EDR Proprietary Records

Manufactured Gas Plants: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association’s annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on private school locations in the United States.

Daycare Centers: Licensed Facilities
Source: Department of Social Services
Telephone: 916-657-4041

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 1999 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 and 2005 from the U.S. Fish and Wildlife Service.

Scanned Digital USGS 7.5' Topographic Map (DRG)
Source: United States Geologic Survey
A digital raster graphic (DRG) is a scanned image of a U.S. Geological Survey topographic map. The map images are made by scanning published paper maps on high-resolution scanners. The raster image is georeferenced and fit to the Universal Transverse Mercator (UTM) projection.

EDR’s GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

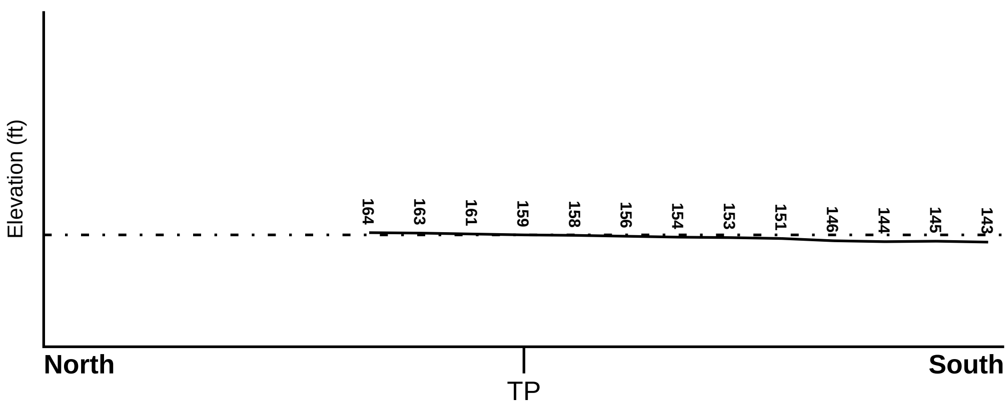
TOPOGRAPHIC INFORMATION

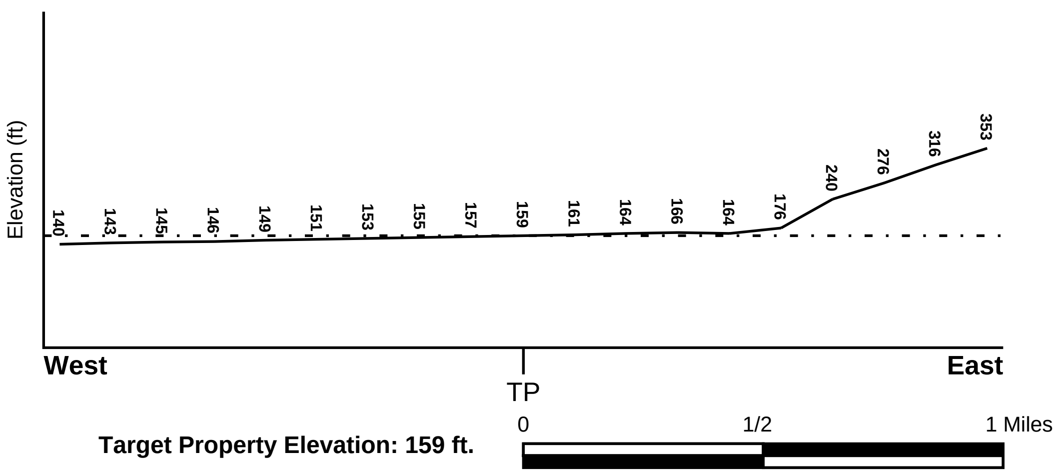
Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General SW

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES





Target Property Elevation: 159 ft.

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
SANTA ROSA	Not Available

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius: 1.25 miles
Status: Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
B3	1/8 - 1/4 Mile North	Not Reported
B4	1/8 - 1/4 Mile North	NNE
B5	1/8 - 1/4 Mile North	Varies
B6	1/8 - 1/4 Mile NNE	NNE
8	1/4 - 1/2 Mile NNW	SW
9	1/2 - 1 Mile NNW	Varies

For additional site information, refer to Physical Setting Source Map Findings.

* ©1996 Site−specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: YOLO

Soil Surface Texture: silt loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

Hydric Status: Unknown

Corrosion Potential - Uncoated Steel: Low

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		Soil Reaction (pH)
1	0 inches	7 inches	silt loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 14 Min: 4	Max: 8.4 Min: 6.1
2	7 inches	59 inches	silt loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 14 Min: 4	Max: 8.4 Min: 6.1

Soil Map ID: 2

Soil Component Name: YOLO

Soil Surface Texture: clay loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Low

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	7 inches	clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 14 Min: 4	Max: 8.4 Min: 6.1
2	7 inches	59 inches	loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 14 Min: 4	Max: 8.4 Min: 6.1

Soil Map ID: 3

Soil Component Name: CORTINA

Soil Surface Texture: very gravelly sandy loam

Hydrologic Group: Class A - High infiltration rates. Soils are deep, well drained to excessively drained sands and gravels.

Soil Drainage Class: Somewhat excessively drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Moderate

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	7 inches	very gravelly sandy loam	Granular materials (35 pct. or less passing No. 200), Stone Fragments, Gravel and Sand.	COARSE-GRAINED SOILS, Gravels, Gravels with fines, Silty Gravel	Max: 42 Min: 14	Max: 7.3 Min: 5.6
2	7 inches	59 inches	stratified very gravelly loamy sand to very gravelly loam	Granular materials (35 pct. or less passing No. 200), Stone Fragments, Gravel and Sand.	COARSE-GRAINED SOILS, Gravels, Gravels with fines, Silty Gravel	Max: 42 Min: 14	Max: 7.3 Min: 5.6

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Scanned Digital USGS 7.5' Topographic Map (DRG)
Source: United States Geologic Survey
A digital raster graphic (DRG) is a scanned image of a U.S. Geological Survey topographic map. The map images are made by scanning published paper maps on high-resolution scanners. The raster image is georeferenced and fit to the Universal Transverse Mercator (UTM) projection.

HYDROLOGIC INFORMATION

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 1999 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 and 2005 from the U.S. Fish and Wildlife Service.

HYDROGEOLOGIC INFORMATION

AQUIFLOW^R Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Services, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

STATE RECORDS

Water Well Database
Source: Department of Water Resources
Telephone: 916-651-9648

California Drinking Water Quality Database
Source: Department of Health Services
Telephone: 916-324-2319
The database includes all drinking water compliance and special studies monitoring for the state of California since 1984. It consists of over 3,200,000 individual analyses along with well and water system information.

OTHER STATE DATABASE INFORMATION

California Oil and Gas Well Locations
Source: Department of Conservation
Telephone: 916-323-1779

RADON

State Database: CA Radon
Source: Department of Health Services
Telephone: 916-324-2208
Radon Database for California

Area Radon Information
Source: USGS
Telephone: 703-356-4020
The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

EPA Radon Zones
Source: EPA
Telephone: 703-356-4020
Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

OTHER

Airport Landing Facilities: Private and public use landing facilities
Source: Federal Aviation Administration, 800-457-6656

Epicenters: World earthquake epicenters, Richter 5 or greater
Source: Department of Commerce, National Oceanic and Atmospheric Administration

California Earthquake Fault Lines: The fault lines displayed on EDR's Topographic map are digitized quaternary fault lines, prepared in 1975 by the United State Geological Survey. Additional information (also from 1975) regarding activity at specific fault lines comes from California's Preliminary Fault Activity Map prepared by the California Division of Mines and Geology.

TABLE OF CONTENTS

The EDR-Site Report™ is a comprehensive presentation of government filings on a facility identified in a search of federal, state and local environmental databases. The report is divided into three sections:

Section 1: Facility Summary . . . . Page 3

Summary of facility filings including a review of the following areas: waste management, waste disposal, multi-media issues, and Superfund liability.

Section 2: Facility Detail Reports . . . . Page 4

All available detailed information from databases where sites are identified.

Section 3: Databases and Update Information. . . . . Page 5

Name, source, update dates, contact phone number and description of each of the databases for this report.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

SECTION 1: FACILITY SUMMARY

FACILITY AREA	FACILITY 1 **LOS GUILICOS** HWY 12 / PYTHIAN RD SANTA ROSA, CA EDR ID #S106235093
WASTE MANAGEMENT Facility generates hazardous waste (RCRA)	NO
Facility treats, stores, or disposes of hazardous waste on-site (RCRA/TSDF)	NO
Facility has received Notices of Violations (RCRA/VIOL)	NO
Facility has been subject to RCRA administrative actions (RAATS)	NO
Facility has been subject to corrective actions (CORRACTS)	NO
Facility handles PCBs (PADS)	NO
Facility uses radioactive materials (MLTS)	NO
Facility manages registered aboveground storage tanks (AST)	NO
Facility manages registered underground storage tanks (UST)	NO
Facility has reported leaking underground storage tank incidents (LUST)	NO
Facility has reported emergency releases to the soil (ERNS)	NO
Facility has reported hazardous material incidents to DOT (HMIRS)	NO
WASTE DISPOSAL Facility is a Superfund Site (NPL)	NO
Facility has a known or suspect abandoned, inactive or uncontrolled hazardous waste site (CERCLIS)	NO
Facility has a reported Superfund Lien on it (LIENS)	NO
Facility is listed as a state hazardous waste site (SHWS)	NO
Facility has disposed of solid waste on-site (SWF/LF)	NO
MULTIMEDIA Facility uses toxic chemicals and has notified EPA under SARA Title III, Section 313 (TRIS)	NO
Facility produces pesticides and has notified EPA under Section 7 of FIFRA (SSTS)	NO
Facility manufactures or imports toxic chemicals on the TSCA list (TSCA)	NO
Facility has inspections under FIFRA, TSCA or EPCRA (FTTS)	NO
Facility is listed in EPA's index system (FINDS)	NO
Facility is listed in a county/local unique database (LOCAL)	**YES - p4**
POTENTIAL SUPERFUND LIABILITY Facility has a list of potentially responsible parties PRP	NO
TOTAL (YES)	1

SECTION 2: FACILITY DETAIL REPORTS

TABLE OF CONTENTS

The EDR-Site Report™ is a comprehensive presentation of government filings on a facility identified in a search of federal, state and local environmental databases. The report is divided into three sections:

Section 1: Facility Summary . . . . Page 3

Summary of facility filings including a review of the following areas: waste management, waste disposal, multi-media issues, and Superfund liability.

Section 2: Facility Detail Reports . . . . Page 4

All available detailed information from databases where sites are identified.

Section 3: Databases and Update Information. . . . . Page 5

Name, source, update dates, contact phone number and description of each of the databases for this report.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

SECTION 1: FACILITY SUMMARY

FACILITY AREA	**FACILITY 1** **MISSION ARBORS** MISSION BLVD AT HIGHWAY 12 100 SANTA ROSA, CA EDR ID #S104857240
WASTE MANAGEMENT Facility generates hazardous waste (RCRA)	NO
Facility treats, stores, or disposes of hazardous waste on-site (RCRA/TSDF)	NO
Facility has received Notices of Violations (RCRA/VIOL)	NO
Facility has been subject to RCRA administrative actions (RAATS)	NO
Facility has been subject to corrective actions (CORRACTS)	NO
Facility handles PCBs (PADS)	NO
Facility uses radioactive materials (MLTS)	NO
Facility manages registered aboveground storage tanks (AST)	NO
Facility manages registered underground storage tanks (UST)	NO
Facility has reported leaking underground storage tank incidents (LUST)	**YES - p4**
Facility has reported emergency releases to the soil (ERNS)	NO
Facility has reported hazardous material incidents to DOT (HMIRS)	NO
WASTE DISPOSAL Facility is a Superfund Site (NPL)	NO
Facility has a known or suspect abandoned, inactive or uncontrolled hazardous waste site (CERCLIS)	NO
Facility has a reported Superfund Lien on it (LIENS)	NO
Facility is listed as a state hazardous waste site (SHWS)	NO
Facility has disposed of solid waste on-site (SWF/LF)	NO
MULTIMEDIA Facility uses toxic chemicals and has notified EPA under SARA Title III, Section 313 (TRIS)	NO
Facility produces pesticides and has notified EPA under Section 7 of FIFRA (SSTS)	NO
Facility manufactures or imports toxic chemicals on the TSCA list (TSCA)	NO
Facility has inspections under FIFRA, TSCA or EPCRA (FTTS)	NO
Facility is listed in EPA's index system (FINDS)	NO
Facility is listed in a county/local unique database (LOCAL)	NO
POTENTIAL SUPERFUND LIABILITY Facility has a list of potentially responsible parties PRP	NO
TOTAL (YES)	1

SECTION 2: FACILITY DETAIL REPORTS

Facility uses radioactive materials (MLTS)	NO
Facility manages registered aboveground storage tanks (AST)	NO
Facility manages registered underground storage tanks (UST)	NO
Facility has reported leaking underground storage tank incidents (LUST)	**YES - p4**
Facility has reported emergency releases to the soil (ERNS)	NO
Facility has reported hazardous material incidents to DOT (HMIRS)	NO
WASTE DISPOSAL Facility is a Superfund Site (NPL)	NO
Facility has a known or suspect abandoned, inactive or uncontrolled hazardous waste site (CERCLIS)	NO
Facility has a reported Superfund Lien on it (LIENS)	NO
Facility is listed as a state hazardous waste site (SHWS)	NO
Facility has disposed of solid waste on-site (SWF/LF)	NO
MULTIMEDIA Facility uses toxic chemicals and has notified EPA under SARA Title III, Section 313 (TRIS)	NO
Facility produces pesticides and has notified EPA under Section 7 of FIFRA (SSTS)	NO
Facility manufactures or imports toxic chemicals on the TSCA list (TSCA)	NO
Facility has inspections under FIFRA, TSCA or EPCRA (FTTS)	NO
Facility is listed in EPA's index system (FINDS)	NO
Facility is listed in a county/local unique database (LOCAL)	NO
POTENTIAL SUPERFUND LIABILITY Facility has a list of potentially responsible parties PRP	NO
TOTAL (YES)	1

TABLE OF CONTENTS

The EDR-Site Report™ is a comprehensive presentation of government filings on a facility identified in a search of federal, state and local environmental databases. The report is divided into three sections:

Section 1: Facility Summary . . . . Page 3

Summary of facility filings including a review of the following areas: waste management, waste disposal, multi-media issues, and Superfund liability.

Section 2: Facility Detail Reports . . . . Page 4

All available detailed information from databases where sites are identified.

Section 3: Databases and Update Information. . . . . Page 5

Name, source, update dates, contact phone number and description of each of the databases for this report.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

SECTION 1: FACILITY SUMMARY

FACILITY AREA	FACILITY 1 **FAST & EASY MART** REDWOOD HIGHWAY, OLD 5321 SANTA ROSA, CA EDR ID #S102429807
WASTE MANAGEMENT Facility generates hazardous waste (RCRA)	NO
Facility treats, stores, or disposes of hazardous waste on-site (RCRA/TSDF)	NO
Facility has received Notices of Violations (RCRA/VIOL)	NO
Facility has been subject to RCRA administrative actions (RAATS)	NO
Facility has been subject to corrective actions (CORRACTS)	NO
Facility handles PCBs (PADS)	NO
Facility uses radioactive materials (MLTS)	NO
Facility manages registered aboveground storage tanks (AST)	NO
Facility manages registered underground storage tanks (UST)	NO
Facility has reported leaking underground storage tank incidents (LUST)	**YES - p4**
Facility has reported emergency releases to the soil (ERNS)	NO
Facility has reported hazardous material incidents to DOT (HMIRS)	NO

TABLE OF CONTENTS

The EDR-Site Report™ is a comprehensive presentation of government filings on a facility identified in a search of federal, state and local environmental databases. The report is divided into three sections:

Section 1: Facility Summary . . . . Page 3

Summary of facility filings including a review of the following areas: waste management, waste disposal, multi-media issues, and Superfund liability.

Section 2: Facility Detail Reports . . . . Page 4

All available detailed information from databases where sites are identified.

Section 3: Databases and Update Information. . . . . Page 5

Name, source, update dates, contact phone number and description of each of the databases for this report.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

SECTION 1: FACILITY SUMMARY

FACILITY AREA	FACILITY 1 **STEVENSON EQUIPMENT** REDWOOD HIGHWAY, OLD 3975 SANTA ROSA, CA EDR ID #S104163195
WASTE MANAGEMENT Facility generates hazardous waste (RCRA)	NO
Facility treats, stores, or disposes of hazardous waste on-site (RCRA/TSDF)	NO
Facility has received Notices of Violations (RCRA/VIOL)	NO
Facility has been subject to RCRA administrative actions (RAATS)	NO
Facility has been subject to corrective actions (CORRACTS)	NO
Facility handles PCBs (PADS)	NO
Facility uses radioactive materials (MLTS)	NO
Facility manages registered aboveground storage tanks (AST)	NO
Facility manages registered underground storage tanks (UST)	NO
Facility has reported leaking underground storage tank incidents (LUST)	**YES - p4**
Facility has reported emergency releases to the soil (ERNS)	NO
Facility has reported hazardous material incidents to DOT (HMIRS)	NO
WASTE DISPOSAL Facility is a Superfund Site (NPL)	NO
Facility has a known or suspect abandoned, inactive or uncontrolled hazardous waste site (CERCLIS)	NO
Facility has a reported Superfund Lien on it (LIENS)	NO
Facility is listed as a state hazardous waste site (SHWS)	NO
Facility has disposed of solid waste on-site (SWF/LF)	NO
MULTIMEDIA Facility uses toxic chemicals and has notified EPA under SARA Title III, Section 313 (TRIS)	NO
Facility produces pesticides and has notified EPA under Section 7 of FIFRA (SSTS)	NO
Facility manufactures or imports toxic chemicals on the TSCA list (TSCA)	NO
Facility has inspections under FIFRA, TSCA or EPCRA (FTTS)	NO
Facility is listed in EPA's index system (FINDS)	NO
Facility is listed in a county/local unique database (LOCAL)	NO
POTENTIAL SUPERFUND LIABILITY Facility has a list of potentially responsible parties PRP	NO
TOTAL (YES)	1

DATABASES FOUND IN THIS REPORT

CA HAZNET: Facility and Manifest Data
Source: California Environmental Protection Agency
Telephone: 916-255-1136
Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method.

SONOMA 101 HIGHWAY WIDENING
ROUTE 101
SANTA ROSA, CA 95403
EDR ID #1009398328

RCRA-LQG:

Date form received by agency:	04/28/2006
Facility name:	SONOMA 101 HIGHWAY WIDENING
Facility address:	ROUTE 101 STEEL LN UC TO BICENTENNIAL OC SANTA ROSA, CA 95403
EPA ID:	CAR000173278
Mailing address:	111 GRAND AVE 12TH FLOOR CALTRANS CONSTRUCTION OAKLAND, CA 94612
Contact:	JILL K POLLOCK
Contact address:	111 GRAND AVE 12TH FLOOR CALTRANS CONSTRUCTION OAKLAND, CA 94612
Contact country:	US
Contact telephone:	510-622-8750
Contact email:	JILL_POLLOCK@DOT.CA.GOV
EPA Region:	09
Classification:	Large Quantity Generator
Description:	Handler: generates 1,000 kg or more of hazardous waste during any calendar month; or generates more than 1 kg of acutely hazardous waste during any calendar month; or generates more than 100 kg of any residue or contaminated soil, waste or other debris resulting from the cleanup of a spill, into or on any land or water, of acutely hazardous waste during any calendar month; or generates 1 kg or less of acutely hazardous waste during any calendar month, and accumulates more than 1 kg of acutely hazardous waste at any time; or generates 100 kg or less of any residue or contaminated soil, waste or other debris resulting from the cleanup of a spill, into or on any land or water, of acutely hazardous waste during any calendar month, and accumulates more than 100 kg of that material at any time

Owner/Operator Summary:

Owner/operator name:	CALTRANS
Owner/operator address:	111 GRAND AVE 12TH FLOOR OAKLAND, CA 94612
Owner/operator country:	US
Owner/operator telephone:	Not reported
Legal status:	State
Owner/Operator Type:	Owner
Owner/Op start date:	01/01/1950
Owner/Op end date:	Not reported
Owner/operator name:	DALE LEGALLEE RE
Owner/operator address:	Not reported Not reported
Owner/operator country:	US
Owner/operator telephone:	Not reported
Legal status:	State
Owner/Operator Type:	Operator
Owner/Op start date:	11/02/2005
Owner/Op end date:	Not reported

Handler Activities Summary:

U.S. importer of hazardous waste:	No
Mixed waste (haz. and radioactive):	No
Recycler of hazardous waste:	No
Transporter of hazardous waste:	No
Treater, storer or disposer of HW:	No
Underground injection activity:	No
On-site burner exemption:	No
Furnace exemption:	No
Used oil fuel burner:	No
Used oil processor:	No
User oil refiner:	No
Used oil fuel marketer to burner:	No
Used oil Specification marketer:	No
Used oil transfer facility:	No
Used oil transporter:	No
Off-site waste receiver:	Commercial status unknown

Hazardous Waste Summary:

Waste code:	D008
Waste name:	LEAD
Violation Status:	No violations found

SECTION 3: DATABASES AND UPDATE DATES

To maintain currency of the following federal, state and local databases, EDR contacts the appropriate government agency on a monthly or quarterly basis as required.

Elapsed ASTM days: Provides confirmation that this report meets or exceeds the 90-day updating requirement of the ASTM standard.

DATABASES FOUND IN THIS REPORT

RCRA-LQG: RCRA - Large Quantity Generators
Source: Environmental Protection Agency
Telephone: 703-308-0035
RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

TABLE OF CONTENTS

The EDR-Site Report™ is a comprehensive presentation of government filings on a facility identified in a search of federal, state and local environmental databases. The report is divided into three sections:

Section 1: Facility Summary . . . . Page 3

Summary of facility filings including a review of the following areas: waste management, waste disposal, multi-media issues, and Superfund liability.

Section 2: Facility Detail Reports . . . . Page 4

All available detailed information from databases where sites are identified.

Section 3: Databases and Update Information. . . . . Page 5

Name, source, update dates, contact phone number and description of each of the databases for this report.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

SECTION 1: FACILITY SUMMARY

FACILITY AREA	**FACILITY 1** **SANTA ROSA COMMUNITY DEVELOPMENT SW ARE** LUDWIG ROAD/WRIGHT ROAD/HIGHWAY 12 / 101 SANTA ROSA, CA 0 EDR ID #S105051171
WASTE MANAGEMENT Facility generates hazardous waste (RCRA)	NO
Facility treats, stores, or disposes of hazardous waste on-site (RCRA/TSDF)	NO
Facility has received Notices of Violations (RCRA/VIOL)	NO
Facility has been subject to RCRA administrative actions (RAATS)	NO
Facility has been subject to corrective actions (CORRACTS)	NO
Facility handles PCBs (PADS)	NO
Facility uses radioactive materials (MLTS)	NO
Facility manages registered aboveground storage tanks (AST)	NO
Facility manages registered underground storage tanks (UST)	NO
Facility has reported leaking underground storage tank incidents (LUST)	NO
Facility has reported emergency releases to the soil (ERNS)	NO
Facility has reported hazardous material incidents to DOT (HMIRS)	NO
WASTE DISPOSAL Facility is a Superfund Site (NPL)	NO
Facility has a known or suspect abandoned, inactive or uncontrolled hazardous waste site (CERCLIS)	NO
Facility has a reported Superfund Lien on it (LIENS)	NO
Facility is listed as a state hazardous waste site (SHWS)	NO
Facility has disposed of solid waste on-site (SWF/LF)	NO

TABLE OF CONTENTS

The EDR-Site Report™ is a comprehensive presentation of government filings on a facility identified in a search of federal, state and local environmental databases. The report is divided into three sections:

Section 1: Facility Summary . . . . Page 3

Summary of facility filings including a review of the following areas: waste management, waste disposal, multi-media issues, and Superfund liability.

Section 2: Facility Detail Reports . . . . Page 4

All available detailed information from databases where sites are identified.

Section 3: Databases and Update Information. . . . . Page 5

Name, source, update dates, contact phone number and description of each of the databases for this report.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

SECTION 1: FACILITY SUMMARY

AREA	FACILITY 1 **UNITY CHURCH** 4351 REDWOOD HIGHWAY, OLD SANTA ROSA, CA 95403 EDR ID #S105051009
WASTE MANAGEMENT Facility generates hazardous waste (RCRA)	NO
Facility treats, stores, or disposes of hazardous waste on-site (RCRA/TSDF)	NO
Facility has received Notices of Violations (RCRA/VIOL)	NO
Facility has been subject to RCRA administrative actions (RAATS)	NO
Facility has been subject to corrective actions (CORRACTS)	NO
Facility handles PCBs (PADS)	NO
Facility uses radioactive materials (MLTS)	NO
Facility manages registered aboveground storage tanks (AST)	NO
Facility manages registered underground storage tanks (UST)	NO
Facility has reported leaking underground storage tank incidents (LUST)	NO
Facility has reported emergency releases to the soil (ERNS)	NO
Facility has reported hazardous material incidents to DOT (HMIRS)	NO
WASTE DISPOSAL Facility is a Superfund Site (NPL)	NO
Facility has a known or suspect abandoned, inactive or uncontrolled hazardous waste site (CERCLIS)	NO
Facility has a reported Superfund Lien on it (LIENS)	NO
Facility is listed as a state hazardous waste site (SHWS)	NO
Facility has disposed of solid waste on-site (SWF/LF)	NO
MULTIMEDIA Facility uses toxic chemicals and has notified EPA under SARA Title III, Section 313 (TRIS)	NO
Facility produces pesticides and has notified EPA under Section 7 of FIFRA (SSTS)	NO
Facility manufactures or imports toxic chemicals on the TSCA list (TSCA)	NO
Facility has inspections under FIFRA, TSCA or EPCRA (FTTS)	NO
Facility is listed in EPA's index system (FINDS)	NO
Facility is listed in a county/local unique database (LOCAL)	**YES - p4**
POTENTIAL SUPERFUND LIABILITY Facility has a list of potentially responsible parties PRP	NO
TOTAL (YES)	1

UNMAPPED PROPERTY

This report certifies that the complete holdings of the Sanborn Library, LLC collection have been searched based on client supplied target property information, and fire insurance maps covering the target property were not found.

The Sanborn Library includes more than 1.2 million Sanborn fire insurance maps, which track historical property usage in approximately 12,000 American cities and towns. Collections searched:

- ✔ Library of Congress
- ✔ University Publications of America
- ✔ EDR Private Collection

Limited Permission To Make Copies

Engeo Inc. (the client) is permitted to make up to THREE photocopies of this Sanborn Map transmittal and each fire insurance map accompanying this report solely for the limited use of its customer. No one other than the client is authorized to make copies. Upon request made directly to an EDR Account Executive, the client may be permitted to make a limited number of additional photocopies. This permission is conditioned upon compliance by the client, its customer and their agents with EDR's copyright policy; a copy of which is available upon request.

EDR Aerial Photo Decade Package

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDRs professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

When delivered electronically by EDR, the aerial photo images included with this report are for ONE TIME USE ONLY. Further reproduction of these aerial photo images is prohibited without permission from EDR. For more information contact your EDR Account Executive.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

2009 Enhancements to EDR City Directory Abstract

New for 2009, the EDR City Directory Abstract has been enhanced with additional information and features. These enhancements will make your city directory research process more efficient, flexible, and insightful than ever before. The enhancements will improve the options for selecting adjoining properties, and will speed up your review of the report.

City Directory Report. Three important enhancements have been made to the EDR City Directory Abstract:

1. *Executive Summary.* The report begins with an Executive Summary that lists the sources consulted in the preparation of the report. Where available, a parcel map is also provided within the report, showing the locations of properties researched.

2. *Page Images.* Where available, the actual page source images will be included in the Appendix, so that you can review them for information that may provide additional insight. EDR has copyright permission to include these images.

3. *Findings Listed by Location.* Another useful enhancement is that findings are now grouped by address. This will significantly reduce the time you need to review your abstracts. Findings are provided under each property address, listed in reverse chronological order and referencing the source for each entry.

Options for Selecting Adjoining Properties. Ensuring that the right adjoining property addresses are searched is one of the biggest challenges that environmental professionals face when conducting city directory historical research. EDR's new enhancements make it easier for you to meet this challenge. Now, when you place an order for the EDR City Directory Abstract, you have the following choices for determining which addresses should be researched.

1. *You Select Addresses and EDR Selects Addresses.* Use the "Add Another Address" feature to specify the addresses you want researched. Your selections will be supplemented by addresses selected by EDR researchers using our established research methods. Where available, a digital map will be shown, indicating property lines overlaid on a color aerial photo and their corresponding addresses. Simply use the address list below the map to check off which properties shown on the map you want to include. You may also select other addresses using the "Add Another Address" feature at the bottom of the list.

2. *EDR Selects Addresses.* Choose this method if you want EDR's researchers to select the addresses to be researched for you, using our established research methods.

3. *You Select Addresses.* Use this method for research based solely on the addresses you select or enter into the system.

4. *Hold City Directory Research Option.* If you choose to select your own adjoining addresses, you may pause production of your EDR City Directory Abstract report until you have had a chance to look at your other EDR reports and sources. Sources for property addresses include: your Certified Sanborn Map Report may show you the location of property addresses; the new EDR Property Tax Map Report may show the location of property addresses; and your field research can supplement these sources with additional address information. To use this capability, simply click "Hold City Directory research" box under "Other Options" at the bottom of the page. Once you have determined what addresses you want researched, go to your EDR Order Status page, select the EDR City Directory Abstract, and enter the addresses and submit for production.

Questions? Contact your EDR representative at 800-352-0050. For more information about all of EDR's 2009 report and service enhancements, visit www.edrnet.com/2009enhancements

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1930 through 2006. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 1320 feet of the target property.

A summary of the information obtained is provided in the text of this report.

RESEARCH SUMMARY

The following research sources were consulted in the preparation of this report. An "X" indicates where information was identified in the source and provided in this report.

ENVIRONMENTAL SITE ASSESSMENT QUESTIONNAIRE FOR CLIENT

To evaluate the potential for possible environmentally related impacts and site contamination the following information is requested. This questionnaire is to be completed by the user of the phase one environmental site assessment, or their authorized representative.

PART I

1. Property address and Assessor's Parcel Number (APN):

50 Mark West Springs Rd.
Santa Rosa, CA 95403

APN 058-040-060
APN 058-040-061

2. Current property owner (name, address, voice/fax number):

Luther Burbank Memorial Foundation
Contact: Marc Hagenlocher
Same address as above.
707.527.7006 #118

3. Date current property owner assumed title of property:

12/21/1982

4. Current property development/improvements:

No changes to outside physical building structure or grounds. Maintenance only.

5. Past property use, development/improvements:

Built as a church (in phases) between 1973- 1977. See PRMD for detailed record of development.

ENGEO
Expect Excellence

6. Neighboring property uses:

Strip Mall, LC property, residences.

PART II

1. Are you aware of any environmental cleanup liens against the *property* that are filed under federal, tribal, local or state law? ☐ Yes X No

2. Are you aware of any activity and land use limitations, such as engineering controls, land use restrictions, or institutional controls that are in place at the property and/or have been filed or recorded in a registry under federal, tribal, state or local law? Outlined in our use permit issued by the County circa 1985. X Yes ☐ No

3. Do you have any specialized knowledge or experience related to the *property* or nearby properties? For example are you involved in the same line of business as the current or former occupants of the *property* or an adjoining property so that you would have specialized knowledge of the chemicals and processes used by this type of business? For purpose of this exercise, yes X Yes ☐ No

4. If a property transaction is occurring in conjunction with this environmental assessment, does the purchase price of this *property* reasonably reflect the fair market value of the *property*? If you conclude that there is a difference, have you considered whether the lower purchase price is because contamination is known or believed to be present at the *property?* X Yes ☐ No

5. Are you aware of any commonly known or reasonably ascertainable information about the property that would help the environmental professional to identify conditions indicative of releases or threatened releases? For example, X Yes ☐ No

   (a) do you know of specific chemicals that are present or once were present at the *property*? Liquid chlorine used for waste water treatment plant.
   (b) do you know of spills or other chemical releases that have taken place at the *property*? No
   (c) do you know of any environmental cleanups that have taken place at the *property*? No

6. Based on your knowledge and experience related to the *property* are there any obvious indicators that point to the presence or likely presence of contamination at the *property*? ☐ Yes x No

If a "Yes" response was provided to any of the above questions, please provide details below:

See Above

I certify that the information herein is true and correct to the best of my knowledge as of the date signed below.

ENVIRONMENTAL SITE ASSESSMENT QUESTIONNAIRE FOR "KEY SITE MANAGER"

To evaluate the potential for possible environmentally related impacts and site contamination the following information is requested. This questionnaire is to be preferably completed by the current property owner, or owner representative, leasing agent, or other person having good knowledge of the uses and physical characteristics of the property (Key Site Manager).

PART I

1. Property Address/Location and Assessor's Parcel Number (APN):

50 Mark West Springs Rd.
Santa Rosa, CA 95403

APN 058-040-060
APN 058-040-061

2. Current property owner (name, address, voice/fax number):

Luther Burbank Memorial Foundation
Contact: Marc Hagenlocher
Same address as above.
707.527.7006 #118

3. Date current property owner assumed title of property:

12/21/1982

4. Current property development/improvements:

No changes to outside physical building structure or grounds. Maintenance only.

5. Past property use, development/improvements:

Built as a church (in phases) between 1973- 1977. See PRMD for detailed record of development.

6. Neighboring property uses:
Strip Mall, LC property, residences, and open space.

PART II - The following questions should be answered to the best of your knowledge.

	Question	Yes	No
1.	Is/has the *property* or any adjoining property used/been used for industrial purposes?	☐	X
2.	Has the *property* or any adjoining property been used as a gasoline station, motor repair facility, commercial printing facility, dry cleaners, photo developing laboratory, junkyard or landfill, or as a waste treatment, storage, disposal, processing, or recycling facility?	X	☐
3.	Are there currently, or have there been previously, any damaged or discarded automotive or industrial batteries, or pesticides, paints, or other chemicals in individual containers of greater than 5 gal in volume or 50 gal in the aggregate, stored on or used at the *property* or at the facility?	X	☐
4.	Has undocumented soil been brought onto the property at any time? If yes, estimated quantity is ____________ cubic yards.	☐	X
5.	Has soil been brought onto the property that originated from a contaminated site or that is of an unknown origin?	☐	X
6.	Are there currently, or have there been previously, any pits, ponds, or lagoons located on the *property* in connection with waste treatment or waste disposal?	X	☐
7.	Is there currently, or has there been previously, any stained soil on the *property*?	☐	X
8.	Are there currently, or have there been previously, any registered or unregistered storage tanks (above or underground) located on the *property*?	☐	X
9.	Are there currently, or have there been previously, any vent pipes, fill pipes, or access ways indicating a fill pipe protruding from the ground on the *property* or adjacent to any structure located on the *property*?	☐	X
10.	Are there currently, or have there been previously, any flooring, drains, or walls located within the facility that are stained by substances other than water or are emitting foul odors?	☐	X
11.	Are there any domestic, irrigation or monitoring wells on the property?	X	☐
12.	If the *property* is served by a private well or non-public water system, have contaminants been identified in the well or system that exceed guidelines applicable to the water system or has the well been designated as contaminated by any government environmental/health agency?	☐	X
13.	Have you been informed of the past or current existence of *hazardous substances* or *petroleum products* or environmental violations with respect to the *property* or any facility located on the *property*?	☐	X
14.	Have there been any *environmental site assessments* of the *property* or facility that indicated the presence of *hazardous substances* or *petroleum products* on, or contamination of, the *property* or recommended further assessment of the *property*? See 2004 report	X	☐

15. Have there been any past, threatened, or pending lawsuits or administrative proceedings concerning a release or threatened release of any *hazardous substance* or *petroleum products* involving the *property*? ☐ Yes X No

16. Has there been any past agricultural use of the *property*, such as orchards or seed crop cultivation? X Yes ☐ No

17. Have any *hazardous substances* or *petroleum products*, unidentified waste materials, tires, automotive or industrial batteries or any other waste materials been dumped above grade, buried and/or burned on the *property*? ☐ Yes X No

18. Is there a transformer, capacitor, or any hydraulic equipment for which there are any records indicating the presence of PCBs? ☐ Yes X No

If a "Yes" response was provided to any of the above questions, please provide details below:

See 2004 Phase 1 report.

- Hazardous materials
- Due diligence evaluations for portfolio property acquisitions
- Hydrogeologic Studies
- UST characterization and remediation
- VOC release assessments and remediation
- Risk Based Corrective Action (RBCA) evaluations
- Agrichemical impact assessments

REFERENCE

Ms. Patty Hirota – Cohen
BART Real Estate Department
1330 Broadway, Suite 1800
Oakland, CA 94612
510- 464-6000

Since joining ENGEO in 1985, Mr. Munger has been managing groundwater supply evaluations, hydrogeologic studies, chemical assessments, phase one and two site assessment projects, UST site investigations, risk based corrective action (RBCA), VOC remediation, and agricultural impact evaluations. He serves as Principal-in-Charge or Project Manager for environmental and hazardous materials projects involving groundwater hydrology, contaminant fate and transport, and remediation.

620 North 9th Street, San Jose, CA
Mr. Munger is Principal-in-Charge for groundwater and soil gas characterization study for former Del Monte Packing Plant site in San Jose. His scope of services included meetings and interaction with multiple members of the San Francisco Regional Water Quality Control Board, and preparation of a Remedial Management Plan and public participation notifications.

ENGEO performed a Phase One Environmental Site Assessment and a subsequent Phase Two Environmental Site Assessment for the 3.1-acre proposed residential property. The property is currently occupied by two commercial warehouses and surrounding asphalt parking. The purpose of the Phase Two study was to provide an assessment of possible remaining soil gas impacts related to residual groundwater impairments from on- and off-site sources. ENGEO prepared a Remedial Action Plan (RAP) for the mitigation of volatile organic compounds (VOCs) and management of potential petroleum impacted soil.

Ivy Glen, Fremont, CA
Mr. Munger is the Principal-in- Charge. ENGEO is providing groundwater sampling, including collecting groundwater samples from existing monitoring wells. Field activities have been conducted by an ENGEO Environmental Engineer. Static water levels are measured in surrounding wells, then checked for the presence of free product or sheen, with no measurable product or sheen found. Prior to groundwater sampling, a well was purged with at least four casing volumes until the field parameters (temperature, conductivity and pH) had stabilized.

Groundwater samples are collected in accordance with ENGEO's standard sampling procedures. Water samples are collected for laboratory testing using a dedicated polyethylene bailer. The samples are decanted into a pre-cleaned 40 ml vial preserved with HCL and cooled in an ice chest until delivery under documented chain-of-custody to Entech Analytical Laboratory in

Santa Clara, California. Samples are analyzed for Volatile Organic Compounds (VOCs) by EPA Method 8260B. Detectable concentrations of VOCs are reported in the laboratory test results.

Cecchini Property, Contra Costa County, CA
Mr. Munger provided an agrichemical study. ENGEO is providing geotechnical, environmental, hydrologic, and long-term storm water Best Management Practices (BMP) consultation services for the project. ENGEO previously performed several surface and subsurface explorations at the site for the purpose of providing geotechnical and environmental design recommendations. The project site is located on Byron Tract at the eastern edge of Contra Costa County. The irregularly shaped parcel is bounded by Old River to the east, Highway 4 to the south, Discovery Bay to the west, and Indian Slough to the north. The site is agricultural in nature with existing farm-related structures in the north central part of the site. Numerous small irrigation and drainage ditches traverse the property. The ditches help maintain artificially depressed ground-water levels that serve as a permanent dewatering system.

Discovery Bay West, Tracts 7686 and 8143, Discovery Bay, CA
Mr. Munger was Principal-in-Charge. ENGEO provide a modified phase one site assessment addressing the entire 756-acre property. The lots have been rough graded with streets and curb/gutter in place. Most underground utilities are also in place. The proposed development consists of single-family homes and areas graded for residential development.

River Islands School Site Preliminary Endangerment Assessment, Lathrop, CA
Mr. Munger was Principal-in-Charge. ENGEO recently performed a Preliminary Endangerment Assessment for a proposed school site, located in the eastern portion of the River Islands project, a 4,800 acres residential development in Lathrop, California. The PEA was completed for the Banta School District for the proposed River Islands middle and elementary schools. ENGEO conducted environmental sampling of the site near surface soils since the site was historically used for agricultural usages since at least the 1930's. ENGEO determined that residual levels of the pesticides DDE and DDT detected onsite were below the acceptable thresholds and did not pose a threat to the future school site. We concluded the onsite concentrations of mercury, arsenic and lead were consistent with the range and mean concentrations of the background soil results. Based on our evaluation of the soil sampling results, we proposed that no further action was necessary for the proposed school site. ENGEO recently received verbal approval by DTSC for the PEA.

Discovery Bay West Villages 4 and 5, Discovery Bay, CA
Mr. Munger was Principal-in- Charge. ENGEO provided environmental services for the installation of three groundwater monitoring wells and advancement of six Geoprobe borings at the project site—adjacent to the existing pipeline easement of ±3,400 lineal feet on the property. The purpose of the additional services is to provide further delineation of the extent of low-level petroleum impacts identified at the site. We also created a letter report presenting the results of the Kinder-Morgan petroleum pipeline assessment.

ENGEO completed a previous petroleum pipeline assessment for the development in 1998. The study did not reveal any appreciable concentrations of target analytes associated with petroleum products. It was concluded that no soil or groundwater impact had occurred to-date. This subsurface assessment was performed to evaluate whether pipeline operations since the 1998 study have subsequently impacted the soil and/or groundwater.

Hogan Drive, Santa Clara, CA
Mr. Munger is the Principal-in-Charge for the active groundwater remediation services for 3 acre former dry cleaner site in Santa Clara. Our scope of services has included an initial site characterization, groundwater plume delineation and ongoing bioremediation services. ENGEO provided a soil and groundwater study to monitor the presence of VOCs, TPHg, BTEX, MTBE, and PCE. All were non-detectable except for PCE. ENGEO recommended that remediation take place to clean the soil and groundwater of PCE.

Mayfield Avenue Site, Mountain View, CA
Mr. Munger is the Principal-in-Charge for groundwater study and dewatering system design for former Hewlett Packard Site in Mountain View. His scope of services included the installation and monitoring of four piezometers.

Aerially Deposited Lead (ADL) Assessment Program, Alcosta Boulevard/Interstate 680 Interchange Improvement, San Ramon, CA
Mr. Munger provided Principal Review. ENGEO performed an Aerially Deposited Lead (ADL) assessment program for the Alcosta Boulevard/Interstate 680 Interchange Improvement. The purpose of the investigation was to determine existing lead levels in surface soils. The scope of services included the recovery of soil samples from the surface to a depth of 3 feet below the ground surface, analytical testing of the samples to determine hydrogen ion content (pH testing), total lead, STLC WET soluble lead, and STLC TCLP soluble lead analyses, and a statistical analysis to determine Confidence Intervals (CI) of soil lead concentrations.

An innovative risk-based statistical analysis was performed to assure site soils were suitable for on-site reuse in accord with Caltrans/State of California regulations. This analysis led to significant project budget savings by avoiding removal and disposal at a solid waste disposal facility.

SR 121 Improvements, Napa, CA
As Principal in Charge, Mr. Munger provided quality assurance and oversight while ENGEO personnel performed aerially deposited lead (ADL) sampling and laboratory analysis for the State Route 121 improvement project. The purpose of the investigation was to determine total lead concentrations in surface soils within the proposed improvement area. Our scope or services included: recovery of 20 surface soil samples from 20 sampling locations and submittal of the soil samples for hydrogen ion content (pH testing) and total lead analyses. The area of study consisted of approximately one-half mile of right-of-way on either side of the existing roadway.

Builder's Square, Multiple States—USA
Mr. Munger led the ENGEO team that provided Phase One Environmental Site Assessments for 90 properties located within 22 states as part of a pre-acquisition due diligence. We completed the work within five and a half weeks and on budget. The properties consisted of 48,000 to

115,000 square foot cornet tilt-up commercial buildings developed as home improvement centers. The existing structures were constructed in the 1980s and 1990s.

Hercules Wastewater Treatment Plant, Hercules, CA—2004
Mr. Munger was Principal-in-Charge of the project. ENGEO performed a phase one environmental site assessment at the 12-acre property currently occupied by the Hercules Waste Water Treatment Plant (WWTP), previously operated by the City of Hercules. The property is also a former parcel of the Hercules Powder Works site (HPW). Remnant facilities previously associated with the WWTP include a treatment vault, above-ground chemical storage tank, and aeration ponds. Based on the findings of the assessment, there were potential environmental concerns associated with the past and current uses of the property:

- The lack of environmental documentation prior to the construction of the Waste Water Treatment Plant and the past history of the site as a part of the Hercules Powder Works represented a potential environmental concern for impacts to the site.
- Sampling and analysis data compiled by Questa Engineering in association with the 1991 – 1992 UST and dispenser removal suggests residual soil and groundwater impacts may exist on the property.
- The use of hazardous materials and waste associated with the Waste Water Treatment Plant present a potential environmental concern for possible impact to the site.

Lockeford Wastewater Treatment Plant Expansion, Lockeford, CA
Mr. Munger is Principal-in-Charge. ENGEO is providing environmental services regarding private party activities to assist the Lockeford Community Services District (LCSD) in acquiring property to support expansion of the existing wastewater treatment plant's capacity. The LCSD operates a wastewater treatment plant (WWTP) that is designed to process wastewater to secondary water quality standards and is reported to have a current design capacity of 340,000 gallons per day. The existing disposal capacity for treated effluent is reported to limit the WWTP to approximately 280,000 gallons per day. Our scope of services includes obtaining clarification of Preliminary Vernal Pools Determination, identifying existing WWTP capacity and identifying use alternatives for 120 acres.

ENGEO is completing study to characterize groundwater for the purpose of preparing a Report of Waste Discharge submittal to the Central Valley Regional Water Quality Control Board. This application is in support of a plan to convert use of an existing agricultural property to effluent reclamation for secondary treated water.

City of Plymouth Treated Water Pipeline Project, Tanner Reservoir to Plymouth Water Treatment Plant, Amador County, CA—on-going
Mr. Munger is Principal-in-Charge. ENGEO is preparing a geotechnical report for the project which will consist of construction of a treated water pipeline connecting the existing Amador Water Agency Water Treatment Plant at Tanner Reservoir, with the existing City of Plymouth treated water storage tank. ENGEO is also providing environmental services related to disposal issues. We created a letter

determining if naturally occurring asbestos issue was a factor. The project also includes construction of a water storage tank north of Sutter Creek. We will perform a geologic reconnaissance of the selected pipeline alignment. We will also perform subsurface explorations and provide design recommendations for foundation design and excavatability.

Bear Creek Property, Contra Costa County, CA
ENGEO has provided a wide range of services for the 83-acre site, a proposed cemetery location. We performed a groundwater availability study to evaluate the underlying aquifer(s) with regard to potential sustained well yield and water quality. We also provided a hydrogeologic evaluation of the groundwater availability on an existing well. In addition, we submitted plans for the installation of an additional groundwater observation well and monitoring, required by Contra Costa County as a Condition of Approval for the project. Most recently we summarized the findings of the groundwater monitoring.

Burroughs Property (State Parcels), Jersey Island Road, Oakley, CA
Mr. Munger conducted a Phase Two Site Assessment to address the environmental concerns associated with the one active natural gas well site and five former natural gas well sites identified in the referenced site assessment report. Mr. Munger identified the following potential environmental concerns associated with the six active/former natural gas well sites:

- Hydrocarbon impacts to soil/groundwater as a result of spillage from condensate tanks
- Spillage from above-ground diesel and motor oil tanks
- Hydrocarbon impacts within the area of compressor units
- Mercury impacts adjacent/beneath meter sheds
- Hydrocarbon/barium impacts associated with former drill sumps
- Hydrocarbon impacts around well heads

Pay N' Pak Real Estate Transactions, CA
A financial money manager of Harvard University hired ENGEO to undertake 18 Phase One Environmental Site Assessments prior to their purchasing a number of Pay N’ Pak stores. The scope of work included site walkovers with an asbestos inspector, review of aerial photographs and available Sanborn Fire Insurance maps, and record research. We prepared a detailed plan showing nearby contaminated sites that could potentially affect the subject property. The reports were prepared under a strict four-week deadline for completion. The full reports were completed within the time limits with no revisions required prior to the completion of the real estate transaction.

170 King Street, San Francisco, CA
Mr. Munger served as the Project Manager for the proposed residential project. The planned development includes an 11-story building and the upper eight levels will consist of residential units with parking on the lower three levels. Our services focused on characterizing the environmental aspects of the project and provide design level recommendations to guide land planning.

Pleasant Hill BART Station, Walnut Creek, CA
ENGEO provided a Phase Two Environmental Site Assessment for this BART station that encompasses 20 acres, including the platform/station area, electrical facilities, a parking garage and additional paved parking areas. The purpose of our study was to address the general soil quality across the area of the parcels (not those underneath the platform or parking structure). The comprehensive scope of services included soil and groundwater samples from 85 locations across the site, laboratory analysis and the preparation of a final report for the client that included an evaluation of reported constituents with comparisons to applicable State and Federal guidelines.

In order to minimize impacts to BART travelers and operations, ENGEO provided our services during the weekends. ENGEO also obtained a right-of-way permit through BART Real Estate Services Division to gain access to the site before the project commenced.

San Ramon Village Plaza, Dublin, CA
Mr. Munger conducted an environmental peer review for the proposed residential development within the mixed-use 4.68-acre San Ramon Village Plaza site. According to the general plan, the proposed development will consist of commercial and residential usage. Approximately 2.94 acres will be developed for residential use and includes construction of 11 townhome buildings and access roadways. The residential townhouses are three-story wood-framed structures, and each building may contain 4, 5 or 8 units.

Arroyo Crossings, Livermore, CA
Mr. Munger was Project Manager while ENGEO provided geotechnical and environmental engineering services for this 34-acre site. The extensive scope of work included supplemental geotechnical exploration, phase one and two environmental site assessments, underground storage tank removal as well as groundwater monitoring. The proposed development for the site will consist of 155 residential lots with associated roadways and underground utilities. The client has received documented site characterization and recommendations necessary to move forward with development.

Iron Horse Trail Improvements, Pleasanton, CA
Mr. Munger was Project Manager while ENGEO performed near surface soil sampling in the proposed landscape “pod” areas along the Iron Horse Trail for the City of Pleasanton. The improvement project includes a bicycle/walking trail, drainage facilities and landscape improvements. The area consists of a strip of land that is ±2,350 feet long and 100 feet wide. ENGEO collected soil samples to determine if the soil had been adversely impacted as a result of its past use as a railroad right-of-way.

Kelseyville Unified School District, Lake County, CA
Mr. Munger was Principal-in-Charge. ENGEO prepared a Preliminary Endangerment Assessment (PEA) for the Kelseyville Unified School District in Lake County, California. The purpose of the PEA was to evaluate the likelihood for elevated levels of Naturally Occurring Asbestos (NOA) and CAM 17 metals to be present at the proposed Cobb School Site. Working under the direction of DTSC we developed a DTSC approved scope of services which included:

- A classification of the sub surface geology at the Site
- Soil and groundwater sample collection. Samples were analyzed for NOA and CAM 17 metals.
- Preparation of a PEA report summarizing our findings for the Site.

Our assessment revealed no significant levels of asbestos and CAM 17 metals at the Site and concluded that Naturally Occurring Asbestos is not a concern for development of the Cobb School facility.

In February 2006, ENGEO's PEA was approved by the DTSC.

S&S Farms, 12-Acre Proposed Grant Street School Site, Brentwood, CA
Mr. Munger completed an updated Phase One Environmental Site Assessment (ESA) for the proposed Grant Street School. The previous phase one site assessment was completed by ENGEO in October 2002, for a larger ±94-acre property. The 12-acre school site is located in the northeast corner of this site. The October 2002 Phase One scope of services was modified to include limited sampling to initially evaluate soil for evidence of leakage from an underground petroleum pipeline and for the presence of agricultural chemical residues in soil from agricultural activities that occurred on the property.

ENGEO also performed a soil vapor study that involved collecting soil vapor samples for analysis of hydrogen sulfide and methane. This objective of this study was to evaluate whether these compounds were introduced to shallow soil by historic natural gas exploration in the area. The results of this study in conjunction with the results from prior soil vapor studies performed at the site indicated hydrogen sulfide and methane were not present at concentrations in soil vapor beneath the site that merited further study.

ENGEO's reports included calculations for cancer risk and hazard quotient posed to human health for the two pesticides and two metals detected in the surface soil. Based on the calculated cancer risk being less that 1 in a million and the hazard quotient being less than 1, ENGEO recommended that a Preliminary Endangerment Assessment (PEA) may not be necessary.

Proposed Cobb School Site, Cobb, CA
Mr. Munger was Principal-in-Charge. ENGEO prepared a work plan for a Preliminary Endangerment Assessment (PEA) regarding Naturally Occurring Asbestos (NOA) and metals in surface and near surface soil and Title 22 contaminants in groundwater. Our scope of services included:

- Collecting soil samples from two depths at three locations previously sampled in December 2004 for analysis of naturally occurring asbestos using the transmitted light microscopy (TEM) method.

- Collecting soil samples from the upper 6 inches of soil at four locations for analysis of the seventeen metals listed in the California Assessment Manual.

- Collecting one groundwater sample from the existing water supply wells for laboratory analysis.

DTSC requested that one groundwater sample be collected from the neighboring water supply well for laboratory analysis. Observation of the well head suggests that the well's condition allows for surface water and debris to enter the well bore. Since this condition is not consistent with the California Water Well Standards, we recommend a limited suite of analyses that is intended to assess the presence of the constituents.

Petersen Mine Tailings Pile, Pine Grove, Amador County, CA
Mr. Munger was Principal-in-Charge. The Site consists of an approximate ½-acre parcel that is surrounded by approximately 141 acres of land proposed for development as the Petersen Ranch subdivision (Petersen Ranch). The Site was used as a repository for mine tailings generated from gold recovery using mercury amalgamation in connection with the former Petersen Mine, which was operated between approximately 1930 and 1948. Closures of the other aspects of the former mine, such as the closure of tunnels, have been addressed to the satisfaction of Amador County.

As the lead agency for the PEA process, the Department of Toxic Substances Control (DTSC) is providing regulatory oversight under the authority of a Voluntary Cleanup Agreement (VCA) executed between DTSC and Mr. Fred Petersen, the project proponent. The RAW objective is to establish a plan for relocating the MTP in a manner that is protective of the public health and the environment.

Proposed Mixed-Use Development Site, Suisun City, CA
Mr. Munger is Principal-in-Charge. ENGEO is performing additional groundwater sampling for the proposed mixed-use development site at the northwestern corner of Highway 12 and Marina Boulevard and is comprised of four parcels totaling approximately 30 acres. The proposed development will consist of a mixture of townhomes and single-family residential housing, commercial, greenscapes, parking and associated roadways. The purpose of the proposed additional groundwater sampling is to provide further delineation of the extent of groundwater impact associated with the former USTs.

The recently completed Phase Two Environmental Site Assessment included a groundwater assessment of the former City Corporation Yard. Although a previous Phase Two assessment did not determine the horizontal and vertical extent of contamination, it was our opinion that the area of impact is limited to the immediate vicinity of the former USTs at the City Corporation Yard, since laboratory testing yielded non-detectable results for samples 2-E6 and 2-E8.

Dougherty Valley High School, Contra Costa County, CA
Mr. Munger is environmental principal-in-charge. Shapell Industries and Windemere BLC are jointly undertaking the construction of the Dougherty Valley High School project. The target capacity for the new high school is 2200 students. The new high school will consist of Four 2 story classroom Buildings, a Library/commons building, a 400 seat Theater, a Career Tech Building, an Administration Building, a Main Gymnasium, an Auxiliary Gymnasium, an Olympic size Swimming Pool, Basketball courts, Baseball fields, Softball Fields,

Soccer/Lacrosse Fields, a football Stadium with a rubberized track, Tennis Courts and approximately 700 student parking stalls. Mr. Munger managed a scope or services for the project including:

- A geotechnical exploration of the site using soil borings and cone penetration testing methods.
- A geotechnical and seismic hazards analysis of the site including probabilistic earthquake magnitudes, mitigation measures for the highly expansive on-site soil materials, and remedial grading and foundation recommendations for the proposed structures and pavements planned for the project. The seismic hazards analysis was reviewed and approved for the project by the California Geological Survey (CGS).
- Plans and Specifications for approximately 2,000 linear feet of Mechanically Stabilized Earth (MSE) walls up to 11-feet in height. The wall plans and specifications were reviewed and approved by the California Division of the State Architect (DSA).
- Testing and Observation services of all earthwork operations involved in the construction of the school.
- Special Inspection services for all on-site retaining wall structures including MSE walls and concrete masonry unit (CMU) walls.

Live Oak Elementary School within Windemere Phase IV, Contra Costa County, CA
Mr. Munger is principal-in-charge. We are currently providing geotechnical engineering services for the school and school park sites, which total approximately 15 acres. ENGEO provided geotechnical explorations for the Windemere Development, Phase IV including the project site, in 1995 and 2002. Geological conditions for the school site were also provided in this report which is located primarily on bedrock material. Mr. Munger provided a site-specific geotechnical exploration for the school site to provide detailed foundation recommendations and related site construction based on the building layouts, local geologic constraints and regional seismicity. He also reviewed all construction specifications for the project for conformance with the recommendations outlined in the geotechnical report.

Gale Ranch Elementary School Site, Contra Costa County, CA
We provided a geologic hazard evaluation and a geotechnical exploration for the proposed school site. The proposed elementary school campus will consist of eight two-story masonry and steel buildings with a combined floor space area of 114,145 square feet. Associated parking, emergency access, recreation, landscape and hardscape areas, and underground utilities are also planned. We anticipated that minor cutting and filling will be required to create relatively level building pads.

Gale Ranch Middle School, San Ramon, CA
Mr. Munger was environmental principal-in-charge. ENGEO provided environmental geotechnical engineering services for the ±15.8-acre school site is located south of Bollinger Canyon Road. Improvements will include the construction of five to six buildings that will

house a library, classroom structures, an administration building and a gymnasium. These buildings will be one to two stories high. Basketball courts and two soccer fields will be constructed at the western half of the site.

Executive Jet Hangar, Concord, CA
ENGEO conducted a geotechnical exploration and Mr. Munger led the Phase One and Phase Two Environmental Site Assessments for the proposed executive jet hangar and surrounding parking area improvements. The proposed jet hangar will be approximately 125 feet wide and 300 feet long with a parking area to the west of the hanger. It is our understanding that the hangar will consist of a first floor totaling 46,906 square feet with 39,320 square feet for hanger use and 7,386 square feet set aside for offices. A second floor is also planned with office space totaling 7,386 square feet.

Suisun City Marina Project, Suisun City, CA
ENGEO was retained by the Suisun City Redevelopment Agency to conduct Phase One Environmental Site Assessments on five parcels totaling 35 acres along the east side of Suisun Channel. The parcels included a number of boat repair and storage facilities; warehouses and light manufacturing. Multiple tenants had occupied the properties since the early 1900s. Subsequent site assessments found areas of questionable in filling of ancient marine inlets with unknown materials. Phase Two assessments found evidence of leaking underground fuel storage tanks; heavy metal contaminated soil, solvents and semivolatile organic material in the site soil and ground water. The degree of environmental impact was evaluated on a parcel-by-parcel basis. Removal of underground storage tanks, installation of ground water monitoring wells, and excavation of contaminated soil have to date resulted in four letters of site closure from the Solano County Department of Environmental Management. Soil remediation techniques included reclassification of soil for less costly landfill disposal, off-site incineration and on-site aeration.

Terminal One, Richmond, CA
ENGEO is providing geotechnical and environmental consultation for the subject development. Our environmental services are focused on reviewing and commenting on the planned environmental remediation and mitigations plans, and to serve as the site consultant for the Toll Brothers. ENGEO evaluated the proposed plans to mitigate the known site contamination to allow for future residential development. ENGEO is also providing geotechnical services related to site development. Design issues include soft bay mud soils over sloping bedrock conditions and high building loads for this multi-level podium residential structure.

Sea Cliff Marina, Richmond, CA
The 12-acre Seacliff Marina site is located west of the Port of Richmond's Shipyard No. 3 and east of the Brickyard Cove Development. The Seacliff Marina site was formerly part of Kaiser Shipyard No. 3 and was used for ship repair and maintenance along with scrap metal and salvage yards. A 1986 soil investigation found elevated concentrations of metals and asbestos at the site. In 1995, a DTSC-approved Remedial Action Plan required the consolidation and capping of contaminated soil at the site, and this remedial action was completed in 1998. ENGEO provided oversight, review, and consultation regarding remediation work performed by the Seacliff

Marina consultant. ENGEO has also provided design level geotechnical studies for the development.

Proposed West Shore Project, Richmond, CA
ENGEO is providing design level geotechnical and environmental studies for this multi level podium structure. The property is currently undeveloped land surrounded by predominately commercial parcels. High -density residential construction is proposed for the site, including a proposed 6-story podium structure to include five residential floors with 269 units and one parking floor.

The site was reclaimed in the late 1920s by constructing a rock bulkhead between the San Francisco Bay and the margins of the peninsula now occupied by the West Shore Areas. Geotechnical issues include consolidation and possible liquefaction of dredge spoils that generally consist of soft silt and loose silty sand.

California Rock & Asphalt, Brisbane, CA
ENGEO provided field and laboratory services in an evaluation of potential lead impacts to imported fill material placed at Cal Rock during the spring and summer of 2002. Based on a review of information on file with the San Mateo County Department of Environmental Health (DEH), potentially lead-contaminated soil was exported to the Cal Rock site in 2002. According to DEH information, approximately 2,350 truckloads of soil was exported from the Prometheus Real Estate Group's (PREG) Metropolitan Apartment development site in the City of San Mateo. Additional soil from the PREG site was transported to the former Burlingame Drive-In property (301 Beach) and San Mateo property (2nd Avenue and B Street) The volume of soil transported to Cal Rock has been estimated at 28,200 cubic yards. Previous analysis of near-surface soils at the Metropolitan Apartment site found total lead concentrations up to 620 parts per million (ppm) and soluble lead concentrations up to 21 milligrams per liter (mg/l). Based on these findings, DEH requested that PREG submit a work plan to address all three of the import fill locations. DEH staff also contacted Cal Rock personnel to inform them that lead-impacted soil may have been transported to the property. Finally in 2004, DEH requested that the City of Brisbane require Cal Rock to develop a work plan to address the potentially impacted fill material.

Former McKesson Facility, Union City, CA
Mr. Munger was the Project Manager who reviewed selected documents provided by a developer, former owners, and the San Francisco Regional Water Quality Control Board (SFRWQCB). The purpose of the review was to evaluate the adequacy of site cleanup efforts to allow proposed single-family residential development across the property. Part of our scope included a review of selected technical reports and letters, comparison of residual soil and groundwater concentrations to applicable residential risk criteria maintained by USEPA and the SFRWQCB and the preparation of a final letter report with conclusions. ENGEO also provided a geotechnical exploration and environmental work. The proposed development includes 62 lots at the northern portion of the site and two parcels at the southwestern corner. The 62 residential lots consist of 58 single-family lots and four duplex lots. Parcel D will contain a park and Parcel E will contain a fire station. Lot 13 at the southeast corner will be used as an interim water treatment facility.

Los Banos Airport, Los Banos, CA
The Los Banos Airport is approximately 112 acres in area. ENGEO provided a draft Phase One Environmental Site Assessment and a Conceptual Soil Remediation Work Plan as part of a multi-phase development for Stonecreek Properties, LLC. The scope of the environmental site assessment consisted of a Phase One environmental site assessment and a soil and groundwater characterization program. A review of regulatory databases at the local, state and federal level revealed that the property is listed in both federal and state databases as a site that has been subjected to environmental impacts.

Blackwelders Iron Works, Extractable Hydrocarbon Contaminated Soils, Rio Vista, CA
The Blackwelders facility was a former manufacturer of farm equipment and machine products. A Phase One Environmental Site Assessment was performed for a property transfer. The initial investigation identified areas of surface and subsurface discharge of hydrocarbon bearing condensate from an extensive air compression system. A Phase II Assessment which included hollow stem auger borings with soil and ground-water sampling found that extractable hydrocarbon contamination of the soil had occurred from both surface discharge and underground piping leaks. The primary area of contamination was located beneath the former compressor building. The affected soil adjacent to and beneath the building was excavated, stockpiled and profiled by laboratory analysis. Discrete soil samples were recovered from the excavation to confirm the removal of the contaminated soils to the regulatory agreed cleanup level of 100 parts per million. Excavated soil volume was approximately 250 cubic yards. Several potential remedial alternatives were evaluated including on-site biodegradation, landfilling and low-temperature rotary kiln thermal treatment. After considering cost, liability, and time constraints, off-site thermal treatment was selected as the most economical for soil treatment.

Richmond Transit Project, BART right of way drilling, Richmond, CA
ENGEO was retained by the Olson Company with the cooperation of the City of Richmond Redevelopment Agency to perform a geotechnical investigation for the proposed transit project. An application was made for permission to drill, and consequently to encroach on or over BART property at the following locations:

Borehole 2: Approximately 110 feet West of 19th Street and approximately 480 feet North of Macdonald Avenue.
Borehole 3: Approximately 340 feet West of 19th Street and approximately 650 feet North of Macdonald Avenue.
Borehole 4: Approximately 60 feet West of 18th Street and approximately 120 feet South of Barret Avenue.
Borehole 5: Approximately 330 feet West of 18th Street and approximately 130 feet South of Barret Avenue.
Borehole 8: Approximately 730 feet East of Marina Way and approximately 300 feet North of Macdonald Avenue.
Borehole 9: Approximately 510 feet East of Marina Way and approximately 270 feet North of Macdonald Avenue.

The purpose of drilling at the said locations was to conduct a geotechnical investigation involving soil borings at 6 locations within the BART right of way (5 of which requiring pavement penetration), and at 3 locations on property belonging to the City of Richmond. A truck mounted drill rig was used, and drive samples were taken at approximately every five feet.

Hercules Village for Bixby Land Development Company LLC, Hercules, CA
The project area consists of ±167 acres located near and along the southeastern shore of San Pablo Bay in Hercules, California. The property was once a portion of a 1300-acre manufacturing facility that was operated by DuPont from 1879 to 1913 and Hercules Incorporated from 1913 to 1979. The planned development included single/multi family residential development with some commercial components. Mr. Munger provided environmental due-diligence services for the prospective purchaser/developer of the property. Previous site operations included the manufacture of explosives, fertilizer products and chemicals such as methanol, nitric acid and nitrogen tetroxide. Initial investigations confirmed the presence of arsenic, cadmium, chromium, copper, lead, mercury, nickel, zinc, petroleum hydrocarbons and polynuclear aromatic hydrocarbons in site soils. ENGEO's scope of work included:

Site Asbestos Survey
In March 1999, an asbestos survey was conducted for structures on the site. The survey included a physical inspection of the buildings, the recovery of bulk material samples, and analysis of the samples using Polarized Light Microscopy (PLM). The survey identified significant quantities of regulated asbestos-containing materials and Category II materials including pipe wrap, ducts, air cell, wall panels, and linoleum/vinyl tile. An estimate of the potential abatement costs was provided for the preparation of bid specifications.

Site Characterization
In order to verify past remedial efforts for the property, ENGEO excavated approximately 110 test pits across the property. Samples recovered from the test pits were submitted for metal, PCB, PNA and TPH analysis. Statistical analyses were performed to determine upper confidence levels (UCLs) for the various contaminants. Contaminant levels were compared to the existing site-specific risk criteria developed for the site.

Demolition Observation/Contaminant Assessment
Remnant foundation elements, utilities, and drainage structures existed across the property. These structures were proposed for demolition prior to initiating the reworking of un-engineered fill material and mass grading work.

ENGEO provided full-time observation services during demolition and pregrading work. This work included a physical inspection of areas around and beneath the structures/foundations, along with the recovery of soil samples with laboratory testing.

Phase One Site Assessment
The Phase One Assessment included a site reconnaissance, a review of regulatory records and interviews with owner/occupants. The areas were viewed for hazardous materials

storage, surficial staining or discoloration, debris, stressed vegetation, or other conditions indicative of potential sources of soil or ground-water contamination. The areas were also inspected for fill/ventilation pipes, ground subsidence, or other evidence of existing or preexisting underground storage tanks.

Based on the findings of the site assessment, ENGEO identified several environmental concerns associated with the property, including potential metal, PCB and petroleum hydrocarbon impacts.

Brann Parcels, Rio Vista, CA
Mr. Munger provided Phase One and Two Environmental Site Assessments. The Phase Two Environmental Assessment included Division of Oil and Gas research, magnetometer survey, exploratory test pits, soil sampling and laboratory analyses.

Hydrogeologic Evaluation for Groundwater Availability, Fox Creek Country Club, Contra Costa County, CA
Mr. Munger provided a general hydrogeologic site characterization of this 350-acre property to determine the potential for an adequate source of groundwater on the subject property for golf course irrigation and other non-potable applications. The proposed development included an 18-hole golf course, a clubhouse, driving range and access roads. The scope of services included a review of geologic and hydrogeologic maps and literature regarding site geologic stratigraphy and structure, groundwater availability and quality; a review of available black and white stereo aerial photographs; an evaluation of available pump test data for existing on and off site groundwater wells; drilling and logging of four exploratory borings on the property; preliminary calculations of anticipated surface water runoff; and evaluation of groundwater availability.

Stop & Go Service Station, Suisun City, CA
Mr. Munger managed the characterization and remediation of service station site in Suisun City. He implemented an innovative sparging and bacterial treatment approach, which resulted in attainment of rapid site closure from the State with no off-site disposal costs.

Suisun City Marina Redevelopment Project, Suisun City, CA
Mr. Munger conducted an environmental assessment, characterization and remediation of a 40-acre redevelopment. His innovative remediation methodologies resulted in savings of over $75,000 to the city.

Builders Square/Home Quarters Site Assessment Project, throughout the United States
Mr. Munger was the Principal in charge of due diligence assessment of 95 commercial properties throughout the country within a one-month time frame.

Former Dry Cleaner Facility, San Ramon, CA
Mr. Munger managed characterization, monitoring and remediation of solvent contamination. His proactive approach to monitoring and characterization using rapid assessment techniques allowed developer to proceed with planned residential subdivision.

Agrichemical Contamination, Brentwood, CA
Mr. Munger managed the characterization, statistical evaluation, and health risk assessment for this large-scale former orchard/row crop property. Statistical methodologies and risk evaluation resulted in expedited site closure allowing rezoning and residential construction. The estimated cost savings to the client was approximately $250,000.

Select Foods Property, Hayward, CA
ENGEO conducted Phase One and Phase Two Environmental Site Assessments on the Select Foods manufacturing facility, which includes an educational facility with associated parking and a playground. The Phase Two Assessment was conducted on the property to address potential soil contamination associated with the past and present use of the property and the removal of five underground fuel tanks. We also provided services to determine if additional soil and groundwater studies were required before planning could continue.

Play Field Improvements, Closed Turk Island Landfill, Union City, CA
Mr. Munger was the Project Manager for this site consisting of approximately 46 acres of land proposed for recreational improvements to include play fields such as soccer and baseball fields and recreational trails. The site contained debris and municipal waste and was capped and considered "closed landfill" by the State of California. The scope of work included a review of available reports including literature and pertinent maps; subgrade requirements for synthetic play-field surfaces; a stability analysis for the placement of fill; geotechnical recommendations for site grading including fill placement criteria for the new cap and playfield surfaces; assess possible geological hazards in the general project area; and provide recommendations for treatment of geotechnical constraints, foundation recommendations, preliminary pavement design for parking areas, drainage considerations and utility trench backfill.

7th Street & East Taylor Street Project, San Jose, CA
ENGEO provided environmental consultation and field services during the removal of metal-impacted soil identified. ENGEO provided additional soil sampling and laboratory analysis services. Approximately 1,100 cubic yards of soil exceeding state hazardous waste criteria was found from the soil sampling and testing. Previous sampling and laboratory testing conducted identified elevated metal concentrations across several areas of the property.

Hacienda Avenue, Campbell, CA
Mr. Munger was the Principal in Charge providing a geotechnical exploration and a Phase Two Environmental Site Assessment for the proposed ±7.5-acre site consisting of 30 single-family residential homes. The geotechnical exploration included a geologic hazards assessment, field exploration, preparation of site development recommendations and a geotechnical design report. The assessment update included a review of the operations, maintenance and hazardous materials management practices, with an evaluation of their potential to adversely impact the site soil and groundwater. In addition, the phase two environmental services addressed the potential environmental impacts of the former orchards and dry cleaners.

Southern Pacific Property - Park Sierra Residential Development, Scarlett Drive/Dougherty Road, Dublin CA

ENGEO performed a Phase One and Phase Two Environmental Site Assessment for the former Southern Pacific property located along the railway corridor between the northern end of the current Scarlett Drive extending northwest across Dougherty Road (*within proposed Scarlett Drive Extension area*). This area has since been developed as a residential subdivision. Work included a review of past management practices associated with the Southern Pacific operation and a review of environmental data compiled for the abutting Camp Parks site. Phase Two work included recovery of soil and groundwater samples along the SP right of way, adjacent to the existing Kinder Morgan petroleum pipeline.

Camp Parks Fire Station, Dublin, CA

ENGEO performed a Phase One Environmental Site Assessment Update for the proposed Camp Parks Fire Station. The assessment included a review of the operations, maintenance and hazardous materials management practices, with an evaluation of their potential to adversely impact the site soil and groundwater.

Dublin Ranch, Dublin, CA

ENGEO performed a Phase One Environmental Site Assessment Update for Phase I – Tract 6956 of the Dublin Ranch subdivision. The assessment included a review of the operations, maintenance and hazardous materials management practices, with an evaluation of their potential to adversely impact the site soil and groundwater.

Valley Plaza, Pleasanton, CA

In 2003, Mr. Munger provided an update to ENGEO's previous environmental site assessment (ESA) from 1998 for this combined retail and residential site. After a review of the previous report, Mr. Munger directed a new reconnaissance of the property and was able to document, within the final report, comparative data from each ESA and, finally, identified potential environmental concerns for the property.

3rd & Connolly Utility Corridor, Mare Island, CA

Mr. Munger provided Principal oversight. ENGEO monitored demolition and soil excavation activities required to prepare for construction of a 300 – foot water and sewer utility corridor along Connelly Street between 3rd Street and Azuar Street for indications of chemical contaminants. The utility corridor, which will service planned residential development on Mare Island, lies adjacent to historic and large facilities that supported the Department of Navy operation of the former Mare Island Shipyard. Plans to excavate the corridor included geotechnical evaluation of trenching to protect the adjacent facilities, geotechnical evaluation of trench backfill to protect against settlement within the future street alignment and environmental evaluation to identify, classify and document to presence of soil contaminants. The environmental consideration was necessary to fulfill the obligations of the identified responsible parties.

Existing/former improvements within the alignment included water and steam pipelines, a former fuel oil pipeline (FOPL), natural gas lines and an industrial waste water line. In addition, a previous fuel island, hydraulic hoists and two underground storage tanks were associated with Buildings 637 and 811. The zones of impacted soil removal were delineated within an approximate 9,300 square foot footprint area and extend to depths from 5 to 10½ feet below existing grade.

Appendix G4

Supplemental Agrichemical Assessment Report, Sutter Medical Center

Project No.
6486.201.102

May 27, 2009

Ms. Nadin Sponamore

SUPPLEMENTAL AGRICHEMICAL ASSESSMENT REPORT

Reference: ENGEO Incorporated, Phase Two Environmental Site Assessment Report, Sutter Medical Center of Santa Rosa, Project No. 6486.2.002.01, February 24, 2005.

Dear Ms. Sponamore:

ENGEO Incorporated is pleased to present this supplemental agrichemical assessment of the subject property (Property) located southeast of the intersection of US Highway 101 and Mark West Springs Road in Sonoma County, California (Figure 1). The Property is the home for the Wells Fargo Center for the Arts (WFC) and a portion of the Property is the proposed future location of the Sutter Medical Center – Santa Rosa (SMCSR). An orchard previously occupied the Property. This supplemental agrichemical study was performed to update our previous agrichemical study, and perform additional sampling and testing to comply with the most recent CAL-EPA guidance document for sampling agricultural properties.

ENGEO previously performed a Phase Two Environmental Site Assessment in 2005, which included an agrichemical study (Reference). The previous agrichemical study evaluated two areas of the Property for the presence of persistent organochlorine pesticides and metal impacts. Area 1 was identified as an approximately 12-acre area that historically supported orchard activities, but had not been disturbed by grading activities. Area 2, an approximate 10-acre area, historically supported orchard activities that was identified as later covered by approximately 3 feet of imported engineered fill. The 2005 ENGEO study documented concentrations of persistent organochlorine pesticides (OCPs) in the southern region of Area 1 and in the northern portion of Area 2. A risk analysis was evaluated for each composite soil sample to determine the potential carcinogenic and hazard risk of exposure to the soil. The evaluation was performed in accordance with procedures presented in the California Department of Toxic Substances Control document entitled, "*Preliminary Endangerment Assessment Guidance Manual*" dated January 1994. Based on the findings of the risk assessment, ENGEO determined that the soils at the site did not pose an unacceptable risk to human health.

This current supplemental agrichemical impact study is to provide an evaluation of historic agricultural field areas in general conformance with California Department of Toxic Substances Control, Cal-EPA, Interim Guidance for Sampling Agricultural Properties (Third Revision); August 7, 2008. In accordance with the referenced CAL-EPA guidance document, a total of 32 soil samples were recovered from the 22-acre study area for laboratory analysis. The sample locations are indicated on Figure 2. The scope of services included the following:

- Recovery of 16 soil samples from the open field located in the western portion of the Property (Area 1). The samples were collected from the interval of 0- to 6 inches below the ground surface.

- Recovery of 16 soil samples from the open fields located in the eastern portion of the Property (Area 2). The sample locations were excavated with the use of a backhoe. A determination of the thickness of fill was made in the field with the samples collected from the interval of 0- to 6 inches below the base of the fill. Upon sample recovery, the excavated pits were backfilled for safety.

- Submittal of the 32 soil samples to a State certified analytical laboratory under documented Chain-of-Custody for laboratory analysis.

- Analysis of the 32 soil samples as eight 4-point composite samples for organochlorine pesticides by EPA Method 8081. One selected discrete sample from each of the eight composites was analyzed for arsenic by EPA Method 6010.

- Preparation of this report with our findings and conclusions.

FINDINGS

The soil sampling results for organochlorine pesticides and arsenic are summarized in Table 1, and detailed analytical laboratory testing results by State Certified McCampbell Analytical, Inc. are provided in Appendix A.

Three OCPs were reported at the Property at levels above the laboratory reporting limit. The three OCP compounds, dichlorodiphenyltrichloroethane (DDT), dichlorodiphenyl-dichloroethylene (DDE), and dichlorodiphenyldichloroethane (DDD), were reported with cumulative concentrations ranging from the reported levels of DDT, DDE and DDD in the soil samples recovered at the Property are well below the California Human Health Screening Levels established by Cal/EPA.

Arsenic concentrations for the composite samples ranged from 4.4 mg/kg to 12 mg/kg with a mean of 6.3 mg/kg (Table 1). Natural background concentrations of arsenic in California are often well above the health-based, direct-exposure goals in soil of 0.07 mg/kg for residential land use. The reported arsenic levels are within the anticipated background concentrations and would not be from an anthropomorphic source.

TABLE 1
Sample Analysis Summary
(Concentrations are reported in milligrams per kilogram – mg/kg)

Sample ID (Composite)	**DDT**	**DDE**	**DDD**	**Cumulative OCPs**	**As** (Discrete sample ID)
CS-1A-D	0.074	0.10	0.0037	0.1777	6.2 (CS-1B)
CS-2A-D	0.058	0.083	0.0083	0.1493	5.0 (CS-2C)
CS-3A-D	0.0037	0.023	0.0065	0.0332	4.4 (CS-3D)
CS-4A-D	0.0043	0.015	0.0046	0.0239	8.6 (CS-4D)
CS-5A-D	ND	ND	ND	---	4.7 (CS-5B)
CS-6A-D	ND	0.020	ND	0.020	12 (CS-6C)
CS-7A-D	0.0024	0.017	0.0013	0.0207	4.4 (CS-7C)
CS-8A-D	ND	ND	ND	---	4.9 (CS-8C)
CHHSL[1]	1.6	1.6	2.3		0.07[2]

1. CHHSL- Cal/EPA California Human Health Screening Level, January 2005.
2. Naturally occurring background concentrations of arsenic may exceed its' soil CHHSL. Cal/EPA generally does not require cleanup of soil to below background levels. Reported concentrations are within the range of expected background arsenic concentrations for Northern California.

CONCLUSIONS

The reported concentrations of organochlorine pesticides are well below the applicable CHHSLs developed by CAL-EPA. The reported arsenic concentrations are within the range of expected background levels for Northern California. Based on the results of the current and previous soil assessments, the property has not been adversely affected as a result of past agricultural use.

We appreciate the opportunity to work with you on this project. If you have any questions, please do not hesitate to contact us.

Very truly yours,

ENGEO Incorporated

Shawn Munger, CHG, REAII Theodore P. Bayham, GE, CEG

Dear Keith:

Enclosed within are:

1) The results of the **4** analyzed samples from your project: **#6486.201.102; WFC-SMC Properti**
2) A QC report for the above samples,
3) A copy of the chain of custody, and
4) An invoice for analytical services.

All analyses were completed satisfactorily and all QC samples were found to be within our control limits.

If you have any questions or concerns, please feel free to give me a call. Thank you for choosing McCampbell Analytical Laboratories for your analytical needs.

Best regards,

Angela Rydelius
Laboratory Manager

MS = Matrix Spike; MSD = Matrix Spike Duplicate; LCS = Laboratory Control Sample; LCSD = Laboratory Control Sample Duplicate; RPD = Relative Percent Deviation.

% Recovery = 100 * (MS-Sample) / (Amount Spiked); RPD = 100 * (MS - MSD) / ((MS + MSD) / 2).

MS / MSD spike recoveries and / or %RPD may fall outside of laboratory acceptance criteria due to one or more of the following reasons: a) the sample is inhomogenous AND contains significant concentrations of analyte relative to the amount spiked, or b) the spiked sample's matrix interferes with the spike recovery.

N/A = not enough sample to perform matrix spike and matrix spike duplicate.

NR = matrix inteference and/or analyte concentration in sample exceeds spike amount for soil matrix or exceeds 2x spike amount for water matrix or sample diluted due to high matrix or analyte content.

WorkOrder: 0904529

April 27, 2009

Dear Keith:

Enclosed within are:

1) The results of the **4** analyzed samples from your project: **#6486.201.102;WFC-SMC Propertie**
2) A QC report for the above samples,
3) A copy of the chain of custody, and
4) An invoice for analytical services.

All analyses were completed satisfactorily and all QC samples were found to be within our control limits.

If you have any questions or concerns, please feel free to give me a call. Thank you for choosing McCampbell Analytical Laboratories for your analytical needs.

Best regards,

Angela Rydelius

Interview with FAA and Helicopter Operators Regarding Sutter Santa Rosa Medical Center Helistop

Memorandum

Date: May 26, 2009

To: Nadin Sponamore, Sponamore Associates

From: Bradley Musinski, Mead & Hunt

Subject: Interviews with FAA and Helicopter Operators regarding Sutter Santa Rosa Medical Center Helistop

As part of the environmental assessment for the proposed Sutter Medical Center, Mead & Hunt contacted the primary helicopter operators for their thoughts and concerns on alternative designs and locations for the helipad at the hospital. The agencies contacted were REACH and the Sonoma County Sheriff Helicopter Unit. The topics of discussion included: rationale for a ground based versus a rooftop helistop, flight paths into the preferred location and each alternative sites, and issues with a helistop location that is adjacent to a major highway. General thoughts were also provided on each alternative location. The control tower at Sonoma County Airport was also asked to provide a point of view on the two alternatives nearest the Airport.

Ground based versus rooftop based helistops – Both REACH and the Sheriff would not have any issues with a ground or a rooftop based helistop at the Mark West location or any of the alternatives. REACH prefers rooftop helistops, and stated wind around a ground based helistop is unpredictable and swirls due to the presence of multiple tall buildings near the helistop, as the hospital is designed. The Sheriff favors ground based helistops over rooftop helistops. The Sheriff feels helistops on the ground offer more room for error should an incident arise and the helicopter needs a location to land under duress. A rooftop helistop does not offer this same room for error. Should an incident involving a helicopter occur on the roof, it may require the evacuation of the entire building. The Sheriff also expressed that a more intricate design for a rooftop helistop is required and the possibility that air conditioning units would have to be shut down when helicopters are using the roof.

Flight path at the Mark West Road location – The proposed approach and departure path is oriented with the prevailing wind. Each agency was satisfied with the flight paths which allow them to approach and depart over US Highway 101. The Sheriff did express some concern over the power lines crossing 101, north of Mark West Road and suggested lighting the poles. REACH was also concerned with noise generated from approaches and departures over the Wells Fargo Center, especially during private functions and religious ceremonies.

Alternative locations – Three other alternative locations were presented to REACH and the Sheriff. These include the Todd Road near Highway 101, Stony Point and Highway 12, and Shiloh Road and Highway 101. The Shiloh Road site and Todd Road site were deemed adequate by both agencies. It was suggested that if a ground based helistop was necessary at the Todd Road location, its best location would be closer to Highway 101, on the east side of the facility away from buildings. The Stony Point site provided the least positive response from each agency. REACH was especially concerned with this site and making approaches to the south, which would require a teardrop turn over a residential neighborhood.

Helistops near major highways – REACH and the Sheriff indicated the helistop at the Children's Hospital Oakland is located about 200' away from a limited access highway (State Highway 24). REACH acknowledged that a helistop this close to a highway probably causes motorists to glance at a helicopter when it is arriving and departing. The Sheriff acknowledged this also, but could not offer any statistics which would indicate helicopter activity near a highway directly results in the distraction of motorists and leads to accidents. REACH also stated a rooftop helistop may keep helicopter activity out of the peripheral vision of motorists on the ground.

Sonoma County Airport (STS) Control Tower – Two of the proposed locations of the hospital would be situated within the airspace of STS. Neither site is of a concern to the tower due to the low amount of activity expected at the hospital. The Shiloh Road site is located at the fix point where the REACH and Sheriff helicopters are at 500' above ground altitude and are to report to the tower. The Shiloh Road location is in the approach path for Runway 19, but the tower indicated this would not be a problem as this runway approach is seldom used.

Appendix G6

Heliport Safety Issues

Memorandum

Date: August 10, 2009

To: SMCSR Project Team

From: Ken Brody, Mead & Hunt

Subject: Heliport Safety Issues

This memo addresses several topics concerning the safety of helicopter operations at the proposed Sutter Medical Center Santa Rosa (SMCSR) helistop. Some of these topics were covered in prior Mead & Hunt memos. For completeness, the information previously provided is incorporated here, but the discussion is expanded to include additional information more recently obtained.

Does the proposed proximity of the helistop to Highway 101 pose a hazard to highway traffic? What data is available on this issue? What other sources of information were investigated? Are there examples of other similarly situated helicopter facilities in the state? How long will helicopters be in view when using the SMCSR helistop? Will lighting of the helistop be a distraction or annoyance?

Several avenues of research were followed in an effort to answer these questions.

First, no data on the topic appears to exist. We contacted the Statewide Integrated Traffic Records System (SWITRS) of the California Highway Patrol on July 21, 2009. The SWITRS stated that there are no records available which would determine if automobile traffic accidents were caused by nearby aircraft activity. The reason is that fault is placed on the driver of the automobile(s), not outside influences such as aircraft activity. We also conducted a search of the National Highway Traffic Safety Administration (NHTSA) online database using keywords such as 'aircraft' and 'helicopter.' This search did not yield any results. This outcome is not unexpected, given that this agency would need to obtain its data from the states and that California and presumably other states do not record the type of data in which we are interested.

Mead & Hunt next contacted the California Department of Transportation Division of Aeronautics and helicopter operators. Division of Aeronautics staff (Division Chief Gary Cathey and Aviation Safety Officers Patrick Miles and Michael Smith) indicated that they were not aware of any general conditions or specific incidents in which helicopter operations have been cited as a vehicle traffic hazard. As further verification, Division staff contacted the Air Operations Commander of the California Highway Patrol (Keith Dittimus) who responded that he had not heard of any problems caused by helicopters landing at a facility near a highway.

Other contacts made by Mead & Hunt were to local helicopter operators: REACH, the primary helicopter emergency medical services operator in Sonoma County; and the Sonoma County Sheriff's Helicopter Unit. Interviews were conducted in May 2009. REACH personnel acknowledged that a helipad close to a highway probably causes motorists to glance at a helicopter when it is arriving and departing. The Sheriff acknowledged this also, but could not offer any statistics which would indicate helicopter activity near a highway directly results in a distraction to motorists and leads to accidents.

Elsewhere in California, there are several existing helicopter facilities situated close to (within approximately 500 feet) a freeway. These include: Calstar (Auburn), Children's Hospital (Oakland), Good Samaritan Hospital (San Jose), Maguire Heliport (Los Angeles), San Joaquin General Hospital (Stockton), and St. Elizabeth Community Hospital (Red Bluff). See accompanying photos. Additionally, other hospitals no doubt have helicopter facilities near major surface roads. Also, many airports have airplane flight paths that pass over highways and major roads at low altitudes.

With respect to operations at the proposed SMCSR facility, approaching and departing helicopters are expected to be in view to motorists on Highway 101 for less than a minute and an average of no more than four to five flights (each flight includes one landing and one takeoff) per week day is anticipated (the number of helicopter flights at the current Sutter hospital in Santa Rosa has ranged between 186 and 213 during the past three years). Planned landscaping along the highway edge of the project site, once it grows in, is intended to shield motorists' view of helicopters on the landing pad.

Lights associated with the helistop are unlikely to be intrusive. The perimeter lights will be green and lead-in lights yellow; both are intended to be seen from the air and will be largely unnoticeable from the highway among parking lot and other lights on the property. The flood light or lights are to help helicopter and ground crews to work around the helistop at night. These lights would normally be on only when a helicopter is present and will be off during helicopter takeoffs and landings so as not to interfere with the vision of pilots. The exact placement and brightness of the flood lights is yet to be determined, but they do not need to be any greater than lighting for the ground ambulance area adjacent to the emergency room entrance.

What is the basis for the approach-departure paths as proposed? Are other alternatives available? Is there assurance that helicopters will not use other routes?

The proposed approach-departure paths to be followed by helicopters using the SMCSR helistop are designed to basically follow Highway 101. As with airplanes, helicopter takeoffs and landings are safest when the helicopter operates into the wind. Even though data from nearby Sonoma County Airport indicates winds are calm (under 10 knots) more than 90% of the time, alignment of the approach-departure paths with the strong winds is highly desirable. The prevailing direction of stronger winds at the airport and the SMCSR site are primarily from the south-southeast and secondarily from the northwest. Based on this data, and consistent with aircraft operations at the airport, helicopters are expected to mostly approach the SMCSR helistop from the northwest and depart to the southeast, though the opposite direction will also be common. These directions are nearly parallel to Highway 101. Highway 101 is also an en-route corridor already used by helicopters as they transit the area.

Obstacles close to the proposed helistop—primarily the redwood trees at the Highway 101 interchange with Mark West Springs Road and the high-voltage power lines north of that location, as well as the proposed hospital buildings themselves—dictate a slight deviation from the above directions in the immediate vicinity. See accompanying drawing. The inner portion of northwesterly approach-departure path is directed more west-northwest to avoid these obstacles, while the outer portion turns to parallel the freeway. Alternatives to at least the inner portions of these approach-departure paths are not possible with the helistop at the proposed location. Other locations for the helistop were investigated during the project site design and were found to have drawbacks including nearby obstructions, proximity to homes, and/or greater impact on on-site circulation and parking.

The operational capabilities of helicopters enable them to maneuver close to where they are landing and then stop immediately on landing—as opposed to airplanes that require a longer straight-in approach to a runway and then a continued distance to decelerate after landing. Thus, helicopters using the SMCSR facility theoretically could use approach-departure routes other than the ones specified. Slow-speed maneuvering, though, uses more fuel, creates additional noise, and adds risks compared to following the normal routes close to the landing pad. Lead-in lights at the helistop will show pilots the direction in which to approach the landing pad. Furthermore, all of the organizations expected to operate helicopters at SMCSR will require prior approval from the hospital and pilots will be expected to be familiar with the prescribed approach-departure routes.

These close-in limitations on helicopter routes do not necessarily apply where helicopters are flying at a higher altitude farther from the helistop (beyond approximately a quarter mile). Helicopters will not necessarily follow the entire length of the delineated approach-departure paths, but may instead make a turn to or from their direction of flight at some point along the outer portion of the route. The proposed northwest approach-departure path, for example, includes a bend that aligns the path with Highway 101, but some helicopters are likely to continue in a northwesterly directly to the Sonoma County Airport or to approach directly from the airport.

What are the risks of helicopter accidents associated with the proposed helistop?

Clearly, establishment of a helistop at the proposed SMCSR will add a risk of helicopter accidents on the site that would not be present without the helicopter facility. That said, the overall risks should be considered minimal, especially when viewed relative to the life-saving mission that the helicopter function will provide.

Design standards for all types of heliports, including those at hospitals, are established by the Federal Aviation Administration (FAA) and published in one of the agency's advisory circulars (AC 150/5390-2B, *Heliport Design*, 9/30/04). The standards specify, among other things, the dimensions of the landing pad and the required clearances around the pad and in the approach-departure paths. To ensure that public-use and hospital helicopter facilities in California are designed in accordance with the FAA standards, state law requires that a Heliport Permit be obtained from the Department of Transportation Division of Aeronautics. Division staff both review the plans for proposed heliports and then conduct annual inspections to check that the facilities continue to be in compliance with the standards and that the approach-departure paths remain free of obstructions.

As to the specific risk of helicopter accidents, a variety of nationwide data is available from various organizations, in particular the National Transportation Safety Board (NTSB) and the Helicopter Association International (HAI). NTSB is the federal government agency charged with investigating transportation accidents. HAI is an industry organization whose mission is to promote helicopter use and safety. Among the relevant information and national statistics gleaned from these sources are the following:

- The rate of accidents for all types of helicopter operations has trended downward over the last decade. The increased numbers of twin-engine turbine-powered helicopters in the helicopter fleet has been an apparent contributing factor both because of the engine reliability and the multiple engines. REACH flies this type of helicopters.

- The accident rate for helicopter emergency medical service (HEMS) operations had also been decreasing, but then experienced a marked increase in 2008. From 1998 through 2007, an average of 10.8 HEMS accidents occurred annually in the U.S. Whether the 2008 increase is an anomaly is uncertain, but the NTSB has investigated and offered recommendations pertaining to flight procedures.

- The vast majority of helicopter accidents, particularly HEMS accidents, take place either en route or at a remote landing site rather than at an established heliport or airport.

- Weather was a significant factor in 19% of all HEMS accidents. The tendency of HEMS pilot to attempt to accomplish their live-saving mission despite adverse weather conditions no doubt is a factor in this regard.

HYDROLOGY AND WATER QUALITY TECHNICAL REPORTS

Appendix H1

Groundwater Aquifer Test and Water Quality Analysis, Sutter Medical Center

Project No.
6486.2.005.01

February 21, 2006

Ms. Nadin Sponamore
Sponamore Associates
1205 McDonald Avenue
Santa Rosa, CA 95404

Subject: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Santa Rosa, California

GROUNDWATER AQUIFER TEST AND WATER QUALITY ANALYSIS

Dear Ms. Sponamore:

At your request and with your authorization, ENGEO Incorporated has performed aquifer testing analyses and has as evaluated groundwater quality for the subject site. The purpose of the study was to determine the well pumping characteristics, perform limited water quality testing, and predict aquifer capability for future land use.

SITE LOCATION AND DESCRIPTION

The site where the existing well is located at 50 Mark West Springs Road in Santa Rosa, California, as shown on the Site Vicinity Map (Figure 1). The property encompasses approximately 78 acres, including the Luther Burbank Center for the Arts (LBC) which is approximately 52 acres in size. In addition to the LBC, a rural residence with barn, out-buildings and undeveloped pasture land, as well as a single-family home that is currently used as law offices, are present within the property boundary.

The Luther Burbank Center (LBC) and associated parking areas are currently located at the center of the site. The LBC structure is a cultural and performing arts event center, and a part of the property is leased to the Sonoma Academy, an independent college-preparatory high school. This portion of the Property includes approximately 39 acres that are occupied by asphalt-covered parking areas, an athletic field, and an existing waste water treatment facility. Two ponds associated with the wastewater treatment facility are located along the main access road that connects to Mark West Springs Road. The athletic field is located opposite to the wastewater treatment facility at the north side of the site along Mark West Springs Road. A vineyard exists at the south and southeast corner of the site. The remainder of the site is currently vacant and covered with seasonal grasses.

GEOLOGIC CONDITIONS

The site is located within the Coast Ranges geologic province of California, a series of northwest-trending ridges and valleys. Locally, the site is mapped as underlain by Holocene-Pleistocene Alluvium (Wagner and Bortugno, 1982). This alluvium consists of unconsolidated deposits of sand, silt, gravel and clay likely derived from the bedrock uplands and older unconsolidated deposits. Regional geology and information from the well driller's log (located in Appendix D) indicate that the alluvial deposits in this area may be greater than 400 feet in thickness.

FAULTS

The site is located in a region that contains numerous active[1] and potentially-active earthquake faults. The site is not located within the State of California Fault Hazard Zone. The active Rodgers Creek fault is located approximately 0.7 mile to the east of the project area. The Maacama Fault is located 6.3 miles to the east and the San Andreas Fault is located 19.5 miles to the west of the site. Regional faulting and seismicity is shown on Figure 4, which shows regional proximity to major active faults and significant historic earthquakes with in proximity to the site. No faults have been mapped that run through the subject site indicating that aquifers beneath the property are not fault controlled.

WATER DEMAND

Information provided to us by Brejle & Race Consulting Civil Engineers of Santa Rosa, California, indicates the planned construction of the proposed hospital will result in water demand of approximately 73,460 gallons per day. The daily demand equates to a yield of roughly 50 gallons per minute for a continuous 24-hour pumping period.

WELL AND PUMP INFORMATION

An existing agriculture groundwater supply well, W-LBC, is located near the center of the property at an elevation of approximately 160 feet above msl (mean sea level). The location of well W-LBC is presented on Figure 2. Reportedly, the LBC well was installed by Les Petersen Drilling and Pump, Inc., of Santa Rosa, California, in August 2000. The well was installed using rotary wash methods and is approximately 400 feet deep. The well consists of 10-inch diameter 200-guage PVC (polyvinyl chloride) casing and screen. The well screen is mill-slot casing with 0.032-inch slot openings. Three screened intervals were installed at 100 to 160 feet, 180 to 320 feet, and 360 to 400 feet. The completed State of California Well Completion Report was furnished to us and is included in Appendix D.

---

[1] An active fault is defined by the State Mining and Geology Board as one that has had surface displacement within Holocene era (about the last 11,000 years) (Hart, 1997).

The existing agriculture groundwater supply well, W-LBC, served as the pumping well for the aquifer test. Drawdown during pumping and recovery after pumping ceased were recorded. A second existing agriculture groundwater supply well, W-SV, is located offsite near the southern end of the property, approximately 1,200 feet from W-LBC. The location of the well W-SV is also presented on Figure 2. Information about the construction details of this well had not been provided. The drawdown and recovery tests of W-SV during and after pumping of W-LBC were documented to serve as a monitoring well.

The following table summarizes well construction data related to the subject LBC and Sutter Vineyard wells:

Table 1 – Well Construction Data

Well Name	Date Constructed	Total Depth	Casing Type and Diameter	Perforation Intervals (ft bgs)
LBC Well (W-LBC)	2000	400 feet	10-inch PVC	100 to 160 160 to 320 360 to 400
Sutter Vineyard Well (W-SV)	unknown	unknown	10-inch PVC	unknown

Reportedly, the pump within the LBC well was installed by Bartley Pump of Santa Rosa, California, and consists of a Berkeley model 6T-275 submersible pump that is equipped with a 30 horsepower motor. Information from testing conducted shortly after the well was constructed is reported to show the well sustained a yield of 300 gallons per minute with 230 feet of drawdown during a 7 day pumping test. The Berkeley 6T-275 pump is rated to pump between 225 and 250 gallons per minute from the well. The pump curve and specifications for this pump model was furnished to us and is included in Appendix D. The pump was pulled out of the well for the purpose of video-surveying and the depth of the pump was found to be approximately 325 feet.

PHASE 1 – W-LBC STEP-DRAWDOWN TEST

Prior to commencing the 24-hour pumping test, an initial step-drawdown test was conducted at W-LBC, as requested by Mr. Richard Shatz, as a Hydrogeologist consultant for Cal American Water, who expressed concern that excessive pumping rates may adversely effect the well and aquifer if water levels were lowered below the upper screened interval (100 feet below ground surface (bgs)). Therefore, the step drawdown test was conducted about one week prior to the scheduled 24-hour pumping test on June 27, 2005. The step-drawdown began at a pumping rate of 100 gallons per minute (gpm); pumping started at 10:00 AM and ended at 11:20 AM as the water level equilibrated in the LBC well. The first few minutes of the test were actually conducted at a rate much higher than 100 gpm. As a result, the average rate over the 100 gpm rate step was roughly 153 gpm. The second step was 150 gpm, which began at 11:25 AM and ended at 4:25 PM. The pumping level did not stabilize while pumping at 150 gpm; the water level in the pumping well continued to decline throughout this second step. The overall rate of pumping during this step was 156 gpm, which we feel is effectively 150 gpm with regards to the equipment used. Based on the results of the step-drawdown test, we decided to implement a 24-hour pump test at a pumping rate of 100 gpm. The data collected during the step-drawdown test are included in Appendix B.

BACKGROUND WATER LEVELS

The water level of the pumping well, W-LBC, was recorded over the period of two weeks leading up to the pump test. The water level averaged a depth of 44 feet below top of casing (btc) which roughly correlates to an elevation of 116 feet above mean sea level (msl). The top of casing is approximately 14 inches above ground surface. On the day of the initial 24-hour pump test, a Bartley Pump technician proof-tested the pump approximately a half-hour before the start of the test, resulting in a background water level of 45.7 feet btc the morning of the test.

PHASE 2 – INITIAL W-LBC PUMPING TEST

A 24-hour pump test was initiated on the morning of July 5, 2005, at 10:00AM. Prior to the initiation of the pump test, groundwater levels were initially measured at pumping well W-LBC and the off-site monitoring well W-SV. The pumping concluded the following day at 10:00 AM. A flow rate meter and volume discharge meter was attached to the pump. The flow rate was maintained at ±100 gallons/minute. The flow rate was regularly verified by evaluating the measured totalizer data readings. The actual average pumping rate throughout the test, after evaluating the total gallons pumped during the 24 hours, was roughly 106 gpm. The water levels were recorded with an electrical conducting water level meter and were to the nearest hundredth of a foot.

Once the pump test commenced, the depth to groundwater was recorded at W-LBC and W-SV as follows: every minute for the first 10 minutes; every 2 minutes from 10 to 30 minutes; every 5 minutes from 30 to 60 minutes; every 10 minutes from 60 to 120 minutes; every 20 minutes from 120 to 240 minutes; every 30 minutes from 240 to 360 minutes; every 60 minutes from 360 to 720 minutes; and every 120 minutes from 720 to 1,440 minutes. After 24 hours of continuous pumping, a recovery test began immediately following the shut down of the pump. The depth was recorded during recovery in the same intervals as during the pumping test to approximately 95% recovery and then at 24 hours. The field-recorded measurements of the drawdown and recovery, as well as observations and notes, are attached as Appendix B.

The drawdown at the pumping well, W-LBC, after 24 hours of continuous of pumping neared 23 feet and fully recovered following 24 hours of recovery. The observation well, W-SV, showed no significant drawdown from the continuous pumping 1,200 linear feet away.

At the request of Mr. Richard Shatz on behalf of Cal American, ENGEO measured sand content with a Rossum Sand Tester at the beginning and end of the 24-hour pumping test. The results of the sand test yielded few grains of sand, and the total amount of sand recovered fell far below the initial reading line of 1 part per million (ppm). The observations and notes from the sand test are included in Appendix B as part of the test data.

AQUIFER ANALYSIS

Using the pumping and recovery test records, we analyzed the aquifer characteristics, specifically, the transmissivity (**T**) and the storage coefficient (**S**). We have assumed in our analysis, based on previous geotechnical explorations, the aquifer is unconfined and the thickness of the aquifer extends from about 20 to 25 feet bgs to the bottom of the well for a total thickness of roughly 375 feet. The drawdown and recovery data obtained from the aquifer test was used to analyze the aquifer using the Cooper-Jacob and Theis Curve-Matching methods to determine the storage coefficient and transmissivity. A brief explanation of the different methods is included in Appendix B.

Transmissivity (**T**) is the hydraulic conductivity of the full thickness of the aquifer; it is a measure of the aquifer's ability to transmit water (i.e., how permeable it is). The values of transmissivity obtained from different methods of analysis are nearly uniform. The arithmetic mean value of transmissivity is 4,396 gallons per day per foot (gpd/ft), with a range between 3,860 gpd/ft and 4,825 gpd/ft. The geometric mean value of calculated transmissivities is 4,385 gpd/ft. These calculated values are characteristic for the type of materials encountered, such as alluvial materials, and an unconfined aquifer.

The storage coefficient (**S**), or storativity, is the volume of water released from or taken into storage per unit surface area per unit change of the hydraulic head; it is a measure of the aquifer's ability to release groundwater from storage. In typical unconfined aquifers, like the subject site, the value of storativity falls in the typical range of 0.01 and 0.35. Since the observation well felt no effect from the continual pumping in W-LBC, the calculations for storativity were limited. However, by assuming an effective well radius (i.e., the distance from the well where the water level is the same as the water level in the well), we estimate the range of storativity values for the tested aquifer to fall towards the upper bound of the typical range, roughly between 0.15 and 0.35. Further study may be warranted if a tighter range of the value of storativity is desired. (An observation well would have to be installed within 400 feet of W-LBC to successfully obtain the necessary data.)

The following table presents the results of our analysis:

TABLE 2 – Aquifer Characteristics

METHOD OF ANALYSIS	TRANSMISSIVITY **T** gpd/ft	STORAGE COEFFICIENT **S**
Cooper-Jacob Drawdown Method	4,825	0.19
Cooper-Jacob Recovery Method	4,177	N/A
Cooper-Jacob Residual Drawdown Method	4,442	N/A
Cooper-Jacob Calculated Recovery Method	3,860	0.35
Theis Curve Matching Drawdown Method	4,443	0.43
Theis Curve Matching Recovery Method	4,628	0.19

Based on a review of the pumping/recovery test data, the aquifer at the subject site can yield at least 100 gpm or 144,000 gallons per day.

Using the geometric mean value of transmissivity of 4,385 gpd/ft with the Cooper – Jacob modification of the Theis equation, we estimate the theoretical radius of influence may be as great as 600 to 800 feet for W-LBC.

PHASE 3 – SUPPLEMENTAL W-LBC PUMPING TEST

We supplemented our initial W-LBC pumping test with a second pumping test on November 14, 2005, in an effort to determine the adequacy of the well and aquifer. The set-up for this test was identical to the prior test. We pumped the well for over twenty-eight hours at ±80 gpm, roughly equivalent to 150% of the expected demand. No recordings were made at the off-site well W-SV due to the lack of drawdown during the step-drawdown and initial pumping tests at greater pumping rates. The actual average pumping rate throughout the test, after evaluating the total gallons pumped during the length of the test, was roughly 79 gpm. Recovery of the groundwater level was recorded for the following 10 hours. The water levels were recorded with an electrical conducting water level meter and were to the nearest hundredth of a foot. The data for this test are presented in Appendix B.

PHASE 4 – W-SV STEP-DRAWDOWN TEST

As a means to preliminarily assess the capacity of the off-site well W-SV, we conducted a step-drawdown test on November 21, 2005. The set-up for this test was similar to the previous tests. We commenced testing at a rate of 80 gpm and found the groundwater levels to consistently fall. After six hours, we reduced the pumping rate to 60 gpm, and within a few hours of pumping at this lower rate, the groundwater level equilibrated and we halted pumping operations. Recovery of the groundwater level was then recorded over the following 4 hours. The water levels were recorded with an electrical conducting water level meter and were to the nearest hundredth of a foot. The data for this test are presented in Appendix B.

GROUNDWATER AVAILABILITY

Review of the pumping/recovery test data and aquifer analysis indicates that the aquifer at Luther Burbank Center has capacity in excess of the predicted water demands for the proposed project. The yield of well W-LBC is at least 80 gallons per minute, or 115,200 gallons per day. The measurements indicate that the groundwater levels outside the LBC property limits and at the periphery of the property did not change. This indicates that pumping from the W-LBC does not impact the groundwater supply of adjacent properties.

WATER QUALITY

Table 3 provides water quality sample results for the two wells, W-LBC and W-SV, for the initial samples collected in July 2005 and the most recent collected in November 2005. W-LBC was only sampled in July 2005 and both wells were sampled in November 2005. For each of the sampling events, samples were collected during a 24-hour pumping test at three times: at the beginning (1 hour), at the middle (12 hours), and at the end (23 hours). The samples were collected from a tap that was installed near the pump. The samples were labeled, preserved in a chilled cooler, and transported to McCampbell Analytical, Inc., of Pacheco, California, with completed chain-of-custody forms the day following the pumping test.

The initial water quality samples collected in November 2005 were analyzed to collect the following water quality parameters: total hardness as $CaCO_3$, total dissolved solids (TDS), total alkalinity as $CaCO_3$, pH; total silica, electrical conductivity, and manganese, iron, and arsenic. The samples collected in November 2005 included additional metal parameters that were not analyzed in the initial samples and included: total alkalinity, bicarbonate as $CaCO_3$, carbonate as $CaCO_3$, hydroxide as $CaCO_3$, hardness, pH, electrical conductivity, TDS, antimony, arsenic, barium, beryllium, cadmium, total chromium, cobalt, copper, iron, lead, manganese, mercury, molybdenum, nickel, selenium, silver, thallium, vanadium, zinc, and silica.

Analysis of the water quality results indicates that the results from the start, the middle, and the end of each test are similar in value. Additionally, results from the two sampling events conducted in July and November 2005 for well W-LBC are similar in value. The lab results from McCampbell Analytical are included in Appendix C and tabulated in Table 3.

The groundwater sampling results were compared to the California Department of Health Services (DHS) Drinking Water Standard and Secondary Standard Maximum Contaminate Levels (MCLs). For the parameters that were detected in the groundwater samples, the majority were below the DHS MCLs. One exception is manganese. Manganese was detected in all the samples at levels greater than the secondary MCL (SMCL) of 0.05 mg/L. Manganese values for well W-LBC ranged from 1.3 to 1.5 mg/L and for well W-SV ranged from 0.83 to 0.86.

GEOPHYSICAL LOGGING

At the request of Mr. Richard Shatz, Welenco of Bakersfield, Calif., a geophysical logging company, was retained to perform a plumbness and alignment survey, a deviation survey, and a video survey. These activities took place on November 19, 2005. A representative of Cal American, Ms. Julliana Harris of Bookman-Edmonston, was on-site during the operations. The full suite of data and the video are included as Appendix E.

The alignment of the well has come in question by Mr. Richard Shatz. Cal American's acceptable maximum allowable deviation of the well's alignment, according to Mr. Shatz, is two-thirds of the well casing diameter, in our case, approximately 7 inches, per every 100 feet of casing length. The data obtained by Welenco suggests that W-LBC's alignment exceeds this deviation standard. The alignment of the well has little affect on the capacity of the well; its importance regards the diameter of pump that may pass through the casing. Well casings that are extremely out-of-plumb may also affect the rate of wear experienced by a pump, which is an issue of the maintenance of the well.

Mr. Shatz's interpretation of the Welenco data is that the well's alignment results in an effective diameter of 2 inches, meaning that a 2-inch plumb-bob (or smaller) is capable of traversing the entire depth of the well without coming in contact with the casing wall. A low effective diameter suggests that the maintenance and occasional service of the pump within the well may be difficult. The pump, which is situated at approximately 325 feet bgs, was pulled out of the well on November 19, 2005, and resituated a few days later. This exhibits that the alignment of the well allows for the current pump to be lowered through the first 325 feet of well casing with little resistance.

WELL CLEANING

Mr. Richard Shatz has suggested that the well screens are clogged with biological fouling, or biofouling, an accumulation of living and deceased microorganisms, which would require cleaning to provide efficient well production.

The still pictures suggest the biofouling has not caused clogging of the well screen due to encrustation. We reviewed the driller's log to see if the zones of greatest fouling correspond to the lowest water producing intervals. Although our review is limited by the generalities of the depths photographed by Welenco and the vagueness of the driller's lithologic descriptions, we perceive that the zones of greatest biofouling correspond to zones that the driller described as clay.

The Welenco photographs indicate the greatest biofouling existed within the intervals: 158 to 178; 275 to 317, and 358 to 366 feet below ground surface. The driller's log describes these intervals below ground surface as: 160 to 194 being blue and brown clay; 268 to 310 being blue clay with gravel and brown clay; and 328 to 364 being blue clay. These data show a high level of correlation between the zones of greatest biofouling and the clayey layers within the subsurface. This correlation suggests that the biofouling is due to the groundwater's low entrance velocity through the well screen. Entrance velocity should be maintained above 0.1 feet per second to limit clogging as seen in the video.

The biofouling can be reduced by disinfection using bleach or pool chlorine to create a 100 mg/l chlorine solution in the well. This solution would remain in the well for at least four hours, during which light agitation may be applied to the well bore. Following the contact period, the well should be redeveloped. Since the well's alignment is in question, we would recommend the well be carefully developed using airlifting methods. This requires a 2- to 3-inch diameter pipe connected to an air compressor be lowered to the bottom of the well. Application of air creates an aerated water column that results in water being brought to the ground surface. Properly varying the rate of air flow and the pressure will remove the dead biomaterial and clean the screen and filter pack.

Drilling and pump installation companies are well versed at well disinfection and airlift development. We recommend that a video survey to assess the well development results be conducted following the well disinfection and development.

CONCLUSIONS

- The demand of 73,460 gallons per day or 50 gallons per minute is met by the existing production well. The anticipated drawdown of the water table should be less than measured during the test.

- The 24-hour pumping test data indicates that the aquifer at the LBC property has adequate transmissivity and reasonable storage capacity.

- After 24 hours of continuous pumping, the groundwater level measured at the closest adjacent well, W-SV on the Sutter Vineyard property (1,200 feet away), did not change. This indicates that the radius of influence for a 100 gallon per minute pumping rate at W-LBC is much less than

1,200 feet. This clearly indicates that pumping from the well W-LBC does not impact adjacent properties.

- Water quality results from the samples collected from both wells, W-LBC and W-SV, indicate good water quality. There is concern with the manganese concentrations that exceed the California DHS secondary maximum contaminant level. Manganese is not considered to present a risk to human health at the SMCL. EPA does not enforce these "secondary maximum contaminant levels" or "SMCLs." They are established only as guidelines to assist public water systems in managing their drinking water for aesthetic considerations, such as taste, color and odor. Excessive manganese in groundwater will cause the water to be black to brown in color; possible black staining and potential bitter metallic taste.

- The similarity of chemical composition indicated by samples collected from the start, middle and end of the two pumping tests support the interpretation that pumping test data do not indicate aquifer boundary conditions affected the calculation of aquifer T and S.

- If water samples are to be collected from the wells in the future, cation and anion parameters should be included in the requested analysis. These parameters will be used to type the water for each well. This data will be used to determine if the wells are screened in the same aquifer.

- Mr. Richard Shatz, consultant to Cal American, has stated that from his review of the draft of this report that we supplied him, that "the aquifers are capable, there seems to be no issues with water quality, and the construction and materials of the well will work." The outstanding issue, in his opinion, is the alignment of the well. It is our experience that the vertical alignment of a well may pose a number of future considerations, which include:

    - If it is necessary to rehabilitate the well, such work may need to be performed using mechanical scrubbing devices if the screens in the well are clogged; and

    - It is possible that the ability to set the pump within the well at greater depths in the future, if necessary, may be restricted if the well deviation is excessive.

It should be noted that to assess these above items, it is possible to check the well for alignment at a later time prior to final acceptance.

We were pleased to be of continued service to you on this project. If you have any questions or comments regarding this letter, please call and we will be glad to discuss them with you.

Very truly yours,

Figure B-4: Drawdown during W-LBC Pump Test @ 100gpm

AQUIFER ANALYSIS METHODOLOGIES

We have calculated the theoretical values of transmissivity and storativity in using the Cooper-Jacob and Theis Curve-Matching methods.

Cooper-Jacob Method

$$T = \frac{264Q}{\Delta s} \qquad S = \frac{0.3T \cdot t_0}{r^2}$$

...where T is the transmissivity in gpd/ft, Q is the flow discharge in gpm, Δs is the drawdown over one time-cycle in feet, S is the storativity, t_0 is the time at which a straight-line extension of the drawdown curve intersects with zero drawdown in days, and r is the distance from the well where the drawdown occurred in feet.

Theis Curve-Matching Method

$$T = \frac{Q \cdot W(u)}{4\pi \cdot s} \qquad S = \frac{4T \cdot t \cdot u}{r^2}$$

...where T is the transmissivity in cubic meters per second per meter, Q is the flow discharge in cubic meters per second, s is the drawdown in meters and t is the time in seconds from one point on the drawdown graph, W(u) is the well function and u is a parameter from the corresponding point on the well function graph, S is the storativity, and r is the distance from the well the drawdown occurred.

Maximum Radius of Influence

We have calculated the theoretical maximum radius of influence from the pumping of W-LBC using Cooper and Jacob modification of the Theis equation as follows:

$$s = \frac{264Q}{T} \log \frac{0.3Tt}{r^2 S}$$

...where *s* is equal to the maximum available drawdown in feet, Q is equal to the discharge in gpm, *T* is equal to the transmissivity in gpd/ft, t is equal to the time in days, *r* is equal to the radius from the well in feet, and *S* is equal to the storativity which is dimensionless.

Invoice Total: $486.00

If paid by**08/13/05** Prompt Pay Invoice Total = $437.40

*** ALL FAXED INVOICES ARE FOR YOUR INFORMATION ONLY - PLEASE PAY OFF ORIGINAL**

Please include the invoice number with your check and remit to Accounts Receivable at the letter head address. MAI also accepts credit card (Visa/Master Card/Discover/American Express) payment. Please call Account Receivable for details on this service.

MAI's EDF charge does not include the EDF charge for subcontracted analyses. The minimum EDF charge per workorder is $25.00. For invoice total greater than $5000.00, EDF will be 2% of the total invoice. The EDF charge for subcontracted analyses will be identical to Subcontractor's fee.

Terms are net 30 days from the invoice date. After this period 1.5% interest per month will be charged. Overdue accounts are responsible for all legal and collection fees. If you have any questions about billing, please contact Accounts Receivable at McCampbell Analytical.

	Client P.O.:	Date Completed:	07/15/05

WorkOrder: 0507082

July 15, 2005

Dear Jeff:

Enclosed are:

1). the results of 3 analyzed samples from your **#6486.2.005.01; Sutter project,**

2). a QC report for the above samples

3). a copy of the chain of custody, and

4). a bill for analytical services.

All analyses were completed satisfactorily and all QC samples were found to be within our control limits. If you have any questions please contact me. McCampbell Analytical Laboratories strives for excellence in quality, service and cost. Thank you for your business and I look forward to working with you again.

Yours truly,

Angela Rydelius, Lab Manager

MS = Matrix Spike; MSD = Matrix Spike Duplicate; LCS = Laboratory Control Sample; LCSD = Laboratory Control Sample Duplicate; RPD = Relative Percent Deviation.

% Recovery = 100 * (MS-Sample) / (Amount Spiked); RPD = 100 * (MS - MSD) / ((MS + MSD) / 2).

MS / MSD spike recoveries and / or %RPD may fall outside of laboratory acceptance criteria due to one or more of the following reasons: a) the sample is inhomogenous AND contains significant concentrations of analyte relative to the amount spiked, or b) the spiked sample's matrix interferes with the spike recovery.

N/A = not applicable to this method.

NR = analyte concentration in sample exceeds spike amount for soil matrix or exceeds 2x spike amount for water matrix or sample diluted due to high matrix or analyte content.

* ALL FAXED INVOICES ARE FOR YOUR INFORMATION ONLY - PLEASE PAY OFF ORIGINAL

Please include the invoice number with your check and remit to Accounts Receivable at the letter head address. MAI also accepts credit card (Visa/Master Card/Discover/American Express) payment. Please call Account Receivable for details on this service.

MAI's EDF charge does not include the EDF charge for subcontracted analyses. The minimum EDF charge per workorder is $25.00. For invoice total greater than $5000.00, EDF will be 2% of the total invoice. The EDF charge for subcontracted analyses will be identical to Subcontractor's fee.

Terms are net 30 days from the invoice date. After this period 1.5% interest per month will be charged. Overdue accounts are responsible for all legal and collection fees. If you have any questions about billing, please contact Accounts Receivable at McCampbell Analytical.

August 31, 2005

Dear Jeff:

Enclosed are:

1). the results of **3** analyzed samples from your **#6486.2.005.01; Sutter project,**

2). a QC report for the above samples

3). a copy of the chain of custody, and

4). a bill for analytical services.

All analyses were completed satisfactorily and all QC samples were found to be within our control limits. If you have any questions please contact me. McCampbell Analytical Laboratories strives for excellence in quality, service and cost. Thank you for your business and I look forward to working with you again.

Yours truly,

Angela Rydelius, Lab Manager

BATCH 16945 SUMMARY

Sample ID	Date Sampled	Date Extracted	Date Analyzed	Sample ID	Date Sampled	Date Extracted	Date Analyzed
0507082-001A	7/05/05 11:00 AM	7/07/05	7/09/05 6:50 AM	0507082-002A	7/05/05 10:00 AM	7/07/05	7/09/05 7:11 AM
0507082-003A	7/05/05 9:00 AM	7/07/05	7/09/05 7:32 AM				

MS = Matrix Spike; MSD = Matrix Spike Duplicate; LCS = Laboratory Control Sample; LCSD = Laboratory Control Sample Duplicate; RPD = Relative Percent Deviation.

% Recovery = 100 * (MS-Sample) / (Amount Spiked); RPD = 100 * (MS - MSD) / ((MS + MSD) / 2).

MS / MSD spike recoveries and / or %RPD may fall outside of laboratory acceptance criteria due to one or more of the following reasons: a) the sample is inhomogenous AND contains significant concentrations of analyte relative to the amount spiked, or b) the spiked sample's matrix interferes with the spike recovery.

N/A = not applicable to this method.

NR = analyte concentration in sample exceeds spike amount for soil matrix or exceeds 2x spike amount for water matrix or sample diluted due to high matrix or analyte content.

*** ALL FAXED INVOICES ARE FOR YOUR INFORMATION ONLY - PLEASE PAY OFF ORIGINAL**

Please include the invoice number with your check and remit to Accounts Receivable at the letter head address. MAI also accepts credit card (Visa/Master Card/Discover/American Express) payment. Please call Account Receivable for details on this service.

MAI's EDF charge does not include the EDF charge for subcontracted analyses. The minimum EDF charge per workorder is $25.00. For invoice total greater than $5000.00, EDF will be 2% of the total invoice. The EDF charge for subcontracted analyses will be identical to Subcontractor's fee.

Terms are net 30 days from the invoice date. After this period 10% interest will be charged annually. Overdue accounts are responsible for all legal and collection fees. If you have any questions about billing, please contact Accounts Receivable at McCampbell Analytical.

ENGEO Incorporated 690 Walnut Avenue, Suite 220 Mare Island, CA 94592	Client Project ID: #6486.2.005.01; Sutter	Date Sampled: 11/21/05 Date Received: 11/22/05
	Client Contact: Jeff Wisnienski	Date Reported: 11/30/05
	Client P.O.:	Date Completed: 11/30/05

WorkOrder: 0511426

November 30, 2005

RECEIVED
DEC 02 2005

Dear Jeff:

Enclosed are:

1). the results of 3 analyzed samples from your **#6486.2.005.01; Sutter project,**

2). a QC report for the above samples

3). a copy of the chain of custody, and

4). a bill for analytical services.

All analyses were completed satisfactorily and all QC samples were found to be within our control limits. If you have any questions please contact me. McCampbell Analytical Laboratories strives for excellence in quality, service and cost. Thank you for your business and I look forward to working with you again.

Yours truly,

Angela Rydelius, Lab Manager

0511426-003D	11/21/05 6:00 PM	11/22/05	11/30/05 3:00 PM				

MS = Matrix Spike; MSD = Matrix Spike Duplicate; LCS = Laboratory Control Sample; LCSD = Laboratory Control Sample Duplicate; RPD = Relative Percent Deviation.

% Recovery = 100 * (MS-Sample) / (Amount Spiked); RPD = 100 * (MS - MSD) / ((MS + MSD) / 2).

MS / MSD spike recoveries and / or %RPD may fall outside of laboratory acceptance criteria due to one or more of the following reasons: a) the sample is inhomogenous AND contains significant concentrations of analyte relative to the amount spiked, or b) the spiked sample's matrix interferes with the spike recovery.

N/A = not applicable to this method.

NR = analyte concentration in sample exceeds spike amount for soil matrix or exceeds 2x spike amount for water matrix or sample diluted due to high matrix or analyte content.

MS / MSD spike recoveries and / or %RPD may fall outside of laboratory acceptance criteria due to one or more of the following reasons: a) the sample is inhomogenous AND contains significant concentrations of analyte relative to the amount spiked, or b) the spiked sample's matrix interferes with the spike recovery.

N/A = not applicable to this method.

NR = analyte concentration in sample exceeds spike amount for soil matrix or exceeds 2x spike amount for water matrix or sample diluted due to high matrix or analyte content.

Plumbness and Alignment Interpretation Package

Prepared Especially For

ENGEO

W-LBC

November 19, 2005

This Plumbness and Alignment Interpretation Package represents our best efforts to provide a correct interpretation. This package is prepared for informational purposes only and is based on our best interpretation of The American Water Works Association, ANSI/AWWA A100-97, Appendix D - "Plumbness and Alignment - Procedure Testing", Dated February 1, 1998. According to the Standard, this procedure is for informational purposes only and is not a part of AWWA A-100. Therefore, Welenco does not guarantee the reliability of this procedure and cannot be held responsible for any errors in this procedure. The data used in our interpretation was not obtained using the AWWA "Apparatus Required For Plumbness and Alignment Tests". Since all interpretations are opinions based on mathematical calculations, and inferences from electrical or other types of measurements, we cannot and do not guarantee the accuracy or correctness of any interpretation, and we shall not be liable or responsible for any loss, costs, damages, or expenses incurred or sustained by Customer resulting from any interpretation made by this document. Welenco does not warrant or guarantee the accuracy of the data, specifically including (but without limitations) the accuracy of data transmitted by electronic process, and Welenco will not be responsible for accidental or intentional interception of such data by third parties. Welenco employees are not empowered to change or otherwise modify the attached interpretation. By accepting this Plumbness and Alignment Interpretation Package, the Customer agrees to the foregoing, and to the General Terms and Conditions of Welenco.

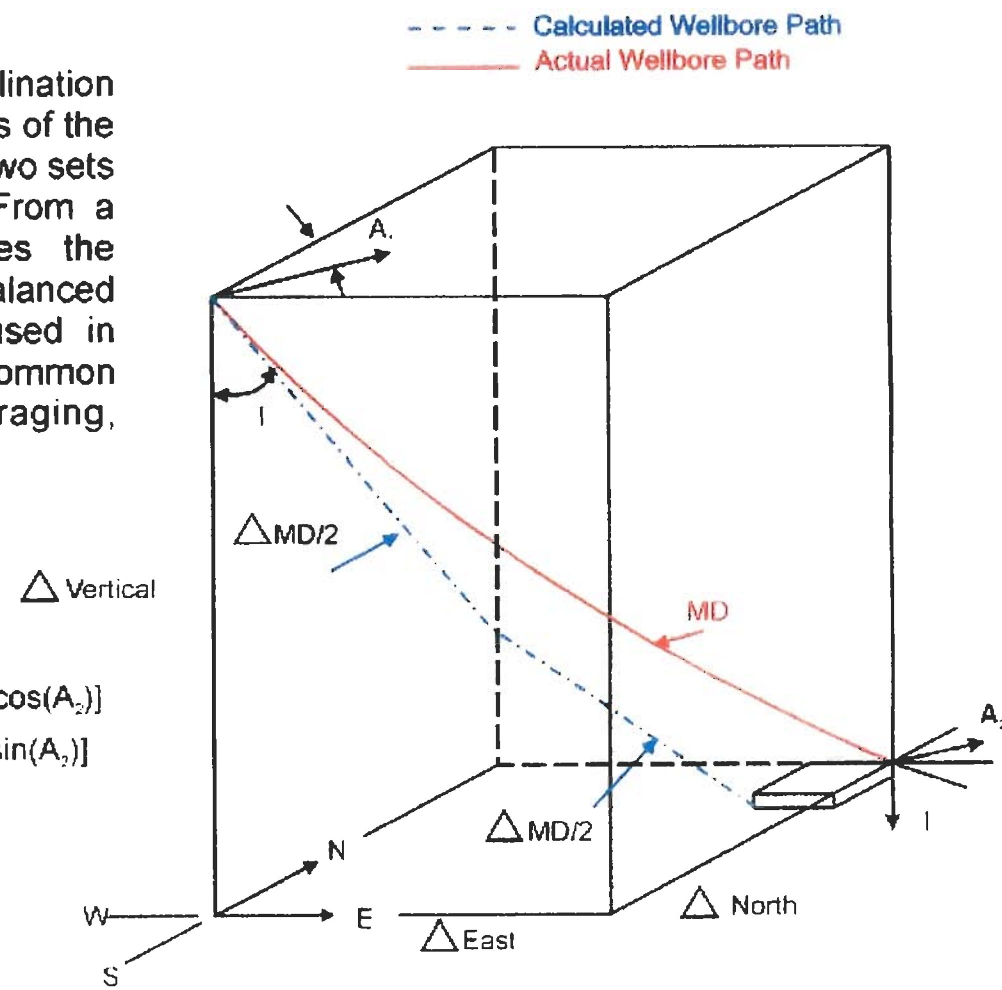
Balanced Tangential Method

The Balanced Tangential Method uses the inclination and direction angles at the upper and lower ends of the course length in a manner so as to balance the two sets of measured angles over a course length. From a theoretical standpoint, this method combines the trigonometric functions to provide the average balanced inclination and direction angles, which are used in standard computational procedures. Other common names for this method are Vector Averaging, Acceleration, and Trapezoidal.



Δ North = [ΔMD/2] x [sin(I_1) x cos(A_1) + sin(I_2) x cos(A_2)]

Δ East = [ΔMD/2] x [sin(I_1) x sin(A_1) + sin(I_2) x sin(A_2)]

Δ Vertical = [ΔMD/2] x [cos(I_2) + cos(I_1)]

Subject: Proposed Water Well Supply System
Sutter Medical Center of Santa Rosa
Sonoma County, California

GROUNDWATER STUDY

Dear Ms. Sponamore:

With your authorization, we completed this groundwater study for the proposed Sutter Medical Center of Santa Rosa, located in Sonoma County, California. The accompanying report presents our findings together with our conclusions regarding the potential cumulative impacts on the local groundwater resources related to increased water use by the proposed medical facility. We would like to thank Todd Engineers for providing third-party peer review of the report and our findings. We would also like to thank Sonoma County officials for their guidance in developing this study.

Sincerely,

ENGEO Incorporated

1.0 EXECUTIVE SUMMARY

1.1 BACKGROUND AND PURPOSE

The proposed Sutter Medical Center (SMC) site is located at 50 Mark West Springs Road in an unincorporated area of Sonoma County, California (Figure 1). As part of the development plans for the medical facility, two new water supply wells are planned at the site. The water supply wells are intended to meet the water demand for the proposed medical facility and irrigation needs of the SMC property. The wells are to be operated as an independent water supply well system with on-site water treatment facilities maintained by SMC. It is our understanding that one of the wells will serve as the primary well to provide the estimated water demand for the proposed medical center and the second well will serve as a backup well in cases where maintenance is required for the primary water supply well. It is also our understanding that the estimated water demand from the proposed primary water supply well will be approximately 58 AFY (acre-feet per year) which equates to a pump rate of around 60 gallons per minute for a little over 14 hours per day.

This report has been prepared in support of the Environmental Impact Report (EIR) for the proposed medical center in an effort to assess the potential use of groundwater to supply estimated water demand for the medical centers and to evaluate the potential impacts of a new water supply well at the site. Additionally, we have also considered potential long-term build out affects on the groundwater basin through 2030.

This report addresses the following issues:

- The hydrogeologic setting of the proposed well.
- Potential impacts to local surrounding wells, local surface waters, and aquatic habitat.
- Potential impacts on the groundwater in the surrounding developments.
- Current state of equilibrium within the water balance.
- Potential growth impacts on the water balance through 2030.

1.2 PROPOSED SUTTER MEDICAL CENTER MUNICIPAL WELL

The proposed Sutter Medical Center is located within the Larkfield District water system (Figure 2), which is currently owned and operated by the Cal-American Water Company (Cal-Am). Cal-Am currently pumps groundwater from four wells in the Larkfield district (Larkfield 1A, 3A, 4A and 5). It is our understanding that to provide for the additional water demand for the proposed Sutter Medical Center, a private water supply well is proposed at the project site. The projected water demand for the proposed medical center is approximately 58 AFY.

1.3 STUDY AREA

The selected study area encompasses a roughly 5,840-acre portion of the Mark West Creek watershed. This area extends from the Mark West development to the east towards Laguna de Santa Rosa (Laguna) Creek to the west. The study area was based on topographic contours in the vicinity of the creek and watershed boundaries and contains a substantial amount of agricultural acreage, in addition to the communities of Larkfield-Wikiup and Fulton.

Groundwater is an important source of water for both domestic and agriculture uses within the study area. Cal-Am distributions are the primary water source for the urbanized portion of the study area (Mark West and Fulton). Cal-Am distributes water pumped from its wells and imported water deliveries that it receives from the Sonoma County Water Agency (SCWA). The majority of the study area that is located west of Highway 101 is not within the Larkfield district water system. This area is predominantly agricultural and relies on privately owned wells for irrigation and rural domestic water use. In addition, some reclaimed water is imported to the western portion of the study area for agricultural uses from both the City of Santa Rosa and the Airport-Larkfield-Wikiup treatment plant.

The primary aquifers within the study area comprise the Pleistocene and Holocene alluvial fan and fluvial terrace deposits, the Plio-Pleistocene Glen Ellen Formation and the Pliocene and late Miocene Wilson Grove Formation (Merced Formation, Cardwell, 1958). The Glen Ellen formation will be the primary source of groundwater for the proposed SMC Well.

1.4 WATER BALANCE

We conducted a month-by-month soil moisture water balance for the study area to determine the approximate balance between water inflows and outflows. We used evapotranspiration data available from the California Irrigation Management Information System (CIMIS) station in Windsor to determine agricultural water demands for the study area. We used National Oceanic and Atmospheric Administration rainfall data to determine total precipitation and net recharge to the groundwater basin. We incorporated interception values, surface water runoff rates, and residential water demand to develop a comprehensive water balance.

1.5 FUTURE BUILD-OUT SCENARIO

In addition to analyzing the existing conditions water balance, we studied the potential impacts of the future build-out scenario in 2030. Sonoma County provided build-out information showing that in 2030 there will be approximately 467 residences within the study area. We quantified the potential impacts of these additional residences on future water demands. We also considered water conservation measures that may be used in the future. We assumed that increases in agricultural lands will be negligible.

1.6 CONCLUSIONS

Based on the results of the analysis, and the review of existing policy documents that create a management framework for groundwater extraction in the study, we conclude the following for the existing conditions.

- Groundwater is a potential potable water source for the proposed Sutter Medical Center development. In that particular portion of Sonoma County, groundwater serves the needs of many residents and a variety of land uses.

- A water balance for the current conditions covering a study period between 1987 and 2007 indicates that inflows and outflows within the study area are at a near balance with estimated inflows of around 2,830 acre-feet per year (AFY) and estimated outflows of 2,840 AFY. This appears to indicate a small net negative change in storage around 10 AFY. It should be noted that very often data and measurements in hydrology are imperfect and have margins of error of 5% or more. Recognizing that this total contains a margin of error and is derived from imperfect data, we conclude that the total is well within the margin of error typical for a study of this type and indicative of a net balance. This is further supported by hydrograph data within the study area that indicates relatively stable to slightly increasing water levels during the study period.

- The existing groundwater basin below the proposed hospital is in an equilibrium state with regard to inflows and outflows. Minor changes to the groundwater balance caused by the proposed well pumping will likely include a small decline in storage around the pumping wells and interception of subsurface outflows.

- The Sonoma County Water Agency and the City of Santa Rosa recognize the importance of groundwater as a resource and have prepared several policy level documents to manage future water resources in the region. Future groundwater development will be guided by City and County policy.

- In general, water quality within the Santa Rosa Plain Subbasin is considered good (DWR 1982). More locally, the groundwater sampling results from existing wells at the subject site (ENGEO, 2006) indicated that the majority of samples were below the California Department of Health Services (DHS) Drinking Water Standards and Secondary Standard Maximum Contaminant Levels (MCLs).

- While the conducted calculations provide numerical estimations of the current net changes in storage (namely, -10 AFY), we recognize that this figure is an annual average and masks the yearly fluctuations inherent to a dynamic groundwater basin system. These systems are capable of responding to external changes such as drought years or wet years to achieve new equilibrium balance points. With the addition of the proposed well, the groundwater basin will adjust to achieve a new stable equilibrium point; groundwater levels in the vicinity of well will drop slightly to accommodate the new pumping and reach a new equilibrium contour configuration. In our opinion, addition of the proposed Sutter well pumping is not likely to adversely affect the ability of the groundwater basin to achieve a stable equilibrium condition.

- Based on the assessment of potential drawdown and the radius of influence for the proposed Sutter Medical Center well, its additional pumping does not represent a significant adverse impact on existing private wells in the local vicinity.

- Based on our calculations for the future build-out scenario in 2030, we estimate an approximate increase in groundwater demand of 168 AFY. This would include a 20% per capita reduction in water use by 2020, as recommended by the Governor of California.

2.0 INTRODUCTION

2.1 BACKGROUND

ENGEO Incorporated has prepared this groundwater study on behalf of P.R.I.S.M. LLC for two proposed groundwater supply wells associated within the proposed Sutter Medical Center (SMC) to be located north of Santa Rosa, California. The proposed Sutter Medical Center site is located at 50 Mark West Springs Road in Santa Rosa, Sonoma County, California (Latitude of 38.4953 degrees North; Longitude of 122.7520 degrees West). The approximate site location is shown on the Site Vicinity Map (Figure 1). The current hospital development includes a 2-story Medical Center Bed Tower and Diagnostic and Treatment (D&T) structure, a 3-story Joint Venture (JV) Bed Tower, a Surgery Wing structure, and associated maintenance structures.

The proposed Sutter Medical Center is located within the Larkfield District water system (Figure 2), which is currently owned and operated by California American Water Company (Cal-Am). Cal-Am currently pumps groundwater from four wells in the Larkfield District (Larkfield 1A, 3A, 4A and 5). The four wells, in addition to supplies from the Sonoma County Water Agency (SCWA), are used to meet the current demands within the Larkfield District (Santa Rosa General Plan, 2008). Additional water demand for the proposed Sutter Medical Center will be provided by a new private water supply well and a backup well proposed at the project site. The water supply wells will be independently owned and operated by SMC. The project's daily and peak flow water demand is based upon calculations that include demand from all the project components. This information is provided in units of gallons per day and is detailed in the Brelje & Race Consulting Engineers' Water and Wastewater Services Report, New Replacement Hospital Project, Sutter Medical Center of Santa Rosa, November 16, 2009, and more recent irrigation projections provided by the landscape architect for the project (Quadriga, November, 2009). Groundwater assessment to determine the suitability of the water basin evaluated long-term needs and this demand is presented in AFY (acre-feet per year). For the purpose of this study, we have assumed that the overall volume of water to be pumped from the proposed wells annually will be approximately 58 AFY.

The proposed SMC Wells are located within an area of the Santa Rosa Plain Sub-Basin generally referred to as the Larkfield Storage Unit (DWR 1975). In general, the Larkfield Storage Unit comprises three known aquifers that are referred to as Shallow, Intermediate, and Deep. The sources of groundwater for the Larkfield District Wells are the Intermediate and Deep aquifers. The source of groundwater for the proposed SMC wells will also likely be the Intermediate and Deep Aquifers. Based on the geology of the water-bearing formations in the area, the two lower aquifers appear to be semi-confined to confined and connected on a regional scale.

2.2 PURPOSE AND SCOPE

The purpose of this study is to support the groundwater-related portions of the Environmental Impact Report (EIR) for the proposed Sutter Medical Center. This groundwater study evaluates the following issues related to the proposed water supply well:

- The suitability of the proposed well to provide sufficient water quantity and quality for the hospital.
- Potential impacts to existing operating wells in the study area.
- Potential cumulative impacts to groundwater quality and long-term supply assuming reasonably foreseeable future growth in the study area, based on Sonoma County General Plan.

2.3 STUDY AREA

The project site is located near the boundary between two sub-watersheds of the Laguna de Santa Rosa Watershed (Figure 3). The proposed SMC water supply well system is located near the southern boundary of the western portions of the Mark West Creek watershed. The proposed Sutter Medical Center site is located across the watershed divide that separates the lower Mark West Creek watershed from the smaller Piner Creek watershed. For the purpose of this study, the study area is defined as the portion of the Mark West Creek watershed that overlies the Santa Rosa plain sub-basin as defined by DWR Bulletin 118, plus the portion of the Piner Creek watershed in the vicinity of the project site (Figure 3). The study area encompasses approximately 5,840 acres (roughly 7% of the area of the Santa Rosa Plain Subbasin) and generally occupies a relatively flat area in the northern portion of the Santa Rosa Plain. The proposed Sutter Medical Center and associated water supply well system site is located on an alluvial fan near the eastern edge of the study area.

3.0 HYDROGEOLOGIC SETTING

3.1 LOCATION

The study area is located in the northwestern portion of the Laguna de Santa Rosa watershed and more specifically represents the western portion of the watershed for Mark West Creek. Mark

West Creek generally flows westward towards the Laguna de Santa Rosa, located near the western edge of the Santa Rosa Plain. Topographically, the study area is relatively flat with an average topographic gradient towards the west-southwest of approximately 0.3%. Elevations within the study area range from near 200 feet above mean sea level near the base of the hills (MSL) at the eastern boundary to approximately 50 feet MSL at the western boundary near the Laguna de Santa Rosa.

Sub-watersheds of Santa Rosa Creek and the Laguna de Santa Rosa border the study area on the south. These sub-watersheds include the Piner Creek and Abramson Creek watersheds, which drain southwest towards Santa Rosa Creek. A sub-watershed of the Laguna de Santa Rosa containing Olivet Creek and designated as "unknown" also borders the southern boundary of the study area (Hargreaves 2002). The watershed for Windsor Creek borders the northern boundary of the study area. Due to the generally flat and subdued topography within the Santa Rosa Plain, the watershed divides are relatively subtle.

3.2 REGIONAL AND LOCAL GEOLOGY

The site is located within the Coast Ranges geologic province of California, a series of northwest-trending ridges and valleys. Bedrock in the province has been folded and faulted during regional uplift beginning in the Pliocene period, about 4 million years before present. Locally, the site is mapped as underlain by Holocene-alluvium as shown on Figures 4 and 5 (McLaughlin et al., 2008; Graymer, 2006; Blake, 2002; Wagner and Bortugno, 1982; Cardwell, 1958). This alluvium consists of unconsolidated deposits of sand, silt, gravel, and clay derived from the bedrock uplands to the east and older unconsolidated deposits. The alluvial deposits in this area are typically greater than 100 feet in thickness. Underlying the Holocene-alluvium is the Glen Ellen Formation (Cardwell, 1958). The Glen Ellen Formation was deposited during late Pliocene and early Pleistocene time as alluvial fans shed from the east towards shallow bays or lagoons (Cardwell, 1958). The Glen Ellen Formation typically comprises lenticular beds of poorly sorted gravel, sand, silt and clay. As is characteristic of alluvial fan deposits, individual beds vary widely in thickness, are not horizontally continuous, and typically grade into one another over short distances. Locally underlying and interfingering with the Glen Ellen Formation are the late Pliocene Wilson Grove (Merced) Formation and, in some instances, the Sonoma Volcanics (McLaughlin et al., 2008; Graymer, 2006; Blake, 2002; Wagner and Bortugno, 1982; Cardwell, 1958). The marine Wilson Grove Formation generally comprises massive sandstone with thin claystone and siltstone interbeds and occasional gravels lenses (Cardwell, 1958). The Glen Ellen and Wilson Grove formations are the primary water-bearing formations in the study area.

3.3 SOILS

According to the USDA Web Soil Survey (Figure 6), the predominant mapped soil units within the study area generally consist of the following:

TABLE 1
Study Area Soils

MAPPED UNIT NAME	HYDROLOGIC SOIL GROUP	AVAILABLE WATER CAPACITY (inches)	APPROXIMATE PERCENTAGE OF STUDY AREA
Huichica Loam	C	3.8	22.95
Huichica Loam	D	2.8	21.34
Yolo Silt	B	10.6	16.48
Zamora Silty Clay Loam	B	10	10.42
Yolo Clay	B	9.7	7.41
Yolo Loam	B	9.6	7.23
Riverwash	D	1.8	4.04
Cortina Very Gravelly Sandy Loam	A	4	2.65
Yolo Loam Overwash	B	10.6	2.32
Alluvial Land, Clayey	C	6.6	1.53
Clear Lake Clay, Ponded	D	9	0.76
Yolo Sandy Loam	B	9.2	0.70
Felta Very Gravelly Loam	B	4.4	0.69
Haire Clay Loam	C	7.3	0.68
Yolo Sandy Loam	B	9	0.27
Spreckels Loam	C	4.6	0.20
Pajaro Clay Loam	C	8.9	0.09
Goulding Cobbly Clay Loam	D	1.5	0.02

The table above provides data both for soil moisture holding capacity and USDA hydrologic soil group for each soil type. The soil moisture holding capacity represents the amount of water that a typical total depth of each soil type can hold in inches; this moisture holding capacity is assumed for the entire mapped extent of each soil in the study area. For the soil moisture water balance, an area-weighted average moisture holding capacity was applied to the study area and used in the calculations to determine the distribution of rainfall into evapotranspiration, runoff, and recharge, and to estimate applied water for agriculture.

In addition to the soil moisture holding information, the spreadsheet also contains USDA soil group information. The USDA soil survey categorizes soils into four Hydrologic Soil Groups (A, B, C, and D) based on estimates of runoff potential. The Hydrologic Soil Groups (HSG) are defined as follows:

- Group A soils have low runoff potential, are well drained, and have high infiltration rates when saturated.

- Group B soils have moderate infiltration rates when saturated, are well to moderately well drained and thus have a moderate potential for runoff.

- Group C soils have slow infiltration rates when saturated, and consist of soils having a layer that impedes the downward movement of water.

- Group D soils have a high potential for runoff, and very slow infiltration rates when saturated.

As shown in the table above, study area soils are predominantly B soils (approximately 46% of the area). Approximately 26% and 25% of the study area is underlain by soils of the D and C HSGs, respectively, while A soils compose only a small fraction of the study area. The preponderance of B type soils indicates that a significant portion of the study area has soils with moderate infiltration rates. This demonstrated capacity for infiltration coupled with the observation that the study area is primarily flat is pertinent to the discussion of rainfall recharge rates, as discussed in the Water Balance section.

3.4 DWR-DESIGNATED AREAS OF SIGNIFICANT GROUNDWATER RECHARGE

The eastern portion of the study area occupies an alluvial fan that slopes gently towards the west from its apex near the location where Mark West Creek flows from the Mayacama Mountains out onto the Santa Rosa Plain (McLaughlin et al., 2008, Sowers et al. 1998). A large portion of this alluvial fan, as well as significant portions of the Santa Rosa Plain south of Mark West Creek (Figure 7), have been designated as areas of significant natural recharge by the California Department of Water Resources (DWR, 1982). According to the 1982 DWR study, recharge areas have been classified based on slope and soil permeability with areas of recharge designated as those with less than a 15% slope coupled with soils with infiltration rates greater than 0.6 inch/hour (1.5 cm/hr). Areas of slow recharge are designated as those with slopes greater than 15% or areas where soil infiltration rates are less than 0.6 inch/hour (1.5 cm/hr).

While acknowledging the DWR documentation of areas of significant recharge, soils data for the area demonstrate that the entire study area is underlain by alluvial soils that provide some amount of recharge to groundwater. Moreover, the relatively flat slopes within the study area result in significant recharge capabilities by slowing runoff and allowing water to percolate into the groundwater basin. The water balance therefore considers potential recharge across the entire study area and does not rely on the DWR designated recharge areas.

3.5 CLIMATE

The primary inflow component in our water balance equation is precipitation. Monthly rainfall data from 1987 to 2009 were acquired from the National Oceanic and Atmospheric

Administration rainfall gauge in Santa Rosa. Figure 8 shows the station location. Annual rainfall totals are provided in Table 1 in Appendix A. As shown, the study period includes average, wet, and dry years. Water years 1995, 1998, and 2006 are each significantly wetter than average, with rainfall totals ranging from 45.72 inches to 52.94 inches. Significant drought years are represented by the period from water year 1987 to 1990 (average rainfall 22.26 inches), with other low rainfall years occurring in 1994, 2001, and 2007 (20.75 to 21.39 inches). By including years with both above- and below-average rainfall, the study period is representative of long-term hydrologic conditions.

Review of the Sonoma County Water Agency isohyetal (rainfall distribution map) indicates that rainfall is about 32 inches in the central portion of the study area and increases to about 35 inches to the east and west. For the purposes of this water balance, the distribution of precipitation is assumed to be uniform across the study area.

It was also assumed that precipitation falling on impervious surface areas in urban areas would not be available for infiltration and therefore would not contribute to the water balance. In rural agricultural areas, it was assumed that precipitation falling on impervious surfaces would flow onto pervious surfaces and become available for infiltration.

Of the rainfall that occurs in the study area, only a portion ultimately becomes groundwater recharge. Rainfall is lost to the atmosphere both through interception and evapotranspiration, and the remaining rainfall is partitioned between runoff into Mark West Creek and recharge into the groundwater basin. Evapotranspiration reflects the amount of water that plants consume and return to the atmosphere either through transpiration or evaporation. Evaporation occurs from the soil and plant surfaces, while transpiration occurs from plant tissues, and evapotranspiraton is the combination of the two. Evapotranspiration rates vary based on the type of vegetation.

For the purposes of the water balance, evapotranspiration rates were estimated based on data acquired from the California Irrigation Management Information System (CIMIS) database of monthly evapotranspiration amounts (Table 2, Appendix A). The CIMIS gauge closest to the study area is in Windsor (Figure 8). Monthly evapotranspiration data are available from 1991 to present, but not for water years 1987-1991. For these years, monthly evapotranspiration were estimated using data from years with similar rainfall amounts. Crop-specific evapotranspiration information was obtained from California Department of Water Resources to take into consideration the different crop types within the study area (Table 3, Appendix A).

3.6 LAND USE

Current land uses within the study area were determined based on the 1999 DWR land use survey (Figure 9). The DWR survey provides actual acreages of land use types such as native vegetation, vineyards, deciduous tree crops, truck crops, urban areas, and commercial areas (Table 4, Appendix A).

Current land use in the study area generally consists of agriculture and rural residential west of Highway 101 and low- and medium-density residential areas, with scattered business and commercial land/minor agriculture east of Highway 101. The most extensive land use within the study area is agriculture, which mainly consists of vineyards in the west and central portions of the study area west of Highway 101. Vineyards cover approximately 40% of the study area, while native vegetation covers approximately 24% of the study area. Other crops such as deciduous trees, corn, hay, and truck crops cover an additional 7% of the study area. Approximately 22% of the study area is classified as urban, residential, industrial, and commercial. The remaining acreage is pasture, riparian vegetation, and idle land. The complete acreages for the DWR land use designations are summarized in Table 4. For the purposes of this study, it is assumed that 1999 agricultural land uses are reasonably representative of the study period, recognizing that irrigated agriculture was less extensive in 1987 than in 1999 or 2007.

3.7 RESIDENTIAL WATER DEMAND AND SUPPLY

The portion of the study area east of Highway 101, as well as the Community of Fulton, are within the Larkfield District water system service area, which is served by Cal-Am. The portion of the study area located west of Highway 101 is generally rural and, with the exception of the community of Fulton, relies on private wells for domestic and agricultural water supply.

The study area includes the southern half of the Cal-American operated Larkfield District (Figure 2). According to the State of California Department of Public Health (Drinking Water), Cal-Am currently services 2,357 connections within the Larkfield District water system and approximately 1,229 of those connections are within the subject study area (EPS 2007).

Cal-Am meets the demand within its service area with the four wells it operates within the District (Larkfield 1A, 3A, 4A and 5) and with water purchased from the Sonoma County Water Agency (SCWA). The annual groundwater production from the Cal-Am wells and the water purchased from SCWA are summarized in the table below.

TABLE 2
Larkfield District Water Sources

CALENDAR YEAR	1997	1998	1999	2000	2001	2002	2003	2004	2005	2006	2007
Cal-Am Annual Groundwater Production (AFY) – (Santa Rosa General Plan 2035)	616	775	690	843	867	688	856	831	763	642	677
Sonoma County Water Agency (SCWA) Supplies to Cal American (AFY)	661	580	569	494	437	614	388	533	506	522	575
Total for Larkfield District (AFY)	1276	1355	1259	1337	1304	1302	1244	1364	1269	1164	1252

Water deliveries from Cal–Am in the Larkfield District have averaged approximately 1284 AFY over the period 1997 through 2007. Cal-Am pumping data for 1987 through 1997 were not available. In order to assess the pumping volumes for those years, US census data for the area was applied to estimate population growth between 1990 and 2000. The estimated population growth was correlated with Cal-Am pumping to approximate values for 1987 through 1997.

In general, rural and agricultural areas not within the Cal-Am water system service area are dependent on private wells for both domestic and agricultural water supply. Water use in these areas was estimated based on typical rural domestic water use in addition to typical irrigation practices and water needs for the crop types within the study area. Based on review of parcel maps and aerial photographs of the study area, approximately 250 rural residences were identified within the study area. The unit residential water use was assumed to be 0.53 AFY. In support of this, well completion reports were requested from DWR and reviewed for the number and types of wells within the study area. Based on well completion reports received from DWR and information from published reports, approximately 230 wells have been installed in the study area (see Table 1 in Appendix B). According to the well completion reports, over 60% of the wells were installed for domestic uses, 20% for agricultural or agricultural/domestic uses, over 10% for monitoring purposes, and about 3% for municipal uses. Well depths range from about 25 feet in depth below ground surface (bgs) to 1,000 feet below the ground surface. Over 50% of the wells within the study area were relatively shallow wells (around 100 feet in depth or less) and drilled prior to 1980. Approximately 25% of the shallow wells are groundwater monitoring wells and the remaining 75% are shallow domestic wells. It is likely that many of the older wells have since been abandoned or replaced.

3.8 AGRICULTURAL WATER DEMAND AND SUPPLY

The portion of the study area west of Highway 101 is devoted primarily to agriculture. Of the agricultural lands, 79% contain vineyards and the remaining 21% contain miscellaneous crops. Based on conversations with the Sonoma County Water Agency, we have assumed that the water required for these crops is obtained primarily from groundwater pumping in the dry summer months, supplemented with precipitation in the wet winter months. A portion of this water demand is satisfied by reclaimed water use, which is discussed in the water balance inflows section. The soil moisture water balance analysis (as discussed below) was used to develop approximate applied water amounts to satisfy crop water requirements. This analysis assumes that farmers in the area are "perfect irrigators," meaning that they do not over-water their crops. On the other hand, it is also assumed that farmers are not practicing deficit irrigation, the practice of stressing vineyards by providing less water than demanded by ideal evapotranspiration conditions.

In addition to providing for plant evapotranspiration needs, agricultural water is also applied for frost protection in vineyards. During the spring (March, April, and May), frost can damage budding vines. Low-lying valley areas, where cold air tends to collect on cold, still nights, are more susceptible to frost damage than higher terraces or hillsides. The number of spring days when frost protection is needed varies by year and location, but is generally about seven days in the Windsor area (IWMI, 2009). Growers can protect vineyards with a number of means, including wind machines, traditional sprinklers, and micro-pulsating sprinklers. Use of traditional sprinklers often involves application of substantial amounts of water over short periods. Accordingly, many growers pump from streams or ponds with pumping systems that can provide frost protection water at substantial rates. For the purposes of this study, the consumptive use of frost protection water is assumed negligible, given the variety of frost protection systems, common use of surface water, and return of most applied water to the soil and groundwater.

Water also may be applied for heat protection when temperatures exceed 90^{o} Fahrenheit. Application of water for heat protection would result in evaporation losses. Water application for heat protection has been estimated at 0.17 acre-feet per year per acre in northern Napa County (West/Yost, 2005), but is applied only to a portion of the vineyard acreage. For the purposes of this study, the use of water for heat protection is considered insignificant for the Mark West Creek area, because it has a cooler, more coastal climate than Napa County.

3.9 STREAMFLOW

Mark West Creek flows in a west-southwesterly direction through the northern portion of the study area. The USGS has a stream gauge on Mark West Creek at the Fulton Road Bridge, approximately 3.6 miles southeast of Windsor. Stream gauge data is limited for Mark West Creek; however, we were able to locate data for the water years of 2007 and 2008 summarized on the table below.

TABLE 3
Mark West Creek Flows

USGS 11465500 Mark West C NR Windsor CA Stream Gauge Data	
CALENDAR YEAR	**ANNUAL FLOW AFY**
2007	15,501
2008	23,937

Precipitation data during the water years of 2007 and 2008 was 74 and 78 percent of normal for the region.

3.10 LOCAL HYDROGEOLOGY

The study area is located within the northern portion of the Santa Rosa Plain groundwater sub-basin 1-55.01. The groundwater sub-basin occupies a surface area of approximately 125 square miles and is located beneath an approximately 22-mile-long and 5- to 9-mile-wide northwest-trending fault bound valley which extends from near the town of Cotati in the south to near the town of Healdsburg in the north (DWR, 2004). The Rodgers Creek and Healdsburg faults are located along the east side of the basin and the Tolay and Bloomfield faults are located to the west (Jennings, 1975). The basin is bordered by the Mayacama and Sonoma mountains on the east and the Mendocino Range on the west. According to DWR (2004), most of the groundwater within the Santa Rosa Plain subbasin is at water table conditions with few local exceptions where folding and faulting creates confined conditions.

Geologic units within the study area include the Jura-Cretaceous Franciscan Complex, the Pliocene and Miocene Sonoma Volcanics, Petaluma and Wilson Grove Formation (Merced Formation), the Plio-Pleistocene Glen Ellen Formation and Pleistocene - Holocene alluvial fan and fluvial terrace deposits (Figure 4).

The basement rocks within the study area are mapped as undifferentiated mélange of the Central Belt of the Franciscan Complex (McLaughlin et al., 2008; Graymer, 2006; Blake, 2002; Wagner and Bortugno, 1982; Cardwell, 1958). In general, these rocks comprise highly sheared, sandstone and argillite with varying sized blocks of various lithologies throughout (McLaughlin et al., 2008). In general, rocks of the Franciscan Complex are well consolidated and not considered water bearing, except in very localized areas where fracture zones are well developed. Wells within the study area do not rely on the Franciscan rocks as a source of groundwater.

The Pliocene and Miocene Petaluma Formation is mapped as unconformably overlying the Franciscan Complex and is interpreted to be underlying a large percentage of the Santa Rosa Plain (McLaughlin et al., 2008). The Petaluma Formation is predominantly composed of sandy to silty gravel, silty sandstone, siltstone, and mudstone that were deposited in fluvial, lacustrine and brackish to estuarine environments (McLaughlin et al., 2008; Cardwell, 1958). In general, water yields are low in this formation and, within the study area, it does not represent an important water-bearing formation.

The Pliocene and Miocene Sonoma Volcanics comprise a series of bimodal volcanic units that range from basalt flows to rhyolitic tuffs that accumulated over a 30-mile (east-west) by 40-mile (north-south) area. Most recent interpretations based on more extensive age dating indicate that these volcanic units were deposited contemporaneously with the Petaluma, Wilson Grove (Merced) and lower Glen Ellen Formations (McLaughlin, et al., 2008). The water yielding capacity of units of the Sonoma Volcanics vary widely depending on lithology, with higher yields from the tuff units (Cardwell, 1958). The Sonoma Volcanics are not a significant hydrogeologic formation in our study area.

The Pliocene and late Miocene Wilson Grove Formation (Merced Formation, Cardwell, 1958) comprises marine pebbly sandstone, siltstone and pebbly gravel (McLaughlin et al., 2008). The Wilson Grove Formation is mapped as underlying a large portion of the Santa Rosa Plain, predominantly along the western half of the Valley (McLaughlin et al. 2008 and Cardwell, 1958). This formation is considered one of the major water-bearing units within the Santa Rosa Plain subbasin with specific yields that range from 10 to 20 percent (DWR, 2004). According to Cardwell (1958), semi-confined to confined conditions may exist locally where clay lenses are present. Recharge is mainly from the southwestern portion of the basin; however, within the study area, much of the recharge likely comes from the overlying Glen Ellen Formation (DWR, 2004). Many of the wells within the study area rely on this formation as a source of groundwater, particularly the agricultural wells in the western portion of the study area.

Overlying the Wilson Grove Formation in the study area is the Plio-Pleistocene Glen Ellen Formation, which represents the primary source of groundwater for the existing wells in the vicinity of the proposed Sutter Medical Center, including the majority of wells within the eastern portion of the study area. The Glen Ellen Formation typically comprises non-marine, lenticular beds of poorly sorted gravel, sandstone, siltstone and mudstone (McLaughlin et al., 2008 and Cardwell, 1958). As characteristic of alluvial fan deposits, individual beds vary widely in thickness, are not horizontally continuous and typically grade into one another over short distances. The Glen Ellen Formation was deposited during late Pliocene and early Pleistocene time as alluvial fans shed from the east towards shallow bays or lagoons (Cardwell, 1958). Average specific yields range from 3 to 7 percent (DWR, 2004). Because the Glen Ellen Formation crops out in many areas within the Santa Rosa Plain, recharge is thought to occur readily, except where overlain by low permeability soils (DWR, 2004).

Pleistocene and Holocene alluvial fan and fluvial terrace deposits blanket the Santa Rosa Plain. These deposits generally comprise poorly sorted gravel, sand, silt, and clay and have a maximum exposed thickness of 100 feet (Cardwell, 1958). These units typically have specific yields that range between 8 and 17 percent and are tapped by some shallow wells within the study area.

Information compiled from published geologic mapping, DWR well completion reports and subsurface information from Cardwell (1958) was used to construct a geologic cross section through the study area (Figure 5). The cross section depicts the interfingering between the Glen Ellen Formation and the Wilson Grove Formation across the Santa Rosa Valley in the study area.

Based on DWR (1982) calculations, the groundwater storage capacity of the entire Santa Rosa Plain Subbasin is approximately 4,313,000 acre-feet. As previously discussed, the study area occupies approximately 5,840 acres or roughly 7% of the area of the basin. Rough calculations for storage capacity within the study area range between 250,000 and 350,000 acre-feet. These values are in the general range of the DWR calculated storage capacity for this portion of the basin (approximately 310,000 acre-feet).

3.11 GROUNDWATER LEVELS

According to DWR (2004), the groundwater within the Santa Rosa Plain Subbasin as a whole is approximately in balance, with increased groundwater levels in the northeast (in the vicinity of our study area) and decreased groundwater levels in the south. Recent groundwater contour mapping within our study area is lacking in the current literature. Cardwell (1958) produced the most comprehensive study of groundwater and hydrogeology in the basin, including a groundwater contour map that covers the study area. Based on Cardwell's (1958) groundwater contour map, groundwater levels within the study area are highest in the east (approximately160 feet above mean sea level) and gradually decrease towards the west to an elevation of around 50 feet near the Laguna de Santa Rosa; generally conforming to the topography across the Santa Rosa Valley.

GEI (2007), on behalf of Cal-Am, developed a groundwater contour map in the Larkfield District that includes areas east of Highway 101 within our study area. Based on available spring 2007 groundwater level data from DWR monitoring wells, GEI (2007) spring groundwater contours, and 2009 groundwater levels from the existing Wells Fargo and Sutter Vineyard wells (with reference to regional groundwater contour mapping from Cardwell), a generalized groundwater contour map was developed for the study area (Figure 10). The groundwater contour mapping shows the same general groundwater trend across the western portion of the study area that Cardwell depicted in 1958, and relatively low groundwater levels in the Larkfield District portion of the study area. These decreased groundwater levels indicate that a pumping depression has developed in this area since the time of Cardwell's study. Review of available groundwater pumping data suggests that this pumping depression is relatively stable.

Available groundwater level hydrographs from the existing Cal-Am and DWR wells were reviewed for the study area. The groundwater level hydrograph for Well 07N/09W01C1 (Appendix C) located in the western portion of the study area (Figure 10) has the longest historical record, extending from 1950 to the present. The historical trend shown on this hydrograph indicates that in 1950 groundwater levels were around 83 feet above mean sea level. Groundwater levels declined at a moderate rate to about 70 feet MSL until the early 1970s where groundwater level declined more rapidly to a low of near 50 feet MSL in 1977. Groundwater levels increased rapidly in the late 1970s to around 70 feet MSL and then increased gradually through the 1980s and 1990s to the spring 2009 level of approximately 84 feet MSL.

Based on this review, groundwater level trends from 1990 through 2008 for the five DWR wells in the vicinity of the study area all indicate either relatively stable or slightly increasing groundwater levels (Appendix C). Groundwater level trends from 2003 through 2007 for the four Cal-Am wells in the study area corroborate this, with three of the wells displaying relatively stable water levels (Wells 1A, 3A and 5A). One of the wells displays a substantial increase of more than 60 feet (Well 4A); this dramatic increase is likely localized and related to modifications in pumping practices within the Cal-Am water system.

These relatively stable to slightly increasing water level trends in the study area support the conclusion that the northeast portion of the Santa Rosa Plain Subbasin is in relative balance, with possibly a slight increase in storage due to decreases in groundwater pumping.

3.12 LAND SUBSIDENCE

Land subsidence is the lowering of the land surface resulting from changes that take place underground (Leake, 2004). Land subsidence can result from the withdrawal of fluid, most typically groundwater or petroleum, in weakly consolidated deposits, chemical weathering of soluble rocks such as limestone, oxidation of organic soils such as peat, or collapse due to underground mining (Leake, 2004). Land subsidence resulting from underground mining, chemical weathering of limestone or the oxidation of organic soils is not a concern in the study area due to the lack of underground mining and these geologic materials.

The overdrafting of aquifers and the resulting consolidation of clays and silts has been documented as a significant cause of subsidence in areas of the San Joaquin and Santa Clara valleys of California (Ireland, 1984; Poland, 1988). The consolidation of the clays and silts results from a loss of hydrostatic pressure associated with water withdrawal from the surrounding more permeable units in the aquifer.

As described in the local hydrogeology section of this report, the geologic formations that are the primary sources of groundwater underlying the study area comprise both Pliocene late Miocene marine deposits and Plio-Pleistocene alluvial deposits. These deposits are relatively incompressible and are therefore not subject to additional consolidation related to decreased hydrostatic pressure.

The proposed SMC well system will be located on the alluvial fan associated with Mark West Creek and underlain by both alluvial fan deposits and the Glen Ellen Formation. Because these geologic units are relatively well consolidated, the potential for subsidence related to pumping from the proposed well system is considered low.

3.13 GROUNDWATER QUALITY

According to a DWR study (1982) from the many wells tested within the Santa Rosa Plain subbasin, only a few wells contained constituents over the recommended concentrations for drinking water. DWR has concluded that, in general, the water quality within the Santa Rosa Plain subbasin is good (DWR, 2004).

More locally, groundwater sampling results from the recently installed Sutter Medical Center well (W-SMC, October 2009) and the existing Wells Fargo (W-WFC) and Sutter Vineyard wells (W-VI) at and near the subject site (ENGEO, 2006) indicated that the majority of samples when compared to the California Department of Health Services (DHS) Drinking Water Standards and Secondary Standard Maximum Contaminant Levels (MCLs) were below the DHS MCLs. Appendix F of this report and Appendix C of the ENGEO 2006 Groundwater Aquifer Test and Water Quality Analysis report (report attached in Appendix E) provides water quality sample results for the W-SMC, W-WFC and the W-SV from which water samples were collected.

The initial water quality samples collected in July 2005 were analyzed to evaluate the following water quality parameters: total hardness as $CaCO_3$, total dissolved solids (TDS), total alkalinity as $CaCO_3$, pH; total silica, electrical conductivity, manganese, iron, and arsenic. The samples collected in November 2005 included additional constituents that were not analyzed in the initial samples including total alkalinity, bicarbonate as $CaCO_3$, carbonate as $CaCO_3$, hydroxide as $CaCO_3$, hardness, pH, electrical conductivity, TDS, antimony, arsenic, barium, beryllium, cadmium, total chromium, cobalt, copper, iron, lead, manganese, mercury, molybdenum, nickel, selenium, silver, thallium, vanadium, zinc, and silica. Analysis of the water quality results indicates that the results from the start, the middle, and the end of each 2005 pump test are similar in value.

Near the end of the October 2009 pump test, water quality samples collected were analyzed to evaluate the following water quality parameters: total alkalinity, bicarbonate as $CaCO_3$, carbonate as $CaCO_3$, hydroxide as $CaCO_3$, antimony, arsenic, aluminum, barium, beryllium, calcium, cadmium, chromium, fluoride, iron, lead, manganese, magnesium, mercury, molybdenum, nickel, nitrate, nitrite, selenium, sodium, thallium, volatile hydrocarbons, perchlorate, total hardness, pH, asbestos and gross alpha. At the time of publishing this report, we had not received results on asbestos or gross alpha. Water quality analysis results indicate that the samples, when compared to the California Department of Health Services (DHS) Drinking Water Standards and Secondary Standard Maximum Contaminant Levels (MCLs), were below the DHS MCLs, with the exception of Manganese. Manganese was reported at 870 ug/L. Arsenic reported at 9.5 ug/L was 0.5 ug/L below the MCL. Three days after the completion of the pump test, two water samples were recovered to confirm the arsenic and manganese concentrations (Appendix F). These analyses reported arsenic at 7.0 ug/L and 4.3 ug/L and Managanese at 810 ug/L and 850 ug/L, which in general is consistent with the initial results indicating elevated Manganese.

4.0 PROPOSED SUTTER MEDICAL CENTER WELL SYSTEM

4.1 BACKGROUND

The additional water demand for the proposed Sutter Medical Center will be supplied by a new water supply well and a backup water supply well, both to be located in the southwest corner of the project site (Figure 10). The projected average water demand after the first year for the proposed medical center not including the 2020+ future expansion is approximately 27,710 gallons per day (Brelje and Race 2009). Including the 2020+ future expansion the estimate water demand for the medical facility is approximately 35,220 gallons per day. Estimated peak irrigation demand for the first year is about 9,000,000 gallons, assuming a late spring or summer landscape plant installation (Brelje and Race 2009). As plants become established, estimated irrigation demands will diminish to about 6,100,000 gallons (Brelje and Race 2009). For the purpose of this study, we have assumed that the overall volume of water to be pumped from the proposed wells annually will be about 58 AFY (based on average water use including 2020+ expansion).

The existing Sutter Medical Center well (W-SMC) was constructed to an approximate depth of 510 feet below the ground surface using reverse circulation drilling methods. The boring was approximately 17 inches in diameter, with an 8-inch-diameter stainless steel casing.

According to the Water/Wastewater report prepared by Brelje and Race, the civil engineering firm designing the proposed well system, the peak pumping rate to meet the maximum demand for the medical facility including irrigation is estimated to be 90 gpm over a 10- to 16-hour period for the establishment year, and just under 70 gpm in subsequent years.

4.2 PREVIOUS PUMPING TEST RESULTS

ENGEO Incorporated previously published a groundwater aquifer test and water quality analysis report (2006) for the existing Wells Fargo Center well (formerly Luther Burbank Center well) located at the site. This report is attached as Appendix E. The existing agriculture groundwater supply well, W-WFC, is located near the center of the property at an elevation of approximately 160 feet above mean sea level (Figure 10). The well is situated approximately 700 feet from the proposed SMC wells. The WFC well was installed in August 2000 by Les Petersen Drilling and Pump, Inc., of Santa Rosa, California. The well was installed using rotary wash methods and is approximately 400 feet deep. The well consists of 10-inch-diameter 200-guage PVC (polyvinyl chloride) casing and screen. The well screen is slotted casing with 0.032-inch slot openings. Three screened intervals were installed at 100 to 160 feet, 180 to 320 feet, and 360 to 400 feet. The completed State of California Well Completion Report was provided to us and is included in the attached ENGEO report (Appendix E).

The results of the ENGEO 2006 report indicated that the demand of the proposed Sutter Medical Center was met by the existing agriculture production well. The previous estimated medical center demand was approximately 73,500 gallons per day, similar to the current proposed demand of around 84,300 gallons per day.

The 24-hour pumping test data from 2006 indicates that the aquifer at the WFC property has moderate to low transmissivity. Transmissivity (**T**) is a measure of the aquifer's ability to transmit water (i.e. how permeable it is). The transmissivity calculated from the previous pump test was 4,400 gallons per day per foot (gpd/ft).

The storage coefficient (**S**), or storativity, is the volume of water released from or taken into storage per unit surface area per unit change of the hydraulic head; it is a measure of the aquifer's ability to release groundwater from storage. During the previous 24-hour pumping test, the observation well located approximately 1,200 feet away, observed no effect from the continual pumping in W-WFC, and as a result, the calculations for storativity were limited. However, by applying reasonable assumptions, an estimated range of storativity between 0.15 and 0.35 was derived. It should be noted that these values are higher than what would be expected for wells that have tapped the deeper levels of the aquifer such as the proposed SMC Wells. Typical values for storativity for these types of aquifers range from .005 to .0005, which are indicative of partially confined to confined conditions. The recent pumping test performed on the SMC well provides information and data to further constrain the value of storativity and transmissivity within this aquifer.

4.3 INSTALLATION OF SUTTER WELL AND RECENT PUMPING TEST RESULTS

A well was recently drilled, designed and constructed in the vicinity of the southwest corner of the Sutter Property. Drilling and construction of the well commenced in August 2009 and was completed in September 2009. A well installation and testing report containing details of drilling, design, construction and testing for the recently installed Sutter Medical Center Well (SMC-W) will be published in November 2009.

The recent well was installed to a depth of approximately 510 feet below the existing ground surface. Three screened intervals were installed at 170 to 310 feet below the ground surface (bgs), 360 to 395 feet bgs, and 430 to 490 feet bgs. The well was constructed with 8-inch-diameter stainless steel casing and .045 – inch slot size stainless steel continuous wire wrap screens. A SRI PF#12 gravel filter pack with bentonite seals between screened intervals was installed in the annular space between the casing and borehole.

Following installation and development of the well, a 72-hour constant rate pumping test was conducted at an average pump rate of approximately 153 gallons per minute (gpm). The pumping rate of 153 gpm, at which the pump test was conducted, is more than 2 times greater than the proposed average pumping rate required to meet the projected water demands for the project. During the pumping test, drawdown measurements were recorded in four observation monitoring wells. The monitoring wells included the Wells Fargo Center Well located approximately 740 feet to the east-northeast of the SMC-W, the Vintners Inn Well (VI-W) located approximately 800 feet to the west, the Sutter Vineyard Well (SV-W) located approximately 1,890 feet to the east-southeast and a shallow domestic well located approximately 1,480 feet to the northeast.

The 72-hour pumping test data from the SMC well indicates that the aquifer underlying the property has moderate to low transmissivity. The transmissivity (T) calculated from the October 2009 pump test using the Cooper-Jacob drawdown method was 5,049 gallons per day per foot (gpd/ft).

Three of our observation wells (W-WFC, W-VI and W-SV) exhibited an effect from the continual pumping in W-SMC; however, because of an apparent local aquifer-wide recovery and other bias in the data, we were not able to obtain a reliable storativity value from the pump test data.

4.4 EVALUATION OF POTENTIAL IMPACTS ON NEARBY WELLS

In order to evaluate the local pumping effects of the SMC well system (using a pumping rate of 80 gpm which is greater than the estimated average), the radius of influence and drawdown of the groundwater surface was estimated at various distances from the pumping well using the Cooper-Jacob modification of the Theis equation. Input parameters for these calculations were based on data compiled from the recent pump tests performed on the recently installed SMC well existing well and a reasonable range of storativity values based on our analysis (Driscoll, 1986; Freeze and Cherry, 1979). The short-term pumping effects from the proposed well system will cause local drawdown in the aquifer near the pumping well. The approximate radius of influence was estimated for the well system at an 80 gpm pump rate. Using the Cooper-Jacob modification of the Theis equation with the value for T calculated from the 2009 pump test and a range of S values, the calculations indicate a radius of influence that ranges from approximately 1,000 to

2,400 feet (Table 4 below and Figure 11). The Radius of influence of a well is the horizontal distance from the center of the well to the limit of the cone of depression that develops in relation to pumping the well; in other words, it is the horizontal distance at which drawdown related to the well is theoretically zero. The range of storativity values cited below appears reasonable for the aquifer in the area. Kleinfelder (2009) used a storativity value of.0004 for drawdown calculation associated with the Faught Road test well, which is located in the same aquifer as the W-SMC. In addition, drawdown in the W-WFC monitoring well, although not able to be used to calculate a precise storativity value, appears to support a value within the middle of this range (an S value of approximately .0005) when the theoretical drawdown is calculated and compared with the observed drawdown using the transmissivity value obtained from the W-SMC. Based on this we have chosen to use a storativity value of .0005 for theoretical drawdown calculations at various distances from the SMC well. Based on an estimated 80 gpm pump rate over an 18-hour period, the calculated drawdown at a distance of 1,000 feet from the proposed well based on the calculated value of T and an S value of .0005 would be approximately 1.5 feet (see Table 5 below). This analysis also indicated that the estimated radius at which drawdown would be less than 1 foot was approximately 1,145 feet.

TABLE 4 – ESTIMATED THEORETICAL RADIUS OF INFLUENCE BASED ON A RANGE OF STORATIVITY VALUES FOR THE AQUIFER

STORATIVITY S	**THEORETICAL RADIUS OF INFLUENCE (feet)** (Based on W-SMC pumping rate of 80 gpm for 18 hours) T = 5,049 gpd/ft
.001	1,066
.0008	1,192
.0006	1,376
.0005	1,507
.0004	1,685
.0002	2,388

DWR well completion reports for the study area were reviewed for well locations and construction and for information on aquifer properties. In addition to reviewing the DWR well completion reports, an ENGEO representative performed a well reconnaissance and spoke with some of the property owners in the area at the north end of Coffey Lane. A summary of the information derived from our discussions with these property owners and the well completion reports is included in Table 1 of Appendix B. The approximate locations of these wells are plotted on Figure 12. Based on our reconnaissance survey, review of DWR well completion reports and the Sonoma County GIS data, four existing wells exist within a distance of 1,000 feet from the proposed Sutter well system.

Of these wells, one is the existing Wells Fargo Center Well (W-WFC), two others are agricultural wells and one is a domestic well (Figure 12); these wells are discussed below.

The existing WFC well is located approximately 740 feet from the proposed Sutter well system. As discussed above, three screened intervals were installed at 100 to 160 feet below the ground surface (bgs), 180 to 320 feet bgs, and 360 to 400 feet bgs. The pump within the W-WFC is set at a depth of approximately 325 feet bgs. A transducer equipped with a data logger was installed in the W-WFC in May 2009 to monitor water levels in the well. Measurements indicate that the non-pumping water level in the well was approximately 40 feet below the ground surface in June 2009 and the water level gradually decreased through the summer months to around 50 feet below the ground surface in September 2009. This water level decrease is indicative of the seasonal water level variations expected as a result of increased pumping and lack of recharge to the aquifer during the late spring and summer. During routine pumping of the WFC well, the recent transducer data indicate a maximum drawdown of about 40 feet. Our calculations indicate that pumping of the proposed SMC well at 80 gpm, may result in an estimated drawdown of around 2.5 feet in the WFC well. This indicates that the additional estimated drawdown will not expose the screened intervals or the pump within the WFC well.

TABLE 5
Drawdown Summary

Summary of Drawdown – Proposed SMC Well Based on T Value Calculated from Cooper - Jacob Modification of the Theis Equation (5,049 gpd/ft) and a Reasonable S Value of .0005	
Distance from Proposed Sutter Well (feet)	**Additional Drawdown at 80 gallons per minute (feet) for 18 hours**
50	12.4
100	9.9
250	6.5
500	4.0
1000	1.5
1200	0.7
1507	0

Another nearby well is located west of the proposed SMC well system on the Vintners Inn Property at a distance of about 800 feet. Three screened intervals were installed at 80 to 280 feet below the ground surface (bgs), 320 to 400 feet bgs, and 480 to 700 feet bgs. A transducer equipped with a data logger was installed in the in this well in August 2009 to monitor water levels in the well. Based on our review of the water level data, the non-pumping water level in this well is around 55 feet below the ground surface. The typical pumping level in this well results in greater than 50 feet of drawdown. This amount of drawdown appears to be already exposing the top of the screened interval. Based on discussions with vineyard manager, it is our understanding that the pump is set at a depth of around 500 feet below the ground surface in this well. The calculated drawdown from pumping the proposed SMC well at 80 gpm is estimated to be around 2.3 feet in this well. This additional drawdown is well within seasonal water level variations and would not be expected to expose the pump.

Two other nearby wells are located south of the proposed SMC well system at 4207/4205 Coffey Lane. These wells are located approximately 950 feet from the proposed SMC well. We were directed to speak with Brian White with Pacific Agriculture regarding the two wells located just south of the existing residences. Based on our telephone communication with Mr. White, we understand that the two wells were installed around 15 years ago and that one of the wells provides water for domestic use and the other provides water for the Coffey Lane Vineyards. We were directed by Mr. White to contact Les Petersen Drilling for the well construction information. We have contacted them on several occasions requesting construction information on the wells but have yet to receive the requested information. The calculated drawdown from pumping the proposed SMC well at 80 gpm is estimated to be approximately 1.7 feet in these two wells.

In addition to the four wells discussed above, according to DWR completion reports and County data, six domestic wells and one array of monitoring wells fall close to or are within a distance of 1,500 feet of the proposed Sutter well. These include the following:

- Approximately 1,270 feet from proposed SMC well - A series of shallow monitoring wells (35 feet) were constructed in 1988. These wells are located at 4605 Old Redwood Highway. DWR Well Numbers 313897, 313898 and 313899.

- Approximately 1,500 feet northeast from the proposed SMC well - We identified two domestic wells on two separate parcels. We were able to obtain a DWR completion report for one of the wells. A 54-foot-deep domestic well constructed in 1953 and located on Old Redwood Hwy; DWR Well Number 49-1219. No parcel number or address is included on the well completion report. The other domestic well is located at 4585 Old Redwood Hwy. We spoke with the well owner and based on our discussions it is our understanding that the well is approximately 160 feet deep. The pump depth and screened intervals was not known. We were granted permission by the well owner to monitor the well during the 72-hour pump test. Based on the water level data collected during the pump test, the well showed almost no change in water level during the majority of the test and a slight decline of approximately 1 inch towards the end of the test. Based on our calculations, a well at this distance would have experienced drawdown in excess of this during our pump test. One possible explanation for the lack of drawdown is related to the fact that this relatively shallow well is screened in the shallow aquifer and the SMC well is only screened in the intermediate and deep aquifers. This appears to support the conclusion that pumping the SMC well will have little drawdown effects on shallower neighboring wells that obtain the majority of their water from the shallow aquifer.

- More than 1,500 feet from proposed SMC well - A 160-foot-deep domestic well constructed in 2001 is located at 4121 Coffey Lane; DWR Well Number 778381. The well was screened from 60 to 160 feet within the shallow aquifer and the uppermost portion of the intermediate aquifer. The non-pumping groundwater level was at 50 bgs at time of construction.

- More than 1,500 feet from proposed SMC well - An 81-foot-deep domestic well constructed in 1974 and located at 4099 Coffey Lane (DWR Well Number 123464). The well was screened from 61 to 81 feet within the shallow aquifer, and the non-pumping groundwater level was at 10 feet bgs at time of construction.

- According to the County GIS database more than 1,500 feet from proposed SMC well – A domestic well is located on Parcel 058-040-052 at Coffey Lane. No DWR well completion report was located for this well.

- According to the County GIS database approximately 1,400 feet from proposed SMC well - A domestic well is located on Parcel 058-040-035 at Coffey Lane. No DWR well completion report was located for this well.

The calculated drawdown from pumping the proposed SMC well at 80 gpm for 18 hours is estimated to be less than 0.1 foot for wells at a distance of around 1500 feet from the SMC well. For the above listed wells at a distance of 1400 feet and 1270 feet, the calculated theoretical drawdown is estimated at 0.3 and 0.6 feet respectively. Additionally, the wells for which information was available all obtain most of their water from the shallower aquifer and not the intermediate and deeper aquifers that will be intersected by the proposed Sutter well system. Because of this, the short-term pumping effects would result in negligible additional drawdown in the above wells as observed in the domestic well located at 4585 Old Redwood Road during the 72-hour pumping test. In addition, based on review of the hydrographs for the area (Appendix C), estimated amount of drawdown in the above-discussed neighboring wells is within seasonal and historical groundwater level fluctuations for this area and would not be expected to adversely impact the performance of these wells.

The cumulative effects of pumping the proposed well at a rate of 52,006 gallons per day on an annual basis were also considered. As previously discussed, the proposed pumping rate equates to an additional 58 AFY from the Larkfield aquifer. This will likely expand the existing pumping depression towards the south during peak seasonal pumping, which typically occurs during the months between May and August (Figures 10, 13 and 14).

5.0 STUDY AREA WATER BALANCE

5.1 METHODOLOGY

A comprehensive water balance was prepared for the groundwater basin in the study area for 21 water years, 1987 to 2007. The water balance quantifies study area inflows and outflows to groundwater using available data gathered from various sources. The study period includes several drought events, and has an average rainfall approximately equal to the long-term average annual rainfall.

The water balance quantifies the significant water inflows and outflows to groundwater in the study area plus change in groundwater storage. Primary inflows include recharge from precipitation, subsurface groundwater inflows, return flows for groundwater pumping, percolation from Mark West Creek and infiltration from water Cal-Am imports from the SCWA. Primary outflows are urban pumping, rural residential pumping, agricultural irrigation pumping, and subsurface outflows. A month-by-month soil moisture water balance (using the Thornthwaite model; see Ritter, 2009) was used to characterize how rainfall partitions between soil moisture storage, evapotranspiration, groundwater recharge, and surface water runoff at different times of the year. Specific evapotranspiration values were applied to the different vegetation types with the area, with the assumption that neither native vegetation nor grain crops are irrigated. The latter generally are grown during the winter and require little or no irrigation. For all other vegetative land use types, the soil moisture balance was used to determine the amounts of applied water needed to meet evapotranspiration needs. It was assumed that all evapotranspiration demands beyond that provided by precipitation would be satisfied by groundwater pumping or recycled water application, as pertinent.

Perennial yield, or the amount of groundwater that can be developed on a sustainable basis without significant adverse impacts, is represented as the long-term average amount of inflows into groundwater, including rainfall recharge, subsurface inflow, return flows, and creek percolation. The inflows also were reviewed in relationship to the outflows (specifically pumping and subsurface outflows) to address the current state of the groundwater basin.

5.2 INFLOWS

5.2.1 Precipitation

The primary inflow component in the water balance equation is precipitation. As discussed in the Climate section, monthly NOAA rainfall totals from the Santa Rosa gauge were used for the study period (1987 through 2007) and applied to the pervious acreages within the study area, as determined by the DWR land use maps. The soil moisture balance calculations partition this rainfall into interception, evapotranspiration, runoff, and groundwater recharge as discussed below.

5.2.2 Imported Water

The study area receives imported water from Sonoma County Water Agency (SCWA) deliveries to the Cal-Am distribution network (as shown in Table 2 in the text). The SCWA water represents a net inflow (import) to the area. This inflow is partitioned to determine the portion that leaves the project area as wastewater, the portion that satisfies urban lawn evapotranspiration needs, and the portion that provides recharge to groundwater. Data acquired from Cal-Am for 1997 through 2007 indicate that on average SCWA delivers approximately 535 AFY to the entire

Cal-Am distribution network, including residences outside of the study area. Based on the relative ratio of houses within the study area, it is estimated that Cal-Am distributes approximately 270 AFY of the total 535 AFY of SCWA deliveries to connections within the study area.

Of the water that is imported, only a small fraction represents groundwater recharge. To estimate this amount, it is estimated that the imported water is distributed among approximately 1,230 residences. At each residence, it is estimated that 50% of the water was used inside the home and 50% was used outside the home. Of the water used inside the home, all of the water was considered as exported via the sewer system. Of the portion used outside the home for irrigation purposes, it was estimated that 15% would infiltrate back into the groundwater basin as recharge. This recharge percentage was based on percentages used for similar residential conditions (Todd Engineers, June 2004).

5.2.3 Recycled Water

In addition to water imported through the SCWA, reclaimed water is imported from both the City of Santa Rosa treatment plant and the Airport-Larkfield-Wikiup treatment plant. The SCWA provided a map delineating recycled water receiving areas, and this map was used to identify the acreage of land receiving recycled water. Discussions with the City of Santa Rosa staff indicate that the two properties receiving recycled water as shown on the map are the Denner Ranch property and the Kunde vineyard. City staff provided data indicating that the Denner Ranch property is currently receiving approximately 282 AFY, while the Kunde vineyard is receiving approximately 16 AFY. In addition to deliveries from the SCWA, the Larkfield-Wikiup Sanitation Zone also provides recycled water to pasture lands located near the airport property. Based on the acreage of pasture receiving recycled water, it is estimated that Larkfield-Wikiup is providing approximately 335 AFY to the study area.

Although the study area is receiving a significant amount of recycled water, it is assumed that no recycled water is allowed to percolate to groundwater as recharge. Instead, the recycled water delivery volumes are used to offset the total calculated agricultural water demand. Because agricultural wells do not have to pump water for the areas irrigated by recycled water, the recycled water provides a net benefit to the local groundwater basin.

5.2.4 Pumped Groundwater Infiltration

Another inflow to the groundwater basin comes via infiltration from pumped groundwater. These values represent return flows from groundwater pumped within the study area. For this study, it is assumed that all of the groundwater pumped for agricultural irrigation is consumed by the crops through evapotranspiration. However, both urban and rural residences receive groundwater and a portion of this water is returned to the groundwater basin through infiltration from landscape irrigation and from septic systems.

For the purpose of this study, it is estimated that each rural residence uses approximately 475 gallons of water per day. It is estimated that 60% of the 475 gallons is used in outdoor applications, and that 15% of water used in outdoor applications returns to the groundwater basin. It is also estimated that 40% of the 475 gpd is used in indoor applications and subsequently flows to the underground septic systems. We expect a portion of the water flowing into the septic systems to become groundwater recharge and a portion of the water to evapotranspirate. In the absence of published or accepted fractions of evapotranspiration to infiltration in standard septic systems, we assumed that 50% of water flowing to the septic system will become groundwater recharge.

In addition to groundwater pumped for residential use in rural areas, Cal-Am pumps groundwater for residential use in approximately 2,350 residences. Of these 2,350 residences, approximately 1,230 are within the study area. As with the imported water infiltration calculations, the pumped groundwater is distributed among the residences and it is estimated that 50% is used for outdoor purposes. Of that 50%, it is estimated that 15% will infiltrate and recharge groundwater.

In order to determine if any houses within the Cal-Am service area were also using septic systems, current utilities information was obtained from Sonoma County (Figure 15). The data from the county indicate that approximately 350 residences lie within the urban limits of the study area, but are on septic systems. These septic systems provide another source of infiltrated groundwater to groundwater, and again we assumed that 50% of septic system water becomes groundwater recharge.

5.2.5 Subsurface Inflow

As mentioned previously in the report, recent groundwater contour mapping within the vicinity of the study area is limited. To date, the most comprehensive groundwater study within the basin was performed by Cardwell (1958). As part of this USGS report, Cardwell produced groundwater contours within the basin. More recently GEI (2007), on behalf of Cal-Am, produced a groundwater contour map for the Larkfield District using June 1, 2007, monitoring data that includes areas east of Highway 101 within the study area. Based on this previous work, coupled with recent groundwater level readings within wells at the project site, a generalized map of groundwater contours was prepared to represent current conditions for the study area (Figure 10).

For the study area west of Highway 101, the groundwater surface reflects the overlying topography within the basin, with relatively high groundwater surface elevations to the east that decrease towards the Laguna de Santa Rosa on the west. General groundwater flow occurs in a west-southwest direction towards the Laguna and parallels surface water drainage. The general coincidence of surface watershed and groundwater divides allows definition of the water balance study area by the watershed divides, which generally results in a northern and southern study area boundary that is perpendicular to the groundwater contours in the area. Based on this, groundwater flow is generally parallel with the northern and southern boundaries of the study area. As a result, there is negligible flow into or out of the study area along these boundaries with the exception of the area east of Highway 101, near the groundwater depression.

For the study area east of Highway 101, the groundwater contours indicate a groundwater depression. As discussed in the groundwater levels section of this report, this depression has developed in response to groundwater pumping within the Larkfield district and would be expected to cause groundwater flow in this area to move downgradient into the depression.

Subsurface inflows occur along the northern and southern boundary of the eastern study area towards the pumping depression, as well as from the northeast where the Glen Ellen Formation is present in the hills. The subsurface inflows were computed using an aquifer width of 4,500 feet along the northern boundary of the study area and 2,000 feet along the southern study area boundary. Transmissivity and hydraulic gradient values of 5000 gpd/ft and .014 were applied respectively. Based on these values, the subsurface inflow is estimated at about 510 AFY (Table 5, Appendix A).

5.2.6 Mark West Creek Percolation

Mark West Creek receives water from the upper watershed and flows near the northern edge of the study area. To estimate percolation to groundwater from the creek, it was assumed that the upper portions of the creek (where the creek bottom is above the water table) would provide a net inflow to groundwater. Approximately 12,600 linear feet of the creek, with an estimated bottom width of 20 feet, was estimated to be available for percolation based on review of groundwater level contours. We have chosen a rate of 6 inches/day applied 90 days out of the year. The resulting percolation volume is 260 AFY.

5.3 OUTFLOWS

5.3.1 Evapotranspiration and Interception

After falling on the study area, precipitation is removed by interception and evapotranspiration. Interception is a process by which rainwater is captured by vegetation and evaporates before it hits the ground surface and becomes available for evapotranspiration, runoff, and recharge. This quantity of water is subtracted from gross precipitation. For this study area, interception is estimated to be 1% of total rainfall.

After interception, water is available for evapotranspiration, which is a major outflow. In order to determine the evapotranspiration rates for the crops in the study area, theoretical maximum evapotranspiration rates from the California Irrigation Management Information System (CIMIS) for the Santa Rosa area were multiplied by crop-specific evapotranspiration factors from the California Department of Water Resources. These factors allow quantification of the approximate monthly evapotranspiration rates based on crop type for use in the soil moisture balance. Evapotranspiration data are provided in Tables 2 and 3 of Appendix A.

ENGEO INCORPORATED

5.3.2 Surface Water Runoff and Groundwater Recharge

After interception and evapotranspiration are removed from the rainfall totals, the remaining water is partitioned between surface water runoff and groundwater recharge. For this study, runoff was estimated at 70% of the remaining available water and recharge was estimate at 30%.

5.3.3 Groundwater Pumping

The major outflow from groundwater is pumping. Pumping occurs from municipal wells operated by Cal-Am, rural residential wells, a small number of urban residential wells, agricultural wells, and wells used for commercial and institutional uses, primarily local wineries and schools.

Urban Use

Cal-Am operates four production wells in the study area as shown in Figure 10. Cal-Am pumping data available from 1997 to 2007 showed that the average groundwater pumping amount during this time period was 749 AFY, with pumping levels decreasing in recent years. This 749 AFY of pumped groundwater is added to the average 535 AFY delivered by SCWA for distribution to the community. Most of the groundwater that Cal-Am pumps is consumed and exported off site via a sewer system. A small fraction of this water is returned to the groundwater basin as infiltration, as accounted for in the inflows section.

Pumping data were not available from CalAm that extended back to the beginning of the study period in 1987. In order to extrapolate reasonable pumping volumes for 1987 to 1997, US Census data were used to determine growth rates in the area between 1990 and 2000. These data indicate that population rose by about 13% during this time period. Extrapolating this 13% growth rate, Cal-Am pumping in 1987 was approximately 542 AFY, and increased by 13% to 1997, when the estimated pumping matched available data showing 615 AFY. The SCWA water delivery data from 1987 to 1997 was also not available from either CalAm or the SCWA, so similarly scaled water distributions from SCWA to develop the best estimate of water delivered to the study area during the study period.

In addition to urban water use provided by Cal-Am, current utilities information supplied by Sonoma County (Figure 15) determined that 35 residences use well water. An average urban water use of 0.4 AFY was used to evaluate groundwater pumped through these wells. We also addressed water supply for local schools. Conversations with Cal-Am staff indicated that local schools are supplied primarily by well water. Eleven schools within the study area were identified, with an estimated indoor annual water use of 3.27 AFY for institutional use (Brown & Caldwell). Irrigated sports field areas were estimated at a combined 25 acres for all schools. We used our water balance calculations for pasture lands to estimate that 53 AFY is applied as irrigation to these fields. To be conservative, we have assumed these sports fields do not receive recycled water deliveries. Water use by local wineries was estimated by identifying local wineries and estimating their respective production through the State Alcohol Beverage

Control database and applying a water use rate of 2.5 gallons water for each gallon of wine produced. This resulted in an estimated winery water use of 10 AFY. This yields a total of 94 AFY for both schools and wineries.

Rural Residential Use

Rural residences within the study area are supplied with water through local pumping wells. There are currently approximately 250 rural residences within the study area and per-residence use was estimated at approximately 0.53 AFY, based on water supply data from Cal-Am. The total estimated rural residential use is approximately 133 AFY.

Agricultural Irrigation Use

Another major use of groundwater is agricultural irrigation. A large portion of the study area is currently being used for agricultural farming, and of this land, approximately 79% is used for vineyards. The other 21% is pasture and other miscellaneous crops. As described in the inflows section, the crop water demand is satisfied primarily by rainfall and pumped groundwater. A small fraction of this water demand is satisfied by reclaimed water use.

The soil moisture balance was used to determine how much water the crops required (evapotranspiration) and how much of that demand could be satisfied by precipitation or soil moisture storage. During months where plant water needs exceeded both the amount of precipitation and the amount of soil moisture, the water deficit became the required applied water amount. Based on this method, agricultural irrigation was estimated on a monthly basis and summed for each water year in the study period. On average, this amount of estimated irrigation demand was approximately 1728 AFY.

5.3.4 Subsurface Outflows

As discussed in the subsurface inflows section, subsurface inflows and outflows along the northern and southern boundaries of the study area are negligible, with the exception of the area near the existing groundwater depression. General groundwater flow is in a west-southwest direction in the western portion of the study area; accordingly, subsurface outflows to the west were estimated across the width of the aquifer in the study area. The estimate of subsurface outflow to the west was based on an aquifer width of approximately 10,500 feet, a transmissivity value of 12,500 gpd/ft and a hydraulic gradient of 0.006. Based on these values, subsurface outflow to the west is about 838 AFY (Table 5, Appendix A).

5.4 CHANGES IN STORAGE

The results of the soil moisture balance as described above are presented in the attached Table 6, Appendix A. This table summarizes the major inflows and outflows to groundwater in the study area. Average annual inflow under current conditions amounts to an estimated 2,830 AFY, while average annual outflow is an estimated 2,840 AFY indicating a balance of inflows and outflows over the 21-year study period. While on a year-to-year basis, 14 of the 21 years experienced greater outflows than inflows, the 7 years experiencing higher inflows were significantly more positive than the 14 years were negative. This indicates that on a long-term basis, the basin is in relative equilibrium with several high inflow years compensating for a greater number of high outflow years.

As discussed in the groundwater levels section of the report, hydrograph data over the study period document relatively stable to slightly increasing groundwater levels within this area of the basin. This independent information indicates that the groundwater basin within the study area is in relative balance with a possible increase in storage over the last few years of the study period. These physical observations correspond to the results of the water balance, which also indicate that the basin is in relative equilibrium.

As shown on the table, there is a net deficit of -10 AFY. This small net deficit is well within the error of an analysis of this type and is indicative of an overall water balance within the study area.

The limitations of available data and resulting need to apply assumptions and estimates inevitably result in a degree of uncertainty in a water balance assessment, such that specific water balance computations probably are significant only to one or two digits. All estimates for the various components of a water balance are subject to probable error, with varying degrees of uncertainty because of the amount and quality of data and method of estimating. Some measured components (e.g. municipal pumping) are relatively accurate, while other components (e.g. evapotranspiration) are quite variable in magnitude over space and time, and thus are difficult to evaluate or even measure accurately.

While the probable error in individual components can be large in some cases, the estimates in a water balance are not all simultaneously overestimating or underestimating the actual values. Accordingly, the net error would have a relatively small range of error compared to that of individual components.

For this study, each element of the water balance was evaluated independently using available data. Data always are inadequate to some degree, resulting in a need to interpolate, extrapolate, or apply assumptions and estimates. Each of these introduces a degree or error and uncertainty.

The intent of this water balance has been to provide a conservative estimate; in other words, we endeavored to provide a reasonable evaluation of available groundwater supply and to identify existing beneficial uses of water, including urban and rural residential use and agricultural irrigation.

5.5 SUTTER WELL IMPACTS

5.5.1 General Impacts

It is useful to analyze the potential impacts of the proposed SMC well pumping in the context of the existing water balance. The water balance summarization provided in Table 6 of Appendix A shows that the average annual inflows to groundwater under current conditions (perennial yield) amount to approximately 2,830 AFY. This represents the average total amount of water entering local groundwater during a given year. As discussed above, the proposed Sutter well would pump an average of 58 AFY, which is only 2.0% of the perennial yield. Therefore, the proposed well extraction by itself represents a small portion of the total water entering the study area groundwater each year.

While the total pumping volume from the well may average 58 AFY, a portion of this pumping increase will be offset by reducing water demand elsewhere. The Sutter hospital is currently striving to achieve “zero impact” to the sewer system, meaning the project will not increase existing sewer system loads. This will be accomplished through a series of offset programs that reduce the amount of sewage produced in other areas of the sewer district by reducing water use. This will be accomplished through rebate programs for high-efficiency appliance retrofits. We understand that the Sutter hospital project is currently planning to provide approximately 30 AFY in offsets, with potentially an additional 5 AFY in the future. Water pumped from the proposed well beyond this approximate 30-35 AFY will not increase the sewer system loads and instead will primarily support the buildings’ HVAC systems. These offsets effectively reduce water demand elsewhere in the study area by 30 AFY, meaning that the net pumping increase proposed by the hospital would be approximately 28 AFY.

One can compare the net pumping increase of 28 AFY to the existing pumping for municipal, institutional, rural residential, and agricultural use. According to the results of the analysis, current pumping is approximately 1,949 AFY, which is 68% of the perennial yield. Adding the proposed SMC well would increase these beneficial uses slightly to 1,977 AFY, or 70% of the perennial yield. This indicates that while a little over two-thirds of the water entering the basin is pumped for beneficial uses, there is also a significant portion that leaves the basin as subsurface outflow. This subsurface outflow moves westward and a portion may surface in the lower reaches of Mark West Creek and the Laguna de Santa Rosa.

As discussed in Section 4.3, we expect some minor decreases in groundwater levels near the proposed well due to groundwater extraction. This reduction in groundwater levels and the resulting cone of depression will intercept additional groundwater flows in the vicinity of the proposed well. Since a portion of the groundwater currently flowing westward in the groundwater basin emerges as surface flow in both Mark West Creek and in the Laguna de Santa Rosa, a diminution of groundwater flow could result in reduced creek flows in those areas. However, we do not anticipate significant reduction in flows compared to existing flow rates.

The maximum net loss of surface flow to the creeks could be estimated by the net proposed pumping rate of 28 AFY proportioned throughout down-gradient portions of the Laguna within our study area. This waterway length is approximately 8,810 feet in length. Converting the maximum theoretical loss of 28 AFY yields 0.039 cfs, and distributing this theoretical loss over the 8,810 foot length of the Laguna yields a corresponding maximum potential flow loss of 0.0000044 cfs per linear foot of creek. This maximum potential reduction distributed over the length of the creek is a very small number and supports the expectation that the potential impacts to flow within the creeks would be insignificant.

In addition to examining maximum distributed potential flow loss, we compared the potential cumulative flow loss estimated for the well with existing flow rates data for the down-gradient creeks. As presented in Section 3.9, the limited available Mark West flow data shows annual flow volumes of 15,501 AFY and 23,937 AFY in 2007 and 2008, respectively. While precipitation during both these years was below average and it can be assumed that average creek flows are significantly higher, 28 AFY still represents only a small fraction of the total annual flow in Mark West Creek. In 2007, 28 AFY represented 0.18% of annual flow, and in 2008, 28 AFY was 0.12% of annual flow.

In addition to the acquired Mark West stream gauge data, the United States Geologic Survey operates multiple stream gauges along the Laguna de Santa Rosa. The closest gauge to the study area is located near Mirabel Heights, roughly 2 miles downstream near the confluence with Windsor Creek. This gauge has stream flow data available for 2005-2008, a time period during which average annual rainfall was 77% of the long term average. According to stream flow data available for 2005 to 2008 in Mirabel Heights, the Laguna de Santa Rosa average annual flow volume is 208,060 AFY. The maximum monthly flow rate occurs in January with average monthly flows of 56,424 AF, or 919 cfs. Minimum monthly flow rates occur in September with average monthly flows of 123.8 AF, or 2.1 cfs. Because the flow data spans three relatively dry years that experienced only 77% of the average long term precipitation, we can adjust the flow data to represent flows during an average precipitation year. Using the adjustment, average September flow rates are approximately 160.7 AF, or 2.7 cfs, and average January flows are 73,277 AF, or 1,193 cfs.. The proposed net extraction of 28 AFY corresponds to 2.3 AF per month and 0.039 cfs. During the peak winter month of January, 0.039 cfs represents only 0.0033% of the flow in the Laguna. In the driest month of September, 0.039 cfs represents 1.8% of the flow. This result represents the very conservative assumption that the entire volume of water drawn from the Sutter well would be pulled directly from the Laguna de Santa Rosa. Based on the facts that the aquifer thickness in the vicinity of the Laguna de Santa Rosa is roughly 1,000 feet and the Laguna is approximately 5 miles from the proposed well, we expect that the numbers calculated above are a very conservative over-estimation of the potential impact to the Laguna.. Based on the above comparisons and the great distance between the proposed well and the creek, we do not expect significant impacts to surface water flows within either Mark West Creek or the Laguna de Santa Rosa.

The groundwater basin is a dynamic system and addition of the proposed 58 AFY pumping extractions (net 28 AFY) would result in adjustment of the basin water balance to a new equilibrium point. As shown in Figure 13, the existing pumping depression will expand slightly in response to the SMC well. This new well will likely intercept a portion of the water flowing south as subsurface flow, and may draw more water from the adjacent southern boundary of the groundwater basin. Based on the relatively small volumes of water the SMC well will extract compared to the overall availability of water within the groundwater basin, we anticipate that the system will establish a new equilibrium, with only minor impacts to the groundwater basin as a whole.

5.5.2 Sutter Well Impacts in Drought Scenarios

While the above section discussed the general impacts of the Sutter well based on the average annual yield, it is also useful to study the project impacts under future drought conditions. As discussed in the climate section, the study period includes the drier than average years of 1994, 2001, and 2007, as well as the extended drought interval occurring from 1987 to 1990. The Water Balance Summarization Table 6 in Appendix A shows the net change in groundwater storage for each of these drought periods. On average, the singular drought years of 1994, 2001, and 2007 had net outflows of 1,435 AFY. The average net outflow during the 1987-1990 period was 977 AFY. As would be expected, the calculated significant drop in groundwater recharge indicates that the existing groundwater basin experiences significant changes to the inflow/outflow ratios during drought periods.

In addition, examining the groundwater recharge for these years demonstrates that the recharge volumes are also below average. The average groundwater recharge for 1994, 2001, and 2007 is 2,216 while the average groundwater recharge for 1987-1990 is 1,911. The addition of the proposed Sutter well will command a larger portion of the groundwater recharge during drought years. The total Sutter Well pumping of 58 AFY represents 2.7% of the average groundwater recharge for 1994, 2001, and 2007, and 3.1% of the total annual recharge for 1987-1990. While these percentages are higher than the calculated approximate 2.0% of groundwater recharge during average years, they still represent a small portion of the groundwater entering the study area during drought years.

5.5.3 Sutter Well Impacts on Riparian Habitat

The riparian habitat along the Mark West Creek corridor represents a rich, diverse ecosystem and it is worthwhile to consider any potential impacts on this ecosystem from the Project. In general, riparian habitat borders rivers and streams, and studies have shown that these riparian habitats support some of the greatest diversity of wildlife species in the Bay Area (Baylands). Accordingly, we have considered the potential impact of the proposed well on nearby riparian habitats. As shown in Figure 11, the proposed well is expected to have a radius of influence of approximately 1,500 feet. However, the nearest location of Mark West Creek in relationship to the proposed well site is approximately 4,100 feet away. Since the creek corridor is significantly outside of the calculated radius of influence, we do not expect to see any additional groundwater level drawdown in the vicinity of the creek corridor. This indicates that riparian vegetation along Mark West creek should not be significantly impacted by the proposed well.

5.5.4 Sutter Well Impacts on Vineyards

In addition to analyzing potential impacts to riparian habitat which was done in the preceding section, it is also worthwhile to examine potential impacts to surrounding vineyards. While Section 4.3 discussed potential impacts to neighboring winery wells, an additional way groundwater drawdown could impact vineyards would be if the vines were relying on groundwater. According to the Deficit Irrigation of Quality Winegrapes Using Micro-Irrigation Techniques report published by the University of California Cooperative Extension, vineyard root zones can extend up to 20 feet. This maximum depth of 20 feet occurs in deep, well-aerated soils and can be significantly less in areas with root zone limiting conditions. Comparison of groundwater and surface water contours in the agricultural area west of Highway 101 and adjacent to our project site shows that groundwater is approximately 25-35 feet below the surface. Even considering the maximum root zone depth of 20 feet, local groundwater levels are 5-15 feet farther below the root zone. This indicates that there is little likelihood that vineyards adjacent to the project site are relying on groundwater. Thus, we do not expect that the localized groundwater drop of several feet that could arise from the proposed well would have adverse effects on the nearby vineyards.

5.6 CUMULATIVE IMPACTS

The water balance analysis indicates an existing equilibrium condition between inflows and outflows of the basin. In the future, this balance is likely to change in response to future proposed land-use alterations in the study area, which may increase pumping of groundwater. The future use of groundwater resources in the City of Santa Rosa and greater Sonoma County has been outlined in several planning level documents.

The Sonoma County Year 2020 General Plan also addresses groundwater issues for the area in which the proposed well is planned. The General Plan addresses the importance of regional groundwater management as a means to conserve use of limited groundwater resources.

The City of Santa Rosa has adopted a general plan, which includes commercial, residential and open space areas within the existing study basin area. The City of Santa Rosa has also prepared a SB 610 water supply assessment as part of an update of the City's General Plan for 2035. Based on the results of the SB 610 assessment, the current City's projected groundwater extraction rate will be approximately 2,300 AFY, which is greater than its current uptake.

Continued future monitoring of groundwater levels will be important in the determination of limitations to the aquifer in regard to equilibrium conditions and the results of monitoring activities should carefully be considered in regard to the cumulative impacts of additional proposed well locations located within the study area. It is expected that future implementation of major groundwater extraction wells will be performed in conformance with generally adopted policies that regulate the beneficial uses of the aquifer.

6.0 FUTURE WATER DEMANDS

6.1 FUTURE BUILD-OUT SCENARIO

6.1.1 Additional Residences

As the Larkfield district and the community of Fulton continue to grow in the future, the water demands and subsequent impacts on local water resources will continue to change. This study evaluates water demand for the potential build-out scenario in the year 2030. While the future build-out configuration and related occupancy will be influenced by many factors and is unpredictable, the increased number of residences in 2030 was estimated using zoning maps provided by Sonoma County. These maps delineate parcels based on zoned uses such as residential, commercial, and industrial. Each zone contains information about the maximum number of business or residences that can be constructed per acre. This information was compiled for all of the zones in the study area to determine the approximate maximum number of residences that could be constructed in the build-out scenario.

The Sonoma County zoning data indicate that the maximum built-out scenario in the study area will contain 467 additional residences. Approximately 120 of the units are zoned to be within the rural areas and the town of Fulton. The remaining 347 houses are to be within the Mark West urban envelope. Based on the zoning data and map (Figure 15), it appears that in the rural areas this development will primarily consist of single-family houses. There are multiple parcels within the urban areas zoned for multiple units, including several complexes that could be high density condominiums or apartments. It is assumed that the residences built in rural areas will be serviced by well water and septic systems, that areas within Fulton will receive Cal-Am water and use septic systems, and that residences within the Mark West urban area will receive Cal-Am water and be connected to the existing sewer system.

While the numbers presented above represent the maximum build-out scenario, it is important to consider the build-out timeline. Based on conversations with Sonoma County and reasonable assumptions about residential growth rates, it is assumed that growth rates within the study area will be 2% until the maximum build-out is achieved. If there are currently approximately 1,200 residences existing houses within Mark West, a 2% growth rate would achieve the build-out scenario of 1,526 residences in 2020. Additionally, a 2% growth rate in Fulton and the rural areas, currently containing approximately 300 residences, will achieve build-out at 2024. By 2030, complete build-out conditions would occur with an additional 467 residences.

6.1.2 Land Use Changes

Agricultural land and related water use changes were considered based on recent trends and local constraints on the expansion of agriculture. Sonoma County Crop Reports were reviewed for trends, focusing on vineyards. Sonoma County data are assumed to be generally indicative of trends in the lower Mark West watershed area. Available information from Sonoma County provides grape acreages from 1976 to 2007 (2007 Sonoma Agricultural Crop Report, Sonoma

County Office of the Agricultural Commissioner, June 3, 2008). Since 1976, the most striking change in Sonoma County agriculture has been the expansion of vineyards. In 1976, vineyards occupied about 25,000 acres. This vineyard area expanded gradually until 1996 (to about 35,000 acres) and then increased dramatically to 60,000 acres by 2002. Since that time, the vineyard acreage in the County has been relatively stable with minimal increase. In 2008, grapes occupied 61,971 acres in Sonoma County (2008 Sonoma Agricultural Crop Report, Sonoma County Agricultural Commissioner's Office, July 2009).

In Sonoma County, the increase in vineyards occurred in part as replacement of other crops and in part as expansion into areas not previously farmed, particularly on slopes adjacent to established vineyard areas. Additional expansion of vineyard acreage into the future is constrained by local factors including availability of suitable cropland for conversion, availability of hillside land suitable for vineyards and relatively high cost of hillside vineyard development, County prohibitions on vineyard development on very steep slopes, and competition for available land with urban and rural residential land uses. Given all of these constraining factors, negligible vineyard expansion is indicated for the study area by 2030.

6.1.3 Water Conservation Measures

In considering the demands on the groundwater basin in 2030, we recognized that water conservation measures will likely play a growing part in the State's efforts to protect water resources for the expanding population. As the population grows and drought events occur, both factors stressing water supply availability, water conservation measures become increasingly important. Based on conversations with Cal-Am staff, it is understood that although there are no formally adopted long-term water conservation goals for 2020 or 2030, Cal-Am is currently working to implement water conservation measures in accordance with the California Urban Water Conservation Council. For the purposes of analyzing changes to the water balance in 2030, it is assumed that the Larkfield-Wikiup area will adopt the Governor of California's proposed water conservation goals of 20% reduction in per capita water demand by 2020. This could be accomplished through a variety of water conservation measures such as installing low-flow fixtures in new residences, retrofitting existing residences with low-flow fixtures, encouraging drought tolerant landscaping, etc. We assume that the proposed 30 AFY in offsets from the Sutter project will contribute to the 20% reduction by 2020, instead of being additional conservation beyond the 20% threshold.

To quantify this 20% reduction demand, current household water demands both in the rural areas and in the urban areas were examined. For rural areas, a current water use of approximately 0.53 AFY has been applied in this study. Urban residences usually reside on smaller parcels and consequently use less water, estimated as approximately 0.4 AFY. Including a 20% reduction in demand would reduce rural consumption to 0.42 AFY and urban consumption to 0.32 AFY. These per-household reductions help offset the impact of the increased population in 2030.

One potential effect from water conservation efforts would be the elimination of over-watering practices. In the current water balance over-watering in urban areas contributes to groundwater recharge. In order to quantify the effects of eliminating over-watering practices, we calculated the annual reduction in groundwater recharge that would occur if over watering practices desist by 2030. To do this we calculated the amount of residential water use that becomes groundwater in current conditions with the over-watering scenario. This calculation demonstrates that 7.5% of total urban residential water use and 9% of total rural residential water use currently infiltrates to groundwater, respectively. These two percentages are slightly different due to the assumption that rural residences would use more water in outdoor irrigation because of the larger parcel sizes. We calculated that 7.5% of urban water use in 2030 represents 46 AFY and 9% of rural water use in 2030 represents 20 AFY, yielding a total of 66 AFY. Therefore, in 2030, we expect to see 66 AFY less water infiltrating to groundwater.

6.1.4 Climate Change

Current climate change models are not sufficiently refined or accurate to predict impacts on a watershed scale. Increased temperatures might be presumed, with some increase in evapotranspiration losses, while effects on precipitation are not known. Unlike the Sierra Nevada, there is no significant snowpack in the Russian River watershed that influences the hydrology of the Russian River system or provides seasonal water storage. During preparation of Sonoma County Water Agency's 2005 Urban Water Management Plan, Agency staff met with researchers at Lawrence Livermore National Laboratory (LLNL) to explore the possible development of a predictive climate model to assess climate change impacts on Agency water supply (SCWA Water Project EIR, p. 5.16-13). However, the researchers indicated that such modeling would not likely be able to provide reasonably accurate results because of the variable nature of storm formation in the Pacific region. Preliminary climate model results for the Pacific coast have predicted that the region could be the same, wetter or drier. Accordingly, the Agency is continuing to rely on historical records for its water supply studies and climate change impacts are not considered in the 2030 scenario.

6.2 FUTURE WATER BALANCE

Future changes to water demand patterns and quantities in the study area will impact the groundwater basin to a certain degree. The current water balance provides a useful framework to analyze the expected changes in 2030 as presented above. This section considers the cumulative impacts of the Sutter hospital in the context of additional changes in 2030. A summary of these impacts is presented below:

Increase in Demand Based on Current Water Consumption Rates:	203 AFY
Decreased recharge due to increased impervious surfaces:	8 AFY
Net Increased Demand from SMC well	28 AFY
TOTAL	239 AFY
Decrease in Demand if 20% Conservation is Implemented:	137 AFY
Decreased recharge if conservation leads to elimination of over-watering:	66 AFY
TOTAL INCREASE CONSIDERING CONSERVATION	168 AFY

Based on the assumptions explained above regarding per-household water consumption and growth, the approximate increase in water demand would be 239 AFY. This value includes the loss of recharge from precipitation to the groundwater basin caused by conversion of pervious surfaces to impervious surfaces. This value also includes the net increase in demand caused by the SMC well, taking into consideration the offset program.

Also provided above is the expected net water savings if all households implement the suggested 20% by 2020 water demand reduction. This calculation was also based on the rates and household totals described above. By including the calculated 137 AFY of savings and the 66 AFY loss of recharge caused by the potential elimination of water-watering, the total net increase in demand in 2030 is approximately 168 AFY. Given an estimated perennial yield of 2,830 AFY (Table 6, Appendix A), then a 168 AFY increase represents 5.9% of the perennial yield. Without the water conservation measures, the water demand would equal 8.5% of the current perennial yield.

We can compare the increased water demand to flows in the Laguna to develop a conservative idea of how the future build-out scenario could affect creek flows. Distributing the increased demand of 168 AFY along the 8,810 linear feet of waterway adjacent to our study area yields a maximum theoretical loss of .00005224 cfs per linear foot of creek. As measured by the USGS stream gauge near Mirabel Heights, average annual flow volume in the Laguna is 208,060 AFY. This average flow was calculated from years where the average precipitation was 77% of normal, indicating that during average rainfall years the Laguna experiences approximately 270,909 AFY of flow within the project watershed. Based on this average annual stream flow, the calculated increased demand of 168 AFY represents only 0.062% of annual flows in the Laguna.

We understand that Cal-Am intends to develop a well within the basin study area, which may potentially serve growth demands outside of the areas identified in this study. We would expect that any additional production wells of this nature would carefully consider the cumulative impact of additional extraction of groundwater from the basin in regards to impacts to regional beneficial uses as part of the regulatory process required to develop production wells currently implemented in the area.

It is understood from discussions with the County that Cal-Am is considering installing an additional groundwater well along the northern border of the study area within Larkfield Wikiup. This well could be used both as an emergency back-up supply and as a potential supply to satisfy future growth in demand. While the production capacity of this new well is unknown, it was evaluated in terms of the production capacity of existing wells. The two major production wells that Cal-Am currently operates produce roughly 300 AFY and 200 AFY. Assuming an average, the potential new Cal-Am well would produce 250 AFY. This new well could thus help satisfy the increased water demand by 2030. Based on the uncertain qualities inherent in future projections, we cannot assume that no additional supply wells would be needed within the study area.

6.3 CONCLUSIONS

Based on the results of the analysis, and the review of existing policy documents that create a management framework for groundwater extraction in the study, we conclude the following for the existing condition.

- Groundwater is a potential potable water source for the proposed Sutter Medical Center development. In that particular portion of Sonoma County, groundwater serves the needs of many residents and a variety of land uses.

- A water balance for the current conditions covering a study period between 1987 and 2007 indicates that inflows and outflows within the study area are at a near balance with estimated inflows of around 2,830 acre-feet per year (AFY) and estimated outflows of 2,840 AFY. This appears to indicate a small net negative change in storage around 10 AFY. It should be noted that very often data and measurements in hydrology are imperfect and have margins of error of 5% or more. Recognizing that this total contains a margin of error and is derived from imperfect data, we conclude that the total is well within the margin of error typical for a study of this type and indicative of a net balance. This is further supported by hydrograph data within the study area that indicates relatively stable to slightly increasing water levels during the study period.

- The existing groundwater basin below the proposed hospital is in an equilibrium state with regard to inflows and outflows. Minor changes to the groundwater balance caused by the proposed well pumping will likely include a small decline in storage around the pumping wells.

- The Sonoma County Water Agency and the City of Santa Rosa recognize the importance of groundwater as a resource and have prepared several policy level documents to manage future water resources in the region. Future groundwater development will be guided by City and County policy.

- In general, water quality within the Santa Rosa Plain Subbasin is considered good (DWR 1982). More locally, groundwater sampling results from existing wells at the subject site (ENGEO, 2006) indicated that the majority of samples when compared to the California Department of Health Services (DHS) Drinking Water Standards and Secondary Standard Maximum Contaminant Levels (MCLs) were below the DHS MCLs.

- While the conducted calculations provide numerical estimations of the current net changes in storage (namely, -10 AFY), we recognize that this figure is an annual average and masks the yearly fluctuations inherent to a dynamic groundwater basin system. These systems are capable of responding to external changes such as drought years or wet years to achieve new equilibrium balance points. With the addition of the proposed well, the groundwater basin will adjust to achieve a new stable equilibrium point; groundwater levels in the vicinity of well will drop slightly to accommodate the new pumping and reach a new equilibrium contour configuration. In our opinion, addition of the proposed Sutter well pumping is not likely to adversely affect the ability of the groundwater basin to achieve a stable equilibrium condition.

- Based on the assessment of potential drawdown and the radius of influence for the proposed Sutter Medical Center well, its additional pumping does not represent a significant adverse impact on existing private wells in the local vicinity.

- Based on our calculations for the future build-out scenario in 2030, we estimate an approximate increase in groundwater demand of 168 AFY. This would include a 20% per capita reduction in water use by 2020, as recommended by the Governor of California.

7.0 LIMITATIONS AND UNIFORMITY OF CONDITIONS

This report is issued with the understanding that it is the responsibility of the owner to transmit the information and recommendations of this report to developers, owners, buyers, architects, engineers, and designers for the project so that the necessary steps can be taken by the contractors and subcontractors to carry out such recommendations in the field. The conclusions and recommendations contained in this report are solely professional opinions.

The professional staff of ENGEO Incorporated strives to perform its services in a proper and professional manner with reasonable care and competence but is not infallible. There are risks of earth movement and property damages inherent in land development. We are unable to eliminate all risks or provide insurance; therefore, we are unable to guarantee or warrant the results of our services.

This report is based upon field and other conditions discovered at the time of preparation of ENGEO's report. This document must not be subject to unauthorized reuse that is, reusing without written authorization of ENGEO. Such authorization is essential because it requires ENGEO to evaluate the document's applicability given new circumstances, not the least of which is passage of time. Actual field or other conditions will necessitate clarifications, adjustments, modifications or other changes to ENGEO's documents. Therefore, ENGEO must be engaged to prepare the necessary clarifications, adjustments, modifications or other changes before construction activities commence or further activity proceeds. If ENGEO's scope of services does not include on-study area construction observation, or if other persons or entities are retained to provide such services, ENGEO cannot be held responsible for any or all claims arising from or resulting from the performance of such services by other persons or entities, and from any or all claims arising from or resulting from clarifications, adjustments, modifications, discrepancies or other changes necessary to reflect changed field or other conditions.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-05) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

TARGET PROPERTY INFORMATION

ADDRESS

4728 OLD REDWOOD HIGHWAY
SANTA ROSA, CA 95403

COORDINATES

Latitude (North):	38.500100 - 38˚ 30' 0.4''
Longitude (West):	122.749700 - 122˚ 44' 58.9''
Universal Tranverse Mercator:	Zone 10
UTM X (Meters):	521826.2
UTM Y (Meters):	4261127.5
Elevation:	165 ft. above sea level

TARGET PROPERTY SEARCH RESULTS

The target property was not listed in any of the databases searched by EDR.

EXECUTIVE SUMMARY

DATABASES WITH NO MAPPED SITES

No mapped sites were found in EDR's search of available ("reasonably ascertainable ") government records either on the target property or within the search radius around the target property for the following databases:

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

EXECUTIVE SUMMARY

STANDARD ENVIRONMENTAL RECORDS

Federal RCRA generators list

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 09/10/2008 has revealed that there are 2 RCRA-SQG sites within approximately 0.25 miles of the target property.

State and tribal leaking storage tank lists

LUST: The Leaking Underground Storage Tank Incident Reports contain an inventory of reported leaking underground storage tank incidents. The data come from the State Water Resources Control Board Leaking Underground Storage Tank Information System.

A review of the LUST list, as provided by EDR, and dated 11/04/2008 has revealed that there are 8 LUST sites within approximately 0.5 miles of the target property.

EXECUTIVE SUMMARY

State and tribal registered storage tank lists

UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the State Water Resources Control Board's Hazardous Substance Storage Container Database.

A review of the UST list, as provided by EDR, and dated 11/04/2008 has revealed that there are 4 UST sites within approximately 0.25 miles of the target property.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Lists of Registered Storage Tanks

CA FID UST: The Facility Inventory Database contains active and inactive underground storage tank locations. The source is the State Water Resource Control Board.

A review of the CA FID UST list, as provided by EDR, and dated 10/31/1994 has revealed that there are 4 CA FID UST sites within approximately 0.25 miles of the target property.

SWEEPS UST: Statewide Environmental Evaluation and Planning System. This underground storage tank listing was updated and maintained by a company contacted by the SWRCB in the early 1990's. The listing is no longer updated or maintained. The local agency is the contact for more information on a site on the SWEEPS list.

A review of the SWEEPS UST list, as provided by EDR, and dated 06/01/1994 has revealed that there are 5 SWEEPS UST sites within approximately 0.25 miles of the target property.

Other Ascertainable Records

Cortese: The sites for the list are designated by the State Water Resource Control Board (LUST), the Integrated Waste Board (SWF/LS), and the Department of Toxic Substances Control (Cal-Sites). This listing is no longer updated by the state agency.

A review of the Cortese list, as provided by EDR, and dated 04/01/2001 has revealed that there are 4 Cortese sites within approximately 0.5 miles of the target property.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.
