Other Pertinent Environmental Activity Identified at Site

California - Hazardous Waste Tracking System - Datamart

The NEI (National Emissions Inventory) database contains information on stationary and mobile sources that emit criteria air pollutants and their precursors, as well as hazardous air pollutants (HAPs).

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 09/29/2008
Date Data Arrived at EDR: 10/10/2008
Date Made Active in Reports: 11/19/2008
Number of Days to Update: 40

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 09/29/2008
Date Data Arrived at EDR: 10/10/2008
Date Made Active in Reports: 11/19/2008

Next Scheduled EDR Contact: 01/26/2009
Data Release Frequency: Quarterly

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991
Date Data Arrived at EDR: 02/02/1994

Federal Delisted NPL site list

DELISTED NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 09/29/2008

Federal CERCLIS list

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site List

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned

Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Transporters, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

RCRA-SQG: RCRA - Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

RCRA-CESQG: RCRA - Conditionally Exempt Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

Federal institutional controls / engineering controls registries

US ENG CONTROLS: Engineering Controls Sites List

A listing of sites with engineering controls in place. Engineering controls include various forms of caps, building foundations, liners, and treatment methods to create pathway elimination for regulated substances to enter environmental media or effect human health.

Date of Government Version: 10/06/2008	Source: Environmental Protection Agency
Date Data Arrived at EDR: 10/17/2008	Telephone: 703-603-0695
Date Made Active in Reports: 12/08/2008	Last EDR Contact: 12/29/2008
Number of Days to Update: 52	Next Scheduled EDR Contact: 03/30/2009
	Data Release Frequency: Varies

US INST CONTROL: Sites with Institutional Controls

A listing of sites with institutional controls in place. Institutional controls include administrative measures, such as groundwater use restrictions, construction restrictions, property use restrictions, and post remediation care requirements intended to prevent exposure to contaminants remaining on site. Deed restrictions are generally required as part of the institutional controls.

State- and tribal - equivalent CERCLIS

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control’s (DTSC’s) Site Mitigation and Brownfields Reuse Program’s (SMBRP’s) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Included in the listing are brownfields properties addresses by Cooperative Agreement Recipients and brownfields properties addressed by Targeted Brownfields Assessments. Targeted Brownfields Assessments-EPA's Targeted Brownfields Assessments (TBA) program is designed to help states, tribes, and municipalities--especially those without EPA Brownfields Assessment Demonstration Pilots--minimize the uncertainties of contamination often associated with brownfields. Under the TBA program, EPA provides funding and/or technical assistance for environmental assessments at brownfields sites throughout the country. Targeted Brownfields Assessments supplement and work with other efforts under EPA's Brownfields Initiative to promote cleanup and redevelopment of brownfields. Cooperative Agreement Recipients-States, political subdivisions, territories, and Indian tribes become Brownfields Cleanup Revolving Loan Fund (BCRLF) cooperative agreement recipients when they enter into BCRLF cooperative agreements with the U.S. EPA. EPA selects BCRLF cooperative agreement recipients based on a proposal and application process. BCRLF cooperative agreement recipients must use EPA funds provided through BCRLF cooperative agreement for specified brownfields-related cleanup activities.

Local Lists of Hazardous waste / Contaminated Sites

CDL: Clandestine Drug Labs
A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

Date of Government Version: 07/01/2008

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

Other Ascertainable Records

RCRA-NonGen: RCRA - Non Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

UMTRA: Uranium Mill Tailings Sites
Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing

A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method.

EDR PROPRIETARY RECORDS

EDR Proprietary Records

Manufactured Gas Plants: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR’s researchers. Manufactured gas sites were used in the United States from the 1800’s to 1950’s to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Oil/Gas Pipelines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines.

Electric Power Transmission Line Data
Source: PennWell Corporation
Telephone: (800) 823-6277
This map includes information copyrighted by PennWell Corporation. This information is provided on a best effort basis and PennWell Corporation does not guarantee its accuracy nor warrant its fitness for any particular purpose. Such information has been reprinted with the permission of PennWell.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association’s annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics’ primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics’ primary database on private school locations in the United States.

Daycare Centers: Licensed Facilities
Source: Department of Social Services
Telephone: 916-657-4041

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 1999 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 and 2005 from the U.S. Fish and Wildlife Service.

Scanned Digital USGS 7.5’ Topographic Map (DRG)
Source: United States Geologic Survey
A digital raster graphic (DRG) is a scanned image of a U.S. Geological Survey topographic map. The map images are made by scanning published paper maps on high-resolution scanners. The raster image is georeferenced and fit to the Universal Transverse Mercator (UTM) projection.

EDR’s GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

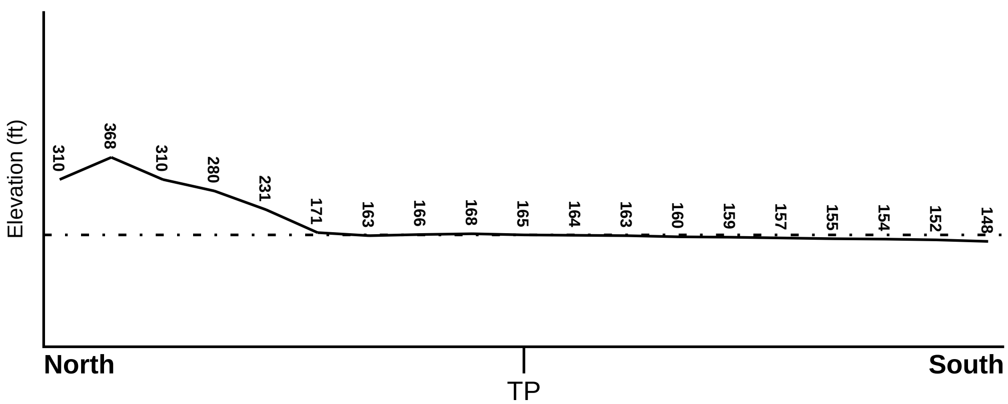
TOPOGRAPHIC INFORMATION

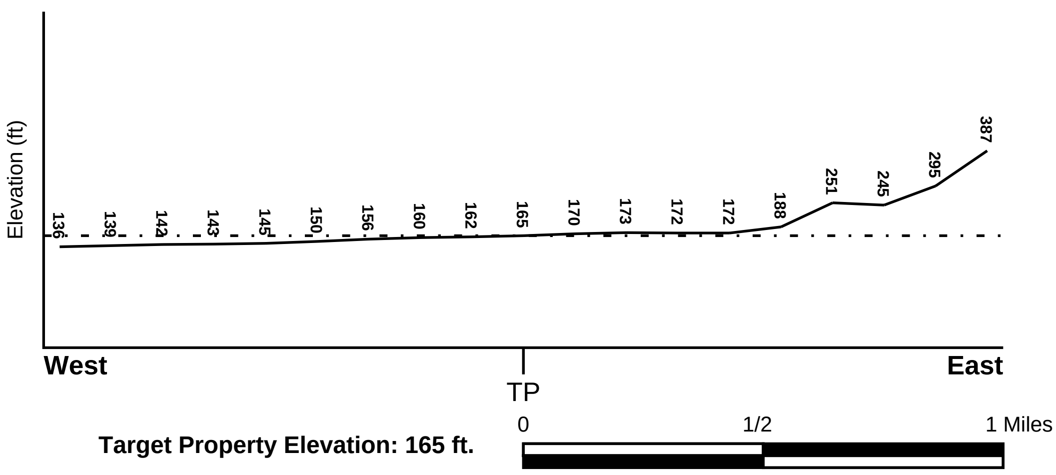
Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General WSW

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES





Target Property Elevation: 165 ft.

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Target Property County	FEMA Flood Electronic Data

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius: 1.25 miles
Status: Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
1	1/8 - 1/4 Mile WNW	SW
A2	1/8 - 1/4 Mile South	Varies
A3	1/8 - 1/4 Mile South	Not Reported
A4	1/8 - 1/4 Mile South	NNE
5	1/8 - 1/4 Mile WNW	Varies
A6	1/8 - 1/4 Mile SSE	NNE
23	1/2 - 1 Mile ENE	Not Reported

For additional site information, refer to Physical Setting Source Map Findings.

* ©1996 Site−specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: YOLO

Soil Surface Texture: silt loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

Hydric Status: Unknown

Corrosion Potential - Uncoated Steel: Low

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		Soil Reaction (pH)
1	0 inches	7 inches	silt loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 14 Min: 4	Max: 8.4 Min: 6.1
2	7 inches	59 inches	silt loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 14 Min: 4	Max: 8.4 Min: 6.1

Soil Map ID: 2

Soil Component Name: YOLO

Soil Surface Texture: clay loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Low

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Scanned Digital USGS 7.5' Topographic Map (DRG)
Source: United States Geologic Survey
A digital raster graphic (DRG) is a scanned image of a U.S. Geological Survey topographic map. The map images are made by scanning published paper maps on high-resolution scanners. The raster image is georeferenced and fit to the Universal Transverse Mercator (UTM) projection.

HYDROLOGIC INFORMATION

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 1999 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 and 2005 from the U.S. Fish and Wildlife Service.

HYDROGEOLOGIC INFORMATION

AQUIFLOW^R Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Services, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

EDR Aerial Photo Decade Package

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDRs professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

When delivered electronically by EDR, the aerial photo images included with this report are for ONE TIME USE ONLY. Further reproduction of these aerial photo images is prohibited without permission from EDR. For more information contact your EDR Account Executive.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-05) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

EXECUTIVE SUMMARY

STANDARD ENVIRONMENTAL RECORDS

Federal RCRA generators list

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 09/10/2008 has revealed that there are 2 RCRA-SQG sites within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

SWEEPS UST: Statewide Environmental Evaluation and Planning System. This underground storage tank listing was updated and maintained by a company contacted by the SWRCB in the early 1990's. The listing is no longer updated or maintained. The local agency is the contact for more information on a site on the SWEEPS list.

A review of the SWEEPS UST list, as provided by EDR, and dated 06/01/1994 has revealed that there are 5 SWEEPS UST sites within approximately 0.25 miles of the target property.

Other Ascertainable Records

Cortese: The sites for the list are designated by the State Water Resource Control Board (LUST), the Integrated Waste Board (SWF/LS), and the Department of Toxic Substances Control (Cal-Sites). This listing is no longer updated by the state agency.

A review of the Cortese list, as provided by EDR, and dated 04/01/2001 has revealed that there are 4 Cortese sites within approximately 0.5 miles of the target property.

Notify 65: Notify 65 records contain facility notifications about any release that could impact drinking water and thereby expose the public to a potential health risk. The data come from the State Water Resources Control Board's Proposition 65 database.

A review of the Notify 65 list, as provided by EDR, and dated 10/21/1993 has revealed that there is 1 Notify 65 site within approximately 1 mile of the target property.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Other Pertinent Environmental Activity Identified at Site

California - Hazardous Waste Tracking System - Datamart

The NEI (National Emissions Inventory) database contains information on stationary and mobile sources that emit criteria air pollutants and their precursors, as well as hazardous air pollutants (HAPs).

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 09/29/2008
Date Data Arrived at EDR: 10/10/2008
Date Made Active in Reports: 11/19/2008
Number of Days to Update: 40

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 09/29/2008

Next Scheduled EDR Contact: 01/26/2009
Data Release Frequency: Quarterly

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Federal Delisted NPL site list

DELISTED NPL: National Priority List Deletions
The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 09/29/2008
Date Data Arrived at EDR: 10/10/2008
Date Made Active in Reports: 11/19/2008
Number of Days to Update: 40

Data Release Frequency: Quarterly

Federal CERCLIS list

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System
CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 10/07/2008
Date Data Arrived at EDR: 10/16/2008

Next Scheduled EDR Contact: 04/13/2009
Data Release Frequency: Quarterly

Federal CERCLIS NFRAP site List

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned
Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

Date of Government Version: 12/03/2007
Date Data Arrived at EDR: 12/06/2007

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Transporters, Storage and Disposal
RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Date of Government Version: 09/10/2008

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

Date of Government Version: 09/10/2008
Date Data Arrived at EDR: 09/23/2008

RCRA-SQG: RCRA - Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

Date of Government Version: 09/10/2008

RCRA-CESQG: RCRA - Conditionally Exempt Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

Date of Government Version: 09/10/2008

Federal institutional controls / engineering controls registries

US ENG CONTROLS: Engineering Controls Sites List

A listing of sites with engineering controls in place. Engineering controls include various forms of caps, building foundations, liners, and treatment methods to create pathway elimination for regulated substances to enter environmental media or effect human health.

Date of Government Version: 10/06/2008
Date Data Arrived at EDR: 10/17/2008
Date Made Active in Reports: 12/08/2008
Number of Days to Update: 52

Telephone: 703-603-0695
Last EDR Contact: 12/29/2008
Next Scheduled EDR Contact: 03/30/2009
Data Release Frequency: Varies

US INST CONTROL: Sites with Institutional Controls

A listing of sites with institutional controls in place. Institutional controls include administrative measures, such as groundwater use restrictions, construction restrictions, property use restrictions, and post remediation care requirements intended to prevent exposure to contaminants remaining on site. Deed restrictions are generally required as part of the institutional controls.

Date of Government Version: 10/06/2008	Source: Environmental Protection Agency
Date Data Arrived at EDR: 10/17/2008	Telephone: 703-603-0695

Federal ERNS list

ERNS: Emergency Response Notification System

Emergency Response Notification System. ERNS records and stores information on reported releases of oil and hazardous substances.

Date of Government Version: 12/31/2007	Source: National Response Center, United States Coast Guard
Date Data Arrived at EDR: 01/23/2008	Telephone: 202-267-2180
Date Made Active in Reports: 03/17/2008	Last EDR Contact: 01/23/2009
Number of Days to Update: 54	Next Scheduled EDR Contact: 04/19/2009
	Data Release Frequency: Annually

State- and tribal - equivalent NPL

RESPONSE: State Response Sites

Identifies confirmed release sites where DTSC is involved in remediation, either in a lead or oversight capacity. These confirmed release sites are generally high-priority and high potential risk.

Date of Government Version: 08/25/2008	Source: Department of Toxic Substances Control
Date Data Arrived at EDR: 08/27/2008	Telephone: 916-323-3400
Date Made Active in Reports: 09/03/2008	Last EDR Contact: 11/26/2008
Number of Days to Update: 7	Next Scheduled EDR Contact: 02/23/2009
	Data Release Frequency: Quarterly

State- and tribal - equivalent CERCLIS

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

Date of Government Version: 08/25/2008	Source: Department of Toxic Substances Control
Date Data Arrived at EDR: 08/27/2008	Telephone: 916-323-3400

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Included in the listing are brownfields properties addresses by Cooperative Agreement Recipients and brownfields properties addressed by Targeted Brownfields Assessments. Targeted Brownfields Assessments-EPA's Targeted Brownfields Assessments (TBA) program is designed to help states, tribes, and municipalities--especially those without EPA Brownfields Assessment Demonstration Pilots--minimize the uncertainties of contamination often associated with brownfields. Under the TBA program, EPA provides funding and/or technical assistance for environmental assessments at brownfields sites throughout the country. Targeted Brownfields Assessments supplement and work with other efforts under EPA's Brownfields Initiative to promote cleanup and redevelopment of brownfields. Cooperative Agreement Recipients-States, political subdivisions, territories, and Indian tribes become Brownfields Cleanup Revolving Loan Fund (BCRLF) cooperative agreement recipients when they enter into BCRLF cooperative agreements with the U.S. EPA. EPA selects BCRLF cooperative agreement recipients based on a proposal and application process. BCRLF cooperative agreement recipients must use EPA funds provided through BCRLF cooperative agreement for specified brownfields-related cleanup activities.

WMUDS/SWAT: Waste Management Unit Database

Waste Management Unit Database System. WMUDS is used by the State Water Resources Control Board staff and the Regional Water Quality Control Boards for program tracking and inventory of waste management units. WMUDS is composed of the following databases: Facility Information, Scheduled Inspections Information, Waste Management Unit Information, SWAT Program Information, SWAT Report Summary Information, SWAT Report Summary Data, Chapter 15 (formerly Subchapter 15) Information, Chapter 15 Monitoring Parameters, TPCA Program Information, RCRA Program Information, Closure Information, and Interested Parties Information.

Date of Government Version: 04/01/2000

Local Lists of Hazardous waste / Contaminated Sites

CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

Date of Government Version: 07/01/2008

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

Other Ascertainable Records

RCRA-NonGen: RCRA - Non Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

UMTRA: Uranium Mill Tailings Sites
Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing

A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method.

EDR PROPRIETARY RECORDS

EDR Proprietary Records

Manufactured Gas Plants: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data

Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Date of Government Version: 12/31/2005
Date Data Arrived at EDR: 06/15/2007
Date Made Active in Reports: 08/20/2007
Number of Days to Update: 66

Oil/Gas Pipelines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines.

Electric Power Transmission Line Data
Source: PennWell Corporation
Telephone: (800) 823-6277
This map includes information copyrighted by PennWell Corporation. This information is provided on a best effort basis and PennWell Corporation does not guarantee its accuracy nor warrant its fitness for any particular purpose. Such information has been reprinted with the permission of PennWell.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association’s annual survey of hospitals.
Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.
Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.
Public Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics’ primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.
Private Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics’ primary database on private school locations in the United States.
Daycare Centers: Licensed Facilities
Source: Department of Social Services
Telephone: 916-657-4041

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 1999 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 and 2005 from the U.S. Fish and Wildlife Service.

Scanned Digital USGS 7.5’ Topographic Map (DRG)
Source: United States Geologic Survey
A digital raster graphic (DRG) is a scanned image of a U.S. Geological Survey topographic map. The map images are made by scanning published paper maps on high-resolution scanners. The raster image is georeferenced and fit to the Universal Transverse Mercator (UTM) projection.

Most Recent Revision:	1993

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

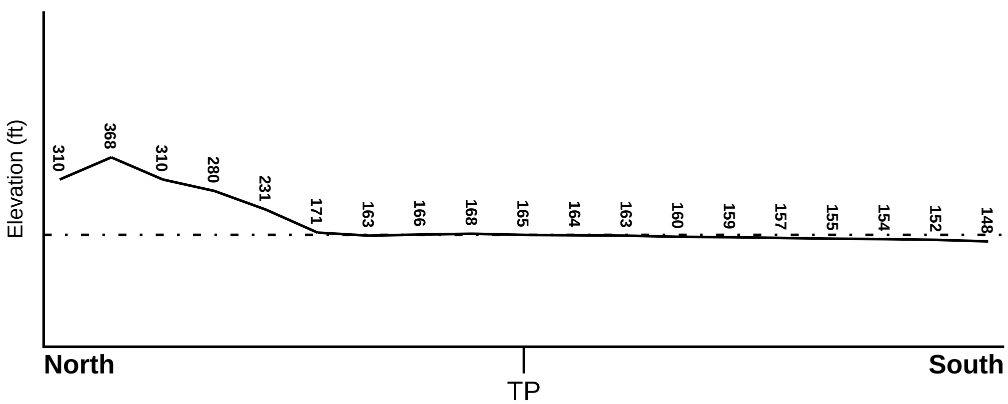
TOPOGRAPHIC INFORMATION

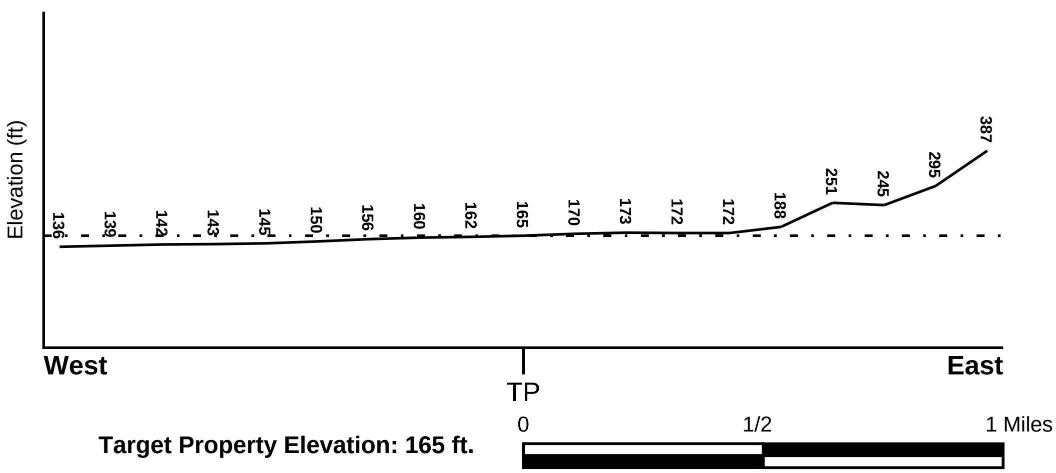
Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General WSW

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES





Target Property Elevation: 165 ft.

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Target Property County	FEMA Flood Electronic Data
SONOMA, CA	YES - refer to the Overview Map and Detail Map

Flood Plain Panel at Target Property: 0603750565B

Additional Panels in search area: 0603750545B
0603750685B
0603750725B

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
MARK WEST SPRINGS	Not Available

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius: 1.25 miles
Status: Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
1	1/8 - 1/4 Mile WNW	SW
A2	1/8 - 1/4 Mile South	Varies
A3	1/8 - 1/4 Mile South	Not Reported
A4	1/8 - 1/4 Mile South	NNE
5	1/8 - 1/4 Mile WNW	Varies
A6	1/8 - 1/4 Mile SSE	NNE
23	1/2 - 1 Mile ENE	Not Reported

For additional site information, refer to Physical Setting Source Map Findings.

* ©1996 Site−specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: YOLO

Soil Surface Texture: silt loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

Hydric Status: Unknown

Corrosion Potential - Uncoated Steel: Low

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		Soil Reaction (pH)
1	0 inches	7 inches	silt loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 14 Min: 4	Max: 8.4 Min: 6.1
2	7 inches	59 inches	silt loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 14 Min: 4	Max: 8.4 Min: 6.1

Soil Map ID: 2

Soil Component Name: YOLO

Soil Surface Texture: clay loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Low

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	7 inches	clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 14 Min: 4	Max: 8.4 Min: 6.1
2	7 inches	59 inches	loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 14 Min: 4	Max: 8.4 Min: 6.1

Soil Map ID: 3

Soil Component Name: ZAMORA

Soil Surface Texture: silty clay loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Moderate

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		Soil Reaction (pH)
1	0 inches	5 inches	silty clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 14 Min: 4	Max: 7.3 Min: 6.6
2	5 inches	29 inches	clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 14 Min: 4	Max: 7.3 Min: 6.6
3	29 inches	40 inches	clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 14 Min: 4	Max: 7.3 Min: 6.6
4	40 inches	55 inches	sandy clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 14 Min: 4	Max: 7.3 Min: 6.6
5	55 inches	59 inches	gravelly clay	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 14 Min: 4	Max: 7.3 Min: 6.6

Soil Map ID: 4

Soil Component Name: YOLO

Soil Surface Texture: loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Low

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Scanned Digital USGS 7.5' Topographic Map (DRG)
Source: United States Geologic Survey
A digital raster graphic (DRG) is a scanned image of a U.S. Geological Survey topographic map. The map images are made by scanning published paper maps on high-resolution scanners. The raster image is georeferenced and fit to the Universal Transverse Mercator (UTM) projection.

HYDROLOGIC INFORMATION

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 1999 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 and 2005 from the U.S. Fish and Wildlife Service.

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Services, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

EDR Aerial Photo Decade Package

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDRs professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

When delivered electronically by EDR, the aerial photo images included with this report are for ONE TIME USE ONLY. Further reproduction of these aerial photo images is prohibited without permission from EDR. For more information contact your EDR Account Executive.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

GROUNDWATER AQUIFER TEST AND WATER QUALITY ANALYSIS

Dear Ms. Sponamore:

At your request and with your authorization, ENGEO Incorporated has performed aquifer testing analyses and has as evaluated groundwater quality for the subject site. The purpose of the study was to determine the well pumping characteristics, perform limited water quality testing, and predict aquifer capability for future land use.

SITE LOCATION AND DESCRIPTION

The site where the existing well is located at 50 Mark West Springs Road in Santa Rosa, California, as shown on the Site Vicinity Map (Figure 1). The property encompasses approximately 78 acres, including the Luther Burbank Center for the Arts (LBC) which is approximately 52 acres in size. In addition to the LBC, a rural residence with barn, out-buildings and undeveloped pasture land, as well as a single-family home that is currently used as law offices, are present within the property boundary.

The Luther Burbank Center (LBC) and associated parking areas are currently located at the center of the site. The LBC structure is a cultural and performing arts event center, and a part of the property is leased to the Sonoma Academy, an independent college-preparatory high school. This portion of the Property includes approximately 39 acres that are occupied by asphalt-covered parking areas, an athletic field, and an existing waste water treatment facility. Two ponds associated with the wastewater treatment facility are located along the main access road that connects to Mark West Springs Road. The athletic field is located opposite to the wastewater treatment facility at the north side of the site along Mark West Springs Road. A vineyard exists at the south and southeast corner of the site. The remainder of the site is currently vacant and covered with seasonal grasses.

GEOLOGIC CONDITIONS

The site is located within the Coast Ranges geologic province of California, a series of northwest-trending ridges and valleys. Locally, the site is mapped as underlain by Holocene-Pleistocene Alluvium (Wagner and Bortugno, 1982). This alluvium consists of unconsolidated deposits of sand, silt, gravel and clay likely derived from the bedrock uplands and older unconsolidated deposits. Regional geology and information from the well driller's log (located in Appendix D) indicate that the alluvial deposits in this area may be greater than 400 feet in thickness.

FAULTS

The site is located in a region that contains numerous active[1] and potentially-active earthquake faults. The site is not located within the State of California Fault Hazard Zone. The active Rodgers Creek fault is located approximately 0.7 mile to the east of the project area. The Maacama Fault is located 6.3 miles to the east and the San Andreas Fault is located 19.5 miles to the west of the site. Regional faulting and seismicity is shown on Figure 4, which shows regional proximity to major active faults and significant historic earthquakes with in proximity to the site. No faults have been mapped that run through the subject site indicating that aquifers beneath the property are not fault controlled.

WATER DEMAND

Information provided to us by Brejle & Race Consulting Civil Engineers of Santa Rosa, California, indicates the planned construction of the proposed hospital will result in water demand of approximately 73,460 gallons per day. The daily demand equates to a yield of roughly 50 gallons per minute for a continuous 24-hour pumping period.

WELL AND PUMP INFORMATION

An existing agriculture groundwater supply well, W-LBC, is located near the center of the property at an elevation of approximately 160 feet above msl (mean sea level). The location of well W-LBC is presented on Figure 2. Reportedly, the LBC well was installed by Les Petersen Drilling and Pump, Inc., of Santa Rosa, California, in August 2000. The well was installed using rotary wash methods and is approximately 400 feet deep. The well consists of 10-inch diameter 200-guage PVC (polyvinyl chloride) casing and screen. The well screen is mill-slot casing with 0.032-inch slot openings. Three screened intervals were installed at 100 to 160 feet, 180 to 320 feet, and 360 to 400 feet. The completed State of California Well Completion Report was furnished to us and is included in Appendix D.

---

[1] An active fault is defined by the State Mining and Geology Board as one that has had surface displacement within Holocene era (about the last 11,000 years) (Hart, 1997).

The existing agriculture groundwater supply well, W-LBC, served as the pumping well for the aquifer test. Drawdown during pumping and recovery after pumping ceased were recorded. A second existing agriculture groundwater supply well, W-SV, is located offsite near the southern end of the property, approximately 1,200 feet from W-LBC. The location of the well W-SV is also presented on Figure 2. Information about the construction details of this well had not been provided. The drawdown and recovery tests of W-SV during and after pumping of W-LBC were documented to serve as a monitoring well.

The following table summarizes well construction data related to the subject LBC and Sutter Vineyard wells:

Table 1 – Well Construction Data

Well Name	Date Constructed	Total Depth	Casing Type and Diameter	Perforation Intervals (ft bgs)
LBC Well (W-LBC)	2000	400 feet	10-inch PVC	100 to 160 160 to 320 360 to 400
Sutter Vineyard Well (W-SV)	unknown	unknown	10-inch PVC	unknown

Reportedly, the pump within the LBC well was installed by Bartley Pump of Santa Rosa, California, and consists of a Berkeley model 6T-275 submersible pump that is equipped with a 30 horsepower motor. Information from testing conducted shortly after the well was constructed is reported to show the well sustained a yield of 300 gallons per minute with 230 feet of drawdown during a 7 day pumping test. The Berkeley 6T-275 pump is rated to pump between 225 and 250 gallons per minute from the well. The pump curve and specifications for this pump model was furnished to us and is included in Appendix D. The pump was pulled out of the well for the purpose of video-surveying and the depth of the pump was found to be approximately 325 feet.

PHASE 1 – W-LBC STEP-DRAWDOWN TEST

Prior to commencing the 24-hour pumping test, an initial step-drawdown test was conducted at W-LBC, as requested by Mr. Richard Shatz, as a Hydrogeologist consultant for Cal American Water, who expressed concern that excessive pumping rates may adversely effect the well and aquifer if water levels were lowered below the upper screened interval (100 feet below ground surface (bgs)). Therefore, the step drawdown test was conducted about one week prior to the scheduled 24-hour pumping test on June 27, 2005. The step-drawdown began at a pumping rate of 100 gallons per minute (gpm); pumping started at 10:00 AM and ended at 11:20 AM as the water level equilibrated in the LBC well. The first few minutes of the test were actually conducted at a rate much higher than 100 gpm. As a result, the average rate over the 100 gpm rate step was roughly 153 gpm. The second step was 150 gpm, which began at 11:25 AM and ended at 4:25 PM. The pumping level did not stabilize while pumping at 150 gpm; the water level in the pumping well continued to decline throughout this second step. The overall rate of pumping during this step was 156 gpm, which we feel is effectively 150 gpm with regards to the equipment used. Based on the results of the step-drawdown test, we decided to implement a 24-hour pump test at a pumping rate of 100 gpm. The data collected during the step-drawdown test are included in Appendix B.

BACKGROUND WATER LEVELS

The water level of the pumping well, W-LBC, was recorded over the period of two weeks leading up to the pump test. The water level averaged a depth of 44 feet below top of casing (btc) which roughly correlates to an elevation of 116 feet above mean sea level (msl). The top of casing is approximately 14 inches above ground surface. On the day of the initial 24-hour pump test, a Bartley Pump technician proof-tested the pump approximately a half-hour before the start of the test, resulting in a background water level of 45.7 feet btc the morning of the test.

PHASE 2 – INITIAL W-LBC PUMPING TEST

A 24-hour pump test was initiated on the morning of July 5, 2005, at 10:00AM. Prior to the initiation of the pump test, groundwater levels were initially measured at pumping well W-LBC and the off-site monitoring well W-SV. The pumping concluded the following day at 10:00 AM. A flow rate meter and volume discharge meter was attached to the pump. The flow rate was maintained at ±100 gallons/minute. The flow rate was regularly verified by evaluating the measured totalizer data readings. The actual average pumping rate throughout the test, after evaluating the total gallons pumped during the 24 hours, was roughly 106 gpm. The water levels were recorded with an electrical conducting water level meter and were to the nearest hundredth of a foot.

Once the pump test commenced, the depth to groundwater was recorded at W-LBC and W-SV as follows: every minute for the first 10 minutes; every 2 minutes from 10 to 30 minutes; every 5 minutes from 30 to 60 minutes; every 10 minutes from 60 to 120 minutes; every 20 minutes from 120 to 240 minutes; every 30 minutes from 240 to 360 minutes; every 60 minutes from 360 to 720 minutes; and every 120 minutes from 720 to 1,440 minutes. After 24 hours of continuous pumping, a recovery test began immediately following the shut down of the pump. The depth was recorded during recovery in the same intervals as during the pumping test to approximately 95% recovery and then at 24 hours. The field-recorded measurements of the drawdown and recovery, as well as observations and notes, are attached as Appendix B.

The drawdown at the pumping well, W-LBC, after 24 hours of continuous of pumping neared 23 feet and fully recovered following 24 hours of recovery. The observation well, W-SV, showed no significant drawdown from the continuous pumping 1,200 linear feet away.

At the request of Mr. Richard Shatz on behalf of Cal American, ENGEO measured sand content with a Rossum Sand Tester at the beginning and end of the 24-hour pumping test. The results of the sand test yielded few grains of sand, and the total amount of sand recovered fell far below the initial reading line of 1 part per million (ppm). The observations and notes from the sand test are included in Appendix B as part of the test data.

AQUIFER ANALYSIS

Using the pumping and recovery test records, we analyzed the aquifer characteristics, specifically, the transmissivity (**T**) and the storage coefficient (**S**). We have assumed in our analysis, based on previous geotechnical explorations, the aquifer is unconfined and the thickness of the aquifer extends from about 20 to 25 feet bgs to the bottom of the well for a total thickness of roughly 375 feet. The drawdown and recovery data obtained from the aquifer test was used to analyze the aquifer using the Cooper-Jacob and Theis Curve-Matching methods to determine the storage coefficient and transmissivity. A brief explanation of the different methods is included in Appendix B.

Transmissivity (**T**) is the hydraulic conductivity of the full thickness of the aquifer; it is a measure of the aquifer's ability to transmit water (i.e., how permeable it is). The values of transmissivity obtained from different methods of analysis are nearly uniform. The arithmetic mean value of transmissivity is 4,396 gallons per day per foot (gpd/ft), with a range between 3,860 gpd/ft and 4,825 gpd/ft. The geometric mean value of calculated transmissivities is 4,385 gpd/ft. These calculated values are characteristic for the type of materials encountered, such as alluvial materials, and an unconfined aquifer.

The storage coefficient (**S**), or storativity, is the volume of water released from or taken into storage per unit surface area per unit change of the hydraulic head; it is a measure of the aquifer's ability to release groundwater from storage. In typical unconfined aquifers, like the subject site, the value of storativity falls in the typical range of 0.01 and 0.35. Since the observation well felt no effect from the continual pumping in W-LBC, the calculations for storativity were limited. However, by assuming an effective well radius (i.e., the distance from the well where the water level is the same as the water level in the well), we estimate the range of storativity values for the tested aquifer to fall towards the upper bound of the typical range, roughly between 0.15 and 0.35. Further study may be warranted if a tighter range of the value of storativity is desired. (An observation well would have to be installed within 400 feet of W-LBC to successfully obtain the necessary data.)

The following table presents the results of our analysis:

TABLE 2 – Aquifer Characteristics

METHOD OF ANALYSIS	TRANSMISSIVITY **T** gpd/ft	STORAGE COEFFICIENT **S**
Cooper-Jacob Drawdown Method	4,825	0.19
Cooper-Jacob Recovery Method	4,177	N/A
Cooper-Jacob Residual Drawdown Method	4,442	N/A
Cooper-Jacob Calculated Recovery Method	3,860	0.35
Theis Curve Matching Drawdown Method	4,443	0.43
Theis Curve Matching Recovery Method	4,628	0.19

Based on a review of the pumping/recovery test data, the aquifer at the subject site can yield at least 100 gpm or 144,000 gallons per day.

Using the geometric mean value of transmissivity of 4,385 gpd/ft with the Cooper – Jacob modification of the Theis equation, we estimate the theoretical radius of influence may be as great as 600 to 800 feet for W-LBC.

PHASE 3 – SUPPLEMENTAL W-LBC PUMPING TEST

We supplemented our initial W-LBC pumping test with a second pumping test on November 14, 2005, in an effort to determine the adequacy of the well and aquifer. The set-up for this test was identical to the prior test. We pumped the well for over twenty-eight hours at ±80 gpm, roughly equivalent to 150% of the expected demand. No recordings were made at the off-site well W-SV due to the lack of drawdown during the step-drawdown and initial pumping tests at greater pumping rates. The actual average pumping rate throughout the test, after evaluating the total gallons pumped during the length of the test, was roughly 79 gpm. Recovery of the groundwater level was recorded for the following 10 hours. The water levels were recorded with an electrical conducting water level meter and were to the nearest hundredth of a foot. The data for this test are presented in Appendix B.

PHASE 4 – W-SV STEP-DRAWDOWN TEST

As a means to preliminarily assess the capacity of the off-site well W-SV, we conducted a step-drawdown test on November 21, 2005. The set-up for this test was similar to the previous tests. We commenced testing at a rate of 80 gpm and found the groundwater levels to consistently fall. After six hours, we reduced the pumping rate to 60 gpm, and within a few hours of pumping at this lower rate, the groundwater level equilibrated and we halted pumping operations. Recovery of the groundwater level was then recorded over the following 4 hours. The water levels were recorded with an electrical conducting water level meter and were to the nearest hundredth of a foot. The data for this test are presented in Appendix B.

GROUNDWATER AVAILABILITY

Review of the pumping/recovery test data and aquifer analysis indicates that the aquifer at Luther Burbank Center has capacity in excess of the predicted water demands for the proposed project. The yield of well W-LBC is at least 80 gallons per minute, or 115,200 gallons per day. The measurements indicate that the groundwater levels outside the LBC property limits and at the periphery of the property did not change. This indicates that pumping from the W-LBC does not impact the groundwater supply of adjacent properties.

WATER QUALITY

Table 3 provides water quality sample results for the two wells, W-LBC and W-SV, for the initial samples collected in July 2005 and the most recent collected in November 2005. W-LBC was only sampled in July 2005 and both wells were sampled in November 2005. For each of the sampling events, samples were collected during a 24-hour pumping test at three times: at the beginning (1 hour), at the middle (12 hours), and at the end (23 hours). The samples were collected from a tap that was installed near the pump. The samples were labeled, preserved in a chilled cooler, and transported to McCampbell Analytical, Inc., of Pacheco, California, with completed chain-of-custody forms the day following the pumping test.

The initial water quality samples collected in November 2005 were analyzed to collect the following water quality parameters: total hardness as $CaCO_3$, total dissolved solids (TDS), total alkalinity as $CaCO_3$, pH; total silica, electrical conductivity, and manganese, iron, and arsenic. The samples collected in November 2005 included additional metal parameters that were not analyzed in the initial samples and included: total alkalinity, bicarbonate as $CaCO_3$, carbonate as $CaCO_3$, hydroxide as $CaCO_3$, hardness, pH, electrical conductivity, TDS, antimony, arsenic, barium, beryllium, cadmium, total chromium, cobalt, copper, iron, lead, manganese, mercury, molybdenum, nickel, selenium, silver, thallium, vanadium, zinc, and silica.

Analysis of the water quality results indicates that the results from the start, the middle, and the end of each test are similar in value. Additionally, results from the two sampling events conducted in July and November 2005 for well W-LBC are similar in value. The lab results from McCampbell Analytical are included in Appendix C and tabulated in Table 3.

The groundwater sampling results were compared to the California Department of Health Services (DHS) Drinking Water Standard and Secondary Standard Maximum Contaminate Levels (MCLs). For the parameters that were detected in the groundwater samples, the majority were below the DHS MCLs. One exception is manganese. Manganese was detected in all the samples at levels greater than the secondary MCL (SMCL) of 0.05 mg/L. Manganese values for well W-LBC ranged from 1.3 to 1.5 mg/L and for well W-SV ranged from 0.83 to 0.86.

GEOPHYSICAL LOGGING

At the request of Mr. Richard Shatz, Welenco of Bakersfield, Calif., a geophysical logging company, was retained to perform a plumbness and alignment survey, a deviation survey, and a video survey. These activities took place on November 19, 2005. A representative of Cal American, Ms. Julliana Harris of Bookman-Edmonston, was on-site during the operations. The full suite of data and the video are included as Appendix E.

The alignment of the well has come in question by Mr. Richard Shatz. Cal American's acceptable maximum allowable deviation of the well's alignment, according to Mr. Shatz, is two-thirds of the well casing diameter, in our case, approximately 7 inches, per every 100 feet of casing length. The data obtained by Welenco suggests that W-LBC's alignment exceeds this deviation standard. The alignment of the well has little affect on the capacity of the well; its importance regards the diameter of pump that may pass through the casing. Well casings that are extremely out-of-plumb may also affect the rate of wear experienced by a pump, which is an issue of the maintenance of the well.

Mr. Shatz's interpretation of the Welenco data is that the well's alignment results in an effective diameter of 2 inches, meaning that a 2-inch plumb-bob (or smaller) is capable of traversing the entire depth of the well without coming in contact with the casing wall. A low effective diameter suggests that the maintenance and occasional service of the pump within the well may be difficult. The pump, which is situated at approximately 325 feet bgs, was pulled out of the well on November 19, 2005, and resituated a few days later. This exhibits that the alignment of the well allows for the current pump to be lowered through the first 325 feet of well casing with little resistance.

WELL CLEANING

Mr. Richard Shatz has suggested that the well screens are clogged with biological fouling, or biofouling, an accumulation of living and deceased microorganisms, which would require cleaning to provide efficient well production.

The still pictures suggest the biofouling has not caused clogging of the well screen due to encrustation. We reviewed the driller's log to see if the zones of greatest fouling correspond to the lowest water producing intervals. Although our review is limited by the generalities of the depths photographed by Welenco and the vagueness of the driller's lithologic descriptions, we perceive that the zones of greatest biofouling correspond to zones that the driller described as clay.

The Welenco photographs indicate the greatest biofouling existed within the intervals: 158 to 178; 275 to 317, and 358 to 366 feet below ground surface. The driller's log describes these intervals below ground surface as: 160 to 194 being blue and brown clay; 268 to 310 being blue clay with gravel and brown clay; and 328 to 364 being blue clay. These data show a high level of correlation between the zones of greatest biofouling and the clayey layers within the subsurface. This correlation suggests that the biofouling is due to the groundwater's low entrance velocity through the well screen. Entrance velocity should be maintained above 0.1 feet per second to limit clogging as seen in the video.

The biofouling can be reduced by disinfection using bleach or pool chlorine to create a 100 mg/l chlorine solution in the well. This solution would remain in the well for at least four hours, during which light agitation may be applied to the well bore. Following the contact period, the well should be redeveloped. Since the well's alignment is in question, we would recommend the well be carefully developed using airlifting methods. This requires a 2- to 3-inch diameter pipe connected to an air compressor be lowered to the bottom of the well. Application of air creates an aerated water column that results in water being brought to the ground surface. Properly varying the rate of air flow and the pressure will remove the dead biomaterial and clean the screen and filter pack.

Drilling and pump installation companies are well versed at well disinfection and airlift development. We recommend that a video survey to assess the well development results be conducted following the well disinfection and development.

CONCLUSIONS

- The demand of 73,460 gallons per day or 50 gallons per minute is met by the existing production well. The anticipated drawdown of the water table should be less than measured during the test.

- The 24-hour pumping test data indicates that the aquifer at the LBC property has adequate transmissivity and reasonable storage capacity.

- After 24 hours of continuous pumping, the groundwater level measured at the closest adjacent well, W-SV on the Sutter Vineyard property (1,200 feet away), did not change. This indicates that the radius of influence for a 100 gallon per minute pumping rate at W-LBC is much less than

1,200 feet. This clearly indicates that pumping from the well W-LBC does not impact adjacent properties.

- Water quality results from the samples collected from both wells, W-LBC and W-SV, indicate good water quality. There is concern with the manganese concentrations that exceed the California DHS secondary maximum contaminant level. Manganese is not considered to present a risk to human health at the SMCL. EPA does not enforce these "secondary maximum contaminant levels" or "SMCLs." They are established only as guidelines to assist public water systems in managing their drinking water for aesthetic considerations, such as taste, color and odor. Excessive manganese in groundwater will cause the water to be black to brown in color; possible black staining and potential bitter metallic taste.

- The similarity of chemical composition indicated by samples collected from the start, middle and end of the two pumping tests support the interpretation that pumping test data do not indicate aquifer boundary conditions affected the calculation of aquifer T and S.

- If water samples are to be collected from the wells in the future, cation and anion parameters should be included in the requested analysis. These parameters will be used to type the water for each well. This data will be used to determine if the wells are screened in the same aquifer.

- Mr. Richard Shatz, consultant to Cal American, has stated that from his review of the draft of this report that we supplied him, that "the aquifers are capable, there seems to be no issues with water quality, and the construction and materials of the well will work." The outstanding issue, in his opinion, is the alignment of the well. It is our experience that the vertical alignment of a well may pose a number of future considerations, which include:

    - If it is necessary to rehabilitate the well, such work may need to be performed using mechanical scrubbing devices if the screens in the well are clogged; and

    - It is possible that the ability to set the pump within the well at greater depths in the future, if necessary, may be restricted if the well deviation is excessive.

It should be noted that to assess these above items, it is possible to check the well for alignment at a later time prior to final acceptance.

We were pleased to be of continued service to you on this project. If you have any questions or comments regarding this letter, please call and we will be glad to discuss them with you.

Very truly yours,

Water Sampling Notes

Sample at 11:00 AM (START); no odor discernable

Sample at 10:00 PM (MIDDLE); mild sulfur-like smell in containers (rotten-egg like)

Sample at 9:00 AM (END); strong sulfur-like smell in container (rotten-egg like)

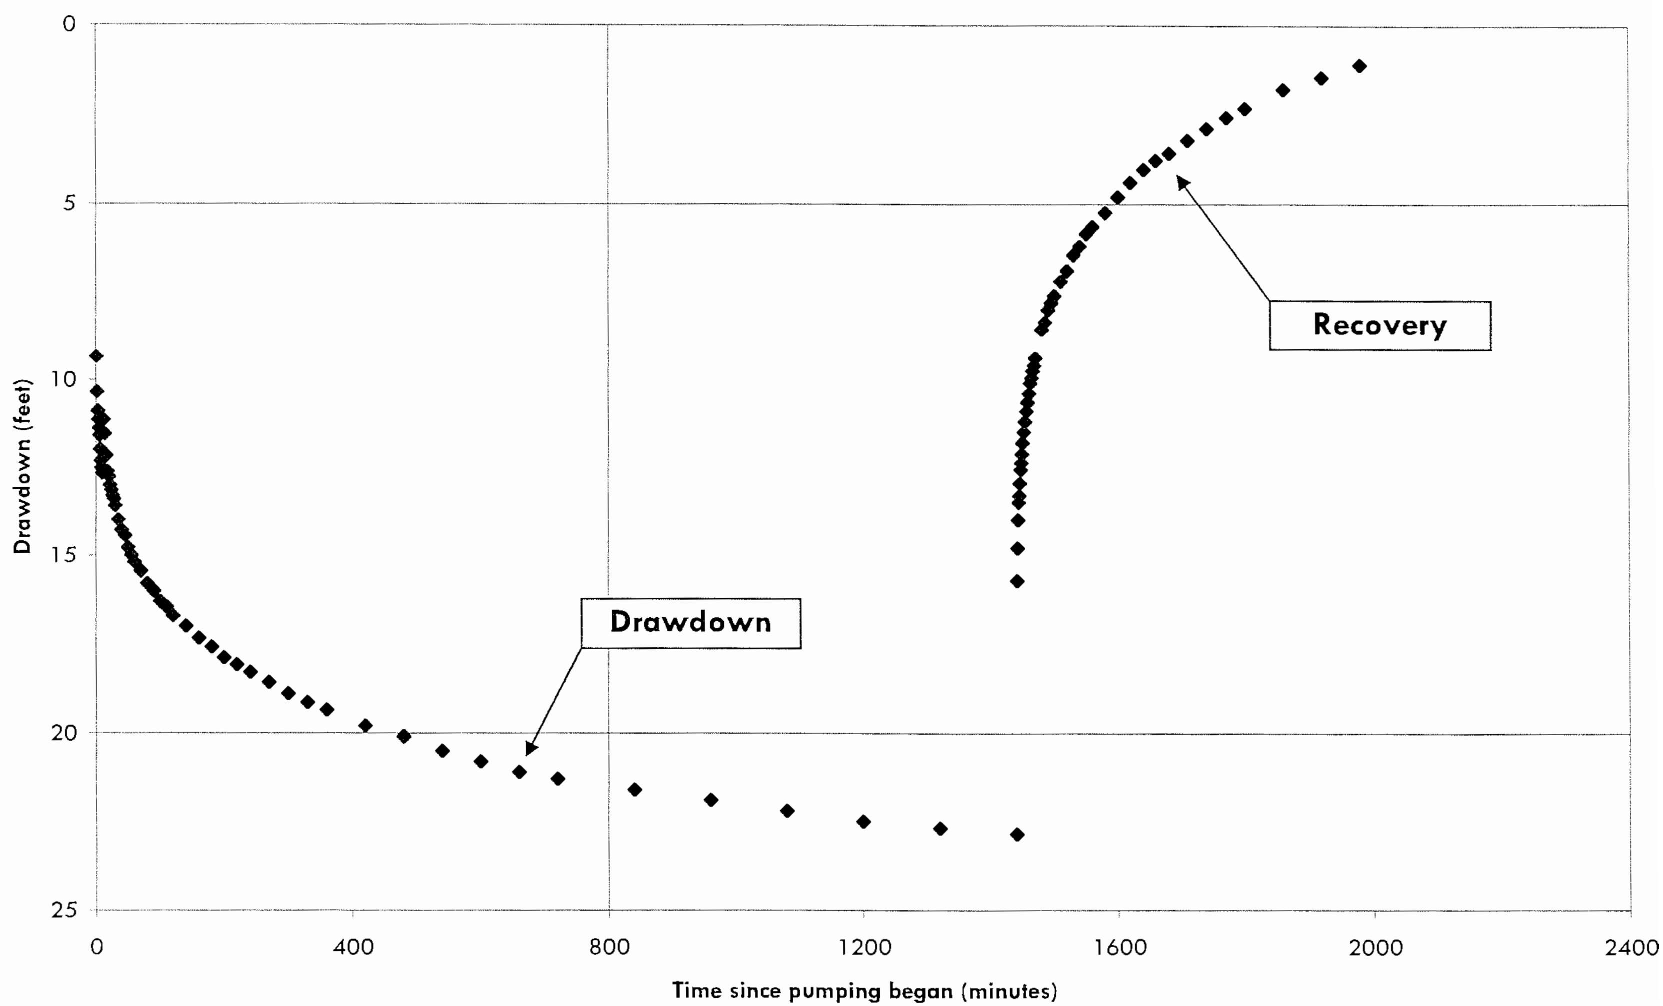
Figure B-4: Drawdown during W-LBC Pump Test @ 100gpm



AQUIFER ANALYSIS METHODOLOGIES

We have calculated the theoretical values of transmissivity and storativity in using the Cooper-Jacob and Theis Curve-Matching methods.

Cooper-Jacob Method

$$T = \frac{264Q}{\Delta s} \qquad S = \frac{0.3T \cdot t_0}{r^2}$$

…where T is the transmissivity in gpd/ft, Q is the flow discharge in gpm, Δs is the drawdown over one time-cycle in feet, S is the storativity, t_0 is the time at which a straight-line extension of the drawdown curve intersects with zero drawdown in days, and r is the distance from the well where the drawdown occurred in feet.

Theis Curve-Matching Method

$$T = \frac{Q \cdot W(u)}{4\pi \cdot s} \qquad S = \frac{4T \cdot t \cdot u}{r^2}$$

…where T is the transmissivity in cubic meters per second per meter, Q is the flow discharge in cubic meters per second, s is the drawdown in meters and t is the time in seconds from one point on the drawdown graph, W(u) is the well function and u is a parameter from the corresponding point on the well function graph, S is the storativity, and r is the distance from the well the drawdown occurred.

Maximum Radius of Influence

We have calculated the theoretical maximum radius of influence from the pumping of W-LBC using Cooper and Jacob modification of the Theis equation as follows:

$$s = \frac{264Q}{T} \log \frac{0.3Tt}{r^2 S}$$

…where s is equal to the maximum available drawdown in feet, Q is equal to the discharge in gpm, T is equal to the transmissivity in gpd/ft, t is equal to the time in days, r is equal to the radius from the well in feet, and S is equal to the storativity which is dimensionless.

Invoice Total: $486.00

If paid by**08/13/05** Prompt Pay Invoice Total = $437.40

*** ALL FAXED INVOICES ARE FOR YOUR INFORMATION ONLY - PLEASE PAY OFF ORIGINAL**

Please include the invoice number with your check and remit to Accounts Receivable at the letter head address. MAI also accepts credit card (Visa/Master Card/Discover/American Express) payment. Please call Account Receivable for details on this service.

MAI's EDF charge does not include the EDF charge for subcontracted analyses. The minimum EDF charge per workorder is $25.00. For invoice total greater than $5000.00, EDF will be 2% of the total invoice. The EDF charge for subcontracted analyses will be identical to Subcontractor's fee.

Terms are net 30 days from the invoice date. After this period 1.5% interest per month will be charged. Overdue accounts are responsible for all legal and collection fees. If you have any questions about billing, please contact Accounts Receivable at McCampbell Analytical.

ENGEO Incorporated 690 Walnut Avenue, Suite 220 Mare Island, CA 94592	Client Project ID: #6486.2.005.01; Sutter	Date Sampled:	07/05/05
		Date Received:	07/07/05
	Client Contact: Jeff Wisniewski	Date Reported:	07/15/05
	Client P.O.:	Date Completed:	07/15/05

WorkOrder: 0507082

July 15, 2005

Dear Jeff:

Enclosed are:

1). the results of 3 analyzed samples from your **#6486.2.005.01; Sutter project,**

2). a QC report for the above samples

3). a copy of the chain of custody, and

4). a bill for analytical services.

All analyses were completed satisfactorily and all QC samples were found to be within our control limits. If you have any questions please contact me. McCampbell Analytical Laboratories strives for excellence in quality, service and cost. Thank you for your business and I look forward to working with you again.

Yours truly,

Angela Rydelius, Lab Manager

Please include the invoice number with your check and remit to Accounts Receivable at the letter head address. MAI also accepts credit card (Visa/Master Card/Discover/American Express) payment. Please call Account Receivable for details on this service.

MAI's EDF charge does not include the EDF charge for subcontracted analyses. The minimum EDF charge per workorder is $25.00. For invoice total greater than $5000.00, EDF will be 2% of the total invoice. The EDF charge for subcontracted analyses will be identical to Subcontractor's fee.

Terms are net 30 days from the invoice date. After this period 1.5% interest per month will be charged. Overdue accounts are responsible for all legal and collection fees. If you have any questions about billing, please contact Accounts Receivable at McCampbell Analytical.

August 31, 2005

Dear Jeff:

Enclosed are:

1). the results of **3** analyzed samples from your **#6486.2.005.01; Sutter project,**

2). a QC report for the above samples

3). a copy of the chain of custody, and

4). a bill for analytical services.

All analyses were completed satisfactorily and all QC samples were found to be within our control limits. If you have any questions please contact me. McCampbell Analytical Laboratories strives for excellence in quality, service and cost. Thank you for your business and I look forward to working with you again.

Yours truly,

Angela Rydelius, Lab Manager

0507082-003A	7/05/05 9:00 AM	7/07/05	7/09/05 7:32 AM				

MS = Matrix Spike; MSD = Matrix Spike Duplicate; LCS = Laboratory Control Sample; LCSD = Laboratory Control Sample Duplicate; RPD = Relative Percent Deviation.

% Recovery = 100 * (MS-Sample) / (Amount Spiked); RPD = 100 * (MS - MSD) / ((MS + MSD) / 2).

MS / MSD spike recoveries and / or %RPD may fall outside of laboratory acceptance criteria due to one or more of the following reasons: a) the sample is inhomogenous AND contains significant concentrations of analyte relative to the amount spiked, or b) the spiked sample's matrix interferes with the spike recovery.

N/A = not applicable to this method.

NR = analyte concentration in sample exceeds spike amount for soil matrix or exceeds 2x spike amount for water matrix or sample diluted due to high matrix or analyte content.

*** ALL FAXED INVOICES ARE FOR YOUR INFORMATION ONLY - PLEASE PAY OFF ORIGINAL**

Please include the invoice number with your check and remit to Accounts Receivable at the letter head address. MAI also accepts credit card (Visa/Master Card/Discover/American Express) payment. Please call Account Receivable for details on this service.

MAI's EDF charge does not include the EDF charge for subcontracted analyses. The minimum EDF charge per workorder is $25.00. For invoice total greater than $5000.00, EDF will be 2% of the total invoice. The EDF charge for subcontracted analyses will be identical to Subcontractor's fee.

Terms are net 30 days from the invoice date. After this period 10% interest will be charged annually. Overdue accounts are responsible for all legal and collection fees. If you have any questions about billing, please contact Accounts Receivable at McCampbell Analytical.

November 30, 2005

RECEIVED
DEC 0 2 2005

Dear Jeff:

Enclosed are:

1). the results of 3 analyzed samples from your **#6486.2.005.01; Sutter project,**

2). a QC report for the above samples

3). a copy of the chain of custody, and

4). a bill for analytical services.

All analyses were completed satisfactorily and all QC samples were found to be within our control limits. If you have any questions please contact me. McCampbell Analytical Laboratories strives for excellence in quality, service and cost. Thank you for your business and I look forward to working with you again.

Yours truly,

Angela Rydelius, Lab Manager

BATCH 19055 SUMMARY

Sample ID	Date Sampled	Date Extracted	Date Analyzed	Sample ID	Date Sampled	Date Extracted	Date Analyzed
0511426-001D	11/21/05 11:00 AM	11/22/05	11/30/05 2:56 PM	0511426-002D	11/21/05 4:00 PM	11/22/05	11/30/05 2:58 PM
0511426-003D	11/21/05 6:00 PM	11/22/05	11/30/05 3:00 PM				

MS = Matrix Spike; MSD = Matrix Spike Duplicate; LCS = Laboratory Control Sample; LCSD = Laboratory Control Sample Duplicate; RPD = Relative Percent Deviation.

% Recovery = 100 * (MS-Sample) / (Amount Spiked); RPD = 100 * (MS - MSD) / ((MS + MSD) / 2).

MS / MSD spike recoveries and / or %RPD may fall outside of laboratory acceptance criteria due to one or more of the following reasons: a) the sample is inhomogenous AND contains significant concentrations of analyte relative to the amount spiked, or b) the spiked sample's matrix interferes with the spike recovery.

N/A = not applicable to this method.

NR = analyte concentration in sample exceeds spike amount for soil matrix or exceeds 2x spike amount for water matrix or sample diluted due to high matrix or analyte content.

All target compounds in the Method Blank of this extraction batch were ND less than the method RL with the following exceptions:

NONE

MS = Matrix Spike; MSD = Matrix Spike Duplicate; LCS = Laboratory Control Sample; LCSD = Laboratory Control Sample Duplicate; RPD = Relative Percent Deviation.

% Recovery = 100 * (MS-Sample) / (Amount Spiked); RPD = 100 * (MS - MSD) / ((MS + MSD) / 2).

MS / MSD spike recoveries and / or %RPD may fall outside of laboratory acceptance criteria due to one or more of the following reasons: a) the sample is inhomogenous AND contains significant concentrations of analyte relative to the amount spiked, or b) the spiked sample's matrix interferes with the spike recovery.

N/A = not applicable to this method.

NR = analyte concentration in sample exceeds spike amount for soil matrix or exceeds 2x spike amount for water matrix or sample diluted due to high matrix or analyte content.

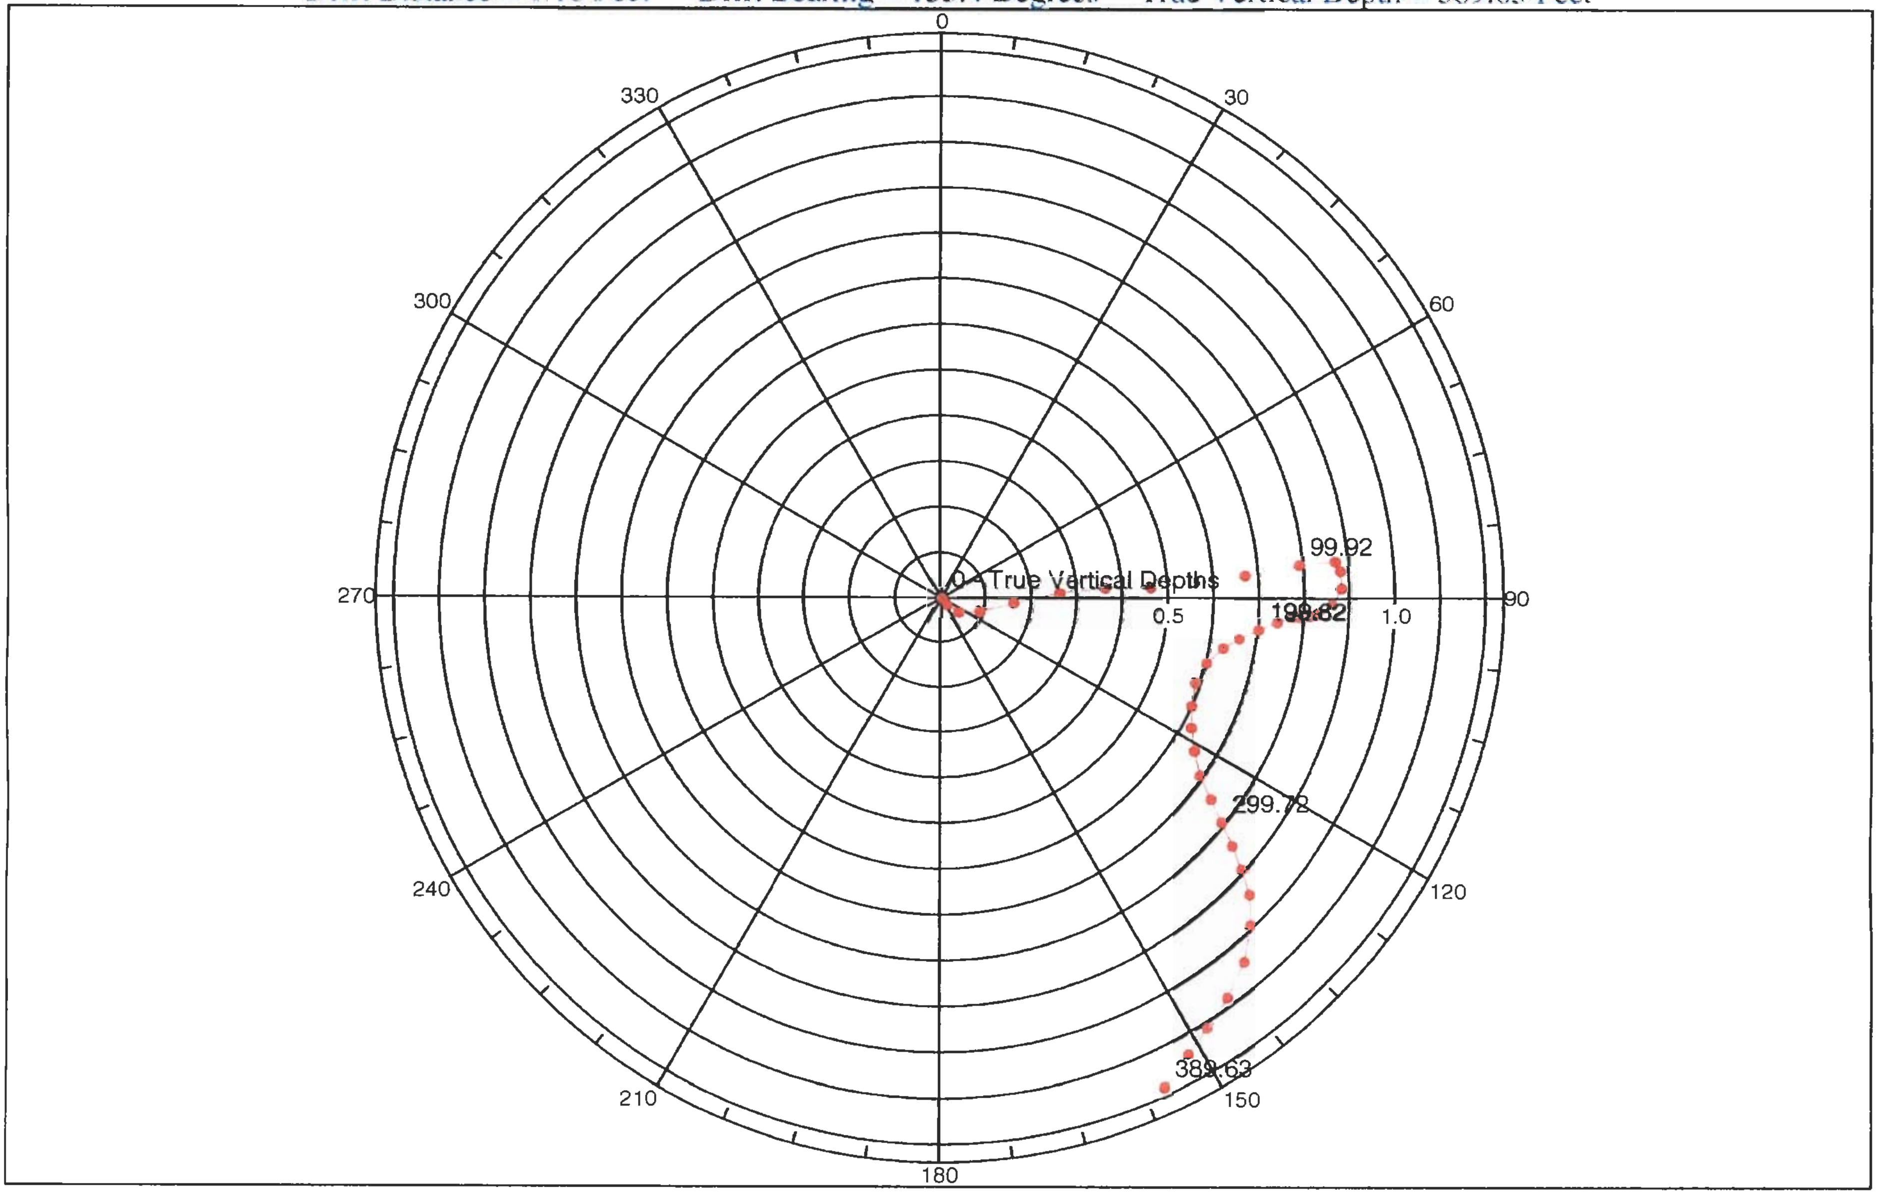
Drift-Pac Polar View

Drift Distance = 1.18 Feet   Drift Bearing = 155.4 Degrees   True Vertical Depth = 389.63 Feet

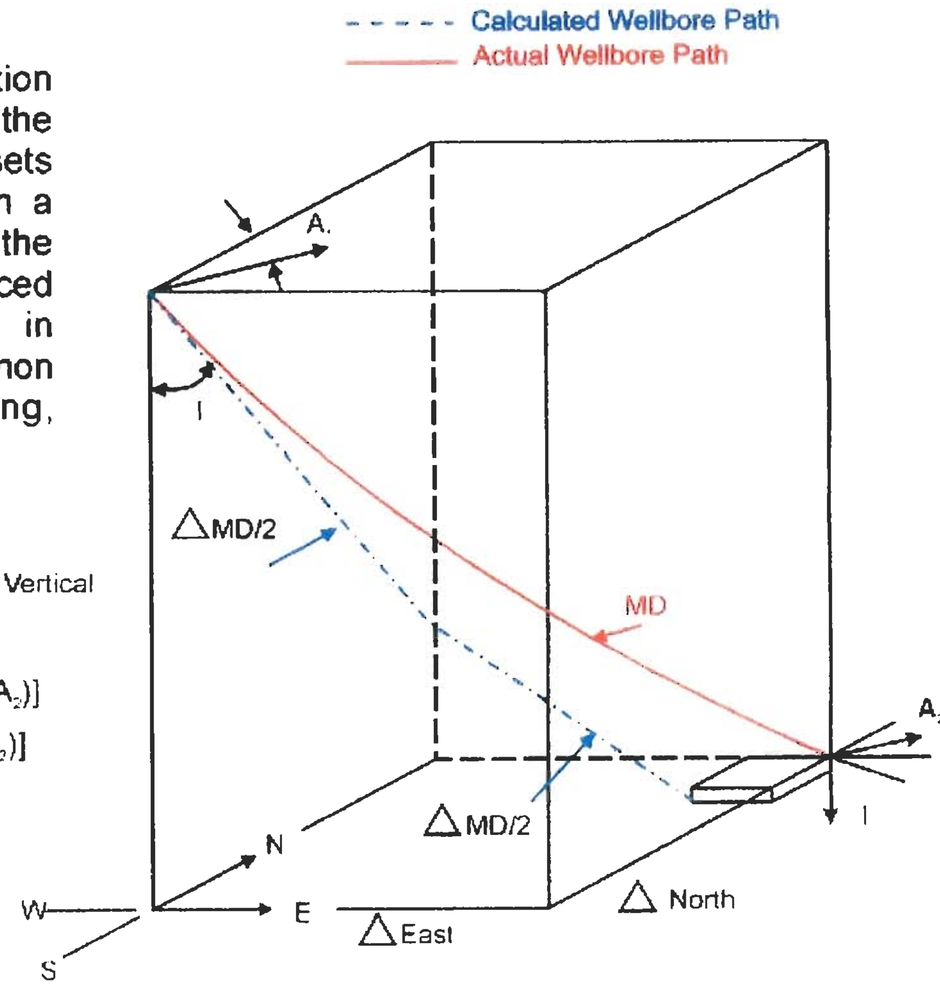


Date of Survey: November 19, 2005   Balanced Tangential Calculation Method

Welenco, Inc. (800) 445-9914

Balanced Tangential Method

The Balanced Tangential Method uses the inclination and direction angles at the upper and lower ends of the course length in a manner so as to balance the two sets of measured angles over a course length. From a theoretical standpoint, this method combines the trigonometric functions to provide the average balanced inclination and direction angles, which are used in standard computational procedures. Other common names for this method are Vector Averaging, Acceleration, and Trapezoidal.



Δ North = [ΔMD/2] x [$\sin(I_1) \times \cos(A_1) + \sin(I_2) \times \cos(A_2)$]

Δ East = [ΔMD/2] x [$\sin(I_1) \times \sin(A_1) + \sin(I_2) \times \sin(A_2)$]

Δ Vertical = [ΔMD/2] x [$\cos(I_2) + \cos(I_1)$]

Dear Brooks,

Enclosed you will find Analytical Sciences' final report 9082402 for your Sutter Medical Center project. An invoice for this work is enclosed.

Should you or your client have any questions regarding this report please contact me at your convenience. We appreciate you selecting Analytical Sciences for this work and look forward to serving your analytical chemistry needs on projects in the future.

Sincerely,

Analytical Sciences

Mark A. Valentini

Notes and Definitions

RDL	Reporting Detection Limit
ND	Analyte NOT DETECTED at or above the reporting detection limit (RDL)
RPD	Relative Percent Difference
NR	Not Reported

Please Note: The drinking water Maximum Contamination Limits (MCL) set by the California Department of Health Services are as follows:

Arsenic (10 ug/L)
Iron (300 ug/L)
Manganese (50 ug/L)
Nitrate (45 mg/L)
Lead (15 ug/L)
Total Coliform (<1 MPN/100 mL)

Dear Brooks,

Enclosed you will find Analytical Sciences' final report 9101517 for your Sutter Well project. An invoice for this work is enclosed.

Should you or your client have any questions regarding this report please contact me at your convenience. We appreciate you selecting Analytical Sciences for this work and look forward to serving your analytical chemistry needs on projects in the future.

Sincerely,

Analytical Sciences

Mark A. Valentini

Subject: Sutter Medical Center of Santa Rosa
Preliminary Storm Water Mitigation Plan & Preliminary Hydrology and Storm Water Detention Plan
B&R File No. 3231.01

Dear Nadine:

The enclosed *Preliminary Storm Water Mitigation Plan & Preliminary Hydrology and Storm Water Detention Plan* dated October 22, 2009 is furnished for use as an attachment to the Draft EIR for the subject project. This report also supersedes and is intended to replace the prior report carrying the same title dated January 29, 2009. This report has been revised to update the exhibits to reflect the latest site plan and to provide minor changes to the associated SUSMP BMP treatment control calculations. The enclosed report maintains the same organization and scope of information presented in the prior report and any reader of the prior report should have little difficulty in accepting this most recent report as one that supersedes the prior report.

Please endeavor to inform all parties utilizing this report that any use or reference to the superseded report dated January 29, 2009 may result in conflicting and/or incorrect information being applied to the CEQA process for this project.

Very truly yours,

BRELJE & RACE

John S. Thompson

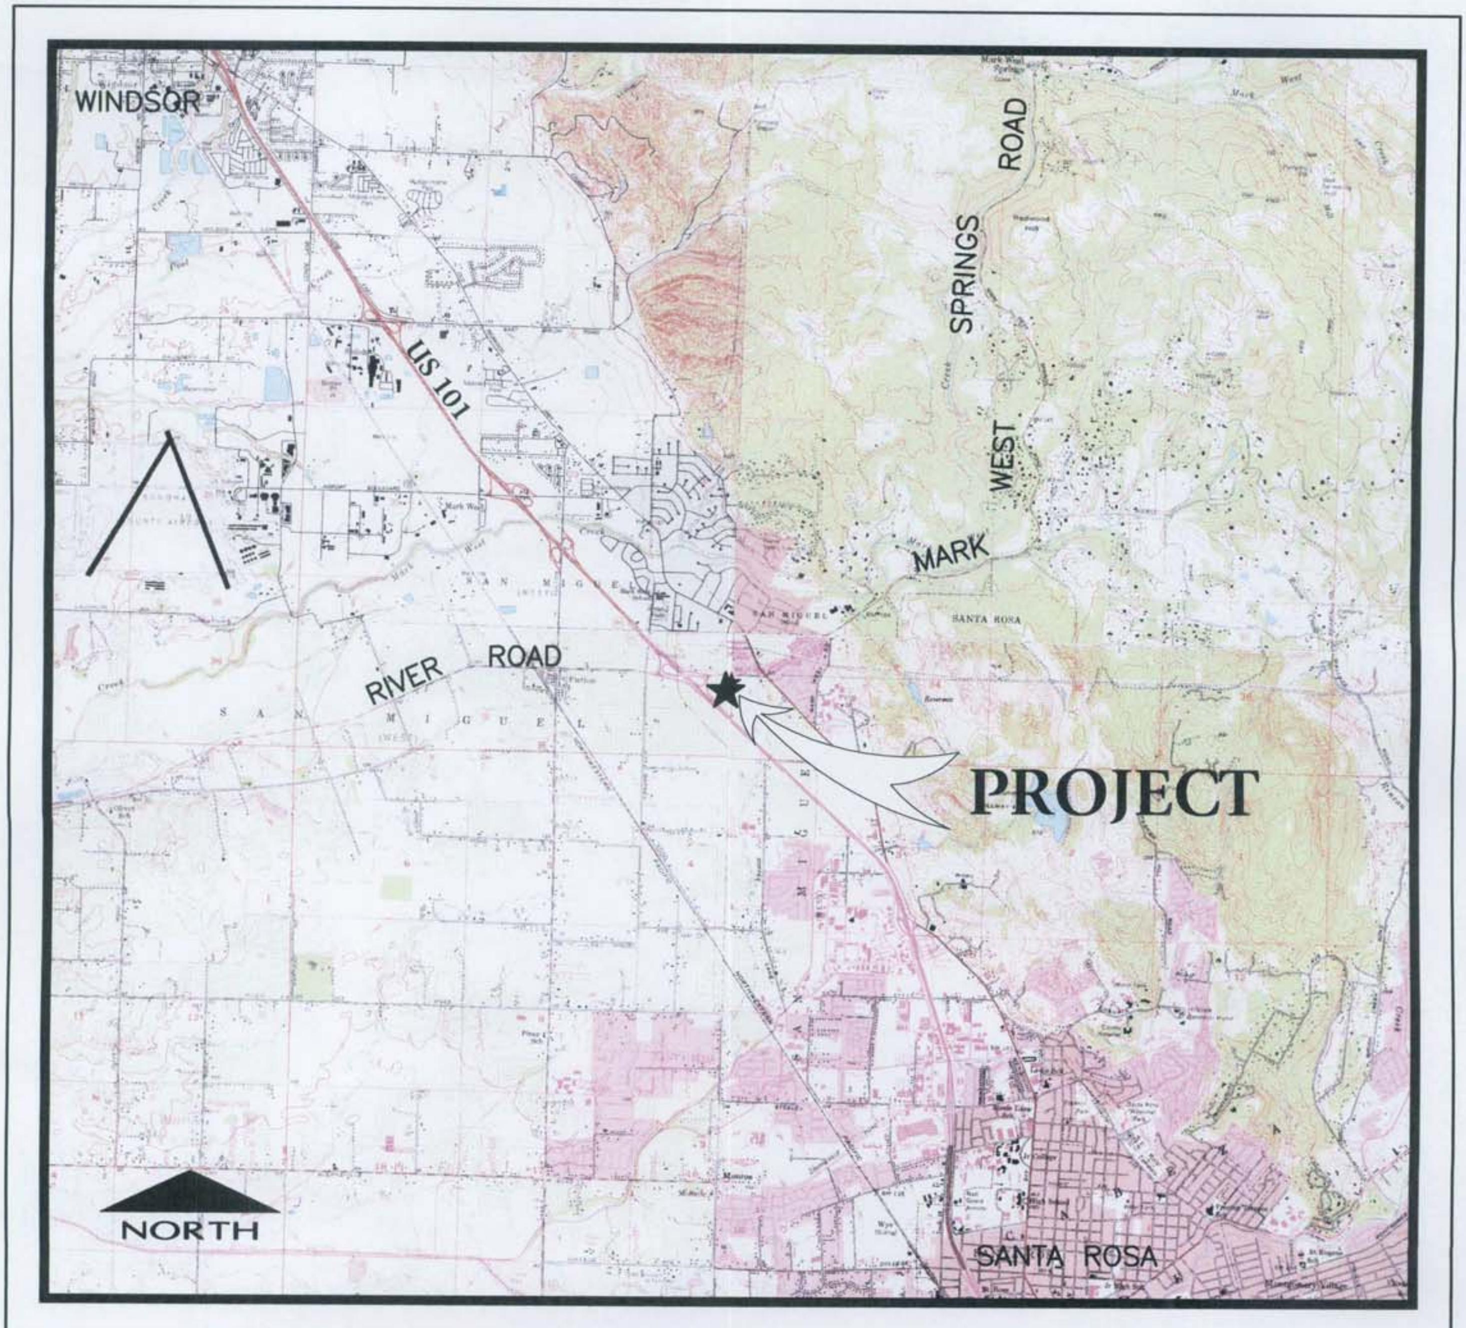
1. Project Description

Sutter Medical Center of Santa Rosa proposes to replace the existing hospital facility in the Chanate Road campus with a new, modern hospital. The proposed hospital, along with an independently operated physicians medical center and medical office building, will be located on what are now two adjacent parcels of mostly vacant land North of the Wells Fargo Center, in the southeast quadrant of the Highway 101 Mark West Springs Road/River Road freeway interchange. The site is currently occupied by a few outbuildings remaining from an otherwise demolished residential building, and is also partially paved where access roads and parking lot pavement for the Wells Fargo Center venue extend onto the property. Sutter Medical Center of Santa Rosa and the Wells Fargo Center are cooperating such that the proposed hospital complex and Wells Fargo Center facilities will be favorably integrated in terms of both separate and shared site improvements. As an initial step in this direction, Sutter Medical Center of Santa Rosa is submitting a Tentative Map depicting the subdivision of their two parcels into five lots appropriately sized, configured and located for the hospital and various support facilities. A sixth parcel will be set aside for construction of a water supply well. In addition to private site development, the proposed project will also include significant improvements within the public right of way, including street widening and highway improvements in Mark West Creek Road and along the Highway 101 northbound River Road exit ramp.

The proposed project will introduce large areas of impervious roof and pavement surface to the site. See the project description worksheet for the tabulation. Because the existing site has less than 50% impervious surface, the project, in addition to providing treatment for storm water runoff, will also need to limit the post-construction "channel-forming" peak discharge (generally accepted as equivalent to the two-year storm event peak flow) to at or below the existing two-year peak flow. See the discussion on existing and post-construction hydrology elsewhere in the subsequent pages of this report.

From research of available drainage records as well as on-site observation it has been determined that the site lies at the uppermost end of a drainage basin that is ultimately tributary to Abramson Creek, but initially drains to an extended network of roadway ditches and culverts in the Northwest Santa Rosa area before actually entering the creek itself. The site surface drains generally from east to west to an array of shallow pipe culverts (an 18" culvert, a 24" culvert, and a 42" culvert) under Highway 101 that discharge to the west into a shallow ditch passing through agricultural lands currently cultivated with vineyards on the far side of the freeway.



VICINITY MAP

NOT TO SCALE

Standard Urban Storm Water Mitigation Plan Questionnaire

NPD-004

PURPOSE: Storm water is the largest source of pollution in creeks and rivers. Projects are required to prevent storm water pollution and clean storm water before it leave a project site. This form is used to determine if a project is subject to special regulation on storm water.

Applicant: ☒ Owner ☐ Engineer ☐ Architect
☐ Landscape Architect ☐ Contractor ☐ Developer

Applicant		Project Site Information:
Sutter Health-Facility Planning & Development		101 Mark West Springs Road
Name		Street Address
100 Rowland Way, Suite 200		Santa Rosa, CA 95403
Mailing Address		City/Town
Novato	CA 94945	058-040-058 & 059
City/Town	State/Zip	Assessor's Parcel Number
707/396-0405 415/899-7484		
Phone	Fax	Permit Number(s)

QUESTIONNAIRE:

To determine if a project is subject to the requirements of SUSMP, please answer the following questions. If you are unable to answer any questions or if you checked unknown, you may consult a PRMD National Pollutant Discharge Elimination System (NPDES) staff member, or your design professional.

☒ Yes ☐ No ☐ Unknown

1. Is the project within either of the two NPDES boundaries? Check the box below for either the North Coast Regional Water Quality Control Board or the San Francisco Bay Regional Water Quality Control Board. See attached map.

   ☒ North Coast ☐ San Francisco Bay

☒ Yes ☐ No ☐ Unknown

2. Does the project create one (1) acre (43,560 square feet) or more of new impervious surface <u>or</u> is it directly adjacent to a waterway <u>or</u> does it require a new storm drain outfall?

☒ Yes ☐ No ☐ Unknown

3. Does the project require a discretionary permit or any ministerial permit(s) related to a discretionary permit (e.g. a grading or building permit for a project subject to a use permit or other discretionary land use approval)?

ACKNOWLEDGMENT:

I, as the applicant, understand that a Yes answer to **all** of the above questions means the project is a SUSMP applicable project subject to the requirements of SUSMP guidelines. Any unknown responses must be resolved to determine if the project is subject to SUSMP requirements. The applicant must complete the Preliminary Storm Water Mitigation Plan Worksheet (NPD-005) for all applicable SUSMP projects.

I. SUSMP Project Description Worksheet

This worksheet provides fundamental information about the project. The information will be used in understanding the extent of the project and reviewing the project.

1. Total Lot or Parcel area: **653,400+435,600** square feet or **15+10** acres.

2. Existing land use(s):
☐ Commercial ☐ Industrial ☑ Residential ☐ Public ☐ Agricultural ☐ Vacant
Please describe: (number of buildings, use of buildings)

This site is predominantly vacant with a few out buildings remaining on the properties, a sewer treatment plant, and sports fields.

3. Proposed land use(s): ☑ Commercial ☐ Industrial ☐ Residential ☐ Public ☐ Other
Please describe: (number of buildings, use of buildings)

There will be four (4) new buildings on the site. Two separate medical centers, a medical office building and a central utility plant.

4. Does the project include any of the following? (check all that apply):
☐ Vehicle cleaning for fleets or commercial facilities
☐ Vehicle cleaning for multifamily residential developments
☐ Vehicle repair/maintenance
☑ Outdoor process activities (examples of businesses that have outdoor process activities include machine shops, auto repair shops, and industries that have pretreatment facilities)
☐ Fuel dispensing areas
☑ Food service
☑ Refuse disposal areas

5. Describe / name any water body(ies) that will receive storm water flows from the project (Include both the immediate receiving water body, and water bodies further downstream):

The site drainage is split between Abrahamson and Piner Creeks, both eventually flow to Santa Rosa Creek

6. Are any hydrologic features on or directly adjacent to project site? (Examples of hydrologic features include wetlands, seeps, springs, natural waterways, modified natural waterways, constructed channels.)
☐ No ☑ Yes (If yes, describe / name):

Seasonal wetlands

7. Will a new storm drain outfall be constructed as part of the project?
☑ No ☐ Yes (If yes, describe / name):

8. Identify natural features located on site (check all that apply and indicate existing and proposed square footage)

Natural Feature	Existing Size	Proposed Size	Size Change
	Choose: ☐ Square Feet ☑ Acres		Indicate decrease with -symbol
☐ Riparian area[1]			0.00
☑ Wetland	0.452	0.059	-0.393
☐ Steep slopes (10% or greater)			0.00
☐ Areas of native vegetation			0.00
☐ Areas containing tree canopy			0.00
☐ Other:			0.00

9. Attach the project site plan to this completed Project Description Worksheet. At a minimum, site plans must include: (see form CSS-019)
   a. Date, scale, legend and north arrow
   b. Lot lines
   c. Locations of existing buildings, structures and impervious surfaces
   d. Proposed buildings, structures, impervious surfaces and storm water
   e. Best Management Practices (BMPs) device or structures
   f. Existing contours and proposed grades
   g. Locations of existing and proposed natural features (as identified in item 8)
   h. Locations of proposed landscaping
   i. Locations of proposed activities of concern (as identified in item 4)

II. SUSMP Impervious Surface Worksheet

Complete at the planning permit application stage. Project phasing to decrease impervious surface area shall not exempt the project from SUSMP requirements. Incorrect impervious area calculations may delay processing of your project application(s) and/or permit(s).

Type of Impervious Surface Impervious surfaces are all areas where improvements result in a ground surface that significantly limits natural percolation rates including, but not limited to, asphalt, cement, pavers, buildings, and plastic liners	**Pre-Project Impervious Surface**	**Project Impervious Surface** New	**Project Impervious Surface** Reconstructed	**Total of New and Reconstructed Impervious Surface**
	Choose: ☑ Square Feet ☐ Acres			
Main building footprint, including attached garage	111,514.00	156,467.00		156,467.00
Detached garage, carport, shed, other misc. structures	0.00	0.00	0.00	0.00
Patio, impervious decking, pavers and impervious liners	0.00	0.00	0.00	0.00
Impervious driveway, parking lot	424,704.00	533,610.00	27,184.00	560,794.00
Streets, roads, sidewalks and other defined walkways	91,040.00	47,918.00	45,281.00	93,199.00
Off-site impervious improvements	Not Applicable	36,696.00	41,838.00	78,534.00
Total impervious surface in square feet	627,258.00	774,691.00	114,303.00	888,994.00

Check box if the total of new impervious surface plus any reconstructed impervious surface is greater than or equal to: ☑ One (1) acre (43,560 square feet).

If the total of new impervious surface plus any reconstructed impervious surface is greater than or equal to one (1) acre (43,560 square feet), a Storm Water Mitigation Plan is required.

[1] Riparian area means the streambank and floodplain between a stream (or other body of water) and the adjacent upland area.

III. SUSMP Proximity to Waterway(s) Worksheet

Complete at the planning permit application stage for all projects that require a discretionary permit, including any ministerial permits that are based on the discretionary permit, and that are directly adjacent[2] to a natural waterway[3], modified natural waterway[4], or constructed channel[5]. Incorrect information regarding a waterway or channel may delay your project application(s) and/or permit(s).

Method for determining proximity (check all that apply):
- ☑ Conducted site visit
- ☑ USGS map name ____________________
- ☐ Consulted agency personnel (name and agency) ____

Type of Waterway	Name of Waterway or other identifier	Directly adjacent to project?
Natural waterway		☐ Yes ☑ No
Modified natural waterway		☐ Yes ☑ No
Constructed channel		☐ Yes ☑ No

IV. SUSMP Pollutants of Concern Worksheet

This worksheet is used to identify potential pollutants of concern associated with land use and to propose Best Management Practices (BMPs) to reduce pollution of storm water. BMP means a device or program that improves storm water quality. BMPs that prevent storm water from becoming polluted are called source controls. BMPs that remove pollutants from storm water are called treatment controls.

Identify the proposed source and treatment controls intended to reduce pollutants to the maximum extent practicable. Alternatively, explain why the pollutant is not anticipated to be generated by the proposed project.

Check a box to indicate proposed land use.

Land Use	Potential Pollutants of Concern	Proposed BMPs
☑ Lawns, Landscaping and Parks	Sediment (coarse and fine), Nutrients (dissolved and particulate), Pesticide, Pathogens, Trash and Debris	**Vegetated Swales, Bioretention Areas**

I declare that to the best of my knowledge, the information presented herein is accurate and complete.

Signature ____________________ Date ____________________

[2] "Directly Adjacent" (County of Sonoma) means within a parcel of land that includes or is contiguous with a Natural Waterway, Modified Natural Waterway, or Constructed Channel; and some portion of the proposed development on said parcel must be within 100 feet of the top of bank, and drainage from the proposed development must flow towards and enter a waterway or channel.

[3] "Natural Waterway" means any natural stream of water flowing in a definite course or channel and possessing a bed and banks. It is not necessary that the flow of water be continuous throughout the year. Natural waterways do not include artificially created channels for storm waters, such as street gutters, roadside ditches, and drainage facilities installed in connection with the development of property.

[4] "Modified Natural Waterway" means any natural waterway that has been modified while retaining significant riparian vegetation, fish, wildlife habitat, and/or scenic values. Modified natural waterways do not include artificially created channels for storm waters, such as street gutters, roadside ditches, and drainage facilities installed in connection with the development of property.

[5] "Constructed Channel" means all waterways that are not in closed conduits and do not meet the definition of a "Natural Waterway" or "Modified Natural Waterway". Constructed Channels also include landscaped constructed waterways. Constructed Channels do not include street gutters, roadside ditches, and drainage facilities installed in connection with the development of property.

2. Summary of Pre- and Post-Construction Storm Water Runoff

2.1 EXISTING HYDROLOGY

Each of the culverts under U.S. Route 101 west of the project conveys a portion of the total site drainage. Existing hydrology calculations were performed for **Tributaries "A", "B" and "D"** by determining the existing tributary drainage area for each culvert, and then determining the peak runoff using the rational method analysis. Tributary "C" was not evaluated since no development is proposed to this tributary. These tributary zones have been designated as Tributary Areas "A,"B","C" and "D" and drain to the existing 24", 42", 24" and 18" concrete pipe culverts under Highway 101, (see attached Existing Site Drainage and Hydrology Exhibit – Figure VIII-1). The results of this study for Tributaries "A", "B", and "D" are as follows:

<u>Tributary Area "A" (to 24" culvert) – 13.68 Acres</u>

"K" Factor	1.17
"C" Factor	0.36
"t" Time of Concentration	34.5 min.
"I" 2-year Intensity*	0.87 in/hr
2-year peak flow (existing)	5.0 cfs

<u>Tributary Area "B" (to 42" culvert) – 27.41 Acres</u>

"K" Factor	1.17
"C" Factor	0.53
"t" Time of Concentration	43.8 min.
"I" 2-year Intensity*	0.77 in/hr
2-year peak flow (existing)	13.1 cfs

<u>Tributary Area "D" (to 18" culverts) – 8.46 Acres</u>

"K" Factor	1.17
"C" Factor	0.61
"t" Time of Concentration	23.0 min.
"I" 2-year Intensity*	1.08 in/hr
2-year peak flow (existing)	6.5 cfs

* IY = 5.12Y (0.1469) t(-0.528) : Plate B-2, SCWA Flood Control Manual

2.2 POST-CONSTRUCTION HYDROLOGY - INTRODUCTION

The nature of the project is such that large areas of currently undeveloped land will be covered with impervious building and pavement surfaces, increasing the amount of surface runoff attempting to exit the site during a storm event. In order to limit the peak runoff from the developed site to the existing flow level, a conceptual hydrologic analysis was performed, assuming a drainage design that will: 1.) Limit post-construction runoff entering the northernmost 24" freeway culvert (**Tributary**

"A") to no greater than existing peak flow by reduction of the size of its tributary acreage in proportion to the increase in C factor as a result of the development; 2.) Limit post-construction runoff entering the 42" culvert (**Tributary "B"**) to no greater than existing peak flow by means of prolonging surface runoff throughout the parking areas and routing stormwater through surface detention basins before discharging to the existing 42" storm drain culvert under the freeway.

In addition to the proposed site development, off-site street improvements on Mark West Springs Road and the Highway 101 freeway exit ramp will be constructed in a separate drainage area (**Tributary "D"**) that is part of the River Road overcrossing freeway interchange drainage system north and west of the site. This drainage area currently drains the northbound freeway exit-ramp, Mark West Springs Road and a portion of the project fronting Mark West Springs Road. The configuration of the proposed site development will necessitate that a portion of the on-site drainage area along Mark West Springs Road (historically tributary to the freeway interchange) will be transferred to Tributaries "A" and "B". This reduction of the tributary drainage basin will virtually offset the minor amount of increase in runoff generated by the increase in impervious surface area due to project road widening improvements. Increases in drainage area in tributary basins "A" and "B" have been considered in the analysis of those basins and with the sizing of the detention basin for tributary "B".

The southern portion of the Wells Fargo Center and southern parking lots (**Tributary "C"**) drain to a separate highway culvert crossing (the southern most 24" freeway culvert). There are no changes to this drainage area proposed with the development.

2.3 POST-CONSTRUCTION HYDROLOGY - DETAILS

2.3.1 Tributary "A"

As previously indicated, the post-construction tributary area to the northernmost 24" culvert will be reduced in size such that the peak 10-year discharge will approximate existing pre-construction conditions. In this analysis, flow from the most northern areas of the project site, including pavements, will be collected by vegetated swales located in the parking areas. This stormwater will then be conveyed to the existing 24" culvert via a perimeter vegetated swale along the northerly and westerly boundary. We estimate that the post-construction Tributary "A" drainage area displayed in Figure 1 will generate a peak flow of 4.9± cfs, the same as existing conditions. (see attached Proposed Site Drainage and Storm Water Detention Exhibit – Figure VIII 2):

<u>Tributary Area "A" (to 24" culvert) – 5.91 Acres</u>

"K" Factor	1.17
"C" Factor	0.71
"t" Time of Concentration	26.5min.
"I" 2-year Intensity*	1.00 in/hr
2-year peak flow	4.9 cfs (≈ 5.0 cfs exist.)

2.3.2 Tributary "B"

In this analysis, Tributary "B" is comprised of the largest portion of the site (38.08± acres) including most of the proposed Hospital complex of buildings, roadways and parking, as well as the north westerly half of the Wells Fargo complex. Stormwater from new and replacement pavement areas will be routed through vegetated swales located throughout the proposed parking areas (increasing the time of concentration and reducing the peak flow) and then into surface detention basins prior to being discharged to the existing 42" storm drain culvert crossing Highway 101. In order to evaluate the detention basins, a computer model using a SCS Type 1A rainfall distribution for the 2-year, 24-hour event was used along with historical Sonoma County Water Agency rainfall data. Two detention ponds are proposed, a northern pond approximately 20,600 sq. ft. in area and a southern pond approximately 28,500 sq. ft. in size. The location of the ponds will be in the southwest portion of the parcel between the existing Wells Fargo Center complex and Highway 101. Ponds will have 3:1 side slopes and will be interconnected with dual storm drain culverts. The northern pond has an approximate depth of 4.5' and the southern pond has a depth of 3.5 feet. The relatively flat terrain allows for a large but shallow basin design. The basin outlet structure will be a standpipe-type with orifice openings sized and staged in elevation to address the design storm flow. The detention basins will drain to the highway culvert entrance via gravity through dual 30" outlet pipes. The detention basins will not have an impermeable liner, allowing for (a very minor amount of) infiltration into the underlying clayey soils.

<u>Tributary Area "B" (to 42" culvert) – 38.08 Acres</u>

"K" Factor	1.17
"C" Factor	0.68
"t" Time of Concentration	30 min.
"I" 2-year Intensity*	0.94 in/hr
2-year peak inflow to ponds	28.5 cfs
2-year peak discharge from ponds	10.7 cfs (< 13.1 cfs exist.)

IY = 5.12Y (0.1469) t(-0.528) : Plate B-2, SCWA Flood Control Manual

2.3.3 Tributary "D"

As previously indicated, the post-construction tributary area (Tributary "D") to the northern most 18" culverts will be reduced in size such that the peak 2-year discharge will approximate existing pre-construction conditions. In this analysis, flow from the off-site street improvements on Mark West Springs Road and the Highway 101 freeway exit ramp, will be collected by vegetated swales located in the along the southern portion of Mark West Springs Road and the East side of the northbound Highway 101 offramp. We estimate that the post-construction Tributary "D" drainage area displayed in Figure VIII-1 will generate a peak flow less than existing conditions 6.5± cfs,. (See Proposed Site Drainage & Storm Detention Exhibit – Figure VIII-2)

3. Required Size of Detention Basins for Treatment Purposes

The area of reconstructed and new impervious surface for the proposed project in Tributary Basin "B" totals approximately 639,900 sq. ft., or 14.7 acres. Of this area, approximately 67% of the runoff will initially be directed into parking lot vegetated swales prior to collection by the underground storm drain and conveyance to the detention basins. Approximately 213,600 sq. ft. of roof area drainage, or the remaining 33%, will pass through roof drain leader filters or an in-ground filter structure prior to entering the underground storm drain system. The following calculation would be the required volume if *all* the runoff entering the detention basins is to be fully treated, and is therefore a conservative result given the benefits of the additional treatment provided by the upstream point source BMP's.

Use volume-based formula: V = (0.08)(C)(K)(A)   Pg. 4-13, Guidelines for the Standard Urban Storm Water Mitigation Plan;, June, 2005

V = (0.08)(0.68)(1.17)(14.7 acres) = 0.9356 acre-feet = 40,800 Cu. Ft.

The maximum 2-year water surface elevation (+155.5) in the interconnected detention basins represents a total storage volume of approximately 82,750 Cu. Ft. and are thus more than adequately sized to treat the runoff flowing through them.

4. Source Control Measures

Source control measures shall be incorporated into the construction of the proposed project improvements:

- Storm Drain inlets shall be clearly marked with the words: "No Dumping. Drains to Creek".
- Irrigation systems shall be designed to minimize overspray and runoff
- Plant materials shall be selected such that they may be properly maintained with minimal water use.
- Planter strip planting shall be maintained appropriately to prevent runoff from contacting bare earth and conveying sediment to the storm drain system.
- Trash Enclosure and exterior waste management areas (trash compactor, medical waste, cart wash, food service mat wash) shall be covered. Adjacent grade shall be designed to drain away from, not toward or through, these designated areas.
- Areas identified in the previous item will be served by dedicated sanitary sewer inlets and in the case where food waste is present, grease interceptors with regularly scheduled maintenance servicing.

5. Treatment Control Measures

The parking lots and hardscape within the post-construction area labeled Tributary "A" on the exhibit map will drain either to internal parking islands that contain vegetated swales, or to the perimeter swale along the outer boundary adjacent to the freeway ramp frontage. The internal vegetated swales will be constructed as Type 2, with a subdrain component to enhance filtering efficiency. The flatness of the project terrain necessitates that the perimeter swale will be Type 1 and not supplemented with a subdrain, however, the perimeter swale provides the opportunity for a significantly longer length of treatment for such stormwater that is conveyed it prior to discharge to the 24" freeway culvert.

The buildings are proposed, where feasible, to incorporate media filters on the roof drain downspouts. These could be installed in all exterior wall routed roof drainage piping that are accessible for maintenance of the filters. Alternatively, or in combination with individual roof drain downspout filters, roof drain lateral piping will be connected into a common end of pipe structural BMP system such as "Bay Saver", "Vortechnics" or equivalent, for treatment prior to entering the underground storm drain system. They will provide an initial treatment of a majority of the roof drainage prior to entry into the underground storm drain. The majority of the roof drainage is included within Tributary "B" and will have the opportunity to undergo additional treatment as it passes through the detention basin prior to discharge to the 42" freeway culvert.

The parking lots and hardscape within the post-construction area labeled Tributary "B" on the exhibit map will initially drain to internal parking islands that contain vegetated swales and ultimately to the detention basins. The internal vegetated swales will be constructed with a subdrain component to enhance filtering ability. The detention basins provide an additional opportunity for what would be an extended length of treatment time for such stormwater that is conveyed to them prior to discharge to the 42" freeway culvert, as well as for stormwater that does not happen to initially pass through the parking lot swales.

7. Maintenance of Treatment Control Measures

The maintenance of the project stormwater quality facilities will be the responsibility of the owner of the private hospital facilities, Sutter Medical Center of Santa Rosa. These include regular maintenance of the hospital grounds and parking lots, removing debris and trash and sweeping up dirt and dust accumulation. Vegetated swales will require occasional reconstruction as they become overly clogged with fine dirt particles, but this is not expected to be needed very often, depending on the location and tributary area served. Structural BMP's will need to be organized with a regular inspection schedule, cleaning and rehabilitation, either by maintenance staff or by contract with an outside company specializing in such services. Because the proposed detention ponds are to be located within the Wells Fargo Center property and will serve both the Wells Fargo Center and the proposed hospital campus, Sutter Medical Center of Santa Rosa and the Luther Burbank Memorial Foundation (owners of the Wells Fargo Center) will enter into a joint maintenance agreement for maintenance of the detention ponds. Within the public right of way, the County of Sonoma and Caltrans will maintain the proposed added street improvements and facilities in accordance with their individual Stormwater Management Plans.

8. Project Hydrology Description

The proposed Sutter Medical Center/Wells Fargo Center site is located in the southeast quadrant of Highway 101 Mark West Springs / River Road freeway interchange. From research of available drainage records as well as on-site observation it has been determined that the site lies at the uppermost end of a drainage basin that is ultimately tributary to Abramson Creek in the Northwest of Santa Rosa area. The site (**Tributaries "A", "B"** and **"C"**) drains generally from east to west to an array of three shallow pipe culverts (one 24" culverts, one 42" culvert and one 24" culvert respectively) under Highway 101 that discharge to the west into agricultural lands currently cultivated with vineyards. The downstream drainage facilities are an informal matrix of ditches and culverts over a widespread area of Northwest Santa Rosa that convey local drainage west and south until it approaches the intersection of Barnes and Dennis Lane. A portion of the drainage enters a 54" storm drain in Barnes Road that flows south and discharges to Piner Creek. The other portion of the drainage crosses Barnes Lane through roadside culverts then crosses the Northwestern Pacific Railroad Authority grade through a single 36" culvert near the intersection of Barnes Road and Dennis Lane. The flow then continues on in small open channels, culverts, and through a new subdivision storm drain system at Fulton Road before entering Abramson Creek. The downstream drainage facilities, which are known to experience occasional flooding, are assumed not to have any capacity to convey any increase in runoff from the site resulting from construction of the proposed project. Drainage review requirements for this site, established through discussions with the County of Sonoma drainage review staff, will involve the design of drainage facilities that limit the 10-year storm peak discharge from the site to existing pre-development conditions, or less.

There is an additional tributary drainage basins located north of the project boundary related to proposed offsite improvements. This tributary drainage basin (**Tributary "D"**) conveys the drainage along the south side of Mark West Springs Road and the north bound highway 101 offramp and outlets to a series of 18" storm drain culverts located at the Highway 101 / Mark West Springs / River Road interchange. This drainage then goes westerly under Highway 101 and flows north along the southerly on-ramp and then west along River Road and eventually to Fulton Creek.

9. Summary of Pre- and Post-Construction Storm Water Runoff

9.1 EXISTING HYDROLOGY (10-YEAR STORM)

Each of the culverts under U.S. Route 101 west of the project conveys a portion of the total site drainage. Existing hydrology calculations were performed for **Tributaries "A", "B" and "D"** by determining the existing tributary drainage area for each culvert, and then determining the peak runoff using the rational method analysis. Tributary "C" was not evaluated since no development is proposed to this tributary. These tributary zones have been designated as Tributary Areas "A,"B","C" and "D" and drain to the existing 24", 42", 24" and 18" concrete pipe culverts under Highway 101, (see attached Existing Site Drainage and Hydrology Exhibit – Figure VIII-1). The results of this study for Tributaries "A", "B", and "D" are as follows:

<u>Tributary Area "A" (to 24" culvert) – 13.68 Acres</u>

"K" Factor	1.17
"C" Factor	0.36
"t" Time of Concentration	34.5 min.
"I" 10-year Intensity*	1.10 in/hr
10-year peak flow (existing)	6.3 cfs

<u>Tributary Area "B" (to 42" culvert) – 27.41 Acres</u>

"K" Factor	1.17
"C" Factor	0.53
"t" Time of Concentration	43.8 min.
"I" 10-year Intensity*	0.97 in/hr
10-year peak flow (existing)	16.5 cfs

<u>Tributary Area "D" (to 18" culverts) – 8.46 Acres</u>

"K" Factor	1.17
"C" Factor	0.61
"t" Time of Concentration	23.0 min.
"I" 10-year Intensity*	1.36 in/hr
10-year peak flow (existing)	8.2 cfs

(See attached Existing Hydrology Calculations)

9.2 POST-CONSTRUCTION HYDROLOGY (10-YEAR STORM)- INTRODUCTION

The nature of the project is such that large areas of currently undeveloped land will be covered with impervious building and pavement surfaces, increasing the amount of surface runoff attempting to exit the site during a storm event. In order to limit the peak 10-year runoff from the developed site to the existing flow level, a conceptual hydrologic analysis was performed, assuming a drainage design that will: 1.) Limit post-construction runoff entering the northernmost 24" freeway culvert (**Tributary "A"**) to no greater than existing 10-year peak flow by reduction of the size of its tributary acreage in proportion to the increase in C factor as a result of the development; 2.) Limit post-construction runoff entering the 42" culvert (**Tributary "B"**) to no greater than existing 10-year peak flow by means of developing vegetated swales throughout the parking areas and surface detention basins located near the existing 42" storm drain culvert under Highway 101.

In addition to the proposed site development, off-site street improvements on Mark West Springs Road and the Highway 101 freeway exit ramp will be constructed in a separate drainage area (**Tributary "D")** that is part of the River Road overcrossing freeway interchange drainage system north and west of the site. This drainage area currently drains the northbound freeway exit-ramp, Mark West Springs Road and a portion of the project fronting Mark West Springs Road. The configuration of the proposed site development will necessitate that a portion of the on-site drainage area along Mark West Springs Road (historically tributary to the freeway interchange) will be transferred to Tributaries "A" and "B". This reduction of the tributary drainage basin will virtually offset the minor amount of increase in runoff generated by the increase in impervious surface area due to project road widening improvements. Increases in drainage area in tributary basins "A" and "B" have been considered in the post-construction analysis (for the 10-year storm event) of those basins and with the size of Tributary "A" and the design of the detention basin for tributary "B".

The southern portion of the Wells Fargo Center and southern parking lots (**Tributary "C")** drain to a separate highway culvert crossing (the southern most 24" freeway culvert). There are no changes to this drainage area proposed with the development.

9.3 POST-CONSTRUCTION HYDROLOGY (10-YEAR STORM) - DETAILS

9.3.1 Tributary "A"

As previously indicated, the post-construction tributary area to the northernmost 24" culvert will be reduced in size such that the peak 10-year discharge will approximate existing pre-construction conditions. In this analysis, flow from the most northern areas of the project site, including pavements, will be collected by vegetated swales located in the parking areas. This drainage will then be conveyed to the existing 24" culvert via a perimeter vegetated swale along the northerly and westerly boundary. We estimate that the post-construction Tributary "A" drainage area displayed in Figure 1 will generate a peak flow of 6.2± cfs, slightly less than existing conditions. (See Proposed Site Drainage & Storm Detention Exhibit – Figure VIII-2)

<u>Tributary Area "A" (to 24" culvert) – 5.91 Acres</u>

"K" Factor	1.17
"C" Factor	0.71
"t" Time of Concentration	26.5min.
"I" 10-year Intensity*	1.26 in/hr
10-year peak flow	6.2 cfs (≈ 6.3 cfs exist.)

9.3.2 Tributary "B"

In this analysis, Tributary "B" is comprised of the largest portion of the site (38.08± acres) including most of the proposed Hospital buildings, roadways and parking, as well as the north westerly half of the Wells Fargo complex. Stormwater from new and replacement pavement areas will be routed through vegetated swales located throughout the proposed parking areas (increasing the time of concentration and reducing the peak flow) and then into surface detention basins prior to being discharged to the existing 42" storm drain culvert crossing Highway 101. To achieve pre-construction peak discharge the detention basins will be sized to reduce peak discharge to at or below existing conditions for the 10-Year design storm event. In order to tentatively size the detention basins, a computer model using a SCS Type 1A rainfall distribution based on the Sonoma County Water Agency rainfall intensity vs. duration curve volume for the 10 year 24 hour event was used. A 10-Year, 24 hour storm hydrograph for Tributary "B" was created based on a CN of 91.0 (runoff factor) and an assumed time of concentration of approximately 30 minutes utilizing Hydraflow "Hydrographs 2004", version 8.0. Two interconnected detention ponds are proposed, a northern pond approximately 20,600 sq. ft. in area and a southern pond approximately 28,500 sq. ft. in size. The location of the ponds will be in the southwest portion of the parcel between the existing Wells Fargo Center complex and Highway 101. Ponds will have 3:1 side slopes and are interconnected with dual storm drain culverts. The northern pond has an approximate depth of 4.5' and the southern pond has a depth of 3.5 feet. The relatively flat terrain allows for a large but shallow basin design. The basin outlet structure will be a standpipe-type with orifice openings sized and staged in elevation to address the design storm flow. The detention basins will drain to the highway culvert entrance via gravity through dual 30" outlet pipes. The hydrograph for this tributary area was then superimposed upon the stage/storage/discharge hydrograph of the assumed ponds design. The area of the graph above the discharge hydrograph and below the 10-year, 24hr storm hydrograph in the hydrograph plot entitled "Sutter Ponds" represents the resultant estimated required storage volume of 106,834cubic feet (2.45 acre-feet) which in this design translates into an average peak pond depth of just about 3.2 feet. Twin 30" pipes were assumed as outlets from the basin for analysis which result in a reduction of the outgoing peak flow to 15.2± cfs (in this analysis) which is slightly less than the pre-development peak flow of 16.5± cfs. The detention basins will primarily drain via gravity drainage through the dual 30" outlet pipes. These detention basins will not have an impermeable liner allowing for a minor amount of infiltration into the underlying soils.

This model represents only one of several combinations of pond geometry that may be applied to achieve equivalent results. The site grading and drainage design will be further developed during detailed site design.

<u>Tributary Area "B" (to 42" culvert) – 38.08 Acres</u>

"K" Factor	1.17
"C" Factor	0.68
"t" Time of Concentration	30 min.
"I" 10-year Intensity*	1.18 in/hr
10-year peak inflow to ponds	35.9 cfs

10-year peak discharge from ponds 15.2 cfs (< 16.5 cfs exist.)

9.3.3 Tributary "D"

As previously indicated, the post-construction tributary area (**Tributary "D")** to the northern most 18" culverts will be reduced in size such that the peak 10-year discharge will approximate existing pre-construction conditions. In this analysis, flow from the off-site street improvements on Mark West Springs Road and the Highway 101 freeway exit ramp, will be collected by vegetated swales located in the along the southern portion of Mark West Springs Road and the East side of the northbound Highway 101 offramp. We estimate that the post-construction Tributary "D" drainage area displayed in Figure VIII-1 will generate a peak flow less than existing conditions 8.2± cfs,. (See Proposed Site Drainage & Storm Detention Exhibit – Figure VIII -2)

THE POST DEVELOPMENT FLOW IS BASED ON A SMALLER DRAINAGE AREA THAN THE EXISTING DRAINAGE AREA WHICH HAS BEEN SIZED TO APPROXIMATE EXISTING PEAK FLOW.

- EXISTING 10-YEAR STORM FLOW = 6.3± CFS (PEAK FLOW)
- EXISTING 2-YEAR STORM FLOW = 5.0± CFS (PEAK FLOW)
- POST DEVELOPMENT 10-YEAR STORM FLOW = 6.2± CFS (PEAK FLOW)
- POST DEVELOPMENT 2-YEAR STORM FLOW = 4.9± CFS (PEAK FLOW)

TRIBUTARY AREA 'B'

A SURFACE STORM WATER DETENTION POND IS PROPOSED TO REDUCE PEAK FLOW TO AT OR BELOW EXISTING PEAK FLOW. (2.84 ACRE-FT OF STORAGE PROPOSED)

- EXISTING 10-YEAR STORM FLOW = 16.5± CFS (PEAK FLOW)
- EXISTING 2-YEAR STORM FLOW = 13.1± CFS (PEAK FLOW)
- POST DEVELOPMENT 10-YEAR STORM FLOW = 15.2± CFS (PEAK FLOW)
- POST DEVELOPMENT 2-YEAR STORM FLOW = 10.7± CFS (PEAK FLOW)

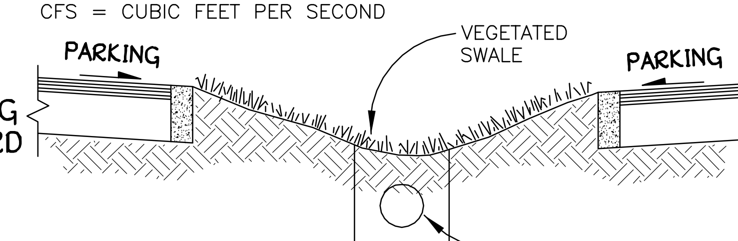
TRIBUTARY AREA 'C'

NO CHANGES ARE MADE TO TRIBUTARY AREA 'C' AS A RESULT OF THE PROJECT.

TRIBUTARY AREA 'D'

REDUCTION IN TRIBUTARY AREA OFFSETS INCREASE IN IMPERVIOUS AREA RESULTING IN A APPROXIMATE ZERO NET CHANGE IN PEAK FLOW.

CFS = CUBIC FEET PER SECOND



TYPICAL VEGETATED SWALE DETAIL
NOT TO SCALE

NOTE:
VEGETATED SWALES WILL BE IMPLEMENTED THROUGHOUT THE PROPOSED PARKING AREAS WHERE FEASIBLE AND AT THE OUTSIDE EDGES OF PARKING ADJOINING LANDSCAPED AREAS. THIS IS PROPOSED AS A POST CONSTRUCTION BEST MANAGEMENT PRACTICE TO IMPROVE STORM WATER QUALITY.

WELL INSTALLATION AND TESTING

Dear Mr. Minard:

With your authorization, we completed this well installation and testing report for the recently installed water supply well for the proposed Sutter Medical Center of Santa Rosa, located in Sonoma County, California. The accompanying report presents data and information together with our conclusions regarding the installation, testing and water quality analyses for the well.

Sincerely,

ENGEO Incorporated

1.0 INTRODUCTION

1.1 PROJECT DESCRIPTION AND SITE LOCATION

ENGEO Incorporated has prepared this groundwater well installation and testing report on behalf of Sutter Health for a recently installed groundwater supply well associated with the proposed Sutter Medical Center (SMC) in Santa Rosa, California. The proposed Sutter Medical Center site is located at 50 Mark West Springs Road in Santa Rosa, Sonoma County, California (Latitude of 38.4953 degrees North; Longitude of 122.7520 degrees West). The approximate site location is shown on the Site Vicinity Map (Figure 1).

The projected average water demand for the proposed medical center not including the 2020+ future expansion is approximately 27,710 gallons per day (Brelje and Race 2009). Including the 2020+ future expansion the estimate water demand for the medical facility is approximately 35,220 gallons per day. Estimated peak irrigation demand for the first year is about 9,000,000 gallons, assuming a late spring or summer landscape plant installation (Brelje and Race 2009). As plants become established, estimated irrigation demands will diminish to about 6,100,000 gallons (Brelje and Race 2009). For the purpose of this study, we have assumed that the overall volume of water to be pumped from the proposed wells annually will be about 58 AFY (based on average water use including 2020+ expansion).

According to the Water/Wastewater report prepared by Brelje and Race, the civil engineering firm designing the proposed well system, the peak pumping rate to meet the maximum demand for the medical facility including irrigation is estimated to be 90 gpm over a 10 to 16 hour period for the establishment year, and just under 70 gpm in subsequent years.

The recently installed SMC Well is located at the southwest corner of the Sutter property which is located within an area of the Santa Rosa Plain Sub-Basin generally referred to as the Larkfield Storage Unit (DWR 1975). In general, the Larkfield Storage Unit comprises three known aquifers that are referred to as Shallow, Intermediate, and Deep. The sources of groundwater for the Larkfield District Wells are typically the Intermediate and Deep aquifers. The source of groundwater for the proposed SMC wells will also be the Intermediate and Deep Aquifers. Based on the geology of the water bearing formations in the area, the two lower aquifers appear to be semi-confined to confined and connected on a regional scale.

1.2 PREVIOUS STUDIES

ENGEO incorporated recently completed a groundwater study (October 2009) in support of the Environmental Impact Report for the proposed Sutter Medical Center. This study included a detailed description of the hydrogeologic setting, an evaluation of the potential pumping impacts on nearby wells, and a detailed water balance.

ENGEO Incorporated previously published a groundwater aquifer test and water quality analysis report (2006) for the existing Wells Fargo Center well (formerly Luther Burbank Center well) located at the site. The existing agriculture groundwater supply well, W-WFC, is located near the center of the property at an elevation of approximately 160 feet above mean sea level (Figure 2). The well is situated approximately 740 feet from the recently installed SMC well. Reportedly, the WFC well was installed by Les Petersen Drilling and Pump, Inc., of Santa Rosa, California, in August 2000. The results of the ENGEO 2006 report indicated that the demand of the proposed Sutter Medical Center was met by the existing agriculture production well.

The 24-hour pumping test data from 2006 was conducted to determine characteristics of the aquifer underlying the project site. Transmissivity (**T**) is a measure of the aquifer's ability to transmit water (i.e. how permeable it is). The transmissivity calculated from the previous pump test was 4,396 gallons per day per foot (gpd/ft). This calculated value is characteristic for the type of materials encountered in the area (typically alluvial materials).

The storage coefficient (**S**), or storativity, is the volume of water released from or taken into storage per unit surface area per unit change of the hydraulic head; it is a measure of the aquifer's ability to release groundwater from storage. During the previous 24-hour pumping test, the observation well located approximately 1,200 feet away, felt no effect from the continual pumping in W-WFC, and as a result, the calculations for storativity were limited.

2.0 GROUNDWATER SUPPLY CONSIDERATIONS

2.1 REGIONAL AND LOCAL GEOLOGY

The SMC Well is located within the Coast Ranges geologic province of California, a series of northwest-trending ridges and valleys. Bedrock in the province has been folded and faulted during regional uplift beginning in the Pliocene period, about 4 million years before present. Locally, the site is mapped as underlain by Holocene- Alluvium as shown on Figure 3 (McLaughlin et al., 2008; Graymer, 2006; Blake, 2002; Wagner and Bortugno, 1982; Cardwell, 1958). This alluvium consists of unconsolidated deposits of sand, silt, gravel, and clay derived from the bedrock uplands to the east and older unconsolidated deposits. The alluvial deposits in this area are typically greater than 100 feet in thickness. Underlying the Holocene alluvium is the Glen Ellen Formation (Cardwell, 1958). The Glen Ellen Formation was deposited during late Pliocene and early Pleistocene time as alluvial fans shed from the east towards shallow bays or lagoons (Cardwell, 1958). The Glen Ellen Formation typically comprises lenticular beds of poorly sorted gravel, sand, silt and clay. As is characteristic of alluvial fan deposits, individual beds vary widely in thickness, are not horizontally continuous, and typically grade into one another over short distances. Locally underlying and interfingering with the Glen Ellen Formation are the late Pliocene Wilson Grove (Merced) Formation and in some instances the Sonoma Volcanics (McLaughlin et al., 2008; Graymer, 2006; Blake, 2002; Wagner and Bortugno, 1982; Cardwell, 1958). The marine Wilson Grove Formation generally comprises massive sandstone with thin claystone and siltstone interbeds and occasional gravels lenses (Cardwell, 1958). The Glen Ellen and Wilson Grove formations are the primary water-bearing Formations in the study area.

2.2 LOCAL HYDROGEOLOGY

The well is located within the northern portion of the Santa Rosa Plain groundwater Sub-Basin 1-55.01. The groundwater sub-basin occupies a surface area of approximately 125 square miles and is located beneath an approximately 22-mile-long and 5- to 9-mile-wide northwest-trending fault bound valley which extends from near the town of Cotati in the south to near the town of Healdsburg in the north (DWR, 2004). The Rodgers Creek and Healdsburg faults are located along the east side of the basin and the Tolay and Bloomfield faults are located to the west (Jennings, 1975). The basin is bordered by the Mayacama and Sonoma mountains on the east and the Mendocino Range on the west. According to DWR (2004), most of the groundwater within the Santa Rosa Plain subbasin is at water table conditions with few local exceptions where folding and faulting creates confined conditions.

Geologic units within the area include the Jura-Cretaceous Franciscan Complex, the Pliocene and Miocene Sonoma Volcanics, Petaluma and Wilson Grove Formation (Merced Formation), the Plio-Pleistocene Glen Ellen Formation and Pleistocene - Holocene alluvial fan and fluvial terrace deposits (Figure 3).

The basement rocks within the vicinity of the well are mapped as undifferentiated mélange of the Central Belt of the Franciscan Complex (McLaughlin et al., 2008; Graymer, 2006; Blake, 2002; Wagner and Bortugno, 1982; Cardwell, 1958). In general, these rocks comprise highly sheared, sandstone and argillite with varying sized blocks of various lithologies throughout (McLaughlin et al., 2008). In general, rocks of the Franciscan Complex are well consolidated and not considered water bearing, except in very localized areas where fracture zones are well developed. The subject well does not rely on the Franciscan rocks as a source of groundwater.

The Pliocene and Miocene Petaluma Formation is mapped as unconformably overlying the Franciscan Complex and is interpreted to be underlying a large percentage of the Santa Rosa Plain (McLaughlin et al., 2008). The Petaluma Formation is predominantly composed of sandy to silty gravel, silty sandstone, siltstone, and mudstone that were deposited in fluvial, lacustrine and brackish to estuarine environments (McLaughlin et al., 2008; Cardwell, 1958). In general, water yields are low in this formation, and consequently, this unit does not represent an important water-bearing formation.

The Pliocene and Miocene Sonoma Volcanics comprise a series of bimodal volcanic units that range from basalt flows to rhyolitic tuffs that accumulated over a 30-mile (east-west) by 40-mile (north-south) area. Most recent interpretations based on more extensive age dating indicate that these volcanic units were deposited contemporaneously with the Petaluma, Wilson Grove (Merced) and lower Glen Ellen Formations (McLaughlin, et al., 2008). The water yielding capacity of units of the Sonoma Volcanics vary widely depending on lithology, with higher yields from the tuff units (Cardwell, 1958). The Sonoma Volcanics are not a significant hydrogeologic formation in the vicinity of the subject well.

The Pliocene and late Miocene Wilson Grove Formation (Merced Formation, Cardwell, 1958) comprises marine pebbly sandstone, siltstone and pebbly gravel (McLaughlin et al., 2008). The

Wilson Grove Formation is mapped as underlying a large portion of the Santa Rosa Plain, predominantly along the western half of the Valley (McLaughlin et al. 2008 and Cardwell, 1958). This formation is considered one of the major water-bearing units within the Santa Rosa Plain subbasin, with specific yields that range from 10 to 20 percent (DWR, 2004). According to Cardwell (1958) semi-confined to confined conditions may exist locally where clay lenses are present. Recharge is mainly from the southwestern portion of the basin; however, within the vicinity of the well, much of the recharge likely comes from the overlying Glen Ellen Formation (DWR, 2004). This formation is a source of groundwater, particularly the agricultural wells located west of the recently installed SMC Well.

Overlying the Wilson Grove Formation in the study area is the Plio-Pleistocene Glen Ellen Formation, which represents the primary source of groundwater for the subject well and existing wells in the vicinity of the proposed Sutter Medical Center. The Glen Ellen Formation typically comprises non-marine, lenticular beds of poorly sorted gravel, sandstone, siltstone and mudstone (McLaughlin et al., 2008 and Cardwell, 1958). As characteristic of alluvial fan deposits, individual beds vary widely in thickness, are not horizontally continuous, and typically grade into one another over short distances. The Glen Ellen Formation was deposited during late Pliocence and early Pleistocene time as alluvial fans shed from the east towards shallow bays or lagoons (Cardwell, 1958). Average specific yields range from 3 to 7 percent (DWR, 2004). Because the Glen Ellen Formation crops out in many areas within the Santa Rosa Plain, recharge is thought to occur readily, except where overlain by low permeability soils (DWR, 2004).

Pleistocene and Holocene alluvial fan and fluvial terrace deposits blanket the Santa Rosa Plain. These deposits generally comprise poorly sorted gravel, sand, silt, and clay and have a maximum exposed thickness of 100 feet (Cardwell, 1958). These units typically have specific yields that range between 8 and 17 percent and are tapped by some shallow wells within the vicinity of the subject well

2.3 GROUNDWATER AVAILABILITY

Based on DWR (1982) calculations, the groundwater storage capacity of the entire Santa Rosa Plain Subbasin is approximately 4,313,000 acre-feet. As previously discussed, the well is located within the Larkfield Storage Unit within the larger Santa Rosa Plain Subbasin (DWR, 1975). According to DWR estimates, the Larkfield Storage Unit has a groundwater storage capacity of roughly 600,000 acre-feet (DWR, 1975).

2.4 EXISTING GROUNDWATER SUPPLY WELLS

Groundwater is an important source of water for both domestic and agriculture uses within the Larkfield area. The Cal-American water company (Cal-Am) currently pumps groundwater from four wells in the Larkfield district (Larkfield 1A, 3A, 4A and 5). Cal-Am distributions and private domestic wells are the primary water source of water in the Larkfield area. Cal-Am distributes water pumped from its wells and imported water deliveries it receives from the Sonoma County Water Agency (SCWA).

As part of the ENGEO (October 2009) groundwater study for the proposed medical center, DWR well completion reports were reviewed for well locations and construction and for information on aquifer properties. A summary of these well completion reports is included in the ENGEO groundwater study report.

2.5 GROUNDWATER LEVELS

According to DWR (2004), the groundwater within the Santa Rosa Plain Subbasin as a whole is approximately in balance, with increased groundwater levels in the northeast (in the vicinity of the proposed SMC) and decreased groundwater levels in the south. Cardwell (1958) produced the most comprehensive study of groundwater and hydrogeology in the basin, including a groundwater contour map that covers the study area. Based on Cardwell's (1958) groundwater contour map, groundwater levels within the study area are highest in the west (approximately160 feet above mean sea level) and gradually decrease towards the west to an elevation of around 50 feet near the Laguna de Santa Rosa, generally conforming to the topography across the Santa Rosa Valley.

As part of the ENGEO (2009) groundwater study for the proposed SMC project, a generalized groundwater contour map was developed for the area in the vicinity of the SMC Well based on available spring 2007 groundwater level data from DWR monitoring wells, GEI (2007) spring groundwater contours, and 2009 groundwater levels from the existing Wells Fargo and Sutter Vineyard wells (with reference to regional groundwater contour mapping from Cardwell). The groundwater contour mapping shows the same general groundwater trend across the western portion of the study area that Cardwell depicted in 1958, and relatively low groundwater levels in the Larkfield District portion of the study area. These decreased groundwater levels indicate that a pumping depression has developed in this area since the time of Cardwell's study. Review of available groundwater pumping data suggests that this pumping depression is relatively stable.

Available groundwater level hydrographs from the existing Cal-Am and DWR wells were reviewed as part of the ENGEO (2009) groundwater study. Based on this review, ENGEO (2009) concluded that groundwater levels in the northeastern portion of the Santa Rosa Plain Subbasin are in relative balance, with possibly a slight increase in storage due to decreases in groundwater pumping.

2.6 REGIONAL AND LOCAL GROUNDWATER QUALITY

According to a DWR study (1982), from the many wells tested within the Santa Rosa Plain subbasin, only a few wells contained constituents over the recommended concentrations for drinking water. DWR has concluded that in general, the water quality within the Santa Rosa Plain subbasin is good (DWR, 2004).

More locally, groundwater sampling results from existing wells at the subject site (ENGEO, 2006) indicated that the majority of samples when compared to the California Department of Health Services (DHS) Drinking Water Standards and Secondary Standard Maximum Contaminant Levels (MCLs) were below the DHS MCLs. Appendix C of the ENGEO 2006

Groundwater Aquifer Test and Water Quality Analysis report provides water quality sample results for the two on-site wells from which water samples were collected (W-LBC and W-SV-July 2005 and November 2005).

The initial water quality samples collected in July 2005 were analyzed to evaluate the following water quality parameters: total hardness as $CaCO_3$, total dissolved solids (TDS), total alkalinity as $CaCO_3$, pH; total silica, electrical conductivity, manganese, iron, and arsenic. The samples collected in November 2005 included additional constituents that were not analyzed in the initial samples, including total alkalinity, bicarbonate as $CaCO_3$, carbonate as $CaCO_3$, hydroxide as $CaCO_3$, hardness, pH, electrical conductivity, TDS, antimony, arsenic, barium, beryllium, cadmium, total chromium, cobalt, copper, iron, lead, manganese, mercury, molybdenum, nickel, selenium, silver, thallium, vanadium, zinc, and silica.

More recent groundwater sampling and analysis was conducted for the recently installed W-SMC and these results are discussed in Section 7.0 of this report.

3.0 BOREHOLE DRILLING

3.1 DRILLING METHODS

Prior to commencement of reverse circulation drilling, 20-inch-diameter steel conductor casing was installed to a depth of approximately 33.5 feet bgs. The borehole for the conductor casing was advanced using a Lo-Drill equipped excavator with a 30-inch-diameter auger. The annulus between the conductor casing and the borehole was backfilled with cement.

Zim Industries from Fresno, California was the well drilling contractor for the project. The borehole for the well was advanced to a depth of approximately 610 feet bgs utilizing a Failing JED-A drill rig equipped for reverse circulation rotary drilling methods. A 16-inch-diameter borehole was advanced using a rotary tri-cone bit and drill collars. Drilling advance was purposely slow and performed with no more than 2,000 to 3,000 lbs. of down pressure to minimize the risk of deviation. The borehole was eventually reamed to 17.5 inches in diameter following geophysical logging and zone testing. Drilling fluid generally consisted of freshwater with a borehole stabilizing dry polymer additive.

3.2 FORMATION SAMPLING AND ANALYSIS

Samples of drill cuttings were collected at a maximum interval of 10 feet and several additional samples were collected from expected producing zones during drilling. Samples were collected from a sediment trap connected to the end of the discharge pipe. Samples were bagged and labeled according to interval depth bgs. A boring log was constructed based on cutting samples, drilling rates, rig chatter and other drilling notes (Appendix A). Samples were selected for laboratory grain-size analysis from specific intervals based on lithology, the geophysical log, water production, and water quality analysis acquired from zone testing. Grain-size analysis results are attached in Appendix B of this report.

The subsurface geology encountered during drilling for the SMC-Well is summarized below:

- Predominantly silty clay, and sandy clay was encountered to a depth of approximately 50 feet below the ground surface (bgs).

- Well-graded sand to silty sand was encountered from a depth of approximately 50 to 75 feet bgs.

- Silty sand with clay to silty clay was encountered from a depth of approximately 75 to 110 feet bgs.

- A sequence of interbedded silty sand and sandy clay with occasional thin gravel beds was encountered from a depth of approximately 110 to 165 feet bgs.

- Sandy clay was encountered from a depth of approximately 165 to 175 feet bgs.

- Interbedded sand and gravel was encountered from a depth of approximately 175 to 205 feet bgs.

- An interbedded sequence of silty sand and clayey sand with occasional thin gravel beds was encountered from approximately 205 to 330 feet bgs.

- Sandy clay with minor interbeds of silty sand was encountered from approximately 330 to 370 feet bgs.

- An interbedded sequence of silty sand clayey sand with minor gravel interbeds was encountered from approximately 370 to 400 feet bgs.

- Below a depth of 400 feet bgs predominantly thin units of clayey sand interbedded with thick clay units were encountered.

4.0 GEOPHYSICAL LOGGING AND ZONE TESTING

4.1 GEOPHYSICAL LOGGING

Following drilling the 16-inch-diameter borehole and circulating to remove excess suspended sediments from the drilling fluid, a geophysical log was conducted by Welenco on August 16, 2009. The geophysical log included the following.

- Gamma Ray
- Spontaneous Potential
- 64-Inch Normal Resistivity
- 16-Inch Normal Resistivity
- Single-Point Resistivity
- Temperature Profile

The resulting geophysical well log is presented on Figure 4.

Gamma Ray logs measure the natural radioactivity in the formations penetrated by the borehole and as a result can be useful in identifying lithologies and lithologic changes. The spontaneous potential log (SP), the 64-Inch Normal Resistivity log, the 16-Inch Normal Resistivity log and the Single-Point resistivity log are very useful in identifying permeable and impermeable zones within a borehole as well as the location of lithologic changes and relative water quality.

4.2 ZONE TESTING

Based on review of the boring log, cutting samples and the geophysical log, three depth intervals were selected for zone testing. Zone testing was conducted using a tool attached to the end of the drill string. The tool consisted of a 22-foot-long section of 5-inch-diameter, perforated, steel pipe. Prior to zone testing, the tool was centered in the desired zone to be tested, a bentonite seal was set at the base of the zone, pea gravel was then backfilled around the tool and a bentonite seal was set at the top of the zone. Zone testing was performed by airlifting with compressed air for initial developments, followed by installation of a submersible pump.

The first zone test was performed in the deeper portion of the borehole centered between the depths of approximately 550 and 590 feet bgs. Minimal water (less than 10 gpm) was produced during this test, and because of the lack of water in this zone, no water samples were collected for water quality analysis.

A second zone test was conducted, centered between the depths of approximately 420 and 460 feet bgs. This zone was producing roughly 20 to 25 gpm towards the end of the test. Water samples were collected for water quality analysis and transported to the lab for testing.

The final zone test was conducted in the intermediate aquifer, centered between the depths of approximately 170 and 210 feet bgs. This zone was producing roughly 130 gpm towards the end of the test. Water samples were collected for water quality analysis and transported to the lab for testing. Water quality analysis results from the zone testing are included in Appendix D of this report.

5.0 WELL DESIGN, INSTALLATION AND DEVELOPMENT

5.1 WELL DESIGN AND INSTALLATION

Design of the SMC well was based on review of the boring log, geophysical log, grain-size analysis, zone testing, and water quality analysis. The boring log and geophysical log indicate a zone of sand and silty sand between a depth of approximately 50 and 75 feet bgs interpreted as the shallow aquifer. Because of potential for poor water quality, it was decided that the well would not be designed to derive water from the shallow aquifer. Below the base of the shallow aquifer, the logs indicate the presence of a clay-rich zone between a depth of 75 and 110 feet bgs. This clay-rich layer is interpreted as a confining layer overlying the intermediate aquifer. Below this clay-rich layer, the logs indicate a sequence of interbedded silty sand with clay and occasional gravel beds to a depth of about 330 feet bgs, interpreted as the intermediate aquifer. Within the intermediate aquifer, the logs indicate a pervasive layer of water-producing sand and gravel between a depth of 175 and 205 feet bgs. Below the base of the intermediate aquifer, the logs indicate the presence of interbedded sandy clay and silty sand to a depth of approximately 370 feet bgs, interpreted as a confining layer overlying the deeper aquifer. Below this confining layer, the logs indicate an interbedded sequence of silty sand and clayey sand with occasional thin gravel interbeds and more pervasive thick clay layers below a depth of 500 feet bgs.

Based on the above interpretation, the well was designed and constructed with the following screen and blank intervals, filter pack and seals (Figure 4).

- Solid stainless steel casing to a depth of approximately 170 feet bgs with an approximately 100-foot sand-cement grout seal from the ground surface.
- Stainless steel wire wrap 0.045-inch well screen between 170 and 310 feet bgs.
- Solid stainless steel casing between 310 and 360 feet bgs.
- Stainless steel wire wrap 0.045-inch well screen between 360 and 395 feet bgs.
- Solid stainless steel casing between 395 and 430 feet bgs.
- Stainless steel wire wrap 0.045-inch well screen between 430 and 490 feet bgs.
- Solid stainless steel casing to a depth of 510 feet bgs.
- A bentonite seal was placed from approximately 515 to 525 feet bgs.
- SRI 5:1 PF#12 filter pack was placed from approximately 105 to 515 feet bgs with intervening bentonite seals between approximately 398 and 403 feet bgs and between roughly 330 and 340 feet bgs.

The stainless steel casing and screen joints were welded by a two-man crew of certified professional welders. The well string was hung to a depth of approximately 510 feet bgs. Seals and granular filter pack were placed in the annulus via a tremie pipe connected to a gravel pump. Depth of filter pack and seals were monitored and recorded using a weighted wire-line depth sounder.

5.2 WELL HYDRAULIC DEVELOPMENT

Initial well development was performed by the drilling crew following well construction. Well development is performed to maximize well yields through various processes that both repair damage to the formation caused by drilling and change the physical characteristics of the aquifer near the borehole to increase the hydraulic conductivity in the zone immediately adjacent to the well. The initial development included airlifting and swabbing. More extensive well development was conducted by the pump crew with the use of a submersible pump. A 250 gallon per minute (gpm), 50 horsepower, electric, 14-stage submersible pump was installed at a depth of approximately 320 feet in the well. The pump was connected to a 6-inch-diameter discharge pipe equipped with an electric flow meter. On September 29, 2009, the well was developed over a period of around 12 hours by surging three times and then operating the pump at 10-minute intervals at a rate of around 320-330 gpm. During development, data on sand content was collected using a Rossum Sand Tester. Sand content results decreased throughout the development process and varied from around 10 ppm to less than 1 ppm towards the end of development.

6.0 WELL PRODUCTION AND AQUIFER TESTING

6.1 BACKGROUND WATER LEVELS AND MONITORING WELLS

The water level of the SMC Well was recorded following installation and over a period of several weeks leading up to the pump test. The water level averaged a depth of 58 feet below top of casing (btc), which roughly correlates to an elevation of 100 feet above mean sea level (msl). The top of casing is approximately 16 inches above ground surface.

The water levels within the two primary monitoring wells, Wells Fargo Center Well (W-WFC) and the Vintners Inn Well (W-VI), were recorded with vented vibrating wire piezometers installed in the two wells for several weeks leading up to the pump test. The W-WFC is located approximately 740 feet east northeast of the W-SMC and the W-VI is located approximately 800 feet west of the W-SMC. Based on the DWR well completion report, it is our understanding that the W-WFC was constructed with three screened intervals, installed at 100 to 160 feet below the ground surface (bgs), 180 to 320 feet bgs, and 360 to 400 feet bgs. The pump within the W-WFC is set at a depth of approximately 325 feet bgs. Measurements indicate that the non-pumping water level in the W-WFC was approximately 40 feet below the ground surface in June 2009 and the water level gradually decreased through the summer months to around 50 feet below the ground surface in September 2009. This water level decrease is indicative of the seasonal water level variations expected as a result of increased pumping and lack of recharge to the aquifer during the late spring and summer. It should be noted that non-pumping water levels within the W-WFC declined from around 50 feet bgs to around 58 feet bgs over a period of eight days prior to the start of the constant rate pump test. The decline in water level in this well appears to be related to an eight-day period of intensive pumping of this well for irrigation purposes. Prior to starting the SMC well pump test, the W-WFC well had recovered to approximately 55.5 feet bgs over a 30-hour period after the pump in the well was shut off.

Based on the DWR well completion report, the W-VI well was constructed with three screened intervals, installed at 80 to 280 feet below the ground surface (bgs), 320 to 400 feet bgs, and 480 to 700 feet bgs. During the month of September 2009, the non-pumping water level in W-VI averaged a depth of approximately 56 feet bgs, which roughly correlates to an elevation of approximately 98 feet above mean sea level. It should be noted that our piezometer data from the W-VI appears to indicate that during a period of eight days prior to the pump test W-VI was in operation such that a non-pumping water level was not attained due to intensive pumping for vineyard irrigation. Prior to starting the pump test on October 9, 2009, at 10:10 AM this well had recovered to approximately 62 feet bgs over a 24-hour period after the pump in the well was shut off.

Two secondary monitoring wells were observed during the constant rate pump test. These two wells included the Sutter Vineyard Well (W-SV) located approximately 1890 feet east of W-SMC and the Cargile residence well (W-C) located approximately 1480 feet northeast of the W-SMC. Detailed information about the construction of these two wells is unknown. Based on discussion with the Cargile residence owner, it is our understanding that the W-C is about 160 feet deep. Prior to the start of the pump test on October 9, 2009, the water level in W-C was measured at approximately 18.75 feet. Prior to the start of the pump test, the water level was measured in the W-SV at approximately 48.10 feet below the top of the casing.

6.2 CONSTANT RATE SMC WELL PUMPING TEST

A 72-hour pump test was initiated on the morning of October 9, 2009, at 10:10AM. Prior to the initiation of the pump test, groundwater levels were initially measured at pumping well W-SMC and the four monitoring wells. The pumping concluded on October 12, 2009, at 10:10AM. A flow rate meter and volume discharge meter was attached to the pump. The flow rate was maintained at ±155 gallons/minute. The flow rate was regularly verified by evaluating the measured totalizer data readings. The actual average pumping rate throughout the test, after evaluating the total gallons pumped during the 72 hours, was roughly 153 gpm. The water levels in the Pumping Well W-SMC were recorded with an electrical conducting water level meter, which were measured to the nearest hundredth of a foot.

Once the pump test commenced, the depth to groundwater was recorded at the W-SMC as follows: every minute for the first 15 minutes; every 5 minutes from 15 to 60 minutes; every 10 minutes from 30 to 100 minutes; every 30 minutes from 100 to 300 minutes; every 60 minutes from 300 to 4320 minutes. After 72 hours of continuous pumping, a recovery test began immediately following the shut down of the pump. The depth was recorded during recovery in the same intervals as during the pumping test to approximately 95% recovery and then at roughly 8-hour intervals. The field-recorded measurements of the drawdown and recovery, as well as observations and notes, are attached as Appendix C.

During the pump test, water levels within the two primary monitoring wells (W-WFC and W-VI) were recorded with vented vibrating wire piezometers equipped with mini-loggers at 1 minute intervals. After 72 hours of continuous of pumping, recovery data was recorded at 1 minute intervals in the two primary monitoring wells.

Water levels in the two secondary wells monitored during the pump test (W-SV and W-C) were recorded with an electrical conducting water level meter and were to the nearest hundredth of a foot. During the pump test water, level measurements were recorded at roughly 10-minute intervals for the first 120 minutes; roughly every 30 minutes from 120 to 300 minutes; roughly every 60 minutes from 300 to 1440 minutes and roughly every 480 minutes from 1440 to

4320 minutes. After 72 hours of continuous of pumping, recovery data was recorded at generally the same intervals as during the pump test.

The W-C exhibited less than a tenth of an inch of drawdown during the 72-hour pump test, and it is not possible to determine whether this minor water level change is related to pumping of the W-SMC or some other more nearby wells. The W-SV exhibited around 0.5 foot of water level rise during the 72-hour pump test. This appears to indicate that the aquifer in the vicinity of this well was in a state of recovery during the pump test and that pumping of the W-SMC exhibited little to no influence on the water level in this well.

ENGEO measured sand content with a Rossum Sand Tester at the beginning and end of the 72-hour pumping test. The results of the sand test yielded very few grains of sand, and the total amount of sand recovered was below the initial reading line of 1 part per million (ppm). The observations and notes from the sand test are included in Appendix C as part of the test data.

6.3 AQUIFER ANALYSIS

Using the pumping test records, we analyzed the aquifer characteristics, specifically, the transmissivity (**T**) and the storage coefficient (**S**). We have assumed in our analysis, based on data and information collected during drilling and installation of the W-SMC, the aquifer is partially confined to confined and the thickness of the aquifers that the W-SMC is designed to withdrawal water from extends from about 100 to 510 feet bgs to the bottom of the well for a total thickness of roughly 410 feet. The drawdown data obtained from the aquifer test was used to analyze the aquifer using the Cooper-Jacob methods to determine the transmissivity. A brief explanation of the different methods is included in Appendix C.

Transmissivity (**T**) is the hydraulic conductivity of the full thickness of the aquifer; it is a measure of the aquifer's ability to transmit water (i.e. how permeable it is). The values of transmissivity obtained from the Cooper-Jacob drawdown method was 5,049 gallons per day per foot (gpd/ft).

The storage coefficient (**S**), or storativity, is the volume of water released from or taken into storage per unit surface area per unit change of the hydraulic head; it is a measure of the aquifer's ability to release groundwater from storage. Three of our observation wells (W-WFC, W-VI and W-SV) exhibited an effect from the continual pumping in W-SMC; however, because of an apparent local aquifer-wide recovery and other bias in the data, we were not able to obtain a reliable storativity value from the pump test data.

The following table presents the results of our analysis:

TABLE 1 – AQUIFER CHARACTERISTICS

METHOD OF ANALYSIS	TRANSMISSIVITY T gpd/ft	STORAGE COEFFICIENT S
Cooper-Jacob Drawdown Method (W-SMC)	5,049	NA

Based on the empirical equation Q/s = T/2000; where Q = 153 gpm, s = drawdown, and T = transmissivity, we find that the theoretical specific capacity for a 100% efficient well is around 2.5 gpm/ft. Based on a review of the pump test drawdown data, the actual 1-day specific capacity of the W-SMC is approximately 2 gpm/ft, indicating that the true well efficiency is approximately 80%.

Using the calculated value of transmissivity from the W-SMC of 5,049 gpd/ft and a reasonable range of storativity values for confined to partially confined aquifers, we estimated a range of theoretical radii of influence (see Table 2 below). The Radius of influence of a well is the horizontal distance from the center of the well to the limit of the cone of depression that develops in relation to pumping the well; in other words, it is the horizontal distance at which drawdown related to the well is theoretically zero. The range of storativity values cited below appears reasonable for the aquifer in the area. Kleinfelder (2009) used a storativity value of.0004 for drawdown calculation associated with the Faught Road test well, which is located in the same aquifer as the W-SMC. In addition, drawdown in the W-WFC monitoring well, although not able to be used to calculate a precise storativity value, appears to support a value within the middle of this range (an S value of approximately .0005) when the theoretical drawdown is calculated and compared with the observed drawdown using the transmissivity value obtained from the W-SMC.

TABLE 2 – ESTIMATED THEORETICAL RADIUS OF INFLUENCE BASED ON A RANGE OF STORATIVITY VALUES FOR THE AQUIFER

STORATIVITY S	THEORETICAL RADIUS OF INFLUENCE (feet) (Based on W-SMC pumping rate of 80 gpm for 18 hours) T = 5,049 gpd/ft
.001	1,066
.0008	1,192
.0006	1,376
.0005	1,507
.0004	1,685
.0002	2,388

7.0 WATER QUALITY SAMPLING AND ANALYSIS

Near the end of the October 2009 pump test, water quality samples collected were analyzed to evaluate the following water quality parameters: total alkalinity, bicarbonate as $CaCO_3$, carbonate as $CaCO_3$, hydroxide as $CaCO_3$, antimony, arsenic, aluminum, barium, beryllium, calcium, cadmium, chromium, fluoride, iron, lead, manganese, magnesium, mercury, molybdenum, nickel, nitrate, nitrite, selenium, sodium, thallium, boron, zinc, volatile hydrocarbons, perchlorate, total hardness, pH, asbestos, organics and gross alpha (Appendix D). Water quality analysis results indicate that the samples, when compared to the California Department of Health Services (DHS) Drinking Water Standards and Secondary Standard Maximum Contaminant Levels (MCLs), were below the DHS MCLs, with the exception of Manganese. Manganese was reported at 870 ug/L. Arsenic reported at 9.5 ug/L was 0.5 ug/L below the MCL. Three days after the completion of the pump test, two water samples were recovered to confirm the arsenic and manganese concentrations (Appendix D). These analyses reported arsenic at 7.0 ug/L and 4.3 ug/L and Manganese at 810 ug/L and 850 ug/L, which in general is consistent with the initial results.

DESCRIPTION

SILTY CLAY (CL), gray, with fine to medium grained sand.

Increasing gravel content.

Some fine and coarse gravel.

CLAYEY SAND to SANDY CLAY (SC-CL), grayish brown, some fine to coarse gravel, medium grained sand.

SILTY CLAY (CL), dark grayish brown, trace fine grained sand.

SILTY CLAY (CL), brown, some sand, some fine to coarse gravel, claystone fragments.

Decreasing sand content.

W-WFC :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**
Distance from Pumping Well Approximately 740 feet
Start Pumping: 2009-10-09 10:10 AM
End Pumping: 2009-10-12 10:10 AM
Initial Volume: 271729 x1000 gal
Final Volume: 272391 x1000 gal
Water Level at Start of Pump Test: 55.36 feet, below ground surface

Elapsed Time (minutes)	Time	W-WFC Depth to Groundwater (feet, btc)	W-WFC Drawdown (feet)

W-WFC :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**
Distance from Pumping Well Approximately 740 feet
Start Pumping: 2009-10-09 10:10 AM
End Pumping: 2009-10-12 10:10 AM
Initial Volume: 271729 x1000 gal
Final Volume: 272391 x1000 gal
Water Level at Start of Pump Test: 55.36 feet, below ground surface

Elapsed Time (minutes)	Time	W-WFC	
		Depth to Groundwater (feet, btc)	Drawdown (feet)

W-WFC :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**

Distance from Pumping Well	Approximately 740 feet	
Start Pumping:	2009-10-09	10:10 AM
End Pumping:	2009-10-12	10:10 AM
Initial Volume:	271729	x1000 gal
Final Volume:	272391	x1000 gal
Water Level at Start of Pump Test:	55.36	feet, below ground surface

Elapsed Time (minutes)	Time	W-WFC Depth to Groundwater (feet, btc)	Drawdown (feet)

W-WFC :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**
Distance from Pumping Well Approximately 740 feet
Start Pumping: 2009-10-09 10:10 AM
End Pumping: 2009-10-12 10:10 AM
Initial Volume: 271729 x1000 gal
Final Volume: 272391 x1000 gal
Water Level at Start of Pump Test: 55.36 feet, below ground surface

Elapsed Time (minutes)	Time	W-WFC	
		Depth to Groundwater (feet, btc)	Drawdown (feet)

W-WFC :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**
Distance from Pumping Well Approximately 740 feet
Start Pumping: 2009-10-09 10:10 AM
End Pumping: 2009-10-12 10:10 AM
Initial Volume: 271729 x1000 gal
Final Volume: 272391 x1000 gal
Water Level at Start of Pump Test: 55.36 feet, below ground surface

Elapsed Time (minutes)	Time	W-WFC Depth to Groundwater (feet, btc)	W-WFC Drawdown (feet)

W-WFC :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**

Distance from Pumping Well	Approximately 740 feet	
Start Pumping:	2009-10-09	10:10 AM
End Pumping:	2009-10-12	10:10 AM
Initial Volume:	271729	x1000 gal
Final Volume:	272391	x1000 gal
Water Level at Start of Pump Test:	55.36	feet, below ground surface

Elapsed Time (minutes)	Time	W-WFC Depth to Groundwater (feet, btc)	W-WFC Drawdown (feet)
1339	10/10/09 8:29	57.97	2.61

W-WFC :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**

Distance from Pumping Well	Approximately 740 feet
Start Pumping:	2009-10-09 10:10 AM
End Pumping:	2009-10-12 10:10 AM
Initial Volume:	271729 x1000 gal
Final Volume:	272391 x1000 gal
Water Level at Start of Pump Test:	55.36 feet, below ground surface

Elapsed Time (minutes)	Time	W-WFC Depth to Groundwater (feet, btc)	Drawdown (feet)
1551	10/10/09 12:01	58.11	2.75

W-WFC :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**

Distance from Pumping Well	Approximately 740 feet
Start Pumping:	2009-10-09 10:10 AM
End Pumping:	2009-10-12 10:10 AM
Initial Volume:	271729 x1000 gal
Final Volume:	272391 x1000 gal
Water Level at Start of Pump Test:	55.36 feet, below ground surface

Elapsed Time (minutes)	Time	W-WFC Depth to Groundwater (feet, btc)	Drawdown (feet)
1763	10/10/09 15:33	58.20	2.84

W-WFC :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**
Distance from Pumping Well Approximately 740 feet
Start Pumping: 2009-10-09 10:10 AM
End Pumping: 2009-10-12 10:10 AM
Initial Volume: 271729 x1000 gal
Final Volume: 272391 x1000 gal
Water Level at Start of Pump Test: 55.36 feet, below ground surface

Elapsed Time (minutes)	Time	W-WFC Depth to Groundwater (feet, btc)	W-WFC Drawdown (feet)

W-WFC :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**

Distance from Pumping Well	Approximately 740 feet
Start Pumping:	2009-10-09 10:10 AM
End Pumping:	2009-10-12 10:10 AM
Initial Volume:	271729 x1000 gal
Final Volume:	272391 x1000 gal
Water Level at Start of Pump Test:	55.36 feet, below ground surface

Elapsed Time (minutes)	Time	W-WFC

W-WFC :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**

Distance from Pumping Well	Approximately 740 feet
Start Pumping:	2009-10-09 10:10 AM
End Pumping:	2009-10-12 10:10 AM
Initial Volume:	271729 x1000 gal
Final Volume:	272391 x1000 gal
Water Level at Start of Pump Test:	55.36 feet, below ground surface

Elapsed Time (minutes)	Time	W-WFC Depth to Groundwater (feet, btc)	W-WFC Drawdown (feet)
2459	10/11/09 3:09	58.48	3.12

W-WFC :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**
Distance from Pumping Well Approximately 740 feet
Start Pumping: 2009-10-09 10:10 AM
End Pumping: 2009-10-12 10:10 AM
Initial Volume: 271729 x1000 gal
Final Volume: 272391 x1000 gal
Water Level at Start of Pump Test: 55.36 feet, below ground surface

Elapsed Time (minutes)	Time	W-WFC Depth to Groundwater (feet, btc)	W-WFC Drawdown (feet)

W-WFC :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**

Distance from Pumping Well: Approximately 740 feet
Start Pumping: 2009-10-09 10:10 AM
End Pumping: 2009-10-12 10:10 AM
Initial Volume: 271729 x1000 gal
Final Volume: 272391 x1000 gal
Water Level at Start of Pump Test: 55.36 feet, below ground surface

Elapsed Time (minutes)	Time	W-WFC Depth to Groundwater (feet, btc)	W-WFC Drawdown (feet)

W-WFC :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**
Distance from Pumping Well Approximately 740 feet
Start Pumping: 2009-10-09 10:10 AM
End Pumping: 2009-10-12 10:10 AM
Initial Volume: 271729 x1000 gal
Final Volume: 272391 x1000 gal
Water Level at Start of Pump Test: 55.36 feet, below ground surface

Elapsed Time (minutes)	Time	W-WFC Depth to Groundwater (feet, btc)	W-WFC Drawdown (feet)
3100	10/11/09 13:50	58.65	3.29

W-WFC :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**
Distance from Pumping Well Approximately 740 feet
Start Pumping: 2009-10-09 10:10 AM
End Pumping: 2009-10-12 10:10 AM
Initial Volume: 271729 x1000 gal
Final Volume: 272391 x1000 gal
Water Level at Start of Pump Test: 55.36 feet, below ground surface

W-WFC :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**
Distance from Pumping Well Approximately 740 feet
Start Pumping: 2009-10-09 10:10 AM
End Pumping: 2009-10-12 10:10 AM
Initial Volume: 271729 x1000 gal
Final Volume: 272391 x1000 gal
Water Level at Start of Pump Test: 55.36 feet, below ground surface

Elapsed Time (minutes)	Time	W-WFC Depth to Groundwater (feet, btc)	Drawdown (feet)
3584	10/11/09 21:54	58.73	3.37

W-WFC :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**

Distance from Pumping Well	Approximately 740 feet
Start Pumping:	2009-10-09 10:10 AM
End Pumping:	2009-10-12 10:10 AM
Initial Volume:	271729 x1000 gal
Final Volume:	272391 x1000 gal
Water Level at Start of Pump Test:	55.36 feet, below ground surface

Elapsed Time (minutes)	Time	W-WFC Depth to Groundwater (feet, btc)	W-WFC Drawdown (feet)
3796	10/12/09 1:26	58.75	3.39

W-WFC :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**
Distance from Pumping Well Approximately 740 feet
Start Pumping: 2009-10-09 10:10 AM
End Pumping: 2009-10-12 10:10 AM
Initial Volume: 271729 x1000 gal
Final Volume: 272391 x1000 gal
Water Level at Start of Pump Test: 55.36 feet, below ground surface

Elapsed Time (minutes)	Time	W-WFC Depth to Groundwater (feet, btc)	W-WFC Drawdown (feet)

W-WFC :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**

Distance from Pumping Well	Approximately 740 feet	
Start Pumping:	2009-10-09	10:10 AM
End Pumping:	2009-10-12	10:10 AM
Initial Volume:	271729	x1000 gal
Final Volume:	272391	x1000 gal
Water Level at Start of Pump Test:	55.36	feet, below ground surface

Elapsed Time (minutes)	Time	W-WFC	
		Depth to Groundwater (feet, btc)	Drawdown (feet)
4233	10/12/09 8:43	58.84	3.48
4234	10/12/09 8:44	58.84	3.48

W-WFC :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**
Distance from Pumping Well Approximately 740 feet
Start Pumping: 2009-10-09 10:10 AM
End Pumping: 2009-10-12 10:10 AM
Initial Volume: 271729 x1000 gal
Final Volume: 272391 x1000 gal
Water Level at Start of Pump Test: 55.36 feet, below ground surface

W-WFC :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**
Distance from Pumping Well Approximately 740 feet
Start Pumping: 2009-10-09 10:10 AM
End Pumping: 2009-10-12 10:10 AM
Initial Volume: 271729 x1000 gal
Final Volume: 272391 x1000 gal
Water Level at Start of Pump Test: 55.36 feet, below ground surface

Elapsed Time (minutes)	Time	W-WFC Depth to Groundwater (feet, btc)	W-WFC Drawdown (feet)

W-WFC :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**

Distance from Pumping Well	Approximately 740 feet	
Start Pumping:	2009-10-09	10:10 AM
End Pumping:	2009-10-12	10:10 AM
Initial Volume:	271729	x1000 gal
Final Volume:	272391	x1000 gal
Water Level at Start of Pump Test:	55.36	feet, below ground surface

Elapsed Time (minutes)	Time	W-WFC Depth to Groundwater (feet, btc)	W-WFC Drawdown (feet)
4930	10/12/09 20:20	56.31	0.95

W-WFC :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**
Distance from Pumping Well Approximately 740 feet
Start Pumping: 2009-10-09 10:10 AM
End Pumping: 2009-10-12 10:10 AM
Initial Volume: 271729 x1000 gal
Final Volume: 272391 x1000 gal
Water Level at Start of Pump Test: 55.36 feet, below ground surface

Elapsed Time (minutes)	Time	W-WFC Depth to Groundwater (feet, btc)	W-WFC Drawdown (feet)

W-WFC :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**
Distance from Pumping Well Approximately 740 feet
Start Pumping: 2009-10-09 10:10 AM
End Pumping: 2009-10-12 10:10 AM
Initial Volume: 271729 x1000 gal
Final Volume: 272391 x1000 gal
Water Level at Start of Pump Test: 55.36 feet, below ground surface

Elapsed Time (minutes)	Time	W-WFC Depth to Groundwater (feet, btc)	W-WFC Drawdown (feet)
5354	10/13/09 3:24	55.10	-0.26

W-WFC :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**
Distance from Pumping Well Approximately 740 feet
Start Pumping: 2009-10-09 10:10 AM
End Pumping: 2009-10-12 10:10 AM
Initial Volume: 271729 x1000 gal
Final Volume: 272391 x1000 gal
Water Level at Start of Pump Test: 55.36 feet, below ground surface

Elapsed Time (minutes)	Time	W-WFC Depth to Groundwater (feet, btc)	Drawdown (feet)

W-VI :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**
Distance from Pumping Well Approximately 800 feet
Start Pumping: 2009-10-09 10:10 AM
End Pumping: 2009-10-12 10:10 AM
Initial Volume: 271729 x1000 gal
Final Volume: 272391 x1000 gal
Water Level at Start of Pump Test: 62.21 feet, below ground surface

Elapsed Time (minutes)	Time	W-VI Depth to Groundwater (feet, btc)	W-VI Drawdown (feet)

W-VI :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**
Distance from Pumping Well Approximately 800 feet
Start Pumping: 2009-10-09 10:10 AM
End Pumping: 2009-10-12 10:10 AM
Initial Volume: 271729 x1000 gal
Final Volume: 272391 x1000 gal
Water Level at Start of Pump Test: 62.21 feet, below ground surface

Elapsed Time (minutes)	Time	W-VI Depth to Groundwater (feet, btc)	W-VI Drawdown (feet)

W-VI :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**
Distance from Pumping Well Approximately 800 feet
Start Pumping: 2009-10-09 10:10 AM
End Pumping: 2009-10-12 10:10 AM
Initial Volume: 271729 x1000 gal
Final Volume: 272391 x1000 gal
Water Level at Start of Pump Test: 62.21 feet, below ground surface

Elapsed Time (minutes)	Time	W-VI Depth to Groundwater (feet, btc)	Drawdown (feet)

W-VI :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**
Distance from Pumping Well Approximately 800 feet
Start Pumping: 2009-10-09 10:10 AM
End Pumping: 2009-10-12 10:10 AM
Initial Volume: 271729 x1000 gal
Final Volume: 272391 x1000 gal
Water Level at Start of Pump Test: 62.21 feet, below ground surface

W-VI :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**
Distance from Pumping Well Approximately 800 feet
Start Pumping: 2009-10-09 10:10 AM
End Pumping: 2009-10-12 10:10 AM
Initial Volume: 271729 x1000 gal
Final Volume: 272391 x1000 gal
Water Level at Start of Pump Test: 62.21 feet, below ground surface

Elapsed Time (minutes)	Time	W-VI Depth to Groundwater (feet, btc)	W-VI Drawdown (feet)
1012	10/10/09 3:02	61.16	-1.05

W-VI :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**
Distance from Pumping Well Approximately 800 feet
Start Pumping: 2009-10-09 10:10 AM
End Pumping: 2009-10-12 10:10 AM
Initial Volume: 271729 x1000 gal
Final Volume: 272391 x1000 gal
Water Level at Start of Pump Test: 62.21 feet, below ground surface

Elapsed Time (minutes)	Time	W-VI Depth to Groundwater (feet, btc)	Drawdown (feet)
1224	10/10/09 6:34	61.10	-1.11

W-VI :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**
Distance from Pumping Well Approximately 800 feet
Start Pumping: 2009-10-09 10:10 AM
End Pumping: 2009-10-12 10:10 AM
Initial Volume: 271729 x1000 gal
Final Volume: 272391 x1000 gal
Water Level at Start of Pump Test: 62.21 feet, below ground surface

Elapsed Time (minutes)	Time	W-VI Depth to Groundwater (feet, btc)	Drawdown (feet)

W-VI :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**
Distance from Pumping Well Approximately 800 feet
Start Pumping: 2009-10-09 10:10 AM
End Pumping: 2009-10-12 10:10 AM
Initial Volume: 271729 x1000 gal
Final Volume: 272391 x1000 gal
Water Level at Start of Pump Test: 62.21 feet, below ground surface

Elapsed Time (minutes)	Time	W-VI Depth to Groundwater (feet, btc)	W-VI Drawdown (feet)

W-VI :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**
Distance from Pumping Well Approximately 800 feet
Start Pumping: 2009-10-09 10:10 AM
End Pumping: 2009-10-12 10:10 AM
Initial Volume: 271729 x1000 gal
Final Volume: 272391 x1000 gal
Water Level at Start of Pump Test: 62.21 feet, below ground surface

Elapsed Time (minutes)	Time	W-VI Depth to Groundwater (feet, btc)	W-VI Drawdown (feet)

W-VI :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**
Distance from Pumping Well Approximately 800 feet
Start Pumping: 2009-10-09 10:10 AM
End Pumping: 2009-10-12 10:10 AM
Initial Volume: 271729 x1000 gal
Final Volume: 272391 x1000 gal
Water Level at Start of Pump Test: 62.21 feet, below ground surface

Elapsed Time (minutes)	Time	W-VI Depth to Groundwater (feet, btc)	W-VI Drawdown (feet)

W-VI :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**
Distance from Pumping Well Approximately 800 feet
Start Pumping: 2009-10-09 10:10 AM
End Pumping: 2009-10-12 10:10 AM
Initial Volume: 271729 x1000 gal
Final Volume: 272391 x1000 gal
Water Level at Start of Pump Test: 62.21 feet, below ground surface

Elapsed Time (minutes)	Time	W-VI Depth to Groundwater (feet, btc)	Drawdown (feet)

W-VI :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**
Distance from Pumping Well Approximately 800 feet
Start Pumping: 2009-10-09 10:10 AM
End Pumping: 2009-10-12 10:10 AM
Initial Volume: 271729 x1000 gal
Final Volume: 272391 x1000 gal
Water Level at Start of Pump Test: 62.21 feet, below ground surface

Elapsed Time (minutes)	Time	W-VI Depth to Groundwater (feet, btc)	W-VI Drawdown (feet)
2508	10/11/09 3:58	60.45	-1.76

W-VI :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**
Distance from Pumping Well Approximately 800 feet
Start Pumping: 2009-10-09 10:10 AM
End Pumping: 2009-10-12 10:10 AM
Initial Volume: 271729 x1000 gal
Final Volume: 272391 x1000 gal
Water Level at Start of Pump Test: 62.21 feet, below ground surface

Elapsed Time (minutes)	Time	W-VI Depth to Groundwater (feet, btc)	W-VI Drawdown (feet)

W-VI :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**
Distance from Pumping Well Approximately 800 feet
Start Pumping: 2009-10-09 10:10 AM
End Pumping: 2009-10-12 10:10 AM
Initial Volume: 271729 x1000 gal
Final Volume: 272391 x1000 gal
Water Level at Start of Pump Test: 62.21 feet, below ground surface

Elapsed Time (minutes)	Time	W-VI Depth to Groundwater (feet, btc)	W-VI Drawdown (feet)

W-VI :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**
Distance from Pumping Well Approximately 800 feet
Start Pumping: 2009-10-09 10:10 AM
End Pumping: 2009-10-12 10:10 AM
Initial Volume: 271729 x1000 gal
Final Volume: 272391 x1000 gal
Water Level at Start of Pump Test: 62.21 feet, below ground surface

Elapsed Time (minutes)	Time	W-VI Depth to Groundwater (feet, btc)	W-VI Drawdown (feet)
3203	10/11/09 15:33	60.23	-1.98

W-VI :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**

Distance from Pumping Well	Approximately 800 feet	
Start Pumping:	2009-10-09	10:10 AM
End Pumping:	2009-10-12	10:10 AM
Initial Volume:	271729	x1000 gal
Final Volume:	272391	x1000 gal
Water Level at Start of Pump Test:	62.21	feet, below ground surface

Elapsed Time (minutes)	Time	W-VI Depth to Groundwater (feet, btc)	W-VI Drawdown (feet)
3415	10/11/09 19:05	60.18	-2.03

W-VI :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**
Distance from Pumping Well Approximately 800 feet
Start Pumping: 2009-10-09 10:10 AM
End Pumping: 2009-10-12 10:10 AM
Initial Volume: 271729 x1000 gal
Final Volume: 272391 x1000 gal
Water Level at Start of Pump Test: 62.21 feet, below ground surface

Elapsed Time (minutes)	Time	W-VI	
		Depth to Groundwater (feet, btc)	Drawdown (feet)
3627	10/11/09 22:37	60.11	-2.10

W-VI :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**
Distance from Pumping Well Approximately 800 feet
Start Pumping: 2009-10-09 10:10 AM
End Pumping: 2009-10-12 10:10 AM
Initial Volume: 271729 x1000 gal
Final Volume: 272391 x1000 gal
Water Level at Start of Pump Test: 62.21 feet, below ground surface

Elapsed Time (minutes)	Time	W-VI Depth to Groundwater (feet, btc)	W-VI Drawdown (feet)
3839	10/12/09 2:09	60.11	-2.10

W-VI :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**

Distance from Pumping Well	Approximately 800 feet	
Start Pumping:	2009-10-09	10:10 AM
End Pumping:	2009-10-12	10:10 AM
Initial Volume:	271729	x1000 gal
Final Volume:	272391	x1000 gal
Water Level at Start of Pump Test:	62.21	feet, below ground surface

Elapsed Time (minutes)	Time	W-VI Depth to Groundwater (feet, btc)	Drawdown (feet)
4051	10/12/09 5:41	60.11	-2.10
4052	10/12/09 5:42	60.10	-2.11

W-VI :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**
Distance from Pumping Well Approximately 800 feet
Start Pumping: 2009-10-09 10:10 AM
End Pumping: 2009-10-12 10:10 AM
Initial Volume: 271729 x1000 gal
Final Volume: 272391 x1000 gal
Water Level at Start of Pump Test: 62.21 feet, below ground surface

Elapsed Time (minutes)	Time	W-VI Depth to Groundwater (feet, btc)	W-VI Drawdown (feet)

W-VI :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**
Distance from Pumping Well Approximately 800 feet
Start Pumping: 2009-10-09 10:10 AM
End Pumping: 2009-10-12 10:10 AM
Initial Volume: 271729 x1000 gal
Final Volume: 272391 x1000 gal
Water Level at Start of Pump Test: 62.21 feet, below ground surface

Elapsed Time (minutes)	Time	W-VI Depth to Groundwater (feet, btc)	Drawdown (feet)

W-VI :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**

Distance from Pumping Well	Approximately 800 feet
Start Pumping:	2009-10-09 10:10 AM
End Pumping:	2009-10-12 10:10 AM
Initial Volume:	271729 x1000 gal
Final Volume:	272391 x1000 gal
Water Level at Start of Pump Test:	62.21 feet, below ground surface

Elapsed Time (minutes)	Time	W-VI	
		Depth to Groundwater (feet, btc)	Drawdown (feet)

W-VI :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**

Distance from Pumping Well	Approximately 800 feet	
Start Pumping:	2009-10-09	10:10 AM
End Pumping:	2009-10-12	10:10 AM
Initial Volume:	271729	x1000 gal
Final Volume:	272391	x1000 gal
Water Level at Start of Pump Test:	62.21	feet, below ground surface

Elapsed Time (minutes)	Time	W-VI	
		Depth to Groundwater (feet, btc)	Drawdown (feet)
4918	10/12/09 20:08	58.73	-3.48

W-VI :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**
Distance from Pumping Well Approximately 800 feet
Start Pumping: 2009-10-09 10:10 AM
End Pumping: 2009-10-12 10:10 AM
Initial Volume: 271729 x1000 gal
Final Volume: 272391 x1000 gal
Water Level at Start of Pump Test: 62.21 feet, below ground surface

Elapsed Time (minutes)	Time	W-VI Depth to Groundwater (feet, btc)	Drawdown (feet)
5130	10/12/09 23:40	58.37	-3.84

W-VI :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**
Distance from Pumping Well Approximately 800 feet
Start Pumping: 2009-10-09 10:10 AM
End Pumping: 2009-10-12 10:10 AM
Initial Volume: 271729 x1000 gal
Final Volume: 272391 x1000 gal
Water Level at Start of Pump Test: 62.21 feet, below ground surface

Elapsed Time (minutes)	Time	W-VI Depth to Groundwater (feet, btc)	Drawdown (feet)
5342	10/13/09 3:12	58.04	-4.17
5343	10/13/09 3:13	58.05	-4.16

W-VI :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**
Distance from Pumping Well Approximately 800 feet
Start Pumping: 2009-10-09 10:10 AM
End Pumping: 2009-10-12 10:10 AM
Initial Volume: 271729 x1000 gal
Final Volume: 272391 x1000 gal
Water Level at Start of Pump Test: 62.21 feet, below ground surface

Elapsed Time (minutes)	Time	W-VI Depth to Groundwater (feet, btc)	Drawdown (feet)

W-VI :: Observation Well 72-hour Pump Test @153 gpm

Project Name: Sutter Medical Center of Santa Rosa / Luther Burbank Center
Project No.: 6486.200.503 **Geologist: Brooks Ramsdell**
Distance from Pumping Well Approximately 800 feet
Start Pumping: 2009-10-09 10:10 AM
End Pumping: 2009-10-12 10:10 AM
Initial Volume: 271729 x1000 gal
Final Volume: 272391 x1000 gal
Water Level at Start of Pump Test: 62.21 feet, below ground surface

Elapsed Time (minutes)	Time	W-VI Depth to Groundwater (feet, btc)	W-VI Drawdown (feet)

Analytical Sciences

August 25, 2009

Brooks Ramsdell
ENGEO
2010 Crow Canyon Place, Suite 250
San Ramon, CA 94583

Dear Brooks,

Enclosed you will find Analytical Sciences' final report 9082107 for your Sutter Medical Center project. An invoice for this work is enclosed.

Should you or your client have any questions regarding this report please contact me at your convenience. We appreciate you selecting Analytical Sciences for this work and look forward to serving your analytical chemistry needs on projects in the future.

Sincerely,

Analytical Sciences

Mark A. Valentini

Mark A. Valentini, Ph.D.

Laboratory Director

Report Date: August 25, 2009

Laboratory Report

Brooks Ramsdell

Dear Brooks,

Enclosed you will find Analytical Sciences' final report 9082402 for your Sutter Medical Center project. An invoice for this work is enclosed.

Should you or your client have any questions regarding this report please contact me at your convenience. We appreciate you selecting Analytical Sciences for this work and look forward to serving your analytical chemistry needs on projects in the future.

Sincerely,

Analytical Sciences

INTRODUCTION

This report presents the results of the noise impact assessment conducted for the proposed Sutter Hospital/Luther Burbank Memorial Foundation Master Plan project in Sonoma County, California. The project site is located at the southeast quadrant of the Mark West Springs Road/ Highway 101 interchange and is shown in Figure 1. This assessment presents the fundamentals of environmental noise, provides a discussion of policies and standards applicable to the project, presents the results of a noise monitoring survey conducted at the site, and provides an evaluation of the potential for significant noise impacts resulting from the proposed project. This assessment addresses noise impacts associated with; (1) traffic noise increases on the local street systems, (2) the noise generated by onsite mechanical equipment at the new central plant and medical center buildings, and parking, (3) helicopter flights to-and-from the proposed emergency helistop, and (4) the construction of the Medical Center.

FIGURE 1: PROJECT SITE PLAN

FUNDAMENTAL CONCEPTS OF ENVIRONMENTAL ACOUSTICS

Noise may be defined as unwanted sound. Noise is usually objectionable because it is disturbing or annoying. The objectionable nature of sound could be caused by its *pitch* or its loudness. *Pitch* is the height or depth of a tone or sound, depending on the relative rapidity (frequency) of the vibrations by which it is produced. Higher pitched signals sound louder to humans than sounds with a lower pitch. *Loudness* is amplitude of sound waves combined with the reception characteristics of the ear. Amplitude may be compared with the height of an ocean wave.

In addition to the concepts of pitch and loudness, there are several noise measurement scales that are used to describe noise in a particular location. *A decibel (dB)* is a unit of measurement, which indicates the relative amplitude of a sound. The zero on the decibel scale is based on the lowest sound level that the healthy, unimpaired human ear can detect. Sound levels in decibels are calculated on a logarithmic basis. An increase of 10 decibels represents a ten-fold increase in acoustic energy, while 20 decibels is 100 times more intense, 30 decibels is 1,000 times more intense, etc. There is a relationship between the subjective noisiness or loudness of a sound and its level. Humans do not perceive sound in *absolute* terms but instead they hear sounds *relative* to the background, or ambient, sound environment, whether transient or continuous. Under controlled listening test, humans have been shown to judge a 10 dB increase in sound levels in the mid to high frequencies to represent an approximate doubling or halving of the loudness of a sound. In these tests a 6 dB change was perceived to be a "noticeable" change and a 3 dB change to be just perceptible. Technical terms are defined in Table 1.

There are several methods of characterizing sound. The most common in California is the *A-weighted sound level or dBA.* This scale gives greater weight to the frequencies of sound to which the human ear is most sensitive. Representative outdoor and indoor noise levels in units of dBA are shown in Table 2. Because sound levels can vary markedly over a short period of time, a method for describing either the average character of the sound or the statistical behavior of the variations must be utilized. Most commonly, environmental sounds are described in terms of an average level that has the same acoustical energy as the summation of all the time-varying events. This energy-equivalent sound/noise descriptor is called L_{eq}. The most common averaging period is hourly, but L_{eq} can describe any series of noise events of arbitrary duration.

The scientific instrument used to measure noise is the sound level meter. Sound level meters can accurately measure environmental noise levels to within about plus or minus 1 dBA. Various computer models are used to predict environmental noise levels from sources, such as roadways and airports. The accuracy of the predicted models depends upon the distance the receptor is from the noise source. Close to the noise source, the models are accurate to within about plus or minus 1 to 2 dBA.

Since the sensitivity to noise increases during the evening and at night -- because excessive noise interferes with the ability to sleep -- 24-hour descriptors have been developed that incorporate artificial noise penalties added to quiet-time noise events. The *Community Noise Equivalent Level, CNEL,* is a measure of the cumulative noise exposure in a community, with a 5 dB penalty added to evening (7:00 pm - 10:00 pm) and a 10 dB addition to nocturnal (10:00 pm - 7:00 am) noise levels. The *Day/Night Average Sound Level, L_{dn},* is essentially the same as CNEL, with the exception that the evening time period is dropped and all occurrences during this three-hour period are grouped into the daytime period.

Effects of Noise

Sleep and Speech Interference

The thresholds for speech interference indoors are about 45 dBA if the noise is steady and above 55 dBA if the noise is fluctuating. Outdoors the thresholds are about 15 dBA higher. Steady noise of sufficient intensity; above 35 dBA, and fluctuating noise levels above about 45 dBA have been shown to affect sleep. Interior residential standards for multi-family dwellings are set by the State of California at 45 dBA L_{dn}. Typically, the highest steady traffic noise level during the daytime is about equal to the L_{dn} and nighttime levels are 10 dBA lower. The standard is designed for sleep and speech protection and most jurisdictions apply the same criterion for all residential uses. Typical structural attenuation is 12-17 dBA with open windows. With closed windows in good condition, the noise attenuation factor is around 20 dBA for an older structure and 25 dBA for a newer dwelling. Therefore the 45 dBA L_{dn} interior residential standard may be exceeded with exterior noise levels between 57-62 dBA L_{dn} with open windows and 65-70 dBA

L_{dn} if the windows are closed. Levels of 55-60 dBA are common along collector streets and secondary arterials, while 65-70 dBA is a typical value for a primary/major arterial. Levels between 75-80 dBA are normal at the first row of development outside a freeway right-of-way.

Table 1 Definitions of Acoustical Terms Used in this Report

	Definitions
Decibel, dB	A unit describing, the amplitude of sound, equal to 20 times the logarithm to the base 10 of the ratio of the pressure of the sound measured to the reference pressure. The reference pressure for air is 20.
Sound Pressure Level	Sound pressure is the sound force per unit area, usually expressed in micro Pascals (or 20 micro Newtons per square meter), where 1 Pascal is the pressure resulting from a force of 1 Newton exerted over an area of 1 square meter. The sound pressure level is expressed in decibels as 20 times the logarithm to the base 10 of the ratio between the pressures exerted by the sound to a reference sound pressure (e.g., 20 micro Pascals). Sound pressure level is the quantity that is directly measured by a sound level meter.
Frequency, Hz	The number of complete pressure fluctuations per second above and below atmospheric pressure. Normal human hearing is between 20 Hz and 20,000 Hz. Infrasonic sound are below 20 Hz and Ultrasonic sounds are above 20,000 Hz.
A-Weighted Sound Level, dBA	The sound pressure level in decibels as measured on a sound level meter using the A-weighting filter network. The A-weighting filter de-emphasizes the very low and very high frequency components of the sound in a manner similar to the frequency response of the human ear and correlates well with subjective reactions to noise.
Equivalent Noise Level, Leq	The average A-weighted noise level during the measurement period.
L_{max}, L_{min}	The maximum and minimum A-weighted noise level during the measurement period.
L_{01}, L_{10}, L_{50}, L_{90}	The A-weighted noise levels that are exceeded 1%, 10%, 50%, and 90% of the time during the measurement period.
Day/Night Noise Level, L_{dn}	The average A-weighted noise level during a 24-hour day, obtained after addition of 10 decibels to levels measured in the night between 10:00 pm and 7:00 am.
Community Noise Equivalent Level, CNEL	The average A-weighted noise level during a 24-hour day, obtained after addition of 5 decibels in the evening from 7:00 pm to 10:00 pm and after addition of 10 decibels to sound levels measured in the night between 10:00 pm and 7:00 am.
Ambient Noise Level	The composite of noise from all sources near and far. The normal or existing level of environmental noise at a given location.
Intrusive	That noise which intrudes over and above the existing ambient noise at a given location. The relative intrusiveness of a sound depends upon its amplitude, duration, frequency, and time of occurrence and tonal or informational content as well as the prevailing ambient noise level.

Annoyance

Attitude surveys are used for measuring the annoyance felt in a community for noises intruding into homes or affecting outdoor activity areas. The L_{dn} as a measure of noise has been found to provide a valid correlation of noise level and the percentage of people annoyed. People have been asked to judge the annoyance caused by aircraft noise and ground transportation noise.

Table 2 Typical Noise Levels in the Environment

		Common Indoor Noise Source
	120 dBA	
Jet fly-over at 300 meters		Rock concert
	110 dBA	
Pile driver at 20 meters	100 dBA	
		Night club with live music
	90 dBA	
Large truck pass by at 15 meters		
	80 dBA	Noisy restaurant
		Garbage disposal at 1 meter
Gas lawn mower at 30 meters	70 dBA	Vacuum cleaner at 3 meters
Commercial/Urban area daytime		Normal speech at 1 meter
Suburban expressway at 90 meters	60 dBA	
Suburban daytime		Active office environment
	50 dBA	
Urban area nighttime		Quiet office environment
	40 dBA	
Suburban nighttime		
Quiet rural areas	30 dBA	Library
		Quiet bedroom at night
Wilderness area	20 dBA	
	10 dBA	Quiet recording studio
Threshold of human hearing	0 dBA	Threshold of human hearing

Source: ILLINGWORTH & RODKIN, INC./Acoustical Engineers

There continues to be disagreement about the relative annoyance of these different sources. When measuring the percentage of the population highly annoyed, the threshold for ground vehicle noise is about 55 dBA L_{dn}. At an L_{dn} of about 60 dBA, approximately 2 percent of the population is highly annoyed. When the L_{dn} increases to 70 dBA, the percentage of the population highly annoyed increases to about 12 percent of the population. There is, therefore, an increase of about 1 percent per dBA between an L_{dn} of 60-70 dBA. Between an L_{dn} of 70-80 dBA, each decibel increase increases by about 2 percent the percentage of the population highly annoyed. People appear to respond more adversely to aircraft noise. When the L_{dn} is 60 dBA, approximately 10 percent of the population is believed to be highly annoyed. Each decibel increase to 70 dBA adds about 2 percentage points to the number of people highly annoyed. Above 70 dBA, each decibel increase results in about a 3 percent increase in the percentage of the population highly annoyed.

REGULATORY CRITERIA

Regulatory criteria that would be applicable to the proposed project would include guidelines, goals, policies, and standards established by the State of California and Sonoma County. The State CEQA guidelines pose questions to assist decision-makers in assessing the potential for significant impacts resulting from planned projects. The State Building Code and the Sonoma County Noise Element establish quantifiable noise levels deemed acceptable for a specified land use. The State Aeronautics Act and California Airport Noise Regulations also regulate noise exposure from special-use helistops at hospitals.

State CEQA Guidelines

The California Environmental Quality Act (CEQA) contains guidelines to evaluate the significance of effects of environmental noise attributable to a proposed project. CEQA asks whether the proposed project would result in:

- Exposure of persons to or generation of noise levels in excess of standards established in the local General Plan or Noise Ordinance, or applicable standards of other agencies?
- Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?
- A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?
- A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

CEQA does not define what noise level increase would be considered substantial. Typically, in high noise environments, if the L_{dn} due to the project would increase by more than 3 dBA at noise-sensitive receptors, the impact would be considered significant. Where the existing noise level is lower, a somewhat higher increase can be tolerated before significance occurs.

State Building Code

The interior noise environment inside hospital patient rooms is subject to the environmental noise standards set forth in Appendix Chapter 35 sec. 3501 of the California State Building Code (Part 2, Title 24,CCR). The purpose of the regulations as stated therein is to establish uniform minimum noise insulation performance standards to protect persons within new hotels, motels, dormitories, long-term care facilities, apartment houses, and dwellings, other than detached single-family dwellings from the effects of excessive noise, including but not limited to, hearing loss or impairment and interference with speech and sleep.

Multi-family residential structures located in noise-critical areas, such as proximity to highways, county roads, or city streets, shall be designed to prevent the intrusion of exterior noises beyond prescribed levels. The allowable interior noise level attributable to exterior sources shall not exceed 45 dBA in any habitable room. The noise metric shall be either the day/night average noise level (L_{dn}) or the community noise equivalent level (CNEL) consistent with the Noise Element of the local General Plan.

<u>Sonoma County Noise Element</u>

The Sonoma County Noise Element of the 2020 General Plan identifies a goal to:

> *"Protect people from the adverse effects of exposure to excessive noise and to achieve an environment in which people and land uses function without impairment from noise."*

The following policies, which are applicable for use at the subject project, are intended to achieve this goal;

NE-1a: Designate areas within Sonoma County as Noise Impacted if they are exposed to existing or projected exterior noise levels exceeding 60 dBA L_{dn}, 60 dBA CNEL, or the performance standards of Table NE-2.

Table NE-2: Maximum Allowable Exterior Noise Exposures for Non-transportation Sources

Hourly Noise Metric[1]	Maximum Exterior Noise Level Standards, dBA	
	Daytime 7 AM to 10 PM	Nighttime 10 PM to 7 AM
L_{50} (30 minutes in any hour)	50	45
L_{25} (15 minutes in any hour)	55	50
L_{08} (5 minutes in any hour)	60	55
L_{02} (1 minute in any hour)	65	60

[1] The sound level exceeded n% of the time in any hour. For example, the L_{50} is the value exceeded 50% of the time or 30 minutes in any hour; this is the median noise level. The L_{02} is the sound level exceeded 1 minute in any hour.

NE-1b: Avoid noise sensitive land use development in noise impacted areas unless effective measures are included to reduce noise levels. For noise due to traffic on public roadways, railroads, and airports, reduce exterior noise to 60 dB Ldn or less in outdoor activity areas and interior noise levels to 45 dB Ldn or less with windows and doors closed. Where it is not possible to meet this 60 dB Ldn standard using a practical application of the best available noise reduction technology, a maximum level of up to 65 dB Ldn may be allowed provided that the interior noise level shall be maintained so as not to exceed 45 dB Ldn.

NE-1c: Control non-transportation related noise from new projects. The total noise level resulting from new sources shall not exceed the standards in Table NE-2 of the recommended revised policies as measured at the exterior property line of any adjacent noise sensitive land use. Limit exceptions to the following:

(1) If the ambient noise level exceeds the standard in Table NE-2, adjust the standard to equal the ambient level, up to a maximum of 5dBA above the standard, provided that no measurable increase (i.e. +/- 1.5 dBA) shall be allowed.

(2) Reduce the applicable standards in Table NE-2 by five dBA. for simple tone noises, noises consisting primarily of speech or music, or for recurring impulsive noises, such as pile drivers and dog barking at kennels.

(3) Reduce the applicable standards in Table NE-2 by 5 decibels if the proposed use exceeds the ambient level by 10 or more decibels.

(4) For short-term noise sources, which are permitted to operate no more than six days per year, such as concerts or race events, the allowable noise exposures shown in Table NE-2 may be increased by 5 dB. These events shall be subject to a noise management

plan including provisions for maximum noise level limits, noise monitoring, complaint response and allowable hours of operation. The plan shall address potential cumulative noise impacts from all events in the area.

(5) Noise levels may be measured at the location of the outdoor activity area of the noise sensitive land use, instead of at the exterior property line of the adjacent noise sensitive use where:
   (a) the property on which the noise sensitive use is located has already been substantially developed pursuant to its existing zoning, and
   (b) there is available open land on these noise sensitive lands for noise attenuation.

This exception may not be used on vacant properties, which are zoned to allow noise sensitive uses.

California Airport Noise Regulations

Section 5006, Title 21, Division 2.5, Chapter 6 of the California Code of Regulations establishes the level of noise acceptable to a 'reasonable' person at a CNEL of 65 dB and identifies the following types of land uses as incompatible with a noise level of 65 dB CNEL or greater:

- Residences of all types;
- Public or private schools;
- Hospitals and convalescent homes

State Aeronautics Act

The State Aeronautics Act (Public Utilities Code Sections 21001 et seq.) covers a range of aeronautical issues governed by the State of California. It references the California Airport Noise Regulations (above) and the California Department of Transportation Airport Land Use Planning Handbook regarding noise issues. The Act also specifically exempts individual emergency aircraft flights from restrictions on time of departure and arrival as described below.

Section 21662.4(a) of the State Aeronautics Act titled "Emergency Flights for Medical Purposes" states that;

> "Emergency aircraft flights for medical purposes by law enforcement, fire fighting, military, or other persons who provide emergency flights for medical purposes are exempt from local ordinances adopted by a city, county, or city and county, whether general law or chartered, that restrict flight departures and arrivals to particular hours of the day or night, that restrict the departure or arrival of aircraft based upon the aircraft's noise level, or that restrict the operation of certain types of aircraft."

Single Event Noise Exposures and Sleep Disturbance (Awakenings)

The State of California and Sonoma County typical use a noise descriptor based on average day/night levels (L_{dn} or CNEL) when judging the compatibility of noise with various land-uses. The L_{dn}/CNEL metric includes a penalty for noises that occur during the nighttime and evening hours and has proven to be an excellent indicator of potential adverse community response in cases where the dominant noise source is highway or major roadway noise. However, in cases where the noise environment is composed of relatively infrequent high noise level events, such as in the vicinity of an emergency helistop, the L_{dn}/CNEL descriptor has a tendency to average out the effect that high noise level events can have in terms of sleep disturbance and annoyance. The compatibility of the proposed project has, therefore, been evaluated against supplemental sleep disturbance criteria recommended by the Federal Interagency Committee on Aviation

Noise (FICAN) in the December 2008 finding titled, "FICAN Recommendation for use of ANSI Standard to Predict Awakenings from Aircraft Noise"[1]. In this finding FICAN recommends the use of the American National Standards Institute (ANSI) standard S12.9-2008, Quantities and Procedures for Description and Measurement of Environmental Sound - Part 6: Methods for Estimation of Awakenings Associated with Outdoor Noise Events Heard in Homes to predict behavioral awakenings from aircraft noise. ANSI S12.9-2008 Part 6 provides a method to predict sleep disturbance in terms of percent awakenings or numbers of people awakened associated with noise levels in terms of indoor A-weighted sound exposure level (ASEL) and also enables the estimation of awakenings from an entire night of noise events as follows:

- The probability that a person of average sensitivity will be awakened by a single noise event is given by the formula $P_{A,single} = 1/(1+e^{-z})$, (1)
  where Z= -6.884+0.04444*L_{AE}, and L_{AE} represents the indoor ASEL of an outdoor single noise event.
- The probability that this person of average sensitivity will be awakened by a single noise event as a function of both the single-event indoor ASEL and the time since retiring is given by the formula $P_{A,single} = 1/(1+e^{-z})$, (2)
  where Z= -7.594+0.04444*L_{AE} + 0.00336T_{retire}, and T_{retire} is the time in minutes since retiring
- The probability of Not awakening at least once to the sound from distributions of single noise events is given by the formula, $P_{NptA,N} = (1-P_{A,single})^N$ (3)
  where $P_{A,i}$ is the probability of being awakened by the *i*th event as found in the proceeding equations.

Using equation (1) shows that there would be a less than 5% probability of awakening from a single event, which produces a single indoor ASEL level of 85 dB or less. However, using equation (2) for an indoor ASEL of 85 dB shows that if the event occurs more than four hours after retiring the probability of awakening begins to increase beyond 5%. Further use of this equation shows that an indoor ASEL of 78 dB or less will result in the probability of awakening remaining at or below 5% as long as the event occurs within 6 hours of the time since retiring with a maximum probability of awakening of 6% an entire seven-hour night of sleep[2]. Also, using the relationship of the number of noise events in a single nighttime period as given in equation (3) it can be seen that with two noise events evenly distributed over a single night an indoor ASEL of 78 dB or less continues to result in the probability of awakening remaining at or below 6%, with one flight per night at an indoor ASEL of 78 dB or less resulting in the probability of awakening remaining at or below 3%. Because of its expected project use (see discussion on pages 11 & 12), the average nighttime usage of the proposed helistop is projected to be less than one flight per night, however a worst-case condition could be two flights per night.

Based on the above, we have established an indoor ASEL of 78 dB as the sound level at which helicopter noise would begin to significantly affect the sleep of residents in the surrounding community. As noted in the Fundamental Concepts of Environmental Acoustics section at the beginning of this report, typical wood framed residential structures provide exterior to interior noise attenuation of 12 to 17 dBA with open windows and around 20 to 25 dBA with closed windows. With the lower range of exterior to interior residential structural attention (i.e. 12 dB

---

[1] Available at http://www.fican.org/pdf/Final_Sleep_Dec2008.pdf
[2] ANSI S12.9-2008 Part 6 considers that adults typically sleep for an average of 7 hours per night.

with open windows and 20 dB with closed windows) exterior ASEL levels of 90 and 98 dB would produce respective interior SEL levels of 78 dB with open and closed windows. Because there are no recognized thresholds of significance regarding number of persons awakened by helicopter operations and data to allow calculations of the number of residents who may be awakened by such events is unavailable for this study, the use of the 90 dB exterior ASEL contour is judged to be a good predictor of areas exposed to a heightened degree of potential sleep disturbance during helicopter operations in the worst-case condition with windows open.

EXISTING NOISE ENVIRONMENT

A noise monitoring survey was conducted from Tuesday, November 2, 2004 to Wednesday, November 3, 2004 to establish existing noise levels in the project vicinity. Environmental noise was measured at three locations in the project study area. The first location was selected to quantify existing noise levels generated by Highway 101 at the approximate setback of the proposed hospital. The second and third noise measurement locations were selected to represent the noise environment at residential land uses in the immediate vicinity of the project site. The locations of these noise measurements are shown on Figure 3, and the data charts for these measurements are presented in Appendix A of this report.

Measurement Location LT-1 was selected to characterize the existing noise environment at the approximate setback of the proposed hospital building. Noise measured at this site resulted primarily from vehicular traffic along Highway 101, and the measured day-night average noise level was 70 L_{dn} (Chart 1, Appendix A). Hourly average noise levels during the daytime (7 a.m. to 10 p.m.) were typically 64 - 68 dBA $L_{eq.}$ During the night (10 p.m. to 7 a.m.), hourly average noise levels were generally 56 to 68 dBA $L_{eq.}$

Noise measurement LT-2 was conducted at the easternmost property line of the site adjacent to residential uses accessed from Darbster Place. Noise levels measured at this site were predominantly the result of vehicular traffic along Highway 101. Typical hourly average noise levels ranged form 55-59 dBA during the daytime and dropped to a minimum level of 48 dBA L_{eq} during the middle of the night (Chart 2, Appendix A). The calculated day-night average noise level at this location was 61 dBA.

The daily trend in noise levels was also measured at a position north of the project site along Lavell Road. Noise levels measured at this site were primarily the result of local and distant vehicular traffic. Chart 3 (Appendix A) summarizes the noise data collected at measurement location LT-3. Hourly average noise levels ranged from as low as 52 dBA L_{eq} at 3 a.m. to 65 to 70 dBA L_{eq} throughout the majority of the day. The calculated L_{dn} noise level at this measurement position was 69 dBA.

FIGURE 3: EXISTING SITE PLAN WITH NOISE MEASUREMENT LOCATIONS

FUTURE NOISE ENVIRONMENT

<u>Traffic Noise</u>

Based on a review of existing, background, and future project traffic volumes for the area roadways shown in the Dowling Associates, Inc traffic study for the project, the following conclusions related to noise level increases on area roadways can be made (See Appendix B for traffic data and calculations);

1. Future traffic noise levels without the project are anticipated to increase by 1 to 3 dBA L_{dn} on area roadways as a result of anticipated growth excluding the project.
2. Project generated traffic would further increase noise levels on these area roadways by up to 2 dBA L_{dn}.

Central Plant Mechanical Equipment Operational Noise

Typical hospital and medical office building mechanical equipment could include chillers, cooling towers, hot water boilers, medical vacuum pump(s), compressor(s), and emergency power generator(s). With the exception of the cooling towers, all of this equipment is usually contained within a central plant building structure. Considering typical manufacturers sound power level ratings for such equipment of less than 80 dBA, that the interior to exterior noise reduction for closed buildings using common building techniques is typically greater than 20 dBA (refer to discussion in the 'Fundamental Concepts of Environmental Acoustics' section above), and that the proposed location of the Central Plant is over 300 feet from the nearest residential property line, and that the expected placement of cooling towers and other mechanical equipment, not in the central plant, on the building rooftops where they would receive noise shielding from the building edge and or parapet walls, the expected noise levels from all hospital mechanical equipment can be expected to produce noise levels at the nearest residential property line below 45 dBA.

Emergency Helistop Operational Noise

Helicopter noise has it's own distinct character. Although a portion of the noise emanates from the engines themselves, the distinctness of helicopter noise is largely due to the modulation of sound created by the relatively slow turning main rotor. This sound modulation is referred to as blade slap. Blade slap is most pronounced during low speed descents and high-speed cruise.

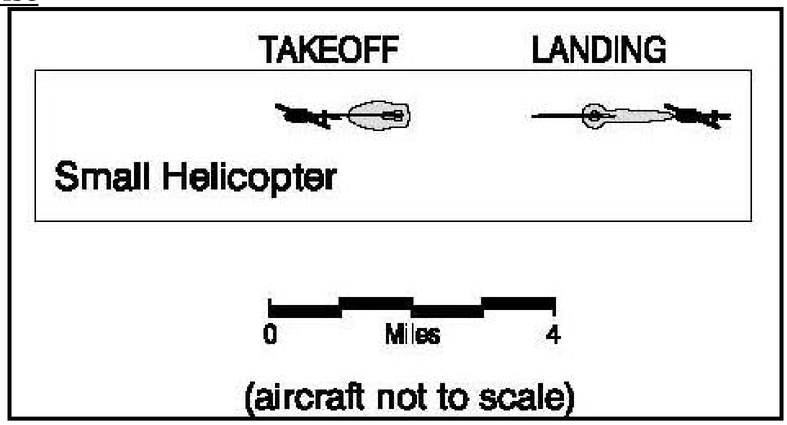

FIGURE 3: Typical Helicopter Noise footprint

To the ground observer helicopters are most audible as the aircraft approaches a landing area. Figure 4 shows 65 and 75 dBA maximum instantaneous noise level ground contours for a typical small helicopter on takeoff and landing.

Average Noise Exposure

The emergency Helistop is proposed be located at ground level between the Sutter Medical Center Building and Highway 101 (see Figure 1). The proposed helistop would take over operations from the current emergency helistop site. Based on the current level of helicopter operations an average of 20 flights per month may be expected for the helistop. The primary helicopter model expected to utilize the helistop is the Bell model B222[3]. Over the last 3 years (2006,2007,and 2008) the helistop at the Sutter Medical Center had an average of 200 yearly flights (one flight = 1 roundtrip = 1 landing and 1 take off). This analysis is based on conservative worst-case scenario with an increase of 20% in annual flights at the helistop for the year 2021 (the project's foreseeable future).

To determine the expected noise levels produced by helicopter operations on the site and in its

[3] Draft Heliport Design Report, Mead & Hunt, January 2009, Page 4.

vicinity, the Federal Aviation Administration's (FAA) Integrated Noise Model (INM) version 7.0a was used to establish current ground level noise contours for an expected (or worst case) future scenario of 240 annual (20 monthly) flights at the helistop[4], based on up to 13% of the helicopter trips occurring during the evening and 37% during the nighttime hours, the proposed primary ground tracks[5], 75% of the flights approaching from the north and departing to the south, a Bell model B222 helicopter with standard configuration (i.e. Noise-Power-Distance [NPD] curves, rotor speeds, etc.) as provided in the INM model, and the takeoff and departure profiles shown in Figures 4a and 4b.

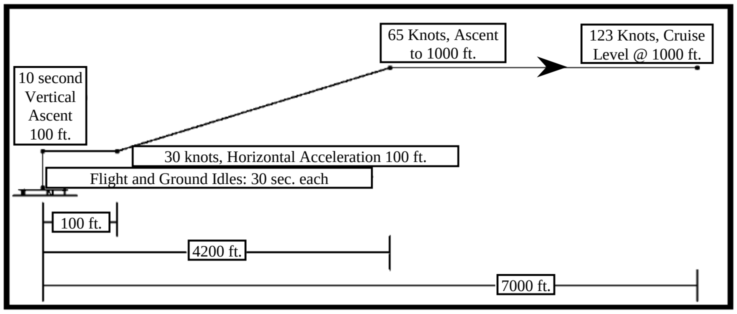

Figure 4a: Typical Departure Profile

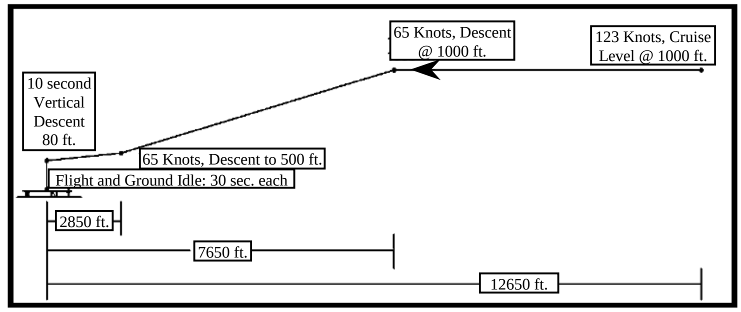

Figure 4b: Typical Approach Profile

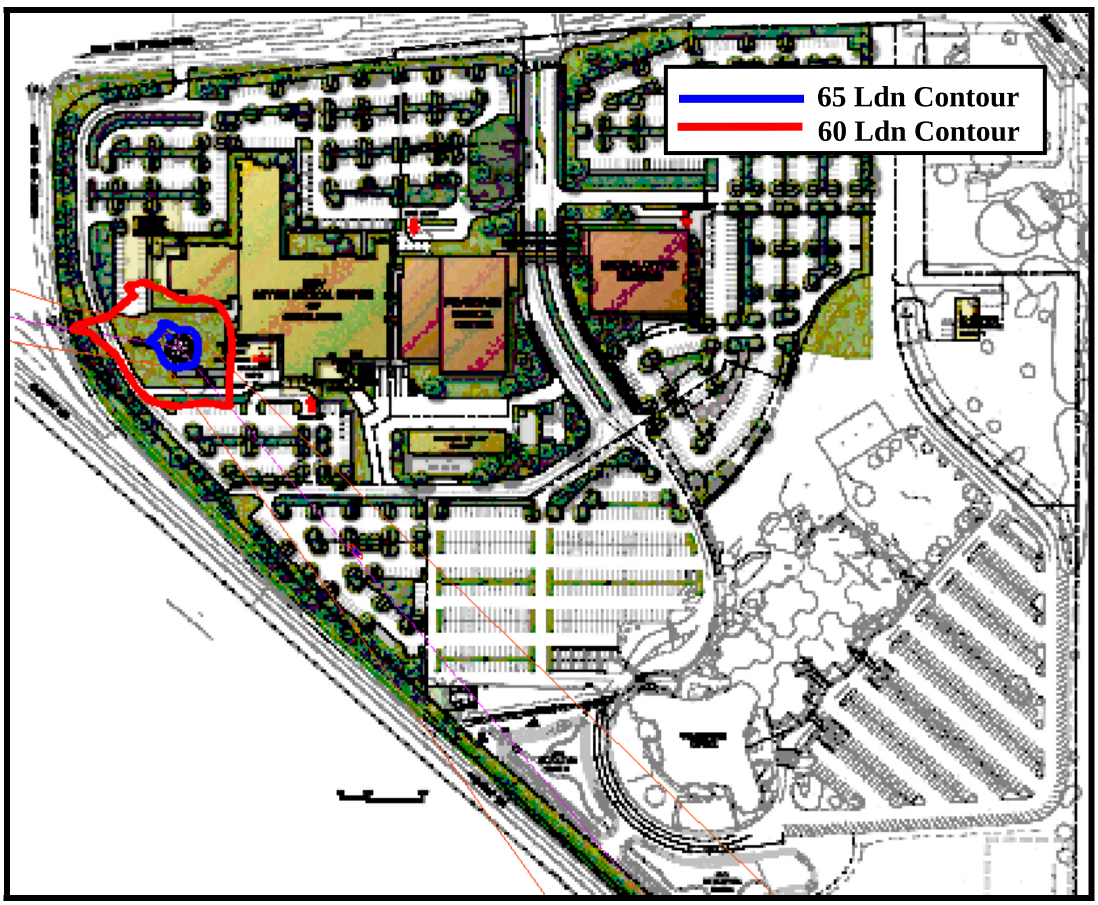

FIGURE 5: 60 AND 65 dBA L_{dn} HELISTOP FUTURE NOISE CONTOURS

---

[4] Draft Heliport Design Report, Mead & Hunt, January 2009, Page 3.

[5] The ground tracks of the northern and southern approaches and departures are shown under the Ldn and SEL contours in Figures 5 and 6 **.**

The 60 and 65 dBA L_{dn} ground level contours for operations using the INM model output are shown overlaying the proposed Medical Center site plan in Figure 5. Based on the modeling results the 65 dBA L_{dn} contour would not extend beyond the landscaped area surrounding the helistop pad, and the 60 dBA L_{dn} contour would just meet to southern façade of the Medical Center immediately noise of the helistop.

Maximum Noise Exposure and Sleep Disturbance

To determine the worst-case noise exposure at residential uses under the proposed approach and departure paths, the ASEL during a single combined takeoff and landing of an Bell 222 helicopter (the design helicopter for the helistop) was modeled with INM 7.0a both for an operation involving an approach from the north and departure to the south and an operation involving an approach from the south and departure to the north. The extent of the 90 dBA ASEL ground level contours for north-to-south & south-to-north flight operations are shown in Figure 6.

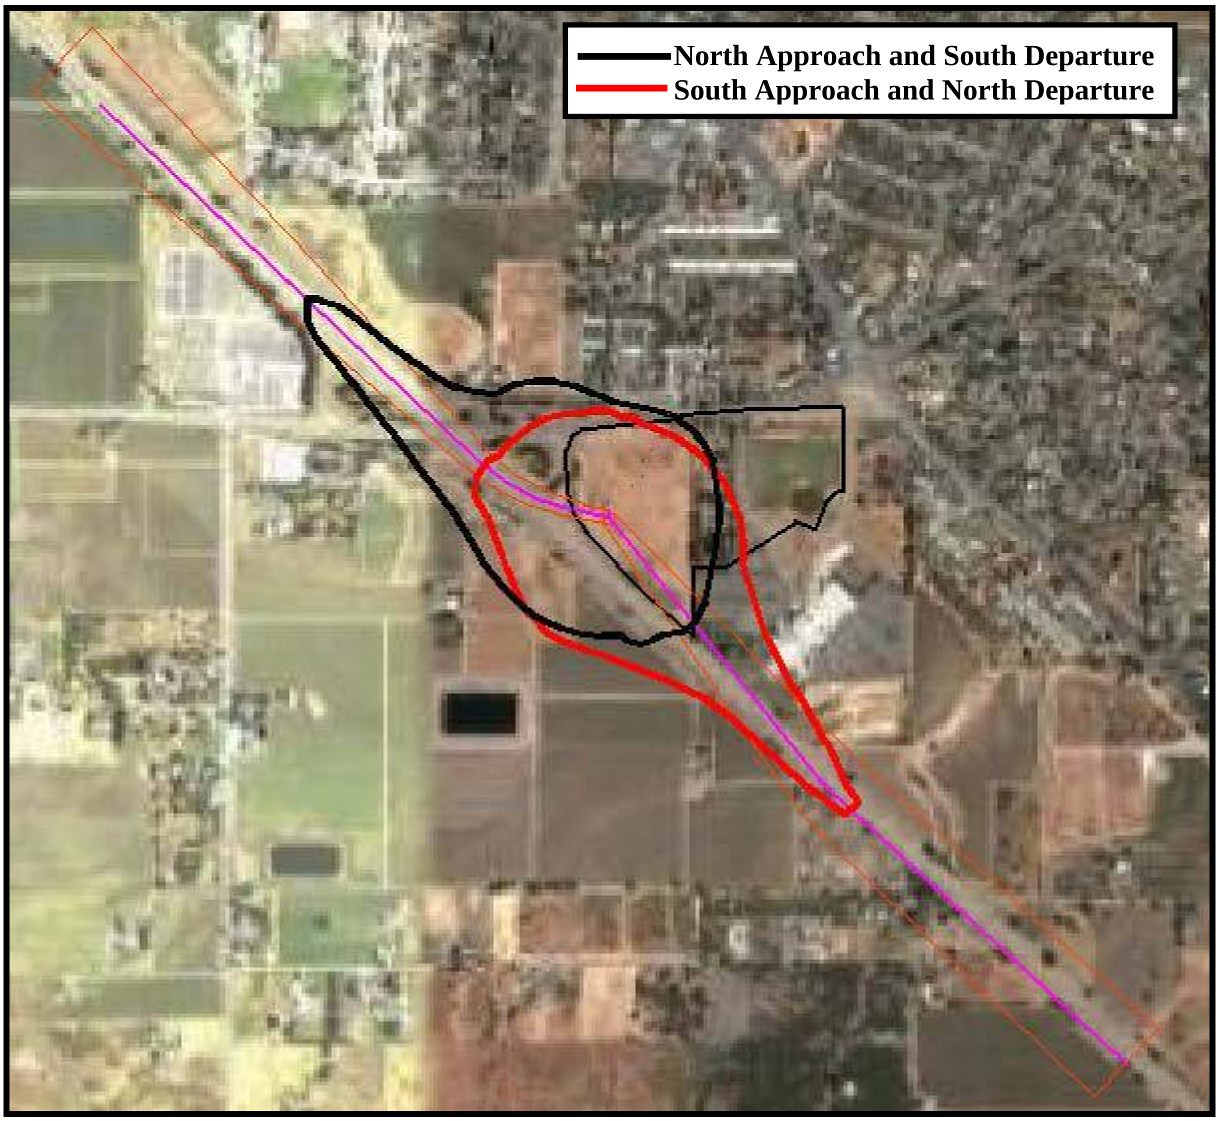

Figure 6: 90 dBA SEL contours for north-to-south and south-to-north flight

NOISE IMPACTS AND MITIGATION MEASURES

Significance Criteria

1. A significant impact would be identified for existing uses on the project site or land uses adjacent to the project, if they would be exposed to noise levels exceeding the noise and land use compatibility guidelines established in the Noise Element of the Sonoma County General Plan.
2. The project would be exposed to or generate excessive groundborne vibration,
3. According to CEQA, a significant noise impact would result if noise levels increase substantially at noise-sensitive land uses (e.g., residences). A substantial increase to noise levels would occur if the project resulted in an increase of 3 dBA or greater[6] at noise-sensitive land uses where noise levels already exceed 60 dBA L_{dn}.
4. A significant local impact can be identified for existing uses near the project if they would be exposed to a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project. A substantial periodic increase is judged to occur if the operation of the project results in awakening or annoyance rates of greater than 6% of the people in residences, hospitals, day care, convalescent homes in the project vicinity. Based on the sleep disturbance prediction methods from ANSI standard S12.9-2008 Part 6, the 90 dB exterior ASEL contour is judged to be a good predictor of areas within which a heightened degree of sleep disturbance during helicopter operations would be experienced.
5. Construction noise levels would be treated somewhat differently because they are temporary. Significant noise impacts could result from construction if noise levels are sufficiently high to interfere with speech, sleep, or normal residential activities. Construction-related hourly average noise levels received at noise-sensitive land uses above 70 dBA during the daytime and 55 dBA at night would be considered significant if the construction phase lasted more than 12 months.

Impact 1: Noise and Land Use Compatibility. Development proposed as part of the project would be exposed to noise levels exceeding local thresholds for acceptability. **This is a significant impact.**

The entire project site is exposed to noise levels exceeding 60 dBA L_{dn}, the Sonoma County threshold of acceptability for noise-sensitive development. The highest noise levels occur along the Highway 101 frontage where the existing noise exposure level at the approximate setback of the proposed hospital is about 70 dBA L_{dn}. According to the General Plan, noise-sensitive developments are considered acceptable where exterior noise levels are 60 dBA L_{dn}. The site plan for the proposed project includes many outdoor areas that are sheltered from perimeter vehicular traffic noise by the buildings themselves. The site plan, therefore, does reduce noise exposure levels in some of the proposed common outdoor activity areas to below the 60 dBA L_{dn} threshold.

The maximum allowable interior noise level for a noise-sensitive use resulting from environmental noise sources is 45 dBA L_{dn}. Standard construction methods for hospitals includes air-conditioning. The building typically provides approximately 25 to 30 dBA of noise reduction when going from outside to inside when the windows are assumed to be closed. Because the noise exposure levels are approximately 70 dBA L_{dn} or higher at the facade of the

[6] As discussed in the section of this report entitled "Fundamental Concepts of Environmental Acoustics" a 3 dB increase in sound levels with similar acoustic qualities is judged to be a perceptible difference in sound.

proposed hospital building, there is the potential for interior levels to exceed the interior noise limit with windows closed for noise control.

Mitigation 1:

- As the site plan develops, continue to utilize building massing to shield outdoor activity areas from traffic noise. Encourage the development of these common outdoor activity areas within the acoustically sheltered portions of the site.
- Incorporate sound insulation treatments into the buildings so as to achieve an interior L_{dn} of 45 dBA or less with windows closed. Such treatments may include, but would not be limited to acoustically rated windows and doors, acoustical caulking at all exterior wall penetrations and noise control treatments for all air transmission paths associated with mechanical ventilation systems. An acoustical analysis of the project's design and the preparation of a report detailing the necessary noise reduction features shall be completed during the project design.

After Mitigation: *Less than Significant*
With the implementation of the above measures should be effective in reducing outdoor use area and interior noise levels to allow compliance with County and State noise standards.

Impact 2: Groundborne Vibration. There are no existing sources of groundborne vibration that affects the proposed development of the project. Though not planned at this time, construction activities may include driven piles using an impact hammer. Pile driving can generate perceptible groundborne vibration levels within 25-50 feet of the pile driving activity. No vibration sensitive receptors, either on- or off-site, are located within 50 feet of where pile driving could occur, and thus any pile driving would be imperceptible at the closest adjacent structures. **This is a less-than-significant impact.**

Mitigation 2: None required.

Impact 3: Vehicular Traffic. The project would increase vehicle trips along roadways used to access the project site. Traffic resulting from the operation of the project would increase noise levels by up to 2 dBA L_{dn}. **This is a less-than-significant impact.**
As discussed previously the relative noise level increases resulting from non-emergency vehicle trips would increase noise levels adjacent to area roadways by 2 dBA or less. This increase would less than the 3 dB significance criteria, and below the typical limit of perceptibility. Based this, such an increase is not considered to be a significant increase in noise.

Mitigation 3: None required.

Impact 4: Hospital Mechanical Equipment operational noise impacts. With proper design noise resulting from operations of the Central Plant is expected to be below ambient noise levels at sensitive receptors. **This is a potentially significant impact.**
As discussed previously the expected noise levels from all hospital mechanical equipment can be expected to produce noise levels at the nearest residential property line below 45 dBA. Noise from the mechanical equipment is assessed with respect to Table NE-2 Noise Limits in the County Noise Element of the General Plan. Considering the steady nature of mechanical equipment noise and measured ambient noise levels in the area, the allowable noise levels at nearby residences would be 55 dBA during the daytime (7:00 am to 10:00 pm) and 50 dBA

during the nighttime (10:00 pm to 7:00 am). Based upon assumptions regarding the final design of the central plant and the placement of auxiliary equipment at building rooftops, noise levels from the mechanical equipment would be expected to be below these allowable noise levels.

However, it is possible that noise from the equipment, if not enclosed or attenuated in what would be considered a normal design, could produce higher noise levels at the nearest residential property lines and exceed he allowable noise levels at nearby residences. **Therefore, this is a potentially significant impact.**

Mitigation 4:
- An acoustical consultant shall review the final design of the Central Plant facility and the placement of auxiliary outdoor mechanical equipment to determine that sufficient noise attenuation is in place to limit equipment noise levels below the County Noise Standards of 55 dBA daytime, 50 dBA nighttime at the nearest residential property line.

After Mitigation: ***Less than Significant***
The implementation of the above measure should insure that outdoor noise levels from Central Plant and auxiliary outdoor mechanical equipment are below the County Noise Standards at the nearest residential property lines.

Impact 5: Parking lot and onsite circulation. Noise from parking and onsite circulation may be annoying or disturbing to residences located adjacent to the proposed parking lot along the east property boundary. **This is a potentially significant impact.**

The proposed Master Plan includes parking adjacent to residences along the project's eastern property boundary. Onsite circulation of motor vehicles including low speed driving, sounds resulting from engine starts and door slams, would intermittently exceed the noise and land use compatibility guidelines of the Sonoma County General Plan. Only a small portion of the parking is proposed near the residences so the impact on the overall noise environment will be negligible. There may, however, be intermittent and occasional disturbances when parking lots are full.

Mitigation 5:
Construct a solid 6-foot high noise barrier on the project side of the eastern property line, as shown in Figure 7, where parking areas are adjacent to residential properties. To be effective the barrier must be constructed airtight over its face and at the base and have a minimum surface weight of 3 lbs./sq. foot. Suitable materials include wood, pre-cast masonry or pre-cast concrete panels.

After Mitigation: ***Less than Significant***
With the implementation of the above measure the noise and land use compatibility guidelines of the Sonoma County General Plan should be met at the residential uses adjacent to project parking areas.

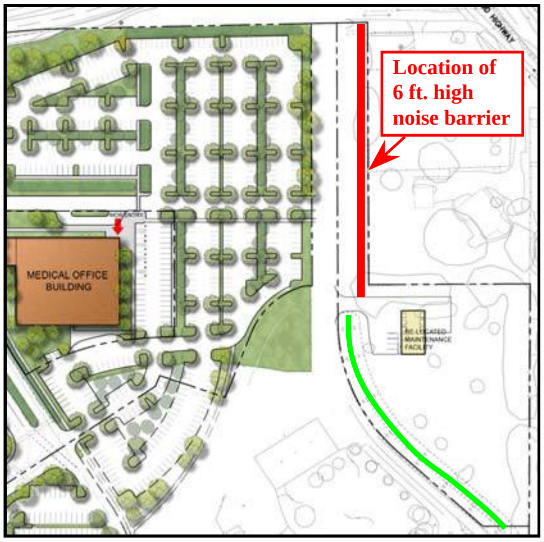

Figure 7: Noise Barrier Location

Impact 6: Helistop operational noise impacts on the adjacent land uses due to average noise exposure levels. This is a less-than-significant impact.

As previously discussed, the L_{dn} contours for a future helistop operations will not expose any non-project site land uses or residential structures to an Ldn/CNEL of 60 dBA or greater.

Mitigation 6: None Required

Impact 7: Helistop operational noise impacts on the adjacent land uses resulting from annoyance and sleep disturbance.

A review of Figure 6 shows that some residential areas north of the project site would be exposed to an ASEL in excess of 90 dB during helicopter operations. Based on this, it is expected that these residential areas may be exposed to noise levels sufficient to result periodic sleep disturbance of some residents. Due to the possible number of helicopter overflights, particularily at nighttime, the noise levels could be annoying and awaken a number of residents and are regarded as locally significant. **This is a considered a significant noise impact.**

Mitigation 7:

Sonoma County cannot designate specific flight paths that must be flown by helicopters or restrict the hours of operation of a helistop used by emergency helicopters. Under the State of California Aeronautics Act (Section 21662.4) emergency aircraft flights for medical purposes are exempt from local ordinances adopted by a city that restrict flight departures and arrivals to particular hours of the day or night, restrict aircraft based upon the aircraft's noise level or that restrict the operation of certain types of aircraft. Minimization of high noise level exposures under the approach track to the helistop may be achieved by the following measures; (a) modify the approach profile to maintain a greater elevation over the residential uses under the flight tracks, or (b) maintaining a log of flight operations and on-going communications with helicopter pilots regarding approach and departure paths. These mitigation measures are discussed below.

a. *Approach profile modification*. Based on a review of the noise-power-distance (NPD) curves contained in INM version 7.0a the SEL of approaching helicopters may be reduced by maintaining higher elevations over residences to the north and using a steep approach angle to the helistop.
b. *Monitoring and Adaptive Management*. A program of monitoring helicopter operations and designating a community noise disturbance coordinator could be used to reduce noise annoyance in nearby residential areas. As a part of these measures, helicopter ambulance companies and pilots would be informed of designated flight paths to and from the hospital helistop to avoid or reduce short-term noise exposures to residential areas. A helistop log could be maintained that includes arrival and departure times, the approach route taken, and explanation of any flight path deviation from the designated flight paths. A noise disturbance coordinator would be identified who would record citizen complaints and review the helistop log to determine the source of the noise disturbance.

After Mitigation: ***significant and unavoidable***

Under worst-case conditions, the project would result in significant noise annoyance from new emergency helicopter operations. Establishing a program of monitoring helicopter operations and responding to community noise disturbance complaints could reduce potential annoyance by avoiding flight elevations and paths that are most annoying to residents, to the extent feasible for individual emergency flights and by providing information on the nature and purpose of emergency flights. However, since the timing and frequency of helicopter operations is a function of when non-scheduled (emergency) evacuations are required, the effects of the project would be considered significant and unavoidable.

Impact 8: Helistop operational noise impacts on the project site.
The operation of the proposed helistop would not result in any ground level outdoor use areas over Ldn/CNEL of 60 dBA, however the majority of the site will be exposed to an ASEL of 90 dB or greater under future conditions. Depending on the construction of the exterior walls and windows of patient rooms and other hospital areas requiring relative quiet on the exterior facades of the hospital may be exposed to interior levels high enough to result in a significant disturbance. **This is a significant noise impact.**

Mitigation 8:

- Maximum noise levels produced by helicopters at the helistop may result in daytime disturbances and nighttime sleep disturbances (awakenings) within patient rooms of the hospital facilities. To reduce these adverse noise effects, patient rooms and other sensitive hospital use areas should be studied during design to determine whether the proposed construction provides sufficient sound insulation with closed windows to reduce the interior SEL to 65 dBA and/or and maximum noise levels (L_{max}) to 55 dBA during helicopter operations. If this review finds the design lacking in sound insulation, the needed degree of sound attenuation should be incorporated in the design.

After Mitigation: *Less than Significant*
The implementation of the above measure should insure that indoor noise levels during helicopter operations do not result in daytime disturbances and nighttime sleep disturbances within patient rooms of the hospital facilities.

Impact 9a: Construction Noise (non-pile driving).
Construction on the site will temporarily increase noise levels at nearby noise-sensitive receptors. Construction could be expected to occur in phases, with the entire build-out of the site taking several building seasons. Construction activities would not typically be located adjacent to a particular receptor during the entire construction period. Therefore, noise generated by construction would create a temporary noise impact on adjacent noise sensitive receptors, but this would be considered a less-than-significant impact provided that standard construction noise control measures are implemented.

Mitigation 9a:
The following mitigation measures are recommended to reduce noise generated by construction:

- Construct temporary noise barriers, such as a solid plywood construction barrier, around the perimeter of project phases before site grading and earthwork begins. There should be no openings for site access between the project site and adjacent residential land uses during these phases of construction. Noise barriers may be removed once all ground level work is complete and upper floor construction is underway.
- Limit noise-generating construction activities, including truck traffic coming to and from the site for any purpose, to daytime, weekday, non-holiday hours (7:00 am to 6:00 pm).
- Properly muffle and maintain all construction equipment powered by internal combustion

engines.

- Prohibit unnecessary idling of internal combustion engines.
- Locate all stationary noise-generating construction equipment, such as air compressors, as far as practical from existing nearby residences and other noise-sensitive land uses. Acoustically shield such equipment.
- Select quiet construction equipment, particularly air compressors, whenever possible. (Fit motorized equipment with proper mufflers in good working order).
- Designate a "noise disturbance coordinator" to be responsible for responding to any local complaints about construction noise. The disturbance coordinator would determine the cause of the noise complaint (e.g., starting too early, bad muffler, etc.) and would require that reasonable measures warranted to correct the problem be implemented. Conspicuously post a telephone number for the disturbance coordinator at the construction site and include it in the notice sent to neighbors regarding the construction schedule. (The project sponsor should be responsible for designating a noise disturbance coordinator and posting the phone number and providing construction schedule notices).

After Mitigation: *Less than Significant*
With the implementation of the above measures will limit the overall noise level and duration of construction activities while also giving any persons disturbed by occasional loud noises an identifiable method of recourse.

Impact 9b: Construction Noise Associated With Pile Driving.
At this time the project intends to surcharge the property rather than develop the site using driven or drilled piers. Such surcharging will have to be approved by OSHPD as part of its review of site design and seismic safety. If surcharging is not approved by OSHPD, then driven piles or possibly drilled pier, foundations will be required.

The Roadway Construction Noise Model (RCNM v.1.1) was used to calculate the maximum and average noise levels anticipated during pile driving activities. This construction noise model includes representative sound levels for the most common types of construction equipment and the approximate usage factors of such equipment that were developed based on an extensive database of information gathered during the construction of the Central Artery/Tunnel Project in Boston, Massachusetts (CA/T Project or "Big Dig"). The usage factors represent the percentage of time that the equipment would be operating at full power. Based on the RCNM results, the L_{eq} during impact or vibratory pile driving activities at 50 feet would be 94 dBA. The nearest residences are located more than 270 feet north, and more than 500 feet to the east and west of the proposed project. Wells Fargo Center is located more than 500 feet southeast of the proposed project. Average noise levels during impact or vibratory pile driving activities at 270 and 500 feet would, respectively, be 94 and 80 dBA. If the foundations for the new buildings can be drilled, with cast-in-place piers, the noise level from this foundation work would be reduced to 86 dBA at a distance of 50 feet and 71 and 65 dBA, respectively, at 270 and 500 feet.

This noise impact would be potentially significant. There is concern that the vibration associated with driven or drilled and driven pile construction could impact the integrity of the nearby homes or the WFC. Due to their distance from the construction this impact is not determined to be significant (see Impact 2, above).

Mitigation 9b: While construction using pile driven or drilled foundations is not anticipated the following mitigation measures are provided should OSHPOD disallow the use of surcharge:

- Where feasible based on a consideration of geotechnical conditions and structural requirements implement "quiet" pile driving technology, such as drilled and cast-in-place piers, the pre-drilling of piles, and the use of more than one pile driver to shorten the total pile driving duration,
- Erect temporary plywood noise barriers or noise control blankets around pile driving rigs to reduce noise emissions from the site and shield adjacent uses.

After Mitigation: ***Less than Significant with full mitigation***
Significant and unavoidable with driven piles

With the implementation of "quiet" pile driving technology and the use of temporary noise barriers the overall noise level at the adjacent residences will be reduced to a less than significant level, however if geotechnical conditions and structural requirements necessitate the use of pile driving, then though somewhat reduced by the use of temporary noise control barriers, this impact would be considered significant and unavoidable.

Facility Planning for Proposed New Sutter Medical Center, Helistop Design Report

Facility Planning for Proposed New
Sutter Medical Center of Santa Rosa

Santa Rosa, California

Helistop Design Report

October 2009

A Technical Report

Prepared for

Sutter Health

by

Mead & Hunt, Inc.

OVERVIEW

This design report examines the site location, proposed site design, projected use, and selected environmental issues pertaining to construction of a helistop at a new campus for the Sutter Medical Center of Santa Rosa (SMCSR), California, proposed to be built by Sutter Health. The report's primary purpose is to provide the supporting documentation necessary for obtaining federal, state, and local approval of the helistop design and operation. It also serves as technical input to an environmental analysis of the Sutter Medical Center project.

General Note

The interrelated terms "heliport" and "helistop" are both used in this report. "Heliport" is a broad category that includes all types of helicopter landing facilities, including helistops. "Helistop" is a functional term that applies to a limited type of heliport where (1) the landing area and the helicopter parking area are usually the same, (2) helicopters generally remain on the ground only for as long as it takes to load or unload patients; and (3) no fueling or maintenance are conducted (except under emergency circumstances if needed for flight safety). The helicopter facility proposed for SMCSR is a helistop. In this report, "helistop" is used when the reference is to the proposed facility. The more encompassing term "heliport" is used when referring to Federal Aviation Administration and other generic design standards. Also, the operating permit that will need to be issued by the California Department of Transportation Division of Aeronautics for the SMCSR helicopter facility will be called a "Heliport Permit" as that is the state permit type for all helicopter landing facilities, including helistops.

Project Site

The site of the proposed new Sutter Medical Center (SMC) is the undeveloped northwestern corner of a 78-acre property previously owned in its entirety by the Luther Burbank Center for the Arts (LBC), now Luther Burbank Memorial Foundation (LBMF). The arts center currently operates under the name Wells Fargo Center for the Arts (WFC). The SMC site consists of 15 acres now owned by Sutter Health that would be exclusively used by the hospital and related facilities together with approximately 10 acres that would be devoted to shared parking facilities. The site lies within unincorporated Sonoma County a short distance beyond the northern edge of the City of Santa Rosa. U.S. Highway 101 runs along the westerly boundary of the site. The site is bounded on the north by Mark West Springs Road and East Fulton Road. The performing arts theater and other facilities that comprise the WFC complex lie to the southeast and residential development is located to the north and east. PG&E high-voltage electrical transmission lines pass approximately 600 feet to the north of the project site, running in a roughly east-west direction. The topography of the site and surrounding area is generally flat.

Information regarding current Sonoma County general plan land use designation and zoning requirements for the site are contained in other technical reports.

Project Description

The proposed helistop is part of a new medical center campus to replace Sutter Health's current Santa Rosa hospital on Chanate Road. Development of the new site has been contemplated for several years, during which time the components of the proposed facility and their sizes and designs have been modified on multiple occasions. Refinement of the current plans will continue to be made.

For the purposes of this technical report, the medical center is expected to consist of three principal components: a 70-bed, two-story hospital; a three-story medical office building containing physician offices; and a two- and three-story physicians medical center which will include a surgery center and 28 beds. The hospital will provide a full range of comprehensive inpatient and outpatient treatment and diagnostic services, including all ancillary and support services. The hospital is not being planned as a trauma center. Automobile parking will be in surface lots. Additionally, the medical center and WFC will share use of part of the parking facilities.

Site Design Alternatives

The conceptual site plan for the Sutter Medical Center, including the proposed helistop, was developed as a coordinated effort among all involved parties including hospital representatives, architects, environmental consultants, and others. Numerous alternatives were sketched and evaluated during this process. Although the LBMF property encompasses some 78 acres and the medical center will share some parking space with WFC, fitting the hospital, other buildings, helistop, additional auto parking, and other essential facilities into the 15 acres available exclusively for these functions is challenging.

Many of the early alternatives that potentially could have worked well in terms of requirements for other facilities to be built on the site would be infeasible with respect to helicopter facility requirements. Subsequent alternatives focused on placing the helistop on the roof of one of the buildings. Such alternatives would have the benefit of not taking space on the ground that could otherwise be used for automobile parking and circulation. However, the cost of a rooftop facility would be significantly greater than for a ground-level site. Further evaluation of possible ground-level helistop sites resulted in a plan that has relatively minimal impact on parking and other facility needs, yet meets aeronautical requirements. This helistop site, immediately adjacent to the emergency room entrance, has now been incorporated into the preferred plan for the medical center as a whole. For the record, though, the design requirements both for ground level and rooftop helistops are outlined in the remainder of this report along with discussion of the functional tradeoffs between these options as evaluated during the site design process.

Summary Description of Proposed Design

As further detailed in this report, major features of the helistop are proposed to include the following:

- A ground-level site on the southwest side of the medical center building, adjacent to the emergency room entrance.
- A 42-foot round landing pad (helipad) with an adjacent working surface for medical staff at least 10 feet wide—thus making an overall minimum surface area of 50 feet diameter. The overall size of the helipad and adjacent area that must be clear of obstructions including parapets and other building features will be a minimum of 103-feet square, although the outer edges of this area can extend beyond the sides of the building.
- Elevation of the pad approximately 5 feet above ground level. A ramp will slope down to the emergency room entrance level. Elevation of the pad provides greater clearance of the approach-departure paths above adjacent auto parking areas and internal roadways, thus reducing the size of the area in which the latter facilities would be precluded.
- Approach/departure paths following Highway 101, then curving in to the helistop. This alignment matches the prevailing winds at the site and minimizes overflight of noise-sensitive land uses.

SMCSR HELISTOP USAGE

Anticipated Activity Levels

Since the new Sutter Medical Center is not proposed to be a designated trauma center, inbound transportation of patients by helicopter from highway accident sites or other hospitals is expected to be infrequent. Santa Rosa Memorial Hospital is the regional trauma center for the area and will continue to receive the majority of accident victims. The primary function of the proposed helistop is anticipated to be outbound transfer of patients who arrive at the Sutter facility by ground, are initially treated, and then require more extensive treatment available only at other hospital facilities in the Bay Area. Flights related to organ transports are another prospect. The primary helicopter flight destinations will likely be John Muir Hospital in Walnut Creek, Oakland Children's Hospital, and Stanford Hospital Medical Center in Palo Alto. If San Francisco General Hospital is successful in building a helistop as is currently proposed, then some patients may be transported there.

The volume of helicopter operations at the new helistop is expected to be similar to the activity levels experienced at the existing Sutter hospital on Chanate Road—an average of approximately 200 flights per year from 2006 through mid 2009. In no case will the number be more than 240 flights (240 landings and 240 takeoffs) per year. This volume equals 4 to 5 flights per week on average. Helicopter operations will be conducted only under visual flight conditions—no instrument approach capabilities will be provided. However, the helipad will be lighted to permit nighttime operations.

Under most circumstances, helicopters will remain at the helistop only for as long as necessary to load or unload patients or medical staff. The facility will be designed for use by only one helicopter at a time. No helicopters will be based there and no fueling or maintenance will be conducted unless emergency repairs are necessary for the airworthiness of the aircraft.

Design Helicopter

A primary variable in the design of heliports, especially hospital heliports, is the size of the helicopters that are to be accommodated. The dimensions of several key components of a heliport depend directly upon the size of the largest helicopter that will operate there. Exhibit 1 lists the characteristics of common aeromedical helicopters including ones operated by companies in the Bay Area.

The Sutter Medical Center helistop will be utilized by a variety of aeromedical companies operating various helicopter types. Only helicopter operators authorized by the hospital will be allowed to land at the helistop. The primary users will be REACH (Redwood Empire Air Care Helicopter) which is based at the Sonoma County Airport; CALStar which is based in Hayward with aircraft at Concord's Buchanan Field; and Stanford Life Flight based at Stanford Hospital in Palo Alto. REACH's primary helicopter currently is a twin engine, instrument-flight capable, Eurocopter EC 135. Stanford Life Flight flies a custom-configured Eurocopter EC 145 helicopter that can operate under both visual and instrument flight rules. CALStar's primary helicopter, a Bell 222, is among the largest helicopter models found in aeromedical use.

For the purposes of the Sutter Medical Center helistop design, the Bell 222 is considered to be the design helicopter. The Bell 222 has a rotor diameter of 42.0 feet, an overall length of 50.3 feet and weighs 8,250 pounds.

One larger helicopter sometimes used for aeromedical purposes is the Bell 212 which has a 48.0-foot rotor diameter. No aeromedical helicopter operator in Northern California is currently operating the Bell 212, however, and none is known to have plans to do so. Moreover, discussions with REACH personnel indicate that the trend in the industry is for larger helicopters to be phased out in favor of lighter, smaller twin-engine helicopters.

Need for use of the helistop by larger helicopters, such as those operated by the U.S. Coast Guard and the California Air National Guard in rescue operations, is expected to be rare and they need not be accommodated. Nearby Sonoma County Airport is available for their use if necessary and patients would be ground transported between the two locations.

Aeronautical Requirements for Heliport Design

The principal aeronautical requirements for the design of heliports are established by the Federal Aviation Administration in Advisory Circular No. 150/5390-2B, published September 30, 2004, and entitled *Heliport Design*. This document establishes dimensions and other standards for the features common to helicopter facilities. Standards such as landing area size, peripheral area dimensions, approach/departure path criteria, marking and lighting specifications, etc., are included. Most of these standards apply to all types of heliports, but the document also contains a chapter focusing specifically on hospital heliports/helistops.

For heliports requiring a permit from the California Department of Transportation, the principal dimensional standards set forth in the *Heliport Design* advisory circular are treated as requirements. Hospital helistops are among the types of heliports for which a state permit is required.

Most of the requirements outlined here apply to all hospital heliports regardless of whether they are located on the ground or on top of a building. Where the requirements differ between ground level and rooftop facilities, these are noted. Also, the information here is not specific to the new Sutter Medical Center of Santa Rosa helistop. Discussion of the manner in which certain of these requirements are issues with regard to the Santa Rosa facility are included later in this report.

Heliport Components

A heliport consists of three primary aeronautical components:

- **Touchdown and Liftoff Area (TLOF)**—The TLOF, often referred to as a helipad, is the surface on which the helicopter actually lands. It can be square or round. The choice is largely a matter of aesthetics and cost. In either case, the minimum dimension must equal the rotor diameter of the design helicopter, but not be less than 40 feet. Specifically, with respect to the Bell 222, the TLOF must be at least 42 feet across, either square or round.

- **Final Approach and Takeoff Area (FATO)—**The FATO is the area within which helicopters complete the final phase of an approach to landing and initiate a takeoff. It encompasses the TLOF and needs to be clear of protruding objects or surface irregularities, but does not need to be load bearing. In the case of a rooftop heliport, the FATO can extend beyond the edges of the building or raised platform on the building roof. The minimum dimensions of the FATO must be no less than 1.5 times the overall length of the design helicopter. For the Bell 222, the required FATO size is 75 feet square.

- **Safety Area**—Surrounding the FATO is a safety area. Except for small frangible objects that functionally must be located there, the safety area must be clear of all obstacles including, fences, poles, trees, and parked vehicles protruding above the helipad level. For rooftop heliports, no portion of the building or equipment can extend upward into the safety area, but the area can extend beyond the edges of the building. The normal minimum width of the safety area is one-third of the helicopter rotor diameter, but not less than 10 feet. For the Bell 222, this width would be 14 feet.

The above components comprise the portion of the heliport required for the landings and takeoffs of helicopters. Functionally, these components are the equivalent of a runway and associated safety areas at an airport. Also similar to airports, some large heliports provide separate areas for the parking of multiple helicopters. At these facilities, the helipad serves only as the place where landings are made and takeoffs initiated. Helicopters ground or hover taxi between the helipad and the parking positions, leaving the helipad free for use by other helicopters.

Most hospital heliports, including the one proposed for the new Sutter Medical Center of Santa Rosa, need to accommodate only one helicopter at a time. Thus, the helipad serves both as the landing and takeoff spot and a parking place while the helicopter is at the hospital.

Approach/Departure Path Requirements

Although the high degree of maneuverability of helicopters gives them wide latitude in the choice of a flight path into and out of a heliport, establishment of a formal landing site requires that defined approach/departure paths be designated. The purpose for designation of these paths is to assure that adequate airspace is and will continue to be available for safe operation of helicopters to and from the heliport. It is desirable, although not absolutely essential, that a heliport have two approach/departure paths separated by an arc of at least 90 degrees. The two most important aeronautical factors in design of the approach/departure paths are the direction of the prevailing wind and the location of potential obstructions.

Wind Speed and Direction

As with fixed-wing aircraft, helicopter takeoffs and landings are easiest and most efficient when conducted into the wind. Unlike fixed-wing aircraft, however, helicopters of the type that will be operating at the hospital need very little final approach distance into the wind—some 500 to 1,200 feet is preferable although they can get by with less if necessary.

Wind data from the nearby Sonoma County Airport indicate that the prevailing winds at the Sutter Medical Center site are from the south-southeast approximately 37% of the time and secondarily from the north-northwest approximately 16% of the time. Winds are from other directions approximately 38% of the time and calm (4 mph or less) 9% of the time. Wind speeds of 13 mph or less occur approximately 60% of the time.

Obstacle Clearance

The standards for heliport approach/departure paths are set by Part 77 of the Federal Aviation Regulations (FAR), *Objects Affecting Navigable Airspace*. These regulations establish a set of imaginary surfaces in the airspace around the heliport. In general, the heliport and its approach/departure paths should be designed so that no objects penetrate the FAR Part 77 surfaces. Motor vehicles on public roads are assumed to have a height of 15 feet; those using private roads or parking lots are assumed to be 10 feet high except where taller vehicles are known to travel.

For heliports, the FAR Part 77 standards specify two types of surfaces:

- **Approach Surfaces**—These surfaces begin at the edge of and having a width equal to the FATO and slope upward 1 foot per every 8 feet horizontally (8:1). The approach surface length is 4,000 feet and the width at the outer end is 500 feet. The surface follows the approach path and the outer portion can be curved if necessary.
- **Transitional Surfaces**—Transitional surfaces are situated along the sides of the FATO and approach surfaces. They slope upward 1 foot per every 2 feet horizontally (2:1) for a horizontal distance of 250 feet from the FATO and approach surface centerlines.

Overall Heliport Size

With the Bell 222 as the design helicopter, the minimum overall size of the heliport is 103 feet square. For rooftop heliports, a portion of this area can extend beyond the sides of the building. However, regardless of whether the facility is on the ground or a roof, additional space must be provided for clearance over obstacles along the approach/departure paths and lateral to the helipad—that is, tall objects cannot be placed immediately adjacent to the 103-foot clear area.

For ground level heliports, the effect of the dimensional standards and obstruction criteria is that public roads must be excluded from an area extending approximately 120 feet (8:1 times 15 feet) along the approach/departure paths from the edge of the FATO. Perpendicular to the approach/departure paths, no roads should be within 30 feet of the FATO. For parking lots, the minimum overhead clearance of 10 feet means that a setback distance of at least 80 feet along the flight path and 20 feet perpendicular to it is required. These distances can be reduced to some extent by elevating the helipad several feet above the adjacent roads and parking areas. However, because of the rotor downwash created as a helicopter passes overhead at low altitude, a minimum distance of approximately 100 feet is advisable.

In general, as much maneuvering airspace as possible should be provided near the heliport either by removing nonessential obstacles or locating the pad at a greater distance from them. As determined by FAA and California Division of Aeronautics analyses, obstruction lights may be required on buildings or other tall objects near the helipad.

OTHER HELIPORT DESIGN AND LOCATION REQUIREMENTS

Design Features

- **Helipad Surface**—As noted above, the surface of the helipad (TLOF) must be capable of supporting the dynamic loads of the helicopters that will operate there. For hospital heliports, a paved, all-weather, surface is essential both for the helicopters and for medical staff working around the helicopters. Ground level helipads typically are constructed of Portland Cement Concrete (PCC) as asphalt surfaces can easily be damaged by the skids on some types of helicopters. Rooftop helipads may be constructed of metal or concrete (or other materials subject to local building codes). Pavements should have a "broomed" or other roughened finish that provides a skid-resistant surface for helicopters and non-slippery footing for people and for moving patients on gurneys. For ground level heliports, surfaces beyond the paved area of the helipad should be constructed of a material that will not be blown around by the downwash of the helicopter rotor. Sod is common, although large cobbles or even asphalt or concrete pavement can be used.

- **Work Space**—The TLOF dimensions cited above are established with respect to the landing and takeoff needs of a helicopter. When the helicopter is parked on the helipad rather than at a separate parking spot, relatively little work space remains around the helicopter for medical staff to maneuver gurneys, ambulances, and other equipment. At a minimum, an additional 10-foot wide work area is recommended on the side of the helipad that provides access to the helicopter doors.

- **Helipad Access**—To enable gurneys and other wheeled equipment to be rolled up to the helicopters, hospital helipads must be accessible without the necessity of negotiating stairs, curbs, or soft ground. Ramps should be built in accordance with state and local requirements. The width of the ramp, and any turns in the ramp, should be wide enough to accommodate a gurney with a person walking on each side. Straight segments should be not less than 6 feet wide. Additional width may be required at turns. A 10-foot width is necessary if there is a need for ground ambulances to be driven up to the helicopter. The ramp surface should provide a slip-resistant surface. The slope should be no steeper than one inch per foot (12:1). Inside the FATO and safety area, any handrails should not extend above the elevation of the TLOF. Where a handrail is not provided, other means such as a safety net must be utilized to protect personnel from fall hazards. Rooftop heliports must have elevator access. If the elevator stops at roof level and the helipad is built on a platform above the roof, ramps can be used to reach the helipad from the level at which the elevator stops. This arrangement is often necessary to keep the elevator penthouse, mechanical equipment, and parapet walls from obstructing necessary heliport airspace. OSHA standards require two separate access points for an elevated helipad such as one on a rooftop. Stairs can be used for the second access point, provided that stair railings are not airspace obstructions.

- **Spill Containment**—Helipads must have fuel spill containment capabilities built in to their design. This capability is particularly critical for rooftop heliports. A rooftop helipad should have a specially designed drainage system capable of containing a catastrophic fuel spill and the means to divert the spilled fuel away from the structure and keep it out of the storm drain system. This can be accomplished by either a perimeter drain or drains (the helipad slopes outward) or a drain near the center of the pad (the helipad slopes inward) that collect rainwater runoff or spilled fuel and direct it into a holding tank equipped with an oil water separator. The holding tank should be designed with sufficient capacity to hold a volume of fuel equivalent to that of the fuel capacity of the helicopters serving the facility plus any rainwater that may fall at the time of the spillage. For rooftop helipads, the drain line typically would run down the outside of the building to a tank on the ground. On ground-level helipads, drainage to a surrounding landscaped area may be considered adequate. The primary requirement is to ensure that any fuel spillage that might occur would not directly enter a nearby storm drain.

- **Lighting**— For nighttime operation, perimeter lighting of the helipad is required. The lights can surround either the TLOF or the FATO. A minimum of eight lights are required. The lights are green in color. Lights on the perimeter of the TLOF must be flush-mounted with the surface. Stake-mounted lights can be used around the edge of the FATO provided that they extend no more than 2 inches above the TLOF surface elevation. In addition to these aviation-related lights, flood lighting is needed to enable medical staff to see while working around the helicopter to load and/or unload patients. Controls for the lights typically are located in an equipment panel near the helipad. The floodlights need to be separately controlled from the perimeter lights so as not to shine in the eyes of pilots while the helicopter is landing at the heliport.

- **Wind Direction Indicator**—A lighted wind cone should be installed near the heliport so that pilots of approaching helicopters can tell the direction and speed of the wind and modify their landing approaches as appropriate. The wind indicator should be located on top of a building or other position where the wind indications would not be affected by nearby structures.

- **Security**—To ensure the safety of helicopter operations and pedestrians, a 3 to 4-foot high chain-link fence should surround a ground level heliport. The fence must be situated sufficiently far from the helipad so as not to be an airspace obstruction. If the approach/departure paths pass over roads or parking areas close to the heliport, temporary controls can be used to keep people out of the area while the helicopter flies over so that they would not be injured by blowing dust or debris caused by the rotor downwash. Rooftop heliports can be secured by limiting elevator and stairway access to authorized personnel only.

- **Communications**—Direct, two-way communication capabilities between approaching helicopters and hospital staff is essential. Advance communication is necessary not only so that medical personnel will be ready for the helicopter, but also so that security personnel can be on hand.

Additional Requirements for Rooftop Heliports

- **Safety Net**—For rooftop heliports having a TLOF on a platform elevated more than 30 inches above its surroundings, a safety net not less than 5 feet wide should be provided. A railing or fence should not be used since it would be a hazardous to helicopter operations. The safety net should have a load carrying capability of 25 pounds per square foot. The net should not project above the level of the TLOF. Both the inside and outside edges of the safety net should be fastened to a solid structure (designers should consider state and local regulations when determining the width required for the safety net).

- **Rooftop Equipment**—For rooftop heliports, particular attention must be paid to the location or placement of antennas, elevator penthouses, fresh-air vents and other raised rooftop structures. Also to be considered is that helicopter exhaust can impact building air quality if the heliport is too close to fresh-air vents. These issues should be resolved during facility design. In addition, design control mechanisms should be established to ensure that objects that would be hazards are not installed after the heliport is operational.

Heliport Location Considerations

- **Proximity to Emergency Room—**A siting consideration unique to hospital heliports is the proximity of the landing pad to the emergency room or operating room. Patients typically are transported between the helicopter and the emergency room by gurney. The maximum distance considered acceptable between the helipad and the emergency room entrance depends upon various factors such as whether slopes must be negotiated, whether roads or congested public areas must be traversed, and how much of the distance is outdoors exposed to the weather. Ideally, this distance should be no more than about 400 feet, but some hospitals have found distances of as much as 850 feet to be workable. Greater distances may require patients to be transferred to an ambulance for transport between the heliport and the emergency room.

- **MRI Equipment**—Magnetic Resonance Imaging (MRI) equipment found in many hospitals can create a strong magnetic field that, if not shielded, will cause temporary aberrations in a helicopter's magnetic compass and may interfere with other navigational systems. The location of any MRI equipment should be considered in the siting of a hospital heliport. A warning sign alerting pilots to the presence of an MRI is recommended. Steps should be taken to inform pilots of the locations of MRIs and other similar equipment.

Land Use Compatibility Factors

Land use compatibility is the other important factor to be considered in locating heliport approach/departure paths. Noise and safety are the two predominant issues of concern.

- **Noise**—In California, the noise impacts of airports is typically measured using a cumulative noise exposure metric, the Community Noise Equivalent Level (CNEL). CNEL takes into account both the loudness of individual noise events and the number and time of day of these events. Cumulative noise exposure metrics are well suited to land use compatibility planning decisions, but they do not give a complete picture of noise impacts. This is particularly true for hospital heliports in that the volume of operations is rarely high enough to show significant cumulative noise levels much beyond the immediate environs of the helipad. A greater concern is the noise level of individual helicopter operations. Helicopter noise can be excessively loud and it also has characteristics that are judged particularly annoying by many people. Helicopter noise also has a vibration component that can cause rattle in window or other parts of buildings. The most significant noise impacts can usually be avoided by aligning the approach/departure paths as far as possible from residential areas and other noise-sensitive land uses. Special sound-attenuation design may be appropriate for portions of the hospital building that face the heliport or approach/departure paths.

- **Safety**—The other principal land use compatibility consideration in the design of heliport approach/departure paths is safety. Accidents by helicopters approaching or departing a designated heliport are rare occurrences. Most accidents by aeromedical helicopters take place either at unimproved landing sites such as near a highway accident or en route between those sites and a hospital or airport. Nevertheless, prudent practice suggests that overflight of buildings near the heliport should be minimized as much as practical. Aligning the approach/departure paths over highways or other relatively open areas also enhances safety by providing places where a helicopter can make an emergency landing if one should become necessary.

SPECIFIC DESIGN AND LOCATION CONSIDERATIONS FOR SMCSR HELISTOP

The preceding sections of this report outline the basic design and location requirements for hospital heliports. The discussion in this section focuses on factors specific to the proposed WFC site for the new Sutter Medical Center of Santa Rosa.

- **Approach/Departure Path Alignment**—The optimum alignment for the approach/departure paths for the proposed helistop are from the south-southeast and north-northwest (Exhibit 3). This alignment coincides not only with the prevailing winds at the site, but also provides the opportunity for helicopters to approach and depart the helistop by flying over Highway 101. This is an ideal flight route for both noise and safety reasons. Noise impacts of the proposed helistop are described in a separate technical report. The inner portion of the flight paths will need to curve to some extent to enable the helicopters to reach the helipad. The exact path will depend upon how far from the highway the helistop is to be situated on the site. In any case, the paths should be aligned so that helicopters do not fly directly over the WFC buildings or the residential area north of Mark West Springs Road.

- **Approach Obstacles**—Existing obstacles around the hospital site are major factors in planning for the helistop. Redwood trees as much as 100 feet tall border Highway 101 and the off ramp to Mark West Springs Road, all within the state right-of-way. Some of these trees have been removed as part of the Highway 101 widening project that began in January 2009, but ones most critical to the helistop approach/departure paths remain. Additionally, power transmission lines are located along the north side of Mark West Springs Road and taller high-voltage lines pass a short distance farther north. Lastly, several light poles are situated along the freeway adjacent to the planned helistop site. Of these obstacles, the trees are the most significant. With the helistop site and approach/departure path alignments as currently planned, the remaining trees will not be obstructions. However, their height and proximity to the helistop limits other options for approach/departure path alignment. One light pole also is a factor and will need to be eliminated or moved.

- **Interaction with Highway 101**—Other than the FAR Part 77 surface clearance requirements, there is no restriction on flight paths following the highway alignment. Helicopters could have a potentially disruptive effect on highway traffic, but the time required for a helicopter to pass by and land would be brief. Having the pad itself visible from the highway could be somewhat more of a factor. In both cases, however, the effects are likely to diminish over time as helicopter activity becomes more familiar to motorists who regularly use the route. Also, planned landscaping will largely shield the view of the pad from the highway.

- **Interaction with Sonoma County Airport**—Informal discussions in 2006 and 2009 with the chief of the air traffic control tower at the airport indicate that a helistop at the proposed hospital site would not be a conflict with air traffic at the airport. However, the site is in the tower's control area and two-way communications between helicopters and the tower would be required. Highway 101 is already a major helicopter flight route. Helicopters passing through the area fly at 500 feet AGL, below the typical airplane altitude of at least 1,000 feet.

HELISTOP APPROVAL PROCESS

Although the SMCSR helistop is being planned as part of the overall medical center project, it has distinct approval requirements of its own. The final step in this approval process will be for Sutter Health to obtain a Heliport Permit from the Division of Aeronautics of the California Department of Transportation as required by California Public Utilities Code Section 21663.

Under the process established by the Division, approval from three other agencies must be obtained prior to issuance of the Heliport Permit.

- **Federal Aviation Administration**—Notice of the proposed facility must be submitted to the FAA (FAA Form 7480-1, *Notice of Landing Area Proposal*). The FAA will conduct an aeronautical study to determine whether the helistop's approach/departure paths would be free of obstructions and not conflict with the approaches to nearby airports.

- **Sonoma County Airport Land Use Commission (ALUC)**—The helistop proposal must be submitted to the ALUC for review in accordance with Public Utilities Code Section 21661.5. The concerns of the ALUC will focus on the compatibility of the helistop with respect to nearby land uses. Noise and safety impacts must be avoided or adequately mitigated.

- **County of Sonoma**—The state requires that the Sonoma County Board of Supervisors, as the governing body of the jurisdiction in which the helistop will be located, approve the plans for the helistop. This action is expected to be taken in conjunction with approval of the medical center project as a whole. County certification that the project complies with California Environmental Quality Act requirements also must be documented.

Once these approvals have been obtained, copies of the approval documents must be submitted to the Division of Aeronautics along with a permit application and certain other materials describing the proposed facility. If the proposal meets state criteria, the Division will first issue a Heliport Site Approval Permit indicating the Division's concurrence with the construction plans. Following construction, the Division staff will inspect the facility to verify that it has been built as proposed. Assuming that the project is built according to those plans, the Division will then issue a Heliport Permit enabling air operations to commence.

A completely separate approval step worth noting involves the California Office of Statewide Health Planning and Development (OSHPD). This agency has specific review and approval authority over the construction of hospital buildings. This approval authority extends to hospital heliports if the heliport is an integral part of the hospital building—as would be the case for a rooftop facility—or draws electrical power from the hospital power supply. Normally, a ground level heliport with its own power connections does not require OSHPD approval.

50 Mark West Springs Rd, Santa Rosa
Assessor's Parcel Numbers 58-040-058 and 059

B&R File No. 3231.01

Gentlemen:

We have been working diligently on the proposed fire and life safety design for the Sutter Medical Center Santa Rosa (SMCSR) project, proposed adjacent to the Wells Fargo Center for the Arts (WFC) to meet the needs of the County Department of Emergency Service and the Rincon Valley Fire District. There is an existing 8" diameter fire and domestic water system loop, owned and operated by California American Water Company (Cal Am), serving the WFC property. SMCSR proposes a privately owned fire system loop for the medical complex. This private loop system will be connected to the Cal Am system in Mark West Springs Road in at least two locations (one directly, one indirectly), and to the existing Cal Am system on the WFC property in two additional locations. This highly looped system will provide significant redundancy and therefore reliability in the expanded fire protection system. The proposal that we offer for your review and approval consists of the following components:

1. Cal Am has confirmed that they can provide a minimum fire flow of 2500 gallons per minute for a duration of 2 hours from their existing water main located in Mark West Springs Road along the project frontage. The calculated basic fire flow for the proposed hospital (SMCSR), future Physician's Medical Center (PMC), and future Medical Office Building (MOB), based upon their size and type of construction, is 3750 GPM. However, §B105 CFC allows the local fire authorities to approve up to a 75% reduction of the required fire flow under certain circumstances, such as providing NFPA 13 fire sprinkler systems in all structures, but in no case less than 1500 GPM. The fire flow available from Cal Am at the project frontage represents a 34% reduction from the base flow, and is approximately 67% more than the 1500 GPM minimum flow.

2. All medical center buildings will be separated into separate fire areas so that if there were an event in one of the buildings, it will be contained within that building.

3. Providing an improved emergency access to the Wells Fargo Center by widening and improving the main and secondary entrance roadways.

4. SMCSR is currently assisting the Wells Fargo Center in securing necessary permits for a new fire alarm system for the WFC facility. This work is intended to be executed by WFC as their separate project.

5. The proposed hospital, future PMC, and future MOB will all be provided with Class I standpipes in the stair enclosures even though Class I standpipes are not required in less than 4 story buildings. These facilities provide additional support for the reduction in the base fire flow.

6. The proposed new hospital (125,715 SF; 2 stories) will be of Type I-B Construction rather than Type III-B as allowed by the California Building Code, providing superior fire resistant construction.

7. The proposed future PMC (100,000 SF; 3 stories) will be of Type II-A Construction rather than Type III-B as allowed by the California Building Code, providing superior fire resistant construction.

8. The proposed future MOB (80,000 SF; 3 Stories) will be of Type I-B Construction rather than Type III-B as allowed by the California Building Code providing superior fire resistant construction. Alternatively, the owner may propose a smaller (72,000 SF, 3 stories) building of Type II-A construction if the cost of the Type I-B building is prohibitive.

9. The proposed new Central Utility Plant (CUP, 4,400 SF; 1 Story) will be of Type II-B Construction rather than Type V-B as allowed by the California Building Code, again, providing superior fire resistant construction. The proposed new Plant Operations and Maintenance building (PO&M, 3,200 SF; 1 Story) will be of Type V-B Construction.

An exhibit depicting the locations on the site of the various structures discussed above is attached to assist with your initial review of the proposal.

Matthew Stockton, PE has met with Kevin Moore, OSHPD Fire Marshal, to preview this proposed design. Mr. Moore has indicated his initial opinion that the proposed design appears to meet the OSHPD requirements for fire flow, contingent upon review and approval from your two jurisdictions.

We would like to meet with you to formally present our proposed design. Please let us know when we can schedule such a meeting.

Very truly yours,

BRELJE & RACE

Thomas R. Jones

50 Mark West Springs Rd, Santa Rosa
Assessor's Parcel Numbers 58-040-058 and 059

B&R File No. 3231.08

Gentlemen:

Following the publication of our letter of August 18, 2009, it was noted that Item 7. contained a typographical error relative to the type of construction proposed for the Physician's Medical Center (PMC). The statement should have read as follows:

7. The proposed future PMC (100,000 SF; 3 stories) will be of **Type I-B** Construction rather than Type III-B as allowed by the California Building Code, providing superior fire resistant construction.

Type I-B is a more fire resistant type of construction than the incorrectly indicated Type II-A in the letter of August 18, so this error does not adversely impact the proposal for fire flow and duration. We apologize for any inconvenience this error may have caused.

Very truly yours,

BRELJE & RACE

Executive Summary

Scope

The scope of this study encompasses the relocation of the existing Sutter Hospital from its existing site on Chanate Road in the City of Santa Rosa, along with a new medical office building and a joint venture (JV) hospital. The existing Chanate Road facilities would be re-used, possibly for family medicine, but are not part of this study. The present study includes a phased development of the site:

2010-2012	Site preparation; import of up to 100,000 cubic yards (CY) of fill via truck
2010-2013	126,000 square foot (sf) Sutter hospital 100,000 sf joint-venture hospital 80,000 sf medical office building
2014 or later	36,000 sf hospital addition

Description of the Proposed Development

The project would consist of a variety of uses on an approximately 53-acre site located in the southeast quadrant of the US 101/Mark West Springs-River Road interchange. These include a medical center complex, including a hospital and medical office building and associated parking. However, no significant changes in the Wells Fargo Center (WFC) operations are proposed, at least in so far as they affect the traffic generation of the site.

Summary of Traffic Generated

The existing Wells Fargo Center currently generates approximately 1,250 trips on a non-event day[1]. The proposed medical center (hospitals and MOB combined) would generate approximately 4,600 (rounded) weekday vehicle trips at completion of Phase II, and 4,950 at completion of Phase III. The traffic generated by the WFC operations would vary considerably depending on the events planned. A major event day at WFC could generate more than 2,800 vehicle trips over 24 hours.

In the morning commute period, the medical center project Phase II (both hospitals and MOB) would generate 302 trips at completion. Most special events at the WFC would not occur in the morning, although it is possible that a conference or banquet event could overlap with the AM peak hour.

In the evening commute, typically 4:30-5:30 PM, the phase II medical center would generate 444 trips at completion.[2] WFC traffic would depend on the nature of the events held; currently, most large events on weekdays begin between 7 and 8 PM, with most traffic traveling inbound to the site and departing some two to three hours later.

---

[1] This data was from 2004, but has not significantly changed since then, since it is limited by the physical facilities at WFC. Crane Transportation Group (CTG) did a count on 5/14/08 (Wednesday) that arrived at a lower count—531 trips in and out of the site, total.

[2] This excludes operations of the Wells Fargo Center.

Description of Primary Access Routes

The site is accessed primarily from Mark West Springs Road. Because of its proximity to the US 101 freeway, however, most of the traffic generated is expected to use the US 101 Mark West Springs Road-River Road interchange, which is less than a quarter-mile from the site entrance. Other access routes are Old Redwood Highway, and to the east Mark West Springs Road becomes Petrified Forest Road, with connections to northern Napa and Lake Counties.

Description of Access Points

The existing property includes two access points: the main driveway at Mark West Springs Road, approximately 200 feet east of Lavell Road; and a secondary access (used mainly by an existing private school on the WFC campus) which is off East Fulton Road. The project proposes to add an additional one-way entry point, for emergency vehicles only, on Mark West Springs Road approximately 250 feet east of the US 101 northbound off-ramp.

Description of the Study Area

The study area includes Mark West Springs-River Road and Old Redwood Highway in the vicinity of the project, between River Road/Fulton Road on the west, and Mark West Springs/Old Redwood Highway on the east. The study area extends down Old Redwood Highway to the northbound US 101 ramps at Old Redwood Highway/Mendocino Avenue, about two miles south.

Description of the Study Area Land Use and Zoning

The project is described in detail in the project application. The Wells Fargo Center is currently within the "PQP" (public/quasi-public) land use category and within the "PF" zoned district. It is also designated PQP in the Larkfield-Wikiup Area Plan. No change in zoning is contemplated.

Surrounding land uses are varied, including agricultural/vineyard uses to the south and west; residential uses to the north and east, along with existing commercial uses near the intersection of Mark West Springs Rd./Old Redwood Highway. There are several public and private schools in the area.

Key Findings, Mitigations and Recommendations of the Study

Mitigations are proposed depending on the project phase and the timing of improvements to the US 101 Mark West Springs-River Road interchange. In summary, the interim improvements necessitated by the project would include:

- Signalization of the Main WFC entry on Mark West Springs Road, with interconnect installed to the two adjacent signals (US 101 northbound off-ramp and Old Redwood Highway).

- Widening of Mark West Springs Road, as shown conceptually in drawings prepared by

Brelje & Race. This provides for an additional eastbound thru travel lane, plus a right turn only lane into the WFC, a bike lane (Class II), and a shoulder area (minimum of 8') between the US 101 northbound off ramp and the emergency vehicle access (EVA) on Mark West Springs Road

- Addition of a second right turn only lane northbound off-ramp from US 101 northbound off-ramp to Mark West Springs Road.

This traffic study anticipates that all of these projects are completed and open to traffic by the time the proposed project is occupied.

In addition to the interim improvements, the ultimate improvements, based on the County's General Plan 2020 and other transportation plans, would include:

- Widening of the River Road-Mark West Springs Road/101 overcrossing to four lanes

- Widening of US 101 to six lanes, with the two inside lanes reserved for high occupancy vehicles (HOVs) during peak periods. This is under construction and expected to be completed by 2012.

- Widening River Road to four lanes between from Brickway Extension (now Laughlin Road) and US 101, along with traffic control improvements at the River/Laughlin intersection.

- Widening Fulton Road to four lanes from the Santa Rosa City limits north to Airport Blvd.

The ultimate improvements shown above are consistent with the *Sonoma County General Plan 2020* and plans by the Sonoma County Transportation Authority (SCTA) and Caltrans. The proposed mitigations are more detailed than, but do not conflict with, the transportation plans of any of these other agencies. These projects are primarily necessitated by cumulative traffic growth in the Larkfield-Wikiup and Airport communities, and northern Santa Rosa.

This page deliberately blank.

1. INTRODUCTION/STUDY PARAMETERS

A. Description of the Proposed Development

1. Project Location

The proposed development is located north of the City of Santa Rosa in the Larkfield-Wikiup community. It includes approximately 53 acres, of which 15 acres near the US 101 northbound off-ramp at River Road/Mark West Springs Road are proposed for use as a medical center, and the remainder of the site by the existing Wells Fargo Center (WFC). Figure 1 on the following page shows the roadways in the immediate vicinity.

2. Existing Uses

Existing uses surrounding the site include US 101 freeway, residential uses to the east and north; vineyards, and the WFC. WFC currently has approximately 140,000 gross square feet of building floor area consisting of:

- The Person Theater (1,668 person capacity, including standees)
- Carston Cabaret (225 seats)
- Fireside Room (multipurpose/banquet room, 150 seats)
- Merlo/East Wing Theater (380 seats)
- East Wing Classrooms (Santa Rosa Christian School, 235 students) and playfields
- Conference facility (50,000 square feet)
- Mechanical structures and wastewater treatment plant
- Ancillary office space for WFC staff
- Approximately 903 paved surface parking spaces

3. Project Description

The project is described in detail in the proposed application materials, along with the purposes of the project. Sutter's project purpose is to provide a new, modern medical facility near Santa Rosa that would comply with the Hospital Seismic Safety Act (SB 1953), and would permit location of doctors' offices close to the hospital in a medical office building (MOB).

There would be three project phases: the first phase between approximately 2010 to 2012, and the second phase before the end of 2013, and the last and final phase undetermined, but in 2014 or later. The components in each phase, described below, could proceed independently, however.

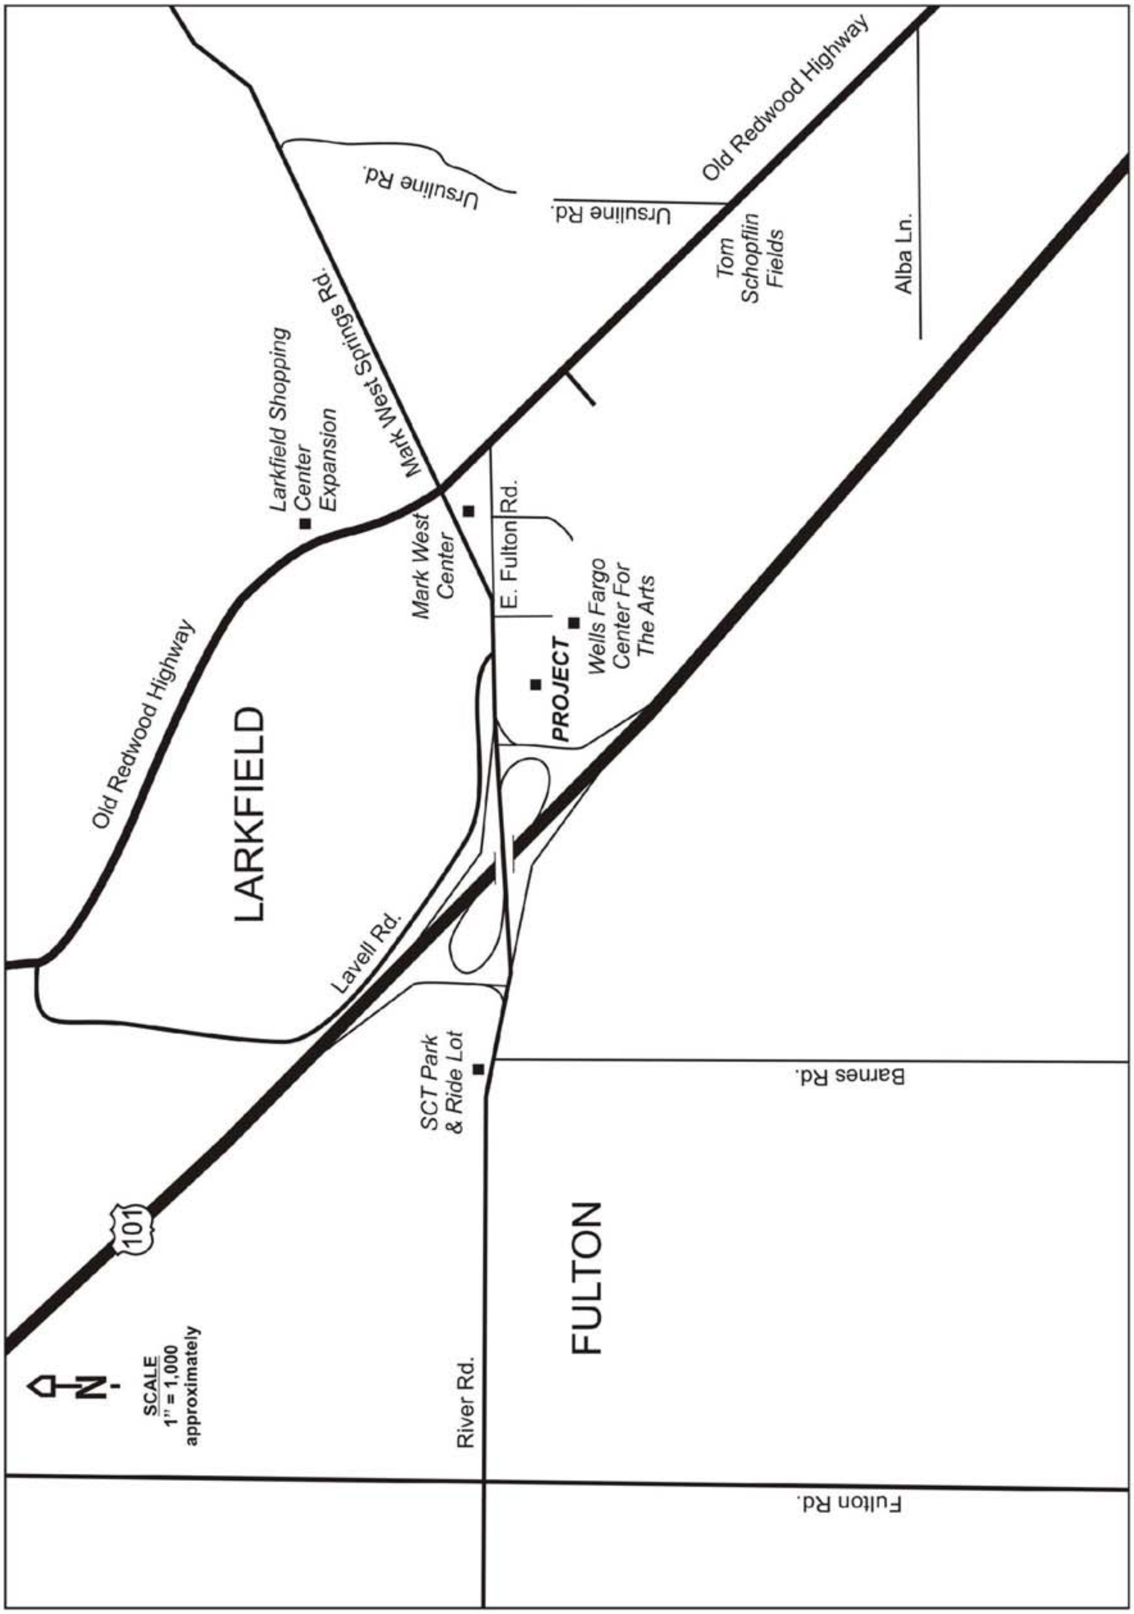

Figure 1

Site Vicinity and Approved Developments

Dowling Associates, Inc.

4. Project Components

Phase I is primarily site preparation. The Medical Center construction begins in Phase II, and relocates and modernizes the existing Chanate Road facility. Sutter's facility would consist of a hospital with a 70-bed acute inpatient facility and 126,000 square feet. A MOB would include 80,000 square feet, including 50 physician offices with approximately 200 supporting staff (total of 250 employees). A joint-venture hospital adjacent to Sutter's would include up to 100,000 square feet of floor space, with 28 hospital beds. An expansion project, if undertaken, would add 29 hospital beds in Phase III. Parking and road improvements are planned as well, as described in this report. Existing administrative and accounting functions would remain at the Warrack hospital location.

The existing WFC has 903 parking spaces. Sutter would add 943 parking spaces to this total in the Phase II development. In Phase III, 44 spaces would be lost due to construction of a new building area and consequent loss of parking, reducing the Sutter-provided parking to 899 spaces. Sutter would share some of its parking, in designated areas, with WFC for event parking after 5 pm. The shared parking area would be on the east side of the main driveway.

The proposed project would share its principal driveway with WFC, but WFC does not intend to operate all of their facilities simultaneously at their capacity; therefore, the concept of a "design day" has been used to better suit their actual operating practices. It is likely that traffic and parking constraints will act as the control on the maximum utilization of the site.

5. Site Plan

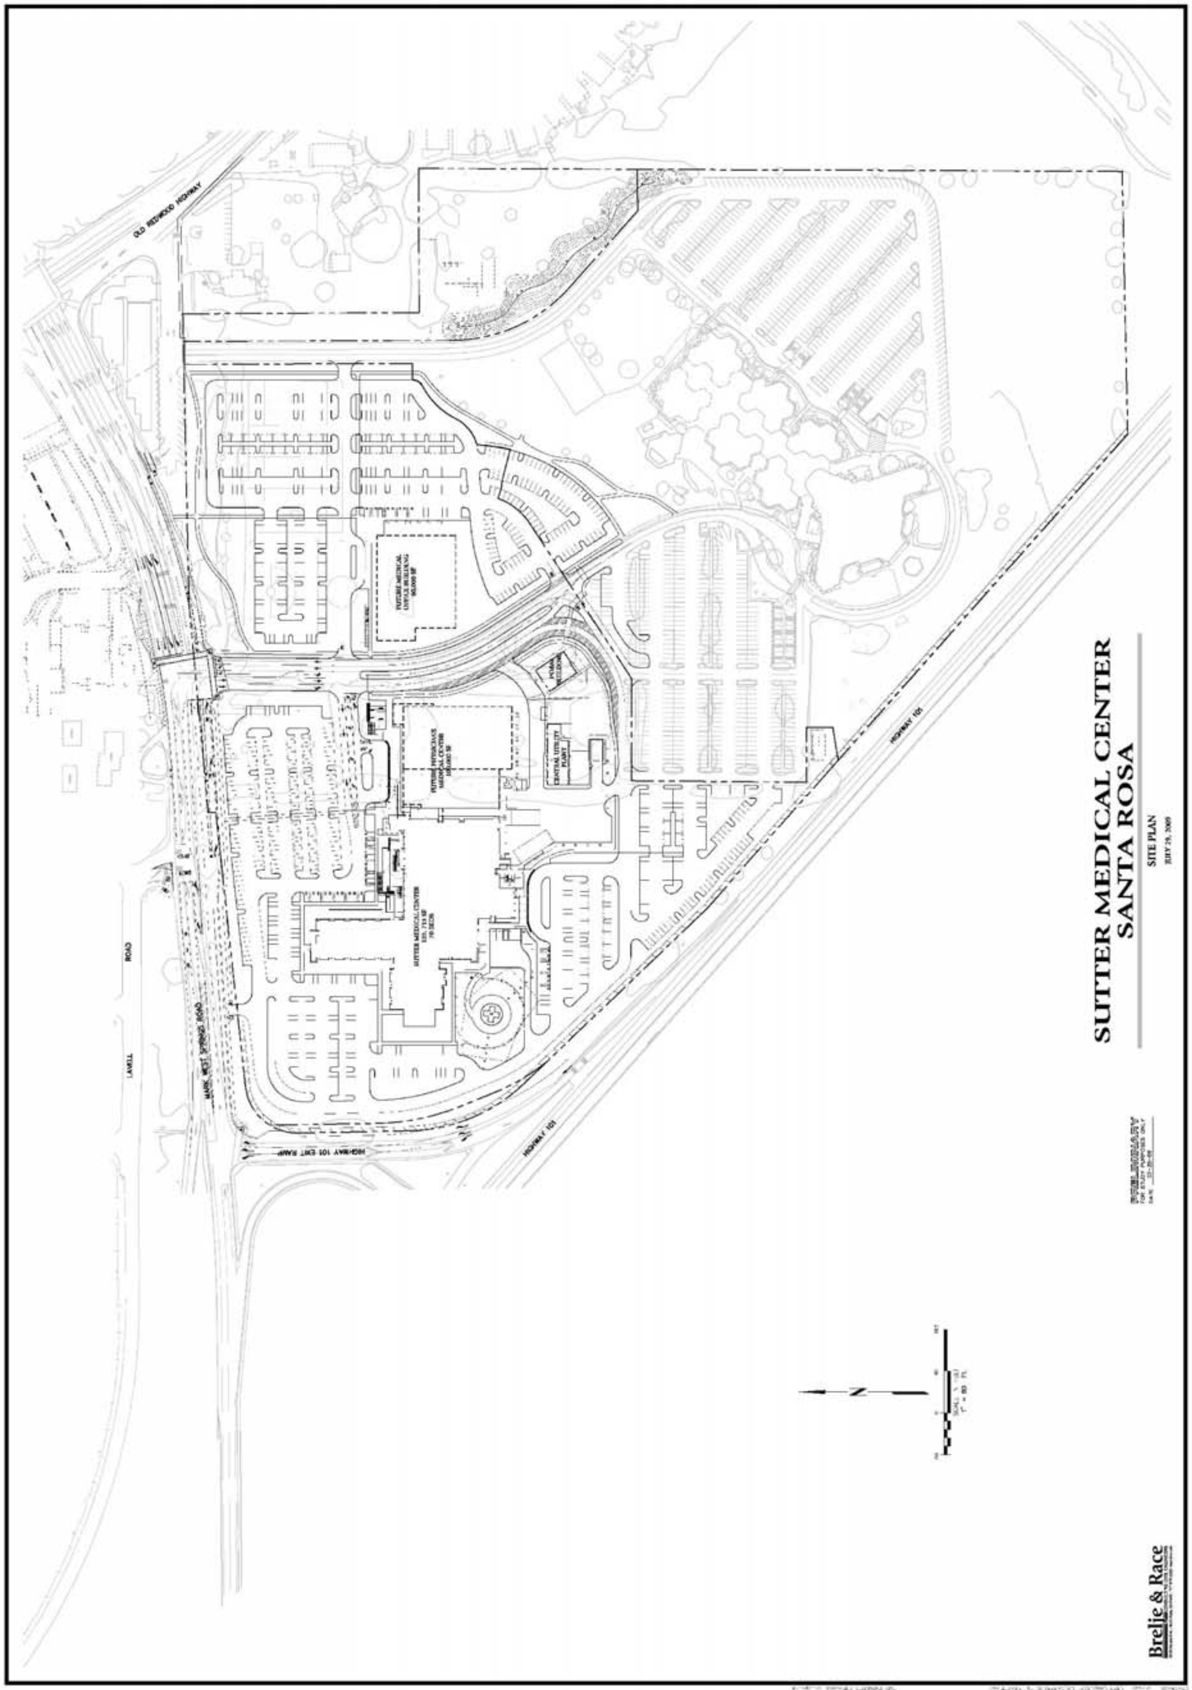
The site plan has not been fully designed at this point, so only a conceptual layout can be used for this traffic study. A dimensioned site plan is shown in Figure 2 on the next page. Because of the scale of the plan, it is difficult to show pedestrian access and circulation. A general description of the pedestrian access is as follows:

- A standard-width sidewalk would be provided along the south side of Mark West Springs Road. There is an existing sidewalk on the south side of the US 101 bridge.
- Pedestrians (and cyclists) can access the medical center facilities using a path located at the proposed EVA on Mark West Springs Road.
- Pedestrian access to Old Redwood Highway (including the transit stops located on it) would be provided either at the old E. Fulton Road (east) entrance, or the main (signalized) driveway. A standard-width sidewalk would be included on at least one side of all major internal roadways.

B. Study Area, Circulation Network and Land Uses

1. Study Area Limits

The study area was shown in Figure 1. The study area includes these intersections:



SUTTER MEDICAL CENTER
SANTA ROSA
SITE PLAN
HIGHWAY 101
HIGHWAY 101 EXIT RAMP
MARK WEST SPRINGS ROAD
OLD REDWOOD HIGHWAY
Brelje & Race

- River Road/ Fulton Road (signalized)
- River Road/Barnes Road (two-way stop on Barnes)
- River Road/US 101 southbound off ramp (two-way stop on ramp—signal under construction)
- Mark West Springs Road/US 101 northbound ramp (signalized)
- Mark West Springs Road/Lavell Road (two-way stop on Lavell)
- Mark West Springs Road/Wells Fargo main entry drive (two way stop on drive)
- Mark West Springs Road/Old Redwood Highway
- E. Fulton Road (Mark West Center)/ Old Redwood Highway

The study area limits were chosen to include the major signalized intersections within 1.25 road miles of the proposed site.[3] Important unsignalized intersections (as noted above) were also included in the analysis. Another reason for choosing this study area is that a large portion of the project traffic (59%) is expected to use US 101 to or from the site from the north or south, because of good freeway access. This is further documented in the traffic distribution assumptions, in Section 2.C.2.

2. Study Area Map and Access to State and Local Roadways

Figure 1 showed the study area map. The main access to the project site would be via the existing private driveway intersecting Mark West Springs Road east of Lavell Road. As part of the project, this roadway would ultimately be widened to two inbound and three outbound lanes, and the intersection signalized. A full width shoulder (8-10 feet wide) would be added in the inbound direction. Presently there is a stop control on the driveway, and no control on Mark West Springs Road, with one inbound and two outbound lanes. The outbound lanes would ultimately be striped for dual left turns and one right turn only lane.

An existing access at East Fulton Road (which is a stub street off Old Redwood Highway) provides a secondary driveway access to the site, used primarily by activities on the east side of the property. As part of the Mark West Center commercial project, E. Fulton Road has been altered to be westbound only between the WFC's secondary driveway and Mark West Springs Road, with a mandatory right turn at Mark West Springs Road. E. Fulton Road and Old Redwood Highway (ORH) would continue to permit all turn movements. The secondary access would continue to be primarily for WFC uses; today, it is used primarily by the Santa Rosa Christian School.

Old Redwood Highway is presently a two-lane roadway with shoulders. Within the Santa Rosa city limits, there are Class II on-street bike lanes, and a posted speed limit of 40 mph. North of the city limits, in unincorporated county territory near the project site, there are shoulders but no bike lanes, and a posted speed limit of 45 mph.

Mark West Springs Road and River Road form a continuous route. Both provide one travel lane in each direction, with left turn pockets at major intersections. Both "flare" out to four travel lanes at the major signalized intersections of Fulton Road on the west, and Old Redwood Highway on the east. The site generally has good access and good visibility from the US 101 freeway. US 101 is designated as a route in the federal National Highway System (NHS), but is not part of the

[3] The intersections of Old Redwood Highway at Lavell Road, and Mark West Springs Road at Ursuline Road, were not included because field observations indicated that they are not subject to congestion.

Federal Interstate system. It was constructed in the 1950s and early 1960s to the rural freeway standards of that era, and is two lanes in each direction.

Freeway access from the south is provided via the existing northbound diagonal off-ramp at River Road-Mark West Springs Road. This intersection is currently signalized and has separate left and right turn lanes. Mark West Springs Road is two lanes (one in each direction) in this area, although it widens to four lanes near ORH. There are left turn lanes at Lavell Road and the WFC main drive. The proposed primary entrance to the project would be approximately 800 feet east of the freeway ramp. Returning to the south involves a left turn out of the site, proceeding west on Mark West Springs road over the two-lane bridge over 101, then using the existing on-loop (a slight right hand turn) to 101 southbound. From the north, freeway access is provided by the unsignalized diagonal off-ramp at River Road, and the return is provided by the diagonal on-ramp from Mark West Springs Road.

The River Road-Mark West Springs Road interchange is a partial cloverleaf ("par-clo") with on-ramp loops in the northwest and southeast quadrants. Although constructed in the mid-1960s, par-clos are still considered a good interchange design and can carry significant traffic volumes, even with the two-lane bridge over US 101.

Mark West Springs Road to the east becomes Petrified Forest Road, and then Calistoga Road. It serves not only rural Northeast Santa Rosa, but also northern Napa County as well as Lake County trips.

3. Zoning Map

A zoning map is shown in Figure 3.

4. Existing, Approved, and Proposed Development in Study Area

The following was supplied by PRMD staff [4] (see Figure 1 for a map of project locations).

Table 1
Nearby Projects - Approved but Not Yet Built

Larkfield Shopping Center Expansion – Old Redwood Highway/Pacific Heights Drive
(retail and drugstore with drive-thru window)
+31,500 square feet to existing center

Other uses represented by growth factors, as follows[5]:

River Road	½ % per year
Mark West Springs Road	1% per year west of Old Redwood Highway
	2% per year east of Old Redwood Highway
Old Redwood Highway	1% per year

[5] Growth factors provided by David Wallace, Transportation and Public Works Department, 9/20/05.

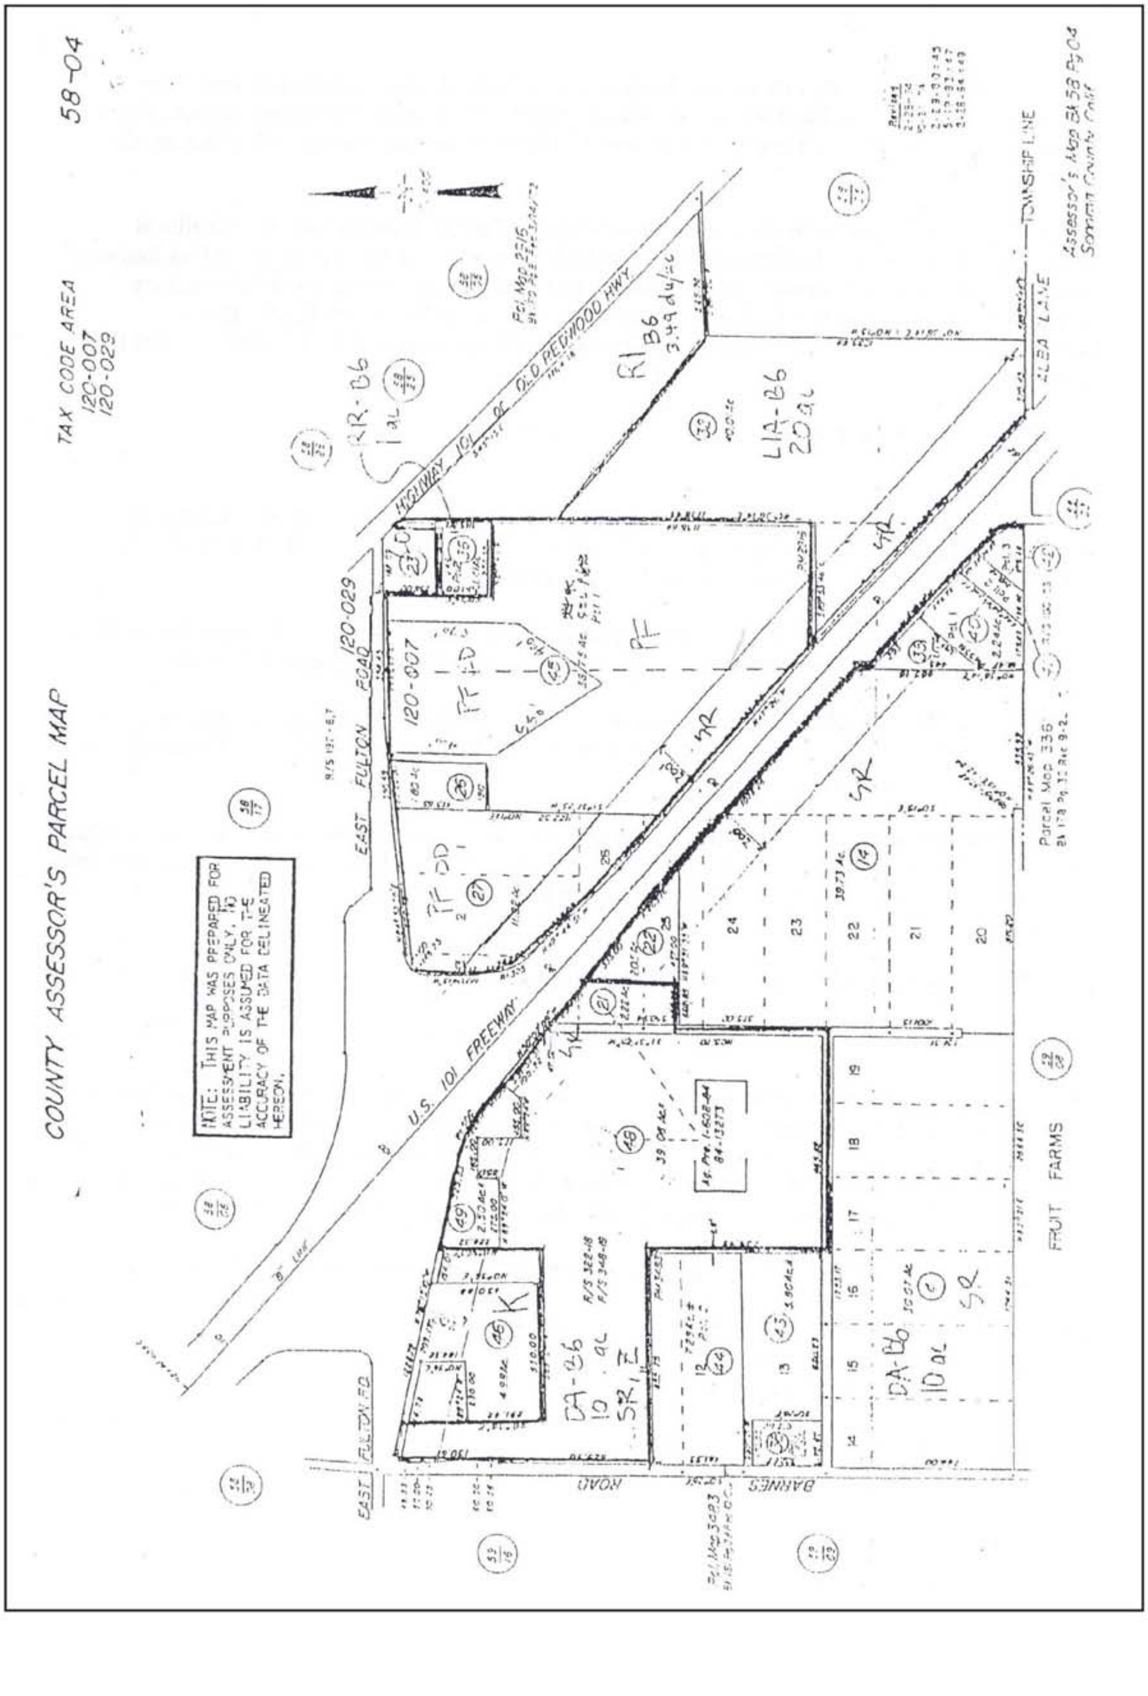


Figure 3
Zoning Map

Dowling Associates, Inc.

The growth factors represent historic trends, and should represent traffic from some projects that have not been individually studied in this report, such as the proposed Spring Hills Community Church at River and Fulton Roads. That project would generate fairly small volumes during weekday PM peak hour—22 inbound and 21 outbound vehicle trips (see W-Trans, 2006, page 13). With the recent major economic recession, the growth factors probably overstate the near-term traffic growth on the study roadways.

There are many approved but not yet built projects in the Airport Industrial area (over a million square feet of industrial/ office). Kaiser Health Plan completed construction of a new MOB to their existing complex on Old Redwood Highway approximately 1.5 miles south of the project site.

There are several schools in the immediate vicinity. The Ursuline High School, St. Rose School, and Cardinal Newman gym are located approximately one-half mile south of the site at 4300 Old Redwood Highway. The school operates classes from 8:15 am-2:15 p.m. Mark West Elementary School is located just over a half mile north of the site, at 4600 Lavell Road. Riebli Elementary School is at 315 Mark West Springs Road, approximately 0.7 miles east of the project site.

Other recent traffic studies done in the general area are in the Airport Industrial area, which focused mostly on the Airport Blvd/Hwy 101 interchange.

C. Operating Scenarios and Hours Studied

1. Description of Operating Scenarios Studied

The operating scenarios studied were the relocation of the existing Sutter Hospital from its existing site on Chanate Road in the City of Santa Rosa, along with new medical office facilities, and a long-term master plan for the development of uses at the Wells Fargo Center. The existing Chanate Road facilities would be re-used, probably for family medicine, but are not part of this study. The present study includes a phased development of the site:

2010-2012 Site preparation; import of up to 100,000 cubic yards (CY) of fill via truck

2010-2013 126,000 square foot (sf) Sutter hospital
100,000 sf joint-venture hospital
80,000 sf medical office building

2014 or later 36,000 expansion of hospital use

Two analysis scenarios of Phase II and III have been done: a near-term scenario assuming the growth factors from Table 1, and a cumulative scenario that uses traffic volumes projected by the latest SCTA Sonoma County Travel Model (SCTM/07). This report also considers an Interim Improvements scenario, assuming the existing two-lane overcrossing (bridge) at US 101-River-Mark West Springs Road; and an ultimate improvements scenario, which assumes that the improvements are made to the interchange structures. These, along with the operating hours, represented reasonable breaks in the volume of traffic and improvements needed.

2. Hours of Operation Studied

The hours of operation studied have been:

- AM Peak Hour (generally, 7:30-8:30) on a weekday
- PM Peak Hour (generally, 4:30-5:30) on a weekday

3. Phasing Plan

The phasing plan is described in detail in the project application materials.

D. Description of Methodologies and Assumptions

1. Conformance to Caltrans Guidelines

The methods used in this study conform to those in Caltrans, "Guide for the Preparation of Traffic Impact Studies." The current version posted on the website is December 2002. The TRAFFIX® software package has been used to analyze intersection and arterial level of service. TRAFFIX® is one of Caltrans' approved software packages and faithfully implements the *2000 Highway Capacity Manual* (HCM) methods for intersections and urban arterials.

2. Assumptions/Rationale for Land Use Projections and Road Improvements

Land use data have been obtained from the current SCTA travel model land use database for 2005 and 2035. New road improvements have been assumed as noted, consistent with the County's General Plan. Consistent with the *Sonoma County General Plan 2020*, it is assumed that in the 2035 scenario, River Road and Mark West Springs Road would be improved to a four-lane facility between Laughlin Road (Brickway Extension) and Old Redwood Highway. Improvements to the freeway interchange (River-Mark West Springs Road), and widening 101 to six lanes with peak period HOV lanes was assumed in the ultimate/year 2020 scenario.

3. Assumptions Used in Calculating Level of Service (LOS)

The 2000 HCM was used for calculating traffic level of service. Mark West Springs Road and Old Redwood Highway were both treated as Urban Street Class II, per the 2000 HCM Exhibit 15-2. For signalized intersection analyses, the following assumptions have been used:

- Five seconds minimum green for each phase
- Three seconds per phase loss time (to a maximum of 12 seconds)
- Maximum 115 second cycle length (sum of max time for actuated signals)
- Actuated signals with no progression (unless explicitly stated)

E. Operating Standards

1. LOS Thresholds of Significance

For state-owned facilities, Caltrans endeavors to maintain a target LOS at the transition between LOS "C" and "D", however, Caltrans acknowledges that this may not always be feasible. The County LOS standard for intersections is LOS D or better. The Project would have a significant traffic impact if the project's traffic would cause an intersection currently operating at an acceptable LOS (D or better) to operate below the standard (i.e., LOS E or F). The County criteria apply to all signalized, all-way stop controlled (AWSC), and side street controlled intersections with *project* traffic volumes over 30 vehicles per hour (vph) per approach or per exclusive left-turn movement.

The County calls for roadway operations to maintain LOS for C for specific roadway segments. The project would have a significant traffic impact if the project's traffic would cause a road currently operating at an acceptable LOS to operate at an unacceptable level (i.e., LOS D, E, or F).

2. Projected Horizon Years for Assessment

The projected horizon years used existing and approved traffic and 2020. Year 2020 is the horizon year for the *Sonoma County General Plan 2020*.

3. Roadway Capacity Criteria

Roadway capacity is based on the values in the 2000 HCM, namely, an ideal capacity of 1,900 vph per lane per hour of green time for signalized intersections, and 2,350 vph per lane for freeways. The maximum freeway flow rate would be is 1,680 vph per lane at LOS C/D.

4. Volume to Capacity Ratios

The transition between C and D corresponds on freeways to a volume to capacity (v/c) ratio of 0.71, as specified by Caltrans "Guide for the Preparation of Traffic Impact Studies," Appendix "C".

2. TRAFFIC AND TRANSPORTATION ANALYSIS

A. Existing Conditions

1. Existing Surrounding Development

The proposed Project is located in travel analysis zone (TAZ) 127 in the Sonoma County Travel Model 2007 (SCTM/07). This zone is generally bounded by US 101, Old Redwood Highway, Mark West Springs Road, and Ursuline Road, and is known as Wikiup South. TAZ 98 is north of Mark West Springs Road, and is bounded by US 101, Old Redwood Highway, and Airport Blvd.; it is known as Larkfield South. TAZ 110 is east of Old Redwood Highway, and is bounded on the south by Mark West Springs Road and to the north by Airport Blvd. SCTA estimates the 2005 land use for these zones had the following land uses (excluding the WFC):

Table 2
Estimated Year 2005 Land Uses, by SCTM/07 Travel Analysis Zone

Land Use	TAZ 127	TAZ 98	TAZ 110
Single family units	230	574	906
Attached & multi-family units*	76	347	86
Office (sq. ft.)	42,800	34,900	69,400
Strip/highway retail (sq. ft.)	2,200	32,300	96,900
Shopping center retail (sq. ft.)	0	0	64,300
Light industrial (sq. ft.)	0	54,950	0
Warehouse-storage (sq. ft.)	0	110,000	0
School (students)	729	440	1,287

Source: Dowling Associates, and SCTA..
* Includes senior units. Values rounded.

2005 data are shown above for informational purposes, because they represent the year for which the SCTM/07 was calibrated, and there are no major additional projects (land uses) believed to have been added in the area. The 2005 data are not used for analyzing existing conditions. For existing conditions analysis and the short-term (through 2014), the analysis is based on 2008 traffic counts, which the SCTA travel model being used only for longer-term projections.

2. List of Prior Studies

This was covered in Section 1.B.5.

3. Traffic Circulation System and Controls

The circulation system with existing traffic control is shown in Figure 4 on the following page. Additional circulation discussion is provided in Section 1.B.2.

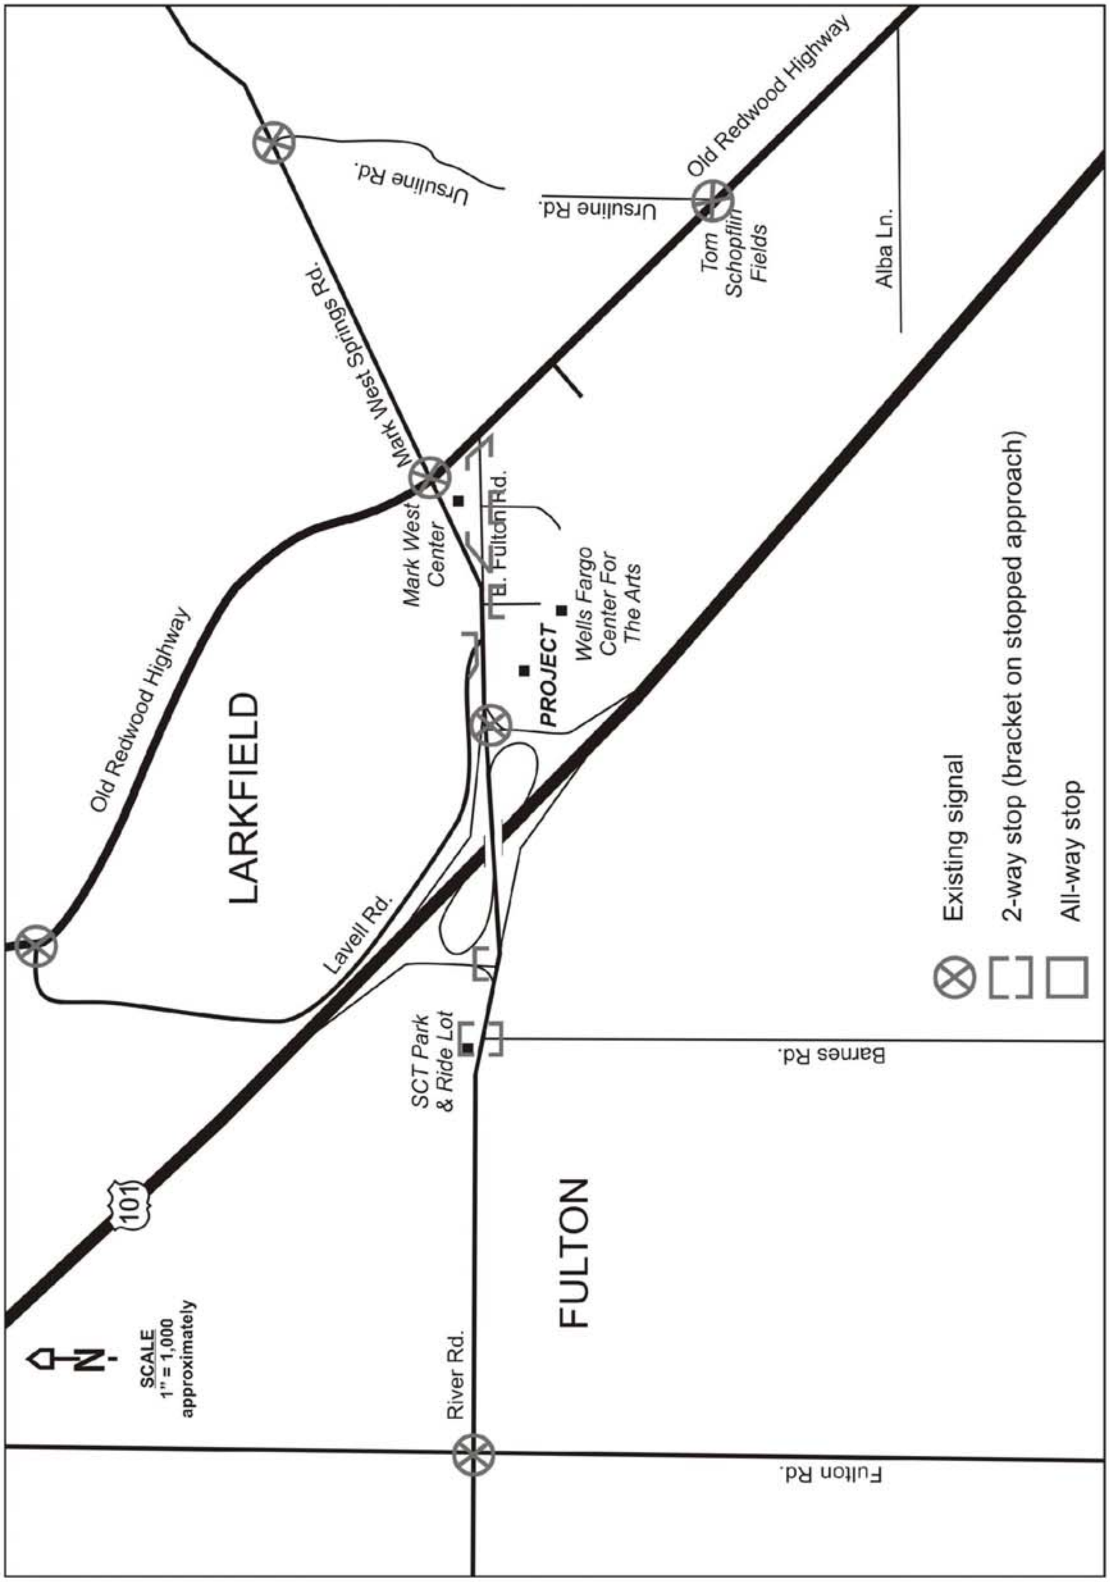

Figure 4
Traffic Circulation System and Controls

Dowling Associates, Inc.

4. Key Road Geometric Features

US 101 Interchange: This par-clo interchange has a two-lane overcrossing with a sidewalk on the south side only. The northbound ramp (east side of the freeway) is a signalized T-intersection, with a left and right turn only lanes. The current storage lengths are 415' for the left turn and 415' for the right turn lane, excluding the shared 'throat' area. The southbound off-ramp is currently a two-way stop controlled intersection, with left and right turn lanes; the southbound right turn lane has YIELD control. The storage lengths here are more than 500'. The signal is under construction as part of the HOV lane additions to US 101 in the vicinity.

Mark West Springs Road: This road has one travel lane in each direction, a left turn pocket at Lavell Road, and a continuous two-way left turn lane (TWLTL) until Old Redwood Highway. There are dual left turns eastbound at this intersection with Old Redwood Highway (570' each, for a total of 1,040 L.F.), and U-turns are prohibited by signage on all approaches. At the WFC main entry, the westbound left provides for 280' of left turn storage, from Mark West Springs Road into the Wells Fargo Center.

It has been assumed that additional lanes on Mark West Springs Road would be constructed toward the south (i.e., the northern curb line is set). This road is classified as a Rural Principal Arterial in the *Sonoma County General Plan 2020*.

River Road: Mark West Springs Road becomes River Road west of US 101 and also has two lanes. Left turn lanes are provided at Barnes Road and at Fulton Road. The intersection of River/Fulton Roads "flares" out to provide an additional travel lane in each direction, which quickly merges back to one lane. There are shoulders on River Road, and it is classified as a Rural Principal Arterial.

Old Redwood Highway: Old Redwood Highway generally has one lane in each direction with left turn lanes at key intersections, such as Mark West Springs Road and E. Fulton Road. Old Redwood Highway is classified as an Urban Principal Arterial.

WFC Main Entry: This private road currently has one inbound and two outbound lanes. The two outbound lanes are more than 500' long, providing at least more than 1,000 L.F. of storage distance.

WFC East Driveway (Santa Rosa Christian School): This roadway extends south from E. Fulton Road. There is one inbound and two outbound lanes (a left and a right turn lane).

Existing site access is further described in Section 1.B.2. Diagrams of existing intersection geometrics are provided in the Appendix to this report.

5. Existing Road Deficiencies

The primary road deficiency is that both Mark West Springs Road and Old Redwood Highway carry high traffic volumes during peak hours relative to their capacity. Vehicle queues during peak field visits were observed to extend nearly the entire distance between the two signalized intersections of Mark West Springs at US 101 and Old Redwood Highway. The congestion and queuing problem is particularly acute, albeit short-lived, when there is a major event at WFC.

6. Posted Speed Limits

US 101: Mainline posted speed 65 mph.

Mark West Springs Road: 40 mph between 101 and Pacific Heights Drive; increases to 45 mph east of Pacific Heights. A school zone (25 mph when children present) exists between Lambert Dr. and near Quiet Water Road.

River Road: 35 mph within the community of Fulton, increasing to 50 mph between Fulton and southbound US 101 off-ramp. The speed on the overcrossing is 40 mph due to sight-distance limitations on the vertical curve on the overcrossing structure.

East Fulton Road: No posted limit.

Lavell Road: 30 mph from Mark West Springs Road to about 500' northwest; then 45 mph.

Old Redwood Highway: 45 mph from the Santa Rosa city limits to about 500' south of East Fulton Rd., where it drops to 35 mph. It continues at 35 mph to Airport Blvd. There are school zones (25 mph) near Alba Lane, Ursuline Road, and Lavell Road.

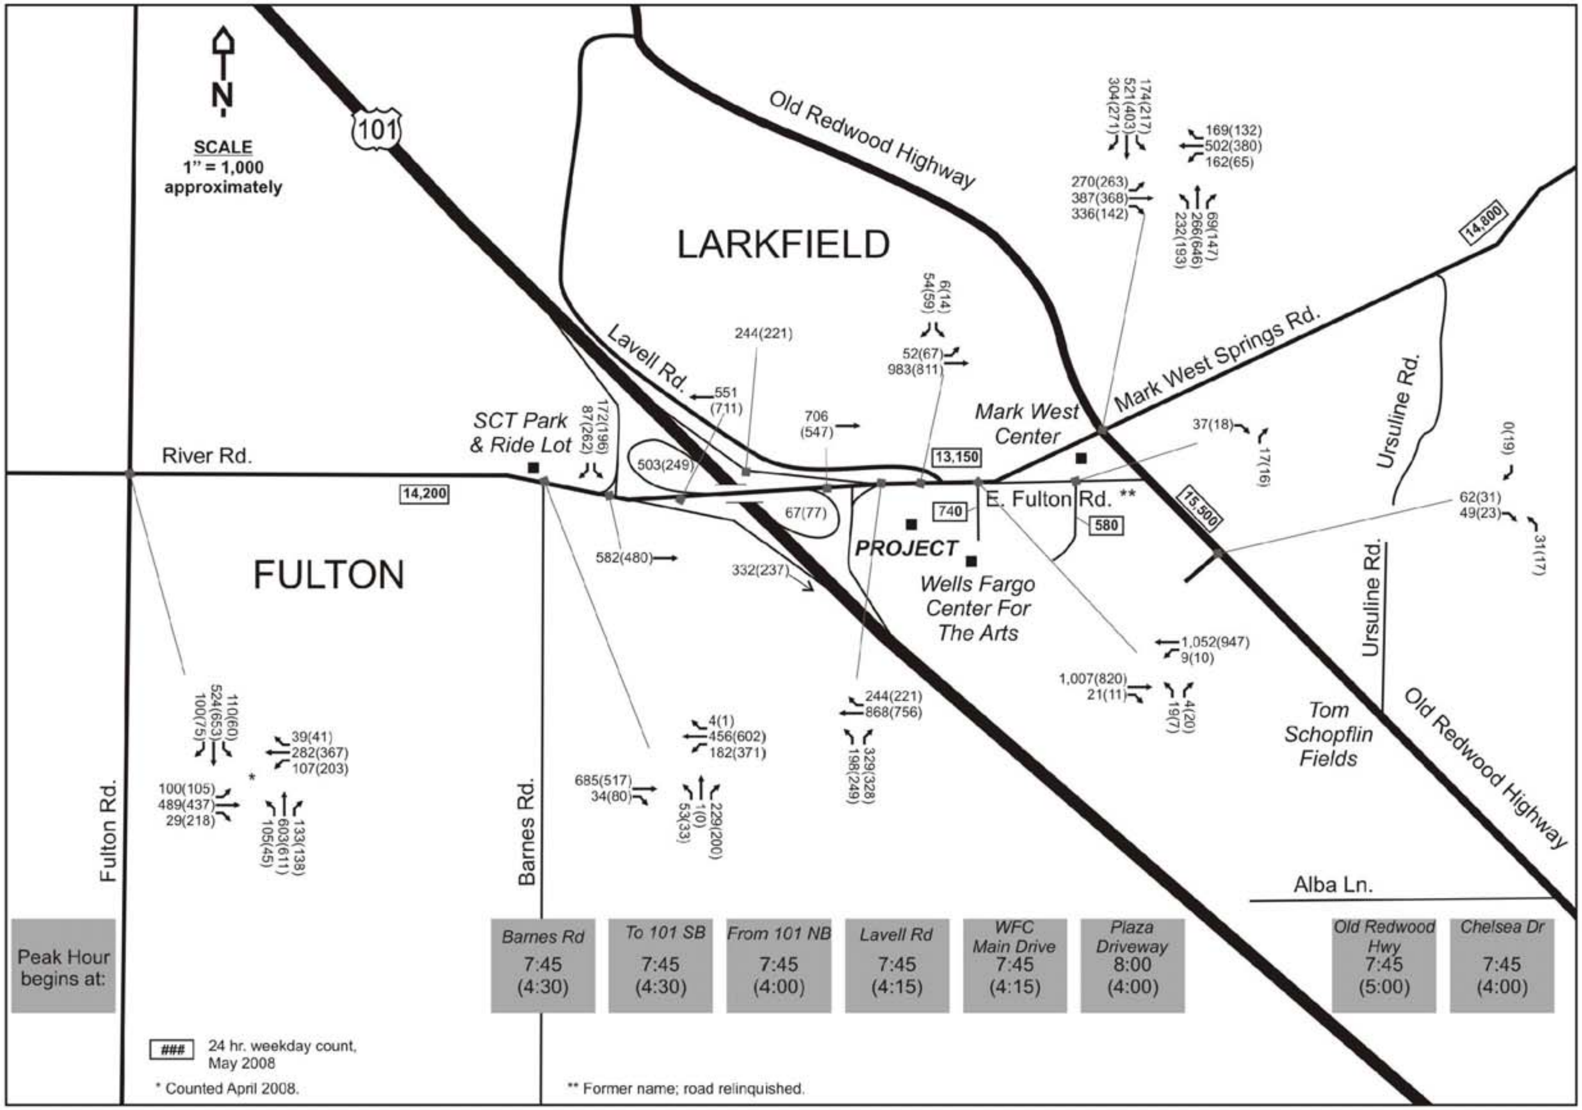
7. Existing Daily Traffic Counts

Existing daily traffic counts were collected for this project in May 2008, as well as on September 30, October 1, and October 2, 2004. These counts are shown in Figure 5. Freeway and freeway ramp data came from Caltrans, based on *2007 Traffic Volumes*.

Turning movements at key intersections used in the analysis were counted from 7-9 AM and 4-6 PM in May 2008 by Crane Transportation Group; additional counts were made by Dowling Associates on November 25 and 24, 2008. Because of the volume of the turning movement information, it is included in the Appendix.

8. Trip Generation for the Site (Existing WFC Uses)

On an average, non-event weekday, traffic counts done Thursday, 9/30/04 indicate WFC generates 1,250 vehicle trip ends. No major changes in use are foreseen, so this information is still considered valid. In the AM peak hour, there are 125 inbound and 68 outbound trips. Much of the traffic is related to the existing school between 7:30-8:30 AM. The afternoon peak is staggered because of the Academy; the peak was 3:30-4:30 PM at the east WFC drive. The outbound volume during the 'traditional' 4:30-5:30 PM peak hour is actually quite small, totaling only 50 vehicles (22 on the main drive and 28 on the east/Sonoma Academy drive). Volumes fluctuate due to sports and related after school activities.



Dowling Associates, Inc.

Figure 5
Daily and Peak Hour Traffic Counts – 2008
AM(PM)

9. Roadway Segment Traffic Counts

These are shown in Figure 5.

10. Intersection Traffic Counts at Key Intersections

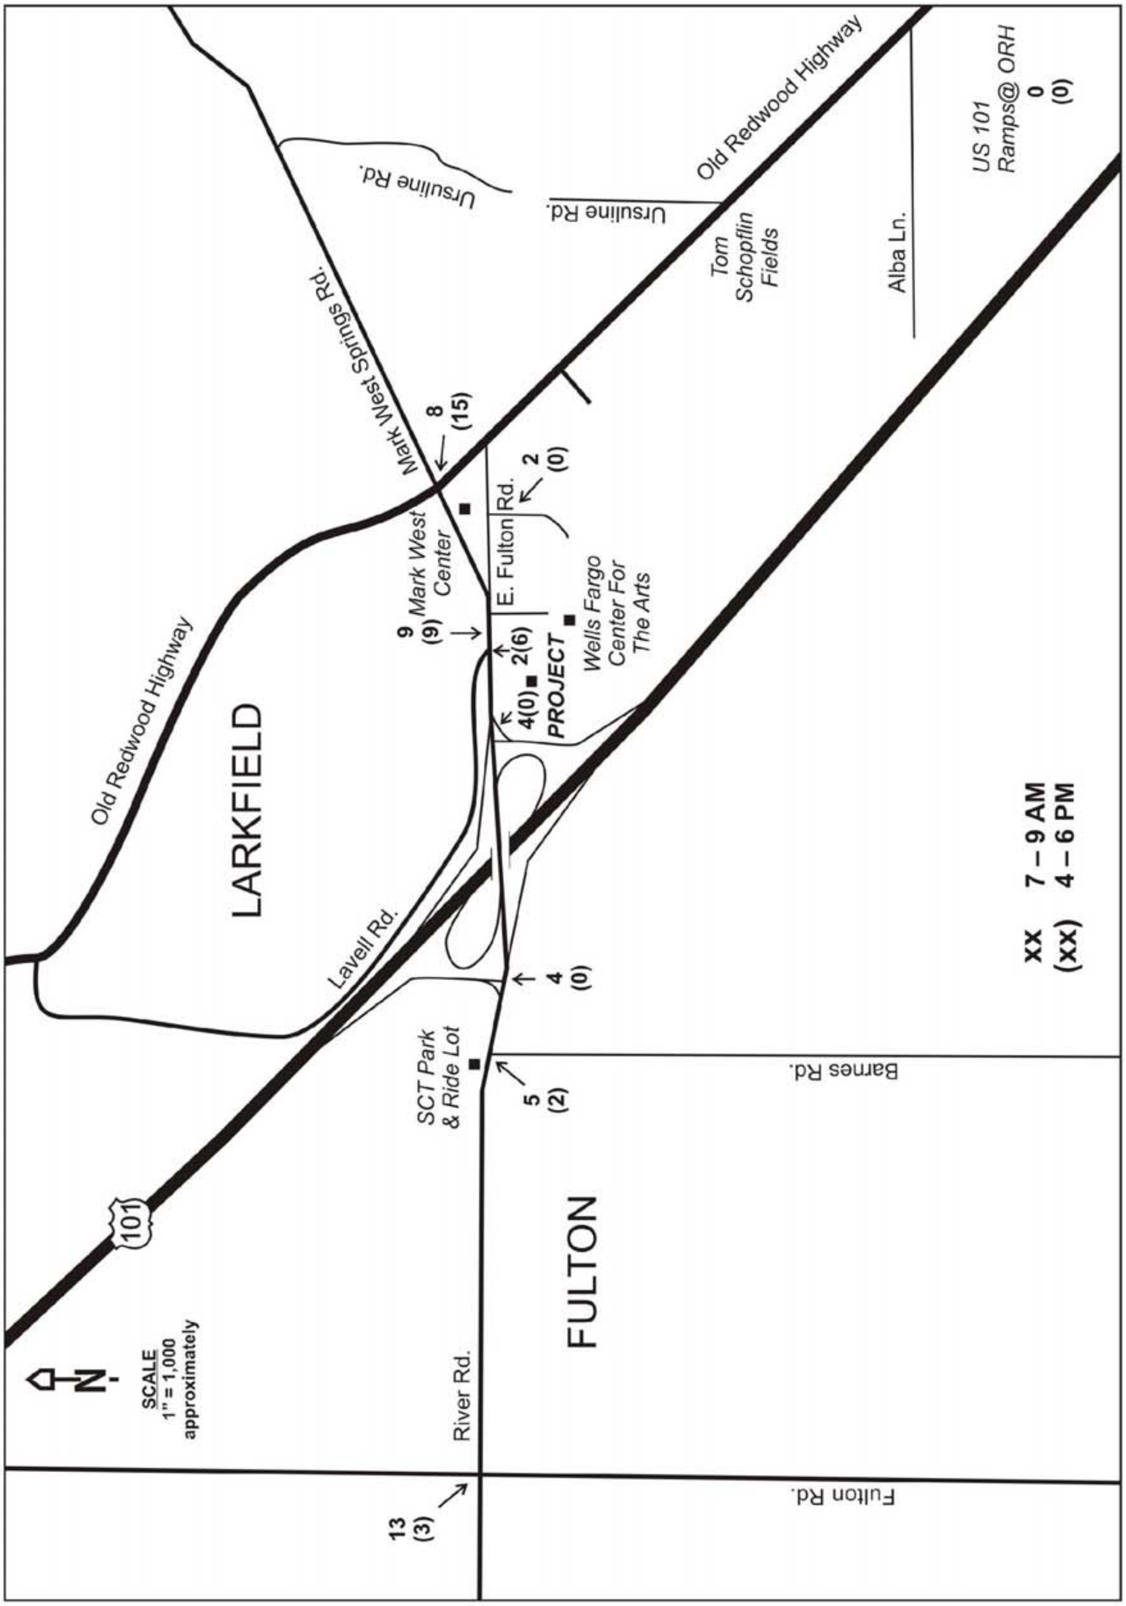
This information is provided in the Appendix and summarized in Figure 5. Turning movement counts were conducted in mid-May and late-November 2008. This was a non-event day for WFC, in order to provide a baseline.

11. Pedestrian Activity and Sidewalks

Pedestrians, like vehicles, were counted 7-9 AM and 4-6 PM. The total pedestrian crossings for each two-hour peak period are summarized in Figure 6. Detailed crossing information by 15-minute intervals and intersection leg is provided in the Appendix. The volumes are fairly low, with the highest volumes experienced at River/Fulton Roads in the AM (13 total), and Mark West Springs Road/Old Redwood in the PM (15 crossings). The corner of River/Fulton Roads has a market and is a place where day laborers sometimes wait for work in the morning. The school peak pedestrian activity probably occurs earlier than the PM count was taken. There are several schools in the area, including Mark West Elementary and John Riebli Elementary schools.

Currently there is very limited availability of sidewalk along Mark West Springs Road on the north side west of the intersection with Lavell Road. On the south side, pedestrians must use a bermed asphalt path and dirt paths. The project applicant proposes to improve this situation by adding a continuous sidewalk between the northbound off-ramp of US 101 and the Mark West Center retail center. This would link to the existing sidewalk that is provided on the south side of the River Road-Mark West Springs Road overcrossing of US 101. Although the application does not anticipate adding any pedestrian pathway on the north side of Mark West Springs Road, the provision of a new traffic signal at WFC's main driveway would include a crosswalk and pedestrian push button, and so would permit more convenient and safer crossings by pedestrians of Mark West Springs Road. Pedestrians could cross Mark West Springs Road to access the proposed sidewalk on the south side of that roadway. Pedestrian improvements to the north side of Mark West Springs Road would be the responsibility of development on that side of the roadway.

Information on pedestrian accessibility to bus stops is provided in Section 13 below.



Dowling Associates, Inc.

Figure 6
Peak Period Pedestrian/Crossing Counts
at Intersections

12. Bicycle Activity

Bicycles, like vehicles, were counted 7-9 AM and 4-6 PM. The total bicycle approach volumes for each two-hour peak period are summarized in Figure 7. Detailed information by 15-minute interval and intersection leg is provided in the Appendix. The volumes are fairly low, with the highest volumes experienced at River/Fulton Roads (6 bicycles in each two-hour peak), and Mark West Springs Road/Old Redwood in the PM (10 in each two-hour peak). In the AM, 12 bicycles were counted in the AM peak period at the northbound hook ramps at 101/Mendocino Avenue, about two miles to the south of the Project. Note that some of the school peak bicycle activity probably occurs earlier than when the PM count was taken.

13. Transit Services

Sonoma County Transit (SCT) provides service to the area, but does not have recent passenger activity by stop available. SCT operates three existing bus routes near the site (see Figure 8 for map):

- **Route 20- River Express** operates on Old Redwood Highway and Mark West Springs Road, and along with Route 62, is the closest public transit to the proposed project (there is a stop on both sides of Mark West Springs Road at Lavell Road). However, the 20X operates only one trip a day in each direction (eastbound AM, westbound PM), timed to meet commuter schedules; the eastbound (traveling toward Santa Rosa) bus currently arrives at approximately 7:21 AM, and westbound at 6:00 PM.

- **Route 60- Cloverdale/Healdsburg** operates on Old Redwood Highway, with a bus stop at Mark West Springs Rd. and Old Redwood Highway. Route 60 provides transit service between the downtown Santa Rosa Transit Mall on 2nd Street, and Windsor, Healdsburg, and Cloverdale. There are 18 trips each weekday in each direction. Because of the higher frequency of service on this line, it is likely that most transit passengers traveling between Santa Rosa and the proposed medical center would use it as the preferred route to the SSRMC.

- **Route 62** provides service between Santa Rosa and Sonoma County/ Charles Schulz Airport and downtown Windsor. Route 62 travels directly adjacent to the site on Mark West Springs Road and operates seven trips per weekday in each direction.

The travel time from the Santa Rosa downtown transit center to the site would be approximately 13 minutes using Route 60, which compares to 13-27 minutes (to/returning) using CityBus Route 1 to the existing Chanate hospital. This is for 'in vehicle' time only (i.e., riding on the bus).

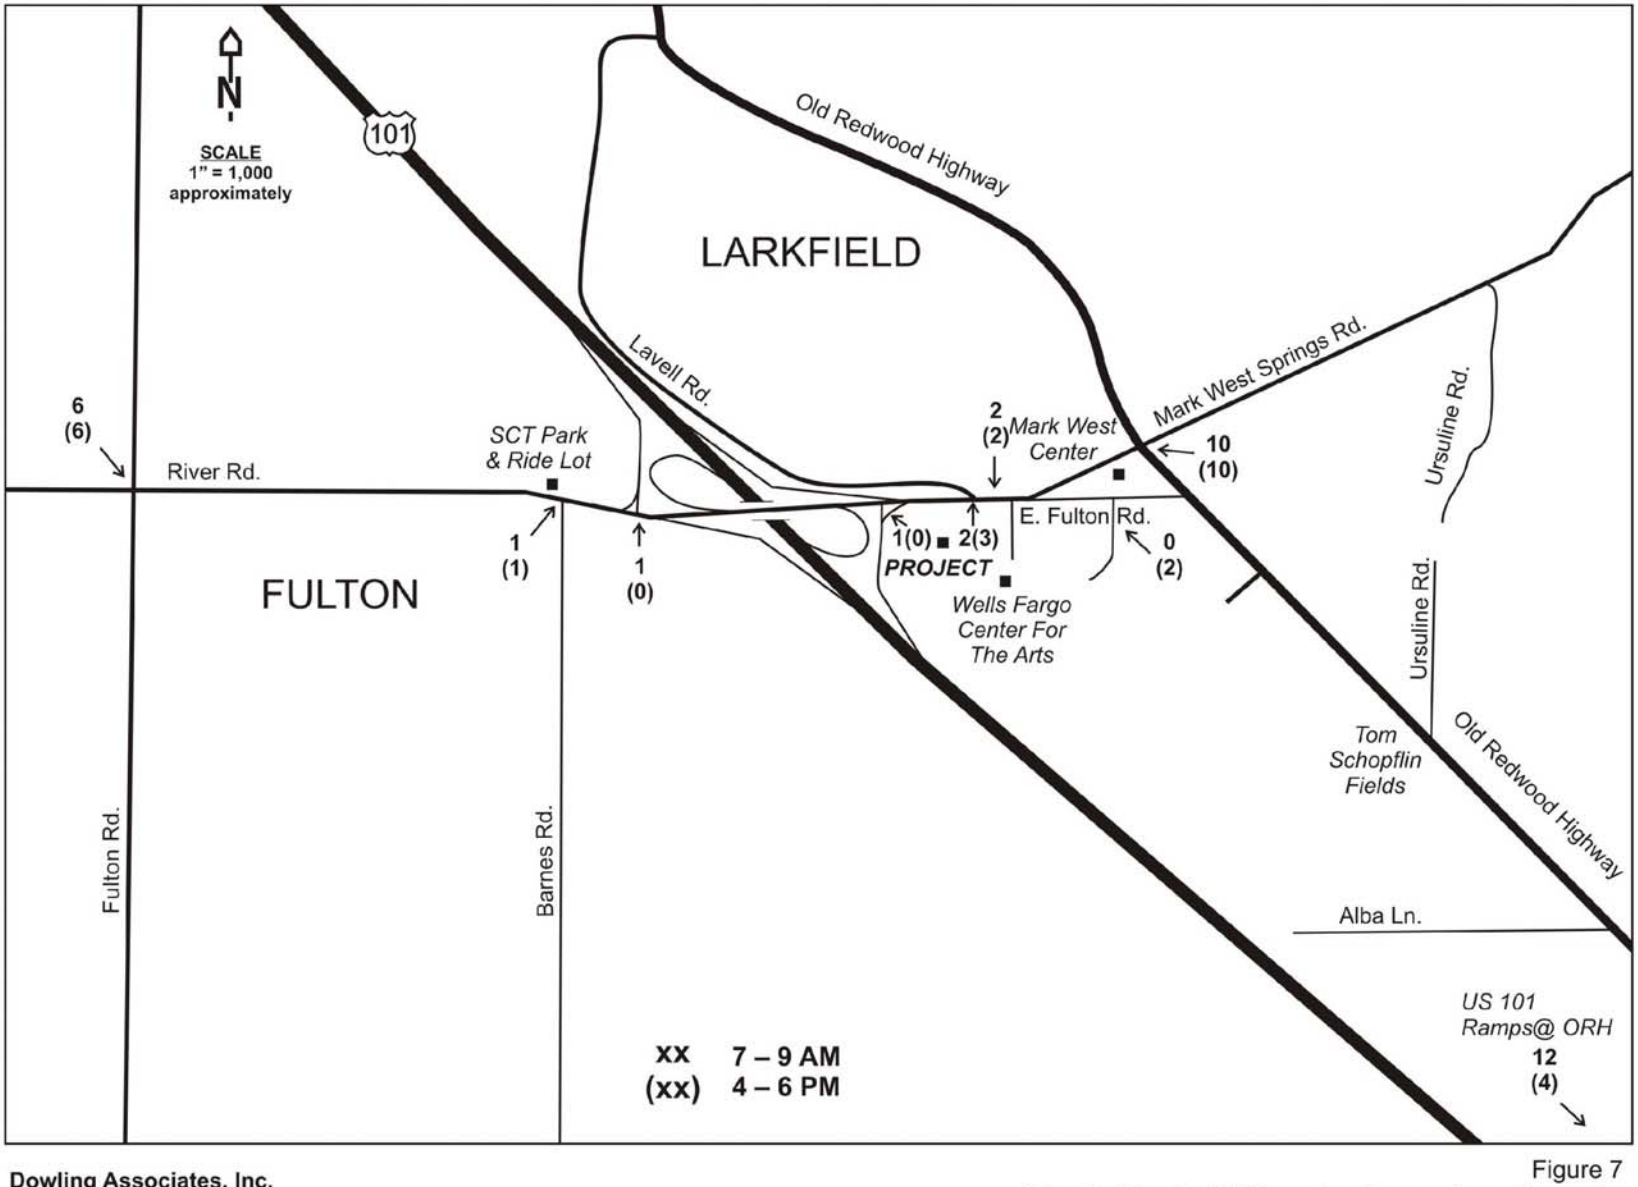


Figure 7
Peak Period Bicycle Crossing Counts at Intersections

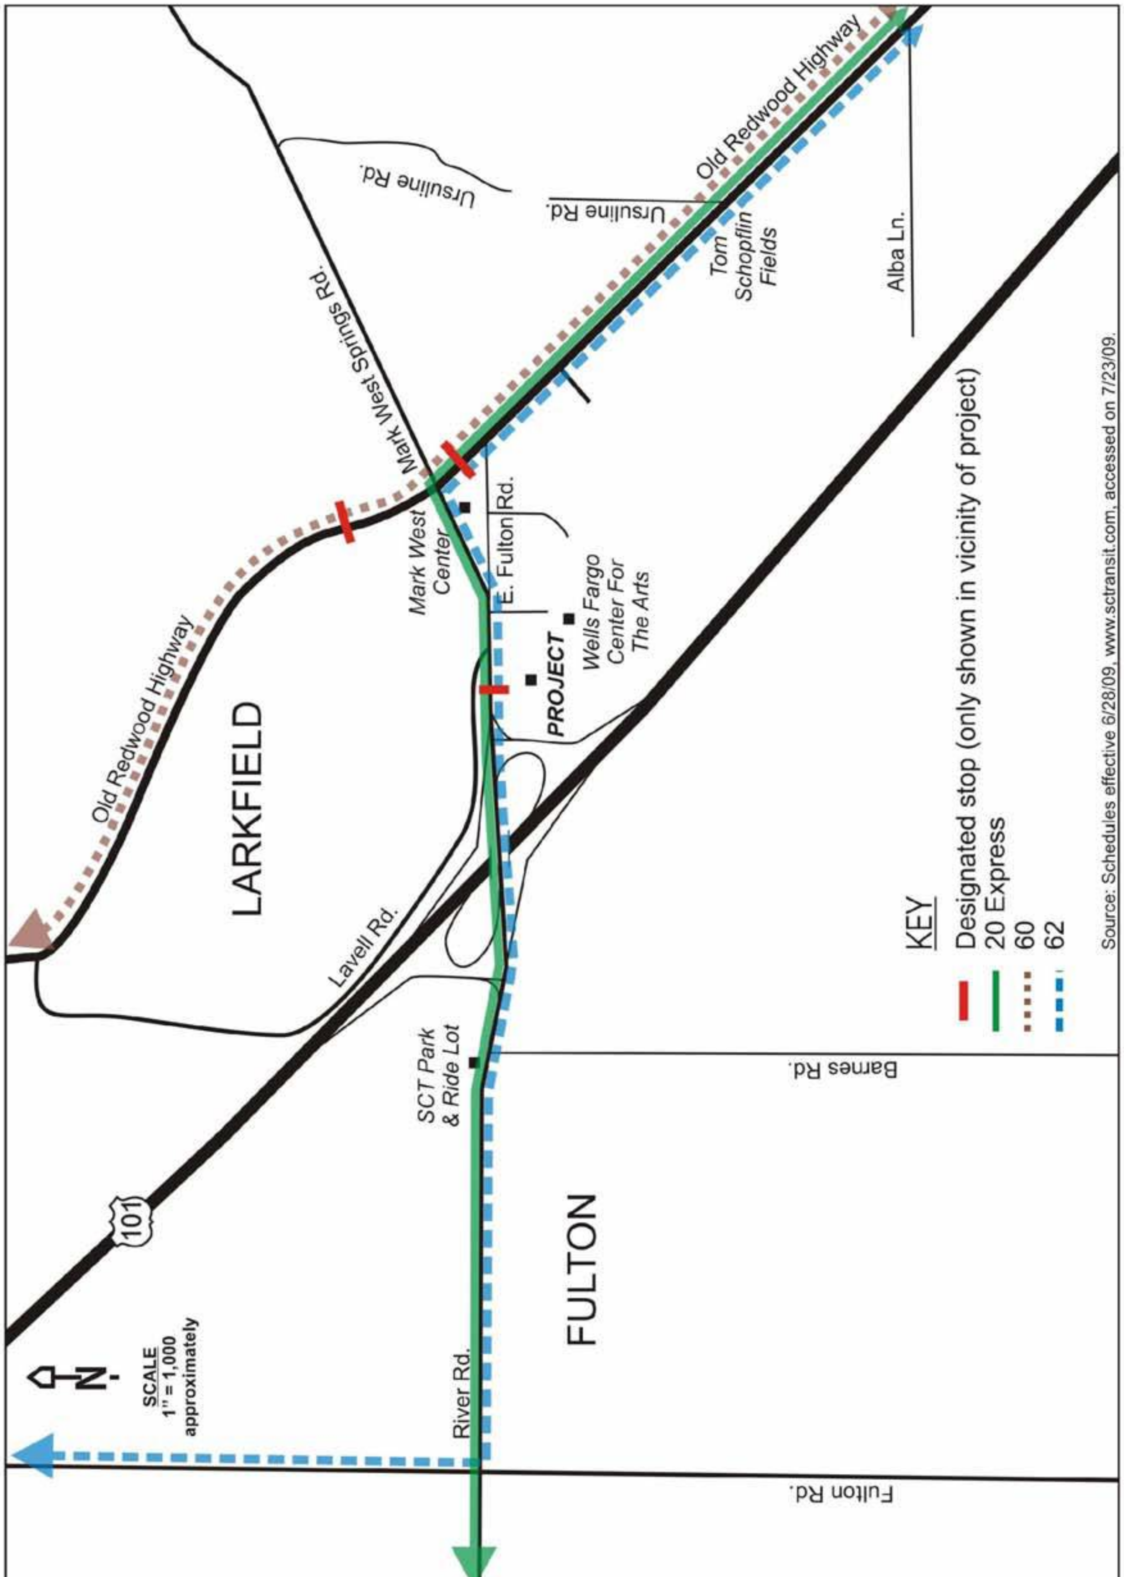

Figure 8
Existing Sonoma County Transit (SCT)
Scheduled Bus Services

Dowling Associates, Inc.

There is a major committed future transit improvement nearby. In November 2008, Marin and Sonoma County voters approved a sales tax increase to pay for a commuter rail service between Larkspur and Cloverdale. Service is anticipated to start in 2014-2015. However, no nearby stations are planned; the closest stations to the project would be Jennings Avenue (Santa Rosa) and downtown Windsor.

Both dependency on transit service (those with no car available for their trip) as well as reliance on county-supported medical services is likely to be a function of income. Although low-income residents live throughout Sonoma County, the greatest concentrations are likely to be south Santa Rosa (e.g., Roseland), the Lower Russian River area, and Sonoma Valley (e.g., The Springs area). These areas are served by existing SCT transit routes (see above), but access from the Sonoma Valley (Route 30) and Lower River (Route 20) and Roseland would be via at least one transfer, typically at the downtown Santa Rosa transit center (2nd & B Streets). Outside peak hours, most access would probably occur via a connection to Routes 60/64, which operate on Old Redwood Highway and have stops nearby to the proposed project site. Route 62 stops directly north of the site near the WFC main driveway; a new traffic signal at this location would facilitate safe pedestrian crossing of Mark West Springs Road. Roseland had a recent "community-based transportation plan" prepared by SCTA[6] which recommended improvements to transit services in that area. The following paragraph has been excerpted from pages 32-33 of that report.

Residents unable to use regular fixed-route buses due to a disability can access paratransit services through the City of Santa Rosa (if a city resident) or SCT. The City of Santa Rosa provides curb-to-curb dial-a-ride paratransit services within the Santa Rosa city boundaries and the unincorporated areas of Roseland. Passengers must be certified as ADA eligible to use this service. Service hours mirror those of CityBus fixed route services. The CityBus paratransit fare is $2 for any one-way trip within Santa Rosa. SCTA contracts for operation of an inter-city ADA paratransit service within a .75 mile corridor of its fixed routes. Trips must begin and end within these corridors. Designated transfer points have been established to enable passengers to transfer to and from other regional paratransit services, such as CityBus. SCT paratransit operates Monday-Friday between 5 AM and 11 PM and weekends from 7AM to 9 PM. Paratransit fares are zone-based, with a base fare of $2.60 and 55 cents for each additional zone.

Sutter's existing Chanate Campus is currently served by a single bus route (CityBus Route 1) that travels on Mendocino Avenue but makes a one-way loop up Parker Hill Road and out Fountaingrove Parkway, which creates a significant amount of "out of direction" travel for riders, taking approximately 30 minutes to reach the downtown transit center. Buses run every 30 minutes until about 8PM. Many Route 1 buses continue as Route 19 to Roseland after a five-minute pause at the Transit Center; others require a transfer at the 2nd Street Transit Center.

14. Queuing Analysis

An analysis of the existing 95th percentile queue lengths at key intersections is provided in Table

[6] SCTA (May 2007). "Roseland Community-Based Transportation Plan," approved May 14, 2007. Available on SCTA's website at *scta-info.org*.

3 on the following page. It is based on HCM methods and assumes that an average stopped vehicle takes up 25 feet. Both the analysis as well as field observation indicate that the principal queuing problem is the westbound thru traffic at the northbound US 101/Mark West Springs Road intersection (signal). Here, westbound queues have been observed backing up to, or beyond, the WFC driveway (in a some cycles to Old Redwood Highway). The calculated queue length in the AM peak is roughly a quarter mile, and in the PM, more than 800 feet.

How to interpret Table 3: distances (in feet) are shown for the 95th percentile queue length. A dash indicates that either the movement does not stop or does not exist at the intersection. A double dash across several turn movements indicates that the movements all share one lane. A zero indicates that the volume is so low on an approach that the queue length is virtually zero. Available queuing space is measured either as the striped tangent length of a lane (for left and right turn lanes), or the distance to the next intersection (for thru lanes). Distances are in lineal feet of total queue, so for a two lane approach, should be divided by two. Available distance is to the nearest intersection, for example, at the 101 interchange the distance is measured from the diagonal intersections back to the point where the upstream on-loop becomes blocked.

Table 3
Queuing Analysis of Existing Traffic Volumes, in feet

Note: table assumes average stopped vehicle requires 25 feet of storage space.
* Distance measured to the point where upstream traffic to the loop on-ramp would be blocked.
**This storage distance includes some blockage of private driveways.

15. Existing Level of Service

The traffic level of service (LOS) was calculated from the recent count information. Traffic LOS is a measure of the quality of service provided to motorists, in terms of delay, maneuverability, safety, and convenience. The traffic level of service ranges from A (best) to F (worst), although F does not necessarily imply gridlock— rather, it means that motorists experience significant delay. Tables 3 through 5 explain LOS for different types of facilities.

Table 4
Level of Service Definitions - Signalized Intersections

Level of Service	Control Delay (secs.)	Description
A	≤10	**Free Flow/Insignificant Delays:** No approach phase is fully utilized by traffic and no vehicle waits longer than one red indication.
B	10.1 – 20.0	**Stable Operation/Minimal Delays:** An occasional approach phase is fully utilized. Many drivers begin to feel somewhat restricted within platoons of vehicles.
C	20.1 - 35.0	**Stable Operation/Acceptable Delays:** Major approach phases fully utilized. Most drivers feel somewhat restricted.
D	35.1 – 55.0	**Approaching Unstable/Tolerable Delays:** Drivers may have to wait through more than one red signal indication. Queues may develop but dissipate rapidly, without excessive delays.
E	55.1 – 80.0	**Unstable Operation/Significant Delays:** Volumes at or near capacity. Vehicles may wait though several signal cycles. Long queues form upstream from intersection.
F	> 80.0	**Excessive Delays:** Represents long delays, but not necessarily "gridlock". Intersections operate below capacity with low volumes. Queues may block upstream intersections.

Method: *2000 Highway Capacity Manual* using TRAFFIX 7.9. Average control delay, in seconds, is shown in parentheses, rounded to nearest tenth second. "F>100" indicates that the calculated delay exceeded 100 seconds and cannot be reliably estimated.
Based on May 2008 counts supplied by Crane Transportation Group.

* Unsignalized intersection; level of service is shown for the STOP controlled movement.

Table 8
2008 Arterial LOS Analysis Results

Level of service – rounded speed in mph

Arterial Route and Direction	Class	Existing AM	Existing PM
River Rd.-Mark West Springs Rd. EB	II	C- 21.9	D- 20.3
River Rd.-Mark West Springs Rd. WB	II	C- 24.1	C- 24.3
Mendocino Ave-ORH NB	II	B- 31.1	B- 33.1
Mendocino Ave-ORH SB	II	D- 20.9	D- 19.5

The US 101 freeway is presently two mixed-flow travel lanes in each direction. Traffic volumes are shown in Figure 5. Based on Appendix "C" of the Caltrans "Guidelines for the Preparation of Traffic Impact Studies," the maximum flow rate (at LOS "E") is 2,350 vehicles per lane per hour. Both north and south of the River Road-Mark West Springs Road interchange, the freeway mainline operates at LOS C (LOS B southbound in the AM north of the interchange ramps). Recent widening through central Santa Rosa reduced the bottlenecking of traffic that frequently occurred to the south (through central Santa Rosa/Highway 12). However, congestion remains to the north (at the Airport/Fulton interchange) that creates queues that can extend into the vicinity of the interchange, and construction activity (e.g., narrowed lanes, lack of shoulders) is currently reducing the capacity of this section of freeway.

The freeway ramp volumes at the River/Mark West Springs Road interchange are generally well within their capacity. The highest volumes occur with the northbound diagonal off-ramp, where the PM peak has more than 700 vehicles/hour; and the southbound on-loop, which experiences a morning demand of more than 600 vehicles/hour.

Table 9
Existing (2002) Mainline Freeway Level of Service
Note: This table includes single occupant and high-occupancy vehicles. Other freeway tables shown later in this report includes single-occupant vehicles only.

Location	Direction	Volume (vph)	Capacity	V/c ratio	LOS
Between River Road ramps and Airport/Fulton Rd. ramps	NB	2,598 AM	4,700	.55	C
		1,816 PM		.39	B
	SB	2,170 AM	4,700	.46	B
		2,540 PM		.54	C
Between Mendocino/Hopper ramps and River Road ramps	NB	2,800 AM	4,700	.60	C
		2,234 PM		.48	B
	SB	2,911 AM	4,700	.62	C
		2,932 PM		.62	C

Note: table reflects the two-lane configuration in each direction that existed in 2008 and earlier years. Source: Parsons Transportation Group, *Highway 101 Widening and Improvements Project, Steele Lane to Windsor River Road, Traffic Operations Existing Conditions Report*, June 2004, Figures 2 and 3. The volumes are for the highest hour in the AM or PM peak period (6-9 AM and 3-6 PM).

B. Collision History Evaluation

An extensive collision history evaluation was provided in Dowling Associates' January 2005 report. Three years of collision data, from January 1, 2001 thru December 31, 2003 were evaluated. See that report for more detail. Safety history related to the Lavell Road/Mark West Springs Road intersection is discussed in Section D.9. More recent collision data covering the years 2006 thru 2008 were requested and received from the CHP. That data indicated a general decline in the number of reported collisions. For example, in the three year period there were 2 reported intersection collisions at Mark West Springs Road and Lavell Road, and 10 at Mark West/Old Redwood Highway. There were three reported crashes at E. Fulton/Old Redwood Highway. This decrease mirrors the decline found in recent years countywide (see *2009 Countywide Transportation Plan,* Appendix C). This may reflect reduced driving due to higher gas prices, more restrictive teenage driving laws, better enforcement (including more severe penalties for DUIs), and an older population.

C. Future Conditions

1. Project Generated Trips

This section covers items (a.) thru (d.) in the Guidelines for Traffic Studies.

The "project" used for traffic analysis would consist of the Sutter Medical Center and the WFC uses. The Sutter Medical Center would include (in its final phase) a 70 bed, 126,000 square foot hospital, and an 80,000 square foot medical office building. An adjacent Physician's Medical Center (PMC) joint-venture (JV) hospital would have 28 beds and approximately 100,000 square feet of floor area.

In the first phase of construction, there would be approximately 25 large trucks per hour in and out of the site, distributed roughly equally over an eight-hour workday, to import up to 100,000 cubic yards of surcharge material.

After completion and occupation of structures, during the morning (AM) peak hour, between 7:30 and 8:30 AM, the medical center (hospitals and MOB) would generate approximately 300 vehicle-trips (in and out) on a typical weekday. In the afternoon peak hour, from roughly 4:30 to 5:30 PM, the project would generate a total of 450 vehicle-trips. ITE recommends that the trip generation be performed based on number of employees, if that value is known. Employees tend to be a better reflection of actual activity levels at a medical center, and thus its traffic generating potential.

Projected build-out trip generation of the WFC facilities is more likely to vary from day to day, depending upon the size and nature of the events taking place. It is (assumed to be) unlikely that all of the facilities will be used to their capacity at the same time. The greatest impact of WFC events is likely to occur on a Saturday afternoon, because combined event and background traffic volumes would be highest then.

Tables 10 and 11 show the estimated trip generation for the medical center phases II and III.

Table 10
Trip Generation Analysis – Medical Center Phase II
(note: vehicle trips are shown in this table; values are rounded to two decimal places)

Source: Institute of Transportation Engineers, *Trip Generation, 8th Edition*.

* Per ITE, the number of employees is the total of full- and part-time employees, over all shifts.

Trip generation for WFC events was estimated from a trip generation count done Friday, October 1, 2004, when there were three different shows beginning between 7 and 8 PM, with the main event beginning at 8 PM. Although this count was made several years ago, there are no changes to the physical facilities (e.g., seats) at the WFC that would have significantly changed these numbers. During the peak hour, 7:15-8:15 PM, there were 668 entries and 22 exits from the site. WFC staff reported 1,722 tickets distributed to these three events, leading to a rate of 0.38 peak hour vehicles per ticket inbound, and .01/ticket outbound. A small number of performers and staff are also present, but probably arrive before the peak hour. The machine traffic count data compared to the ticket sales also tends to confirm the assumption of approximately 2.0 persons per vehicle for show attendees for these events.

Table 11
Trip Generation Analysis – Medical Center Phase III
(note: vehicle trips are shown in this table; values are rounded to two decimal places)

* Per ITE, the number of employees is the total of full- and part-time employees, over all shifts.

WFC notes that some events—particularly those appealing to families—will have higher vehicle occupancies.

e. ADT Generated during Weekends

The Phase II Medical Center would generate an estimated 2,842 vehicle-trip ends on a Saturday, over 24 hours—2,125 from the hospitals and 717 from the MOB.[7] It should be

[7] ITE's Saturday trip rate for hospitals is 2.95*(employees)+691.43. For MOBs, it is 8.96(thousand square feet).

noted that the sample size (number of sites studied) for MOBs on a Saturday is small—just five sites. For Phase III, the total vehicle trip-ends generated would be 3,081—2,364 from the hospitals and 717 from the MOB. Sunday trip generation is lower, especially because medical office buildings have a very low level of operation on that day.

The weekend ADT for WFC facilities is more difficult to estimate, because it depends on the number and character of events being held. On a weekend, there could be day and evening events. Assuming a vehicle occupancy of 2.0 persons/vehicle, the ADT would be 0.5 times the number of attendees at the total of all events.

f. Peak Hour Trips Generated by Project During a Work Week

This was shown in Tables 8 and 9 above.

g. Peak Hour Trips During a Peak Weekend Day

The number of peak hour trips would depend on the events held. WFC does no propose to expand the number of patrons able to attend events.

h. Pass-By Traffic

No reduction in trips for pass-by traffic was assumed for project traffic. Pass-by traffic occurs mainly for retail uses.

i. Winery Tasting Room Traffic

No winery tasting room is planned, although it is possible that WFC might hold wine and food events.

j. Special Events Matrix

This information has been provided by Marc Hagenlacher of WFC and is included in Appendix F of this document.

k. Trip Generation Rates

The latest published Institute of Transportation Engineers (ITE) trip generation rates have been used throughout this report. ITE does not have good data on generators similar to WFC however (e.g., live performances, RV shows, etc.), so trip generation data were collected for this study.

l. Trip Generation Assumptions

Trip generation has been based on a “design day” involving the worst-case scenario for the WFC special events. Project staging (phasing) has been included in the analysis.

m. Truck Traffic

Sutter Health reports that the existing Chanate Road hospital receives 10 truck deliveries (i.e., 20 truck trip-ends, or one-way trips) on an average day. Six of these deliveries are scheduled, and four are unscheduled. Truck traffic during the project construction period would be heavier, as noted earlier, especially when the import of fill was occurring. However, this period would last only approximately two months, assuming the work occurs five days a week.

n. Peak Hour

Generally, counts have been made of peak period traffic, and the peak hour (i.e., peak 60 minutes based on quarter-hour counts) used for analysis.

o. Pass By Factors

No pass by factors were used for any of the project uses.

p. Internal Trip Reductions

For purposes of analysis, no internal trip reductions were made; this probably results in a somewhat conservative analysis. There are some potential favorable (i.e., trip reducing) interactions within the medical center and between the medical center and the WFC facilities. For example, doctors would be able to walk between their office and the hospital; a patient could have a lab test in the hospital after an appointment in the MOB, etc. Of lesser importance, but still noteworthy, is that the WFC conference facility could provide room for training, meetings, conferences, etc. for MOB/hospital workers.

q. Trip Generation from Known Future Developments within Study Area

Projects in the area were shown earlier in Table 1 and Figure 1.

r. Volume Projections for Background Traffic Growth

Background—essentially no project traffic for the future—was forecasted for the year 2035 using the SCTA's latest traffic model. This is described later in the text, and takes into account cumulative growth in the County, the City of Santa Rosa, and the region.

s. Maps

Relevant maps of the information presented are included in this report.

t. Parking Analysis

In this section, several terms are used with very specific meanings. "Code parking requirements" are the requirements set forth in the current Sonoma County Zoning Code, Article 86, as found at www.sonoma-county.org/prmd/docs/zoning. This code does not formally recognize shared parking, although apparently projects have been allowed to submit shared parking information in support of a reduced number of spaces in the past.

"Parking **demand**" refers to the average number of vehicle spaces actually occupied on a typical weekday. "Coverage" refers to the additional spaces required to reduce time-consuming "hunting" for parking spaces, and to allow for weekly and seasonal variations.

It is generally agreed that even in the peak hour of parking demand that no more than 85 to 90% of all parking spaces should be occupied; when exceeded, patrons will find parking inconvenient and will have to spend considerable amounts of their time looking for a space. Parking is typically a source of customer dis-satisfaction, and in a competitive business environment, may lead to them seeking other places of business. On the other hand, for special events (like a theatrical event), customers may "factor in" the additional inconvenience and expect to have to spend some time looking for spaces, so they may not be of as great a concern.

The term "Parking **Requirement**" is used to refer to the sum of parking demand plus the coverage, in other words, it is about 1.1 to 1.18 times the parking demand. Higher ratios provide more convenience at the expense of higher parking development (and maintenance) costs. For this analysis, we have assumed that the parking requirement would be 1.1 times the demand, except for special events at the WFC, where it was assumed that the spaces supplied should equal maximum demand.

Code Requirements

The parking code analysis has been done for informational purposes. This report shows later that, given the shared parking on the site, the code results in many more spaces than necessary. County code requires 4 spaces per thousand square feet (KSF) for hospitals, and 5 spaces/KSF for medical office building (MOB) uses. The code requirements for the medical facilities are shown in Table 10 below.

Table 12
Medical Center Parking Code Requirement, By Phase

Uses/Phase	Size	Code	Spaces Required
Phase II			
Medical Office Bldg.	80 KSF	5/KSF	400
Hospital	226 KSF	4/KSF	904
Total Phase II			1,304
Phase III			
Medical Office Bldg.	80 KSF	5/KSF	400
Hospital	262 KSF	4/KSF	1,048
Total Phase III			1,448

There are currently approximately 903 off-street parking spaces provided by the Wells Fargo Center in surface lots.[8]

[8] Information provided by Marc Hagenlacher, WFC Events Coordinator, telecommunication, 12/29/08.

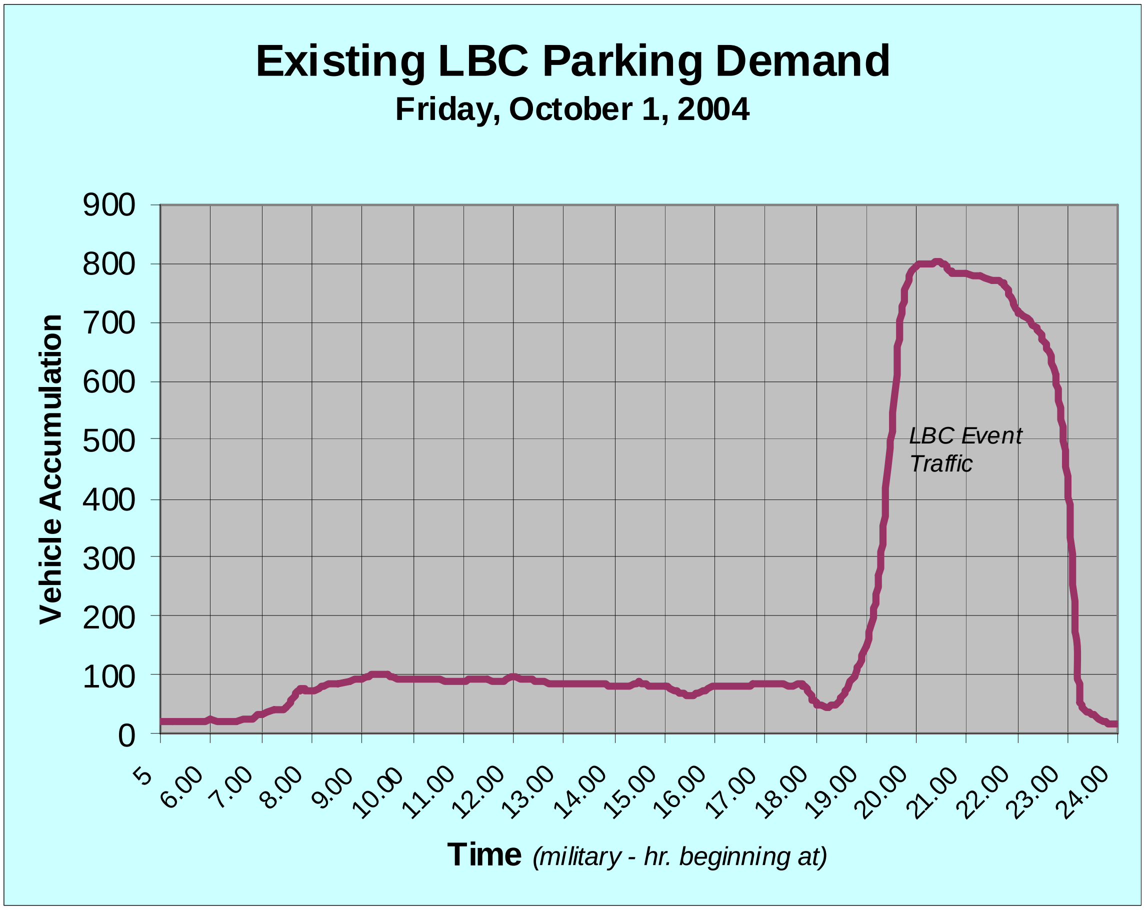

Figure 9. Existing WFC Parking Demand on an Event Weekday

Shared Parking Analysis

No shared parking is currently proposed. The Sutter Medical Center and WFC would each attempt to meet their own parking needs. However, available information on Sutter's event day parking demand has been provided in Figure 9 above.

The parking analysis made the following assumptions:

- The peak occupancy (**demand**) for the hospital would be 0.83 spaces per employee, per ITE's Parking *Generation 3rd Edition*, occurring around 3 PM (at the nursing shift change). This based on ITE's land use code 610 (the Appendix contains copies of the relevant pages). As used in this ITE publication, "employees" mean full- or part-time workers on all shifts on a weekday (hospitals operate three shifts daily).

- The peak occupancy for the MOB would be 3.49 spaces per ksf, per ITE's fitted curve equation, and would occur around 11 AM, based on ITE land use code 720.

The peak parking demand for the Sutter Medical Center is straightforward to calculate (see Table 11 below). In Phase II, there would be a peak demand for approximately 791 spaces at between 1-3 PM. With coverage (reserve) of 10%, the parking requirement would be 760 spaces in Phase II, but 943 spaces would be provided. In Phase III, the peak parking demand would be 751 parking spaces, with a requirement of a total of 835 spaces required to provide for coverage, but 899 parking spaces would be provided.

Table 13
Medical Center Parking, Peak Parking Demand, By Phase (spaces actually occupied at the peak demand hour—assumes no coverage/reserve)

Uses/Phase	Size	ITE Rate (Parking Generation)	Spaces Demanded
Phase II			
Medical Office Bldg.	80 KSF	3.49 /KSF	280
Hospitals	486 emp.	0.83 /employee	404
Total Phase II			684
Phase III (Total)			
Medical Office Bldg.	80 KSF	3.49 /KSF	280
Hospitals	567 emp.	0.83 /employee	471
Total Phase III			751

Note: Fractional values are rounded upwards; e.g., 80 ksf x 3.49 = 279.2, which is rounded to 280 spaces in the table above. Spaces demand is actual number of spaces occupied. Employee counts are totals, over all shifts.

WFC's parking requirements are more complicated, because of the possible combination of different events that may occur on a given day. In summary, it can be said that the Sutter Medical Center would (in the absence of a major WFC event) determine the maximum *daytime* demand, and WFC events would determine the maximum *night and weekend* demands. When demand can fluctuate significantly depending on circumstances, the concept of a "design day" is often used, for example, in airport planning, where there is a considerable difference in passenger traffic between a Tuesday in January and a Friday in August.

In these calculations, we have assumed that two large events occur on a weekday evening, with starting times between 7 and 8 PM:

- a sold-out event at the Person theater (1,668 attendees)
- Carston Cabaret, 225 persons
- Fireside Room, 150 attendees banquet/multi-purpose

This totals, rounding up slightly, to 2,050 people. At an average vehicle occupancy of 2.0-2.2, these events together result in a WFC-generated parking demand of between 932 and 1,025 spaces for event patrons. Add to these 30 spaces for WFC non-event needs (e.g., staff), and approximately 262 spaces demanded for Sutter (staff and visitors), and the total number of spaces occupied required is approximately 1,256 spaces between 8 and 9 PM, in Phase II.[9] This

[9] This is the actual number of spaces demanded (occupied). The hospitals may want to have additional spaces—

assumes that 100% occupancy of the WFC event spaces is acceptable. It would probably be necessary to control Sutter's spaces (e.g., coning off the parking area and monitoring by a security guard) in order to assure sufficient spaces for evening visitors.

Figure 10 shows the parking demand for Phase II with both Sutter Medical Center and a major WFC event as per the "design day" described above. The (blue) dashed line indicates Sutter's demand, and the difference between it and the solid burgundy line is the projected WFC demand. Sutter's Phase II demand is essentially the dashed line; the difference between it and the solid line represents Phase III demand. At 6 AM, there are fewer than 200 cars parked, mainly for the night shift workers and hospital patients. The night shift at the Chanate and Warrack hospitals currently averages 185 employees, according to data provided by Sutter and based on their payroll records. The parking accumulation quickly rises until about 10-11 AM, as workers and patients arrive on the site. Demand is relatively constant until approximately 3 PM, when there is a small upward "bump" because of the nursing shift change, then demand begins to fall until about 5-6 PM, when would pick up as a result of WFC events. The peak demand, as shown in Figure 11, would occur between about 8-9 PM. The difference between the dashed solid and dashed lines show most of this is due to WFC, although a few hundred spaces are still needed by the medical center during these hours. Figure 11 shows the Phase III parking demand.

It is unlikely given the combined available spaces in both the Sutter and WFC facilities that an evening event would exceed the parking capacity of the combined lots.

---

at least 14 or so—vacant to reduce "hunting" and make parking more convenience. However, for large special events, as noted, it's assumed that WFC spaces can be 100% occupied.

Figure 10. Shared Parking Demand for Phase II

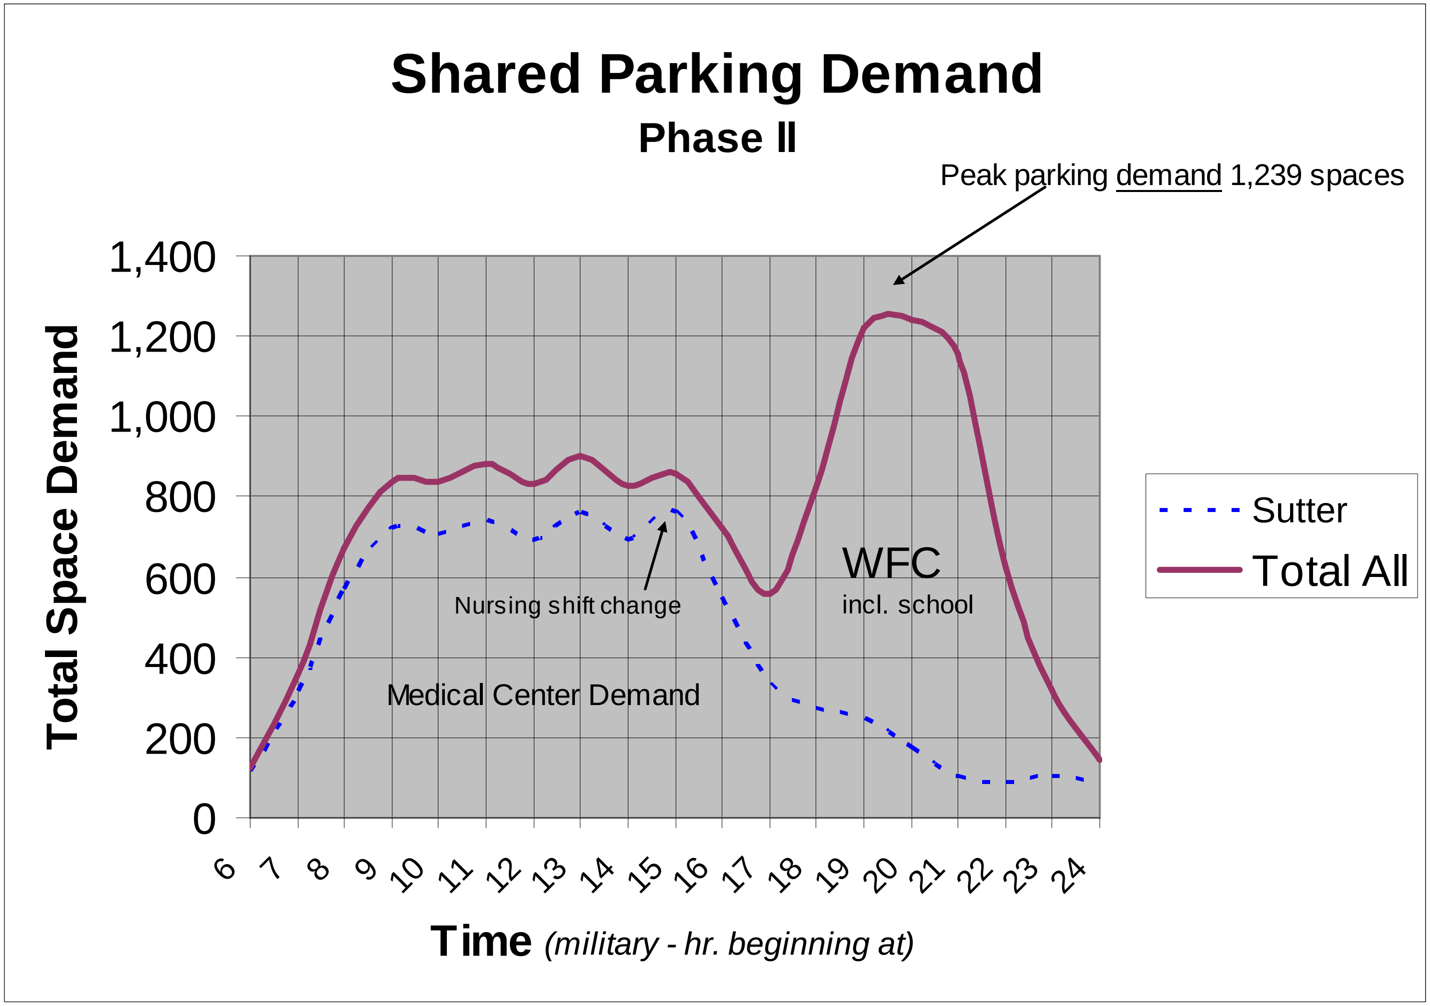

Figure 11. Shared Parking Demand Phase III

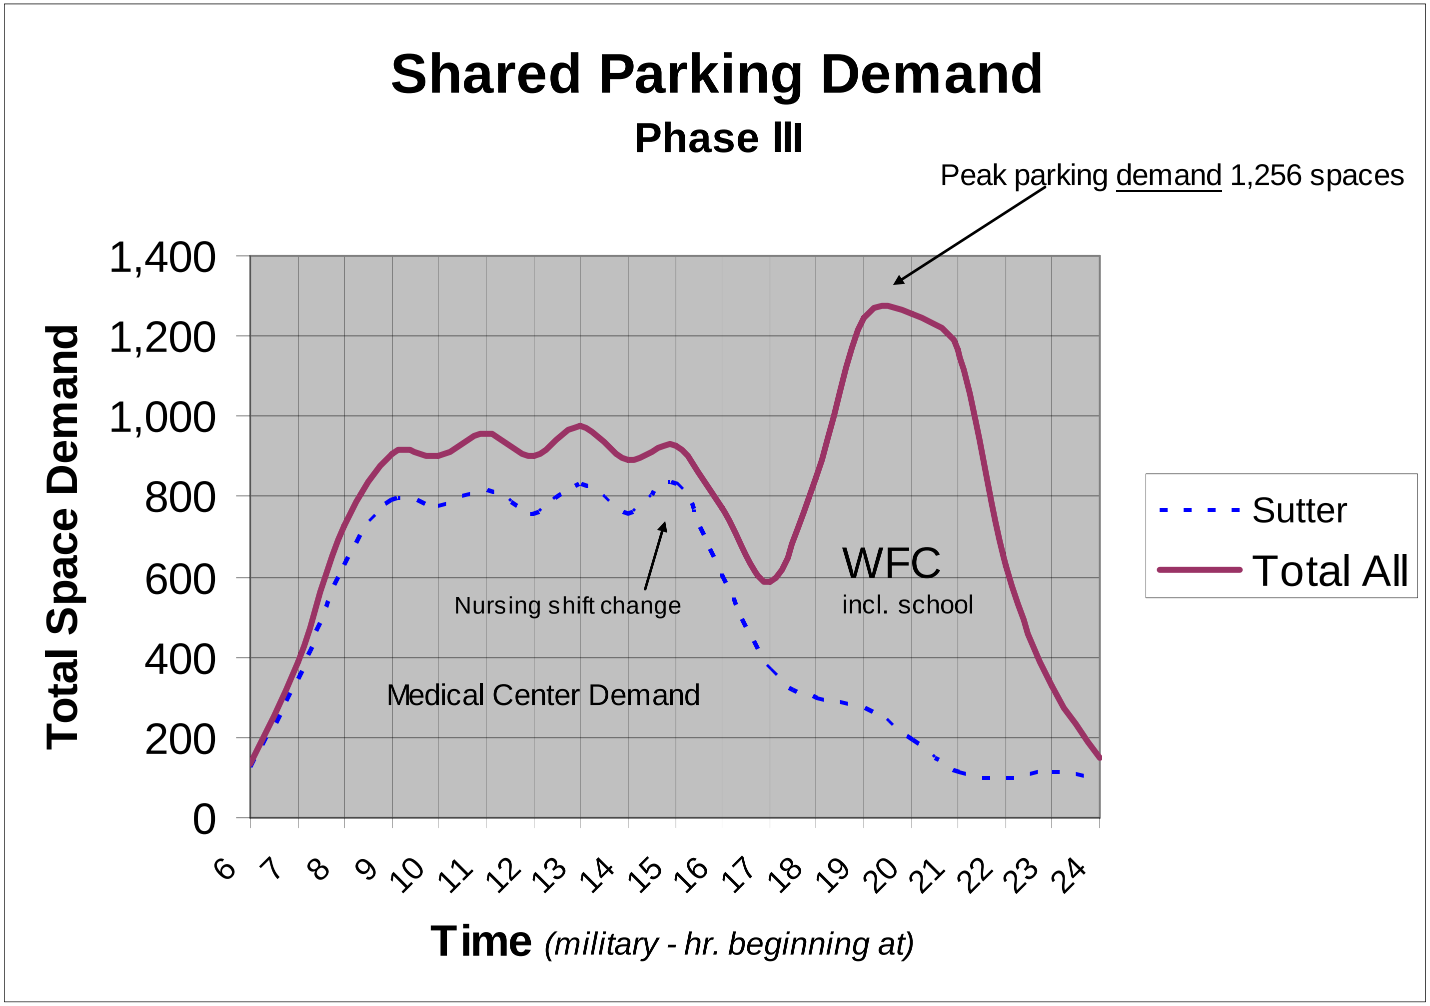


u. Truck Operations

Only a modest number of trucks are likely to service the site on an individual day. The hospital will need linen, food service, and other similar types of deliveries, as well as solid waste collection. The WFC has trucks hauling stage equipment (props, amps, etc.) a few hours before and after events. There is no excessive wear and tear associated with such traffic, beyond normal levels that would occur with most uses.

2. Project-Generated Trip Distribution

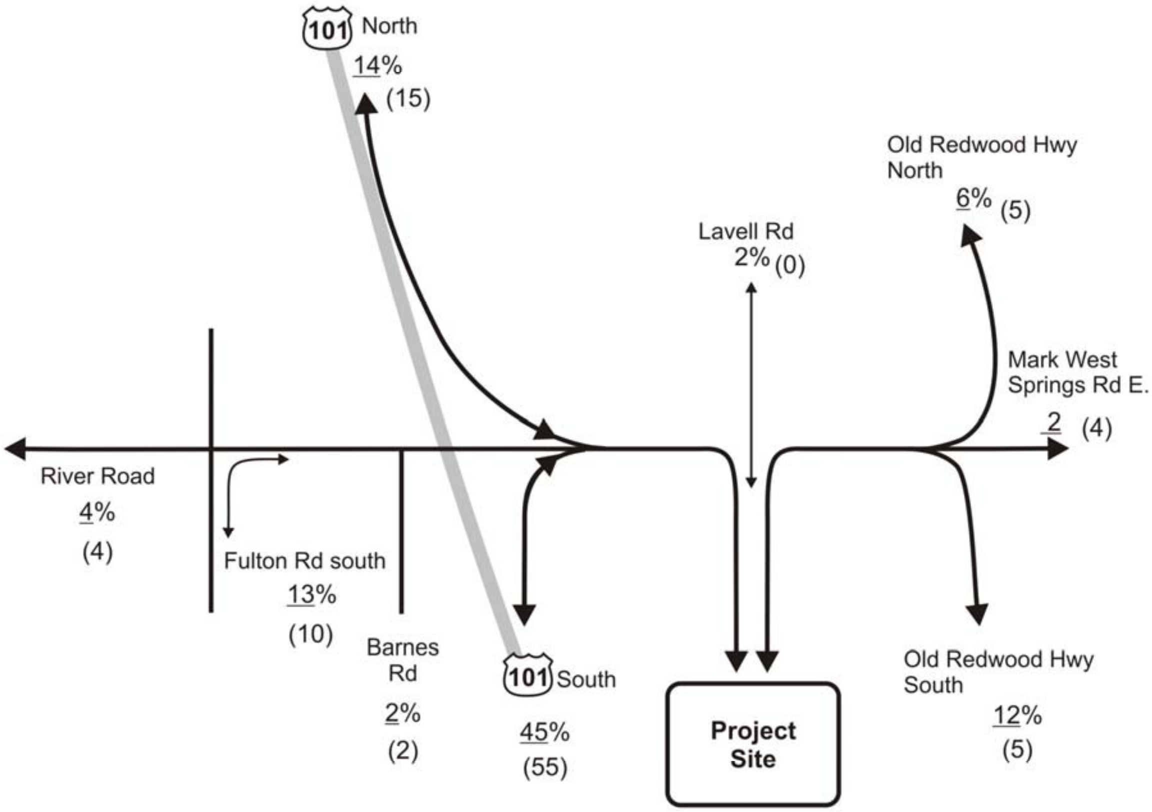
The project related trip distribution was developed from several sources: Sutter Santa Rosa provided zip code information on employees (approximately 1,200 valid home zip codes of Sutter employees), and this information was combined with a trip distribution determined by using the Sonoma County Travel Model (SCTM/02). It was also checked against trip distribution data from employees at the Kaiser Medical Office Building on Old Redwood Highway, and tempered with some professional judgment. For example, some motorists avoid congestion on US 101 by using Fulton Road as an alternative route, especially when their origin or destination is in east Santa Rosa or parts of the West County. This ultimately led to the following proposed distribution of trips, which is also shown graphically in Figure 12.

This distribution corresponds with the general population distribution of Sutter's service area. No data were available on the distribution of the attendees of events, however, for analysis purposes, it seemed reasonable to assume that the distribution would be similar to the general population distribution of Sonoma County, and because most WFC events are not held at peak commuter traffic hours, there would be more use of the 101 freeway.

Table 14
Trip Distribution of Traffic

Route / Gateway	Office Space/ Medical Center	WFC Event
US 101 South	45	55
River Road west of Fulton	4	4
Fulton Road south of River Rd.	13	10
Barnes Road south	2	2
US 101 North	14	15
Old Redwood Hwy North	6	5
Mark West Springs Rd East	2	4
Old Redwood Highway South	12	5
Lavell Road North	2	0
TOTAL	100%	100%

Figure 12
Sutter Medical Center & LBC Event Traffic
Trip Distribution



xx = Final recommended distribution after considering zip codes of employees

(xx) = LBC Event traffic

Observations of traffic made by Dowling Associates, Inc. on October 1, 2004 for a major event to confirm this distribution. Absent any better data, it was assumed that the distribution of traffic was symmetric, i.e., that the inbound and outbound traffic would be the same.

2. Existing and Project Conditions

The existing and project condition uses the existing traffic, plus traffic estimated to be generated from the approved developments, plus the Phase I project traffic.

a. Projected Traffic Volumes and Traffic Queues

There are two scenarios considered here: Phase II medical center operations, and Phase III with expansion of either the Sutter or JV hospital. The details of the Phase I construction activity are still being developed, and can probably best be addressed by a construction/truck management plan that specifies times and routes of delivery. At the time of writing, it appears that the most likely scenario will involve a right turn in/right turn out access on Mark West Springs Road, between the northbound freeway off-ramp and the main WFC entry drive.

There are several road improvements that would be completed prior to the opening of the facility (i.e., Phase II). These include what are referred to as the Interim Transportation Improvements, including the following:

- Signalization of the Main WFC entry on Mark West Springs Road, with interconnect installed to the existing signal at Old Redwood Highway.
- Signalization of the southbound US 101 off-ramp at River Road, which is now under construction as part of the HOV lane addition to the freeway
- Widening of Mark West Springs Road, as shown in the diagram on the following page. This provides for an additional eastbound thru travel lane, plus a right turn only lane into the WFC, a bike lane (Class II), and a shoulder area (minimum of 8', with 10' desirable) between the US 101 northbound off ramp and the emergency vehicle access (EVA) on Mark West Springs Road
- Addition of a green arrow (right turn overlap) at the northbound 'hook' off ramp at Mendocino Avenue/Old Redwood Highway

The Interim Improvements have been selected because they can be constructed by the time Phase II is occupied, and because they do not rely on widening the US 101 overcrossing (bridge) at River/Mark West Springs Road. Some work will be required in state (Caltrans) right-of-way with minimal dedication of property for widening.

The actual turning movement volumes, because they take many pages to print out, are included in the Appendix to the report. Queuing summary tables are provided in Appendix G.

b. Projected Level of Service and Signal Warrant Analysis

The LOS results for the near-term (2014) analysis are shown in Table 15 on the following page.

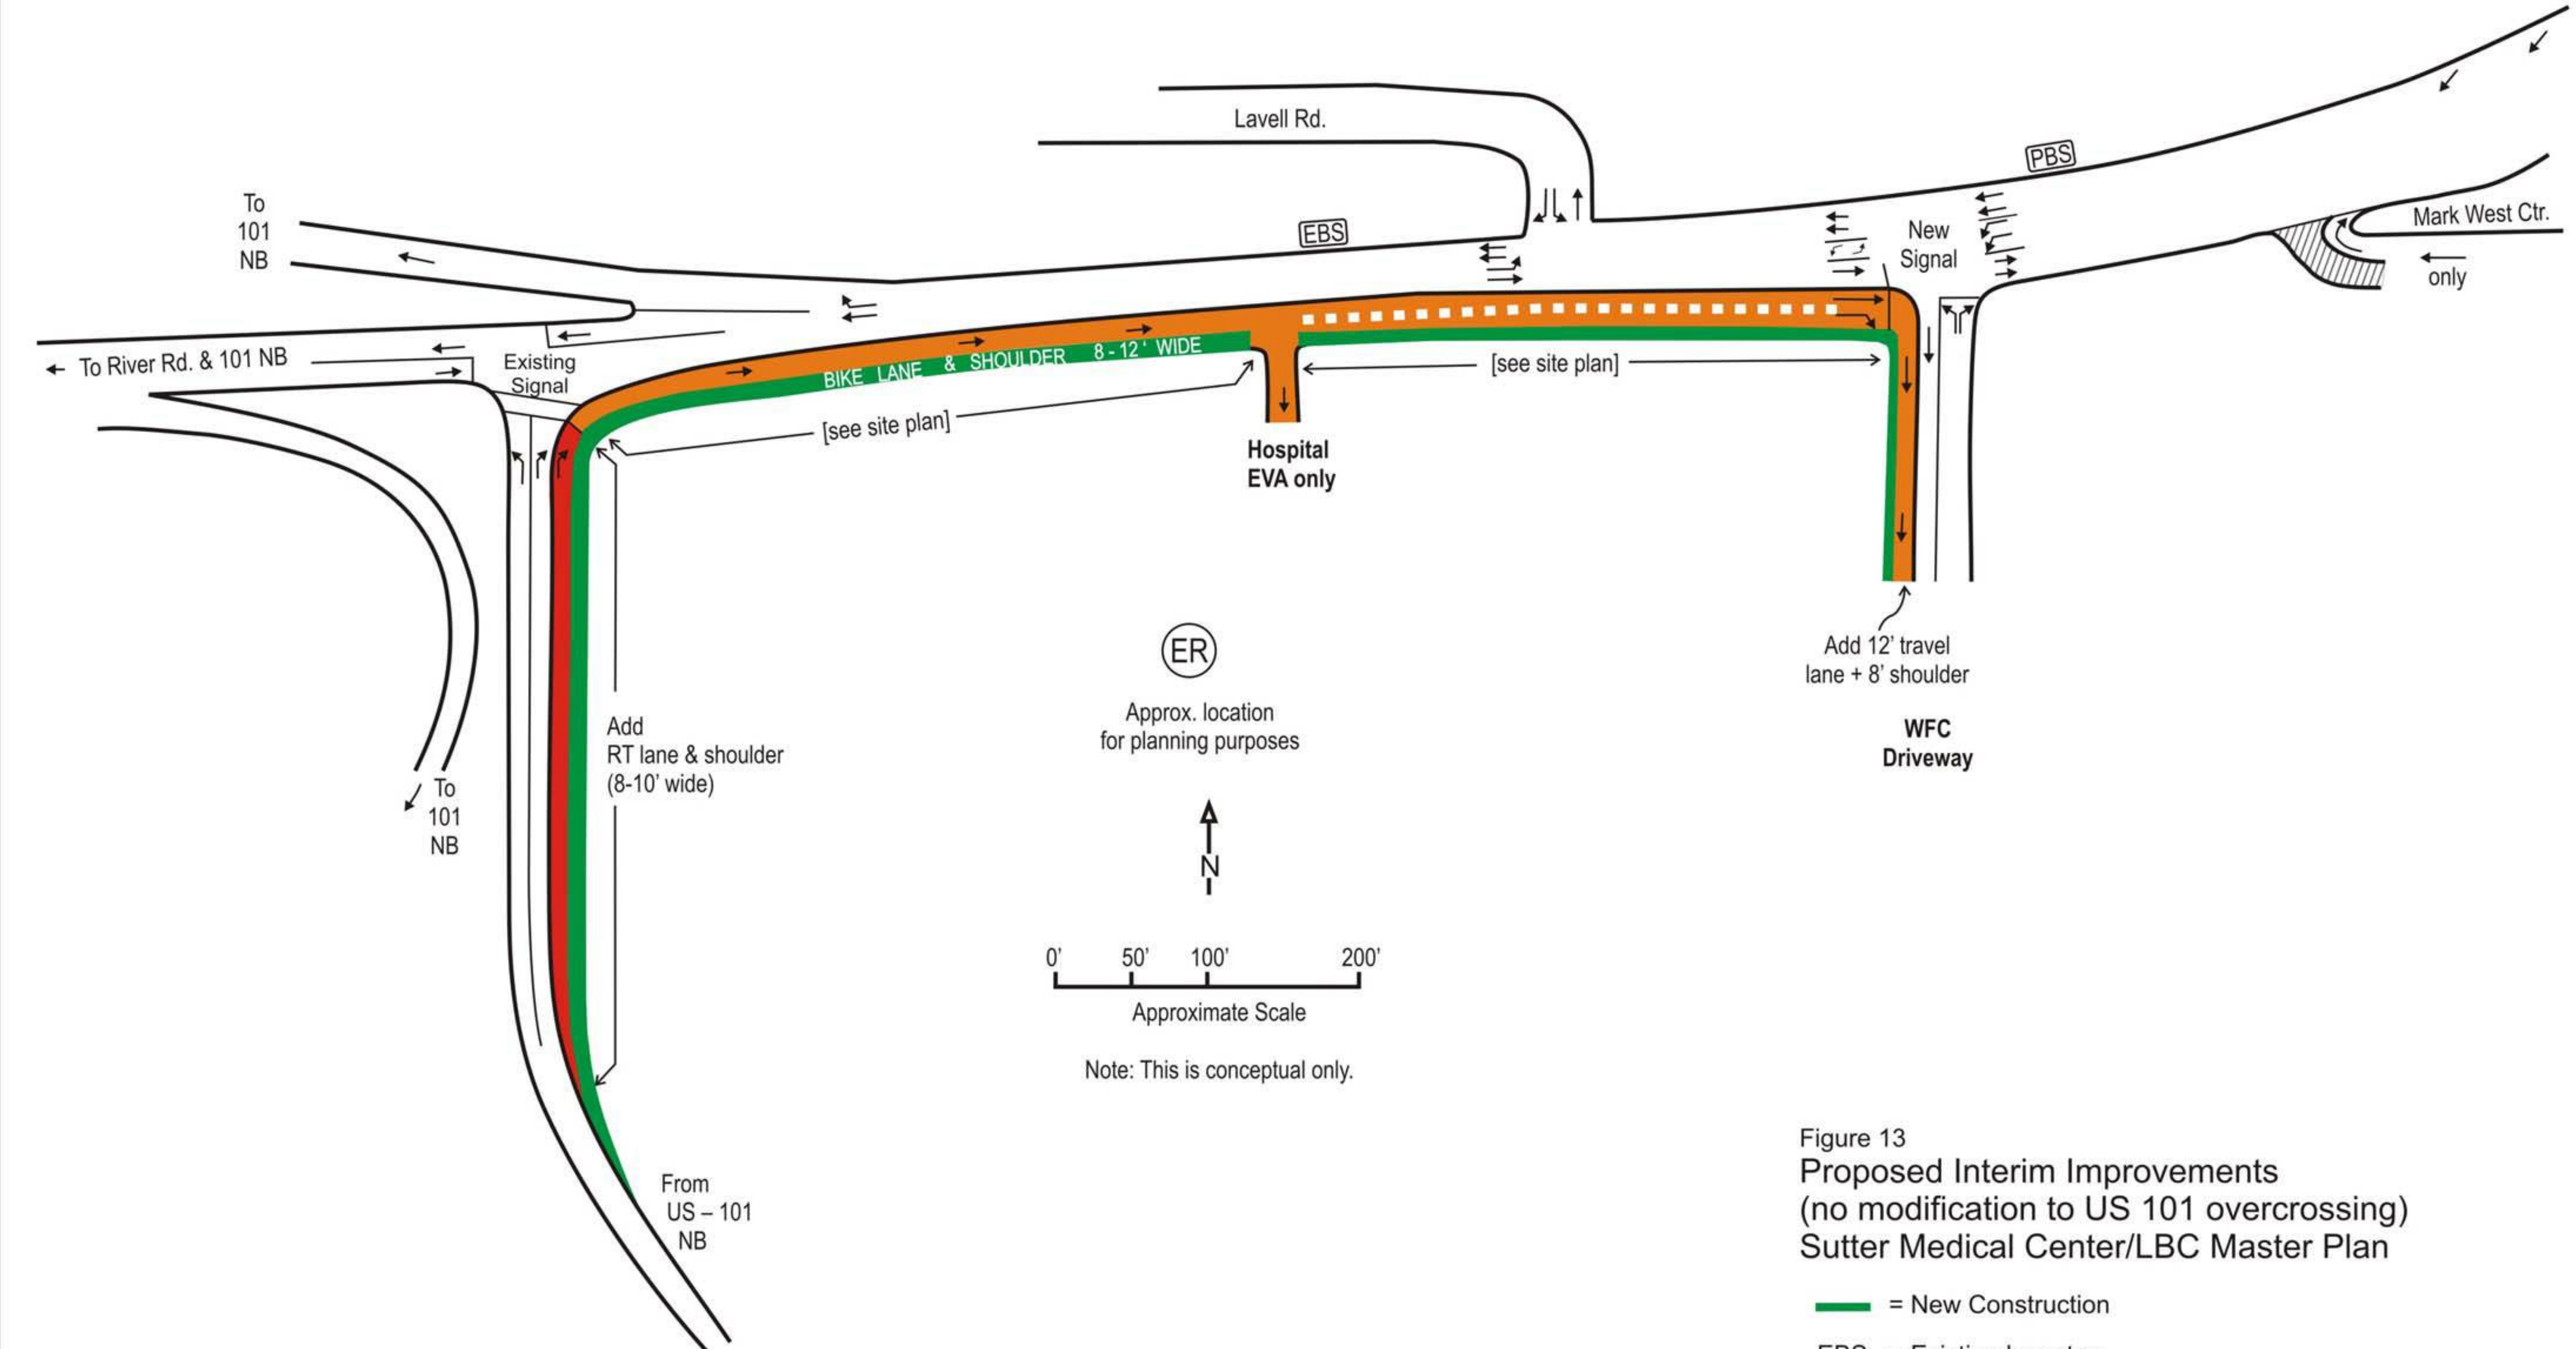


Figure 13
Proposed Interim Improvements
(no modification to US 101 overcrossing)
Sutter Medical Center/LBC Master Plan

Table 15
Intersection Levels of Service Comparison—2008 and 2014 without and with Project

	Existing (2008)		2014 No Project		2014 w/ Project Phase II	
Intersection	AM Peak	PM Peak	AM Peak	PM Peak	AM Peak	PM Peak
River Road/Fulton Road (45)	D (40.3)	E (55.3)	D (49.9)	F (82.0)	E (57.0)	F (95.3)
River Road/Barnes Road* -right turn (RT) (46) -left turn (LT)	F (56.6) F (>100)	C (21.5) F (>100)	F (95.7) F (>100)	D (25.9) F (>100)	F (>100) F (> 100)	D (28.9) F (>100)
US 101 Southbound Off-ramp/ River Road (4)	B (15.0)	B (12.8)	B (15.0)**	B (13.1)**	B (16.5)**	B (14.0)**
US 101 Northbound Off-ramp/ Mark West Springs Road (10)—assumes dual NB right turn	B (17.0)	B (16.3)	B (12.4)	B (15.6)	B (16.5)	B (19.2)
Mark West Springs Road/ Lavell Road* - RT (50) - LT	E (35.3) F (>100)	C (35.2) F (81.9)	E (42.3) F (>100)	D (27.1) F (>100)	F (53.0) F (>100)	F (57.8) F (>100)
Mark West Springs/ WFC Main Entry* - RT (51) - LT	D (25.2) F (>100)	D (49.1) E (56.0)	A (3.9)**	A (3.4)**	B (11.2)**	B (18.2)**
Old Redwood Hwy/ Mark West Springs Road (9)	C (32.1)	C (27.3)	D (38.3)	C (33.0)	D (42.5)	C (34.3)
E. Fulton Road/Old Redwood Highway* (53)	D (29.7)	C (18.1)	E (35.9)	C (20.8)	E (43.6)	F (85.4)

Method: *2000 Highway Capacity Manual* using TRAFFIX 7.9. Average control delay, in seconds, is shown in parentheses, rounded to nearest tenth second. "F>100" indicates that the calculated delay exceeded 100 seconds and cannot be reliably estimated.
* Unsignalized intersection; level of service is shown for the STOP controlled movement.
** Overall intersection with signalization; delay is reduced in future by assumed signal in this scenario.

Signal warrants analysis were done for the unsignalized intersections in the study area—at the Mark West Springs intersections with Barnes Road and Lavell Road, and at E. Fulton/Old Redwood Highway. The peak hour warrant (MUTCD Warrant 3) was used for this purpose. Of the three intersections, the Mark West Springs/Barnes Road intersection does meet the warrant in the PM peak hour. However, there are two factors that should be considered in deciding whether to signalize this intersection: its close proximity to the US 101 southbound ramp (where a signal is under construction and may help to create additional gaps in traffic for Barnes Road traffic); and the possibility that Barnes Road traffic may be largely a function of congestion on 101. Barnes Road volumes could, conceivably, drop once US 101 is widened and some of the freeway mainline congestion alleviated.

c. Projected Impact of Project on Key Intersections

The Project would have varying effects depending on the intersection and the mitigations that are made. The two intersections proposed for signalization (south 101 ramp at River Road, and the main WFC entry) improve in LOS, at least for the minor street approaches. The Mendocino Avenue/Old Redwood Highway northbound ramps also improve in level of service, due to provision of the right-turn overlap signal and phasing. At some of the unsignalized intersections, the left turn out of the side street experiences poor LOS, but the volume is not large. Mark West Springs Road/Lavell Road is an example of this; although consideration was given to signalizing this intersection, it is very close to the WFC Main entry, and could create problems due to queuing distance. It may also be that the left turn delay at this intersection is overestimated, because it does not take into account new gaps in traffic that would be created by the Mark West/WFC signal. Further discussion of this topic is provided in Section D (9.).

d. Impact on Key Roadway Segments

The impact on the two major roadways, Mark West Springs-River Road, and Old Redwood Highway, is shown in the table below:

Table 16-
2014 Project Phase II Arterial LOS Analysis Results With Interim Mitigations

Level of service – rounded speed in mph

	No Project		With Project Phase II	
Arterial Route and Direction	AM	PM	AM	PM
River Rd.-Mark West Springs Rd. EB	C- 23.3	D- 20.1	C- 22.9	E- 15.7
River Rd.-Mark West Springs Rd. WB	C- 25.5	C- 23.6	C-24.2	C- 22.2
Mendocino-ORH NB	B- 31.6	B- 32.8	B-32.5	B- 32.1
Mendocino-ORH SB	C- 22.7	C- 22.1	C-21.6	C- 24.7

e. Volume to Capacity Ratios

Intersection v/c ratios are shown in the Appendix for all study intersections. The freeway LOS tables are shown below.

Table 17
Near-Term (2014) No Project Freeway Level Of Service – Mixed Flow Lanes, with freeway widening now under construction

Location	Direction	Volume (mixed flow lanes)	Capacity	V/c ratio	LOS
Between River Road ramps and Airport/Fulton Rd. ramps	NB	3,272 AM	4,700	.70	C
		3,212 PM		.68	C
	SB	3,487 AM	4,700	.74	D
		3,855 PM		.82	D
Between Mendocino/Hopper ramps and River Road ramps	NB	3,338 AM	4,700	.71	D
		3,364 PM		.72	D
	SB	4,058 AM	4,700	.86	D
		3,822 PM		.81	D

Note: this table does not include HOV volumes, HOV lanes are expected to operate at LOS C or better. These are demand volumes; constrained volumes could be lower.

Table 18
Near-Term (2014) With-Project Freeway Level of Service – Mixed Flow Lanes, with freeway widening now under construction

Location	Direction	Volume (mixed flow lanes)	Capacity	V/c ratio	LOS
Between River Road ramps and Airport/Fulton Rd. ramps	NB	3,283 AM	4,700	.70	C
		3,254 PM		.69	C
	SB	3,519 AM	4,700	.75	D
		3,875 PM		.82	D
Between Mendocino/Hopper ramps and River Road ramps	NB	3,440 AM	4,700	.73	D
		3,429 PM		.73	D
	SB	4,092 AM	4,700	.87	D
		3,957 PM		.84	D

Note: this table does not include HOV volumes, HOV lanes are expected to operate at LOS C or better. Volumes include project traffic from Phase II medical center (MOB and hospitals).

Table 19
Future (2035) No Project Freeway Level of Service – Mixed Flow Lanes, with widening now under construction

Location	Direction	Volume (mixed flow lanes)	Capacity	V/c ratio	LOS
Between River Road ramps and Airport/Fulton Rd. ramps	NB	3,845 AM	4,700	.82	D
		3,910 PM		.83	D
	SB	4,008 AM	4,700	.85	D
		4,667 PM		.99	E
Between Mendocino/Hopper ramps and River Road ramps	NB	4,017 AM	4,700	.85	D
		4,021 PM		.86	D
	SB	4,501 AM	4,700	.96	E
		4,363 PM		.93	E

Note: this table does not include HOV volumes, HOV lanes are expected to operate at LOS C or better. Values represent Parsons' 2030 volumes increased by 7.56% growth, which is ABAG's forecast of job growth in Sonoma County between 2030 and 2035.

Table 20
Future (2035) With-Project Phase III Traffic Freeway Level of Service – Mixed Flow Lanes, with widening now under construction

Location	Direction	Volume (mixed flow lanes)	Capacity	V/c ratio	LOS
Between River Road ramps and Airport/Fulton Rd. ramps	NB	3,857 AM	4,700	.82	D
		3,954 PM		.84	D
	SB	4,042 AM	4,700	.86	D
		4,688 PM		1.00	E
Between Mendocino/Hopper ramps and River Road ramps	NB	4,127 AM	4,700	.88	D
		4,089 PM		.87	D
	SB	4,538 AM	4,700	.97	E
		4,505 PM		.96	E

Note: this table does not include HOV volumes, HOV lanes are expected to operate at LOS C or better. Values represent Parsons' 2030 volumes increased by 7.56% growth, which is ABAG's forecast of job growth in Sonoma County between 2030 and 2035. All table values are rounded to the nearest digit, e.g., the v/c ratio for the PM peak hour between River and Fulton Roads is actually .997 but is shown as 1.00 in the table above. Because the v/c is <1.00, the LOS as shown as E.

f. Adequacy of On-Site Parking

A parking analysis of the Project is provided in Section 2.C.1.t. It shows that onsite parking is proposed is greater than the parking demand of both the Sutter Medical Center and JV Hospital and the medical office building.

g. Pedestrians, Bicycles, Emergency Access, and Loading Areas

The site has not been fully designed at this time, however, the following comments can be made at this stage of the project's development.

Pedestrian Circulation: Pedestrian circulation will occur primarily (in order of magnitude) between:

- Parking areas and buildings
- MOB/hospital and WFC
- Transit stops on Mark West Springs Road and Old Redwood Highway

The pedestrian paths from parking areas could include raised walkways to act as speed humps to deter vehicles speeding on longer tangent sections of the parking lots. In general, any tangent parking aisle longer than 200' long should have either a speed hump or stop sign to deter excessive vehicle speeds. Sidewalks should be provided on at least one side of all internal roadways, at least in so far as they would be used to walk between buildings.

Bicycles: Bicycle circulation is assumed to be similar to vehicular circulation on site. Bicycle parking would be provided as per County code. Bicycle parking should be located as near to building entrances as practical. The wide shoulder area on the main inbound WFC driveway could be used as a bike lane, as could the pedestrian access path adjacent to the EVA on Mark West Spring Road.

Transit: As noted earlier, several County transit routes run by the site. Presently there is a stop for the 20X and 62 buses on Mark West Springs Road near Lavell Rd. The signalization of Mark West Springs Road and the WFC Main drive will provide a safer location for crossing. It may therefore be desirable to relocate the westbound stop to the far side of the Mark West Springs Road/WFC intersection, although it may add some distance to the walking distance to the medical center buildings. Bus stop changes should be coordinated with Sonoma County Transit.

Emergency Vehicle Access (EVA): This has been provided for by providing an additional EVA on Mark West Springs Road between the northbound 101 off-ramp and the WFC main driveway. Also, the project proposes to add wide shoulders to the 101 off-ramp and Mark West Springs Road eastbound in order to facilitate emergency vehicles bypassing vehicle queues, even during a major WFC event. First response fire protection would be provided by the existing fire station to the north on Old Redwood Highway near Lark Center Drive. The primary fire access routes would be via the main WFC drive, or via Old Redwood Highway to E. Fulton, then in the east WFC drive.

3. Cumulative 2035 Conditions without Project

a. Approved and Reasonably Foreseeable Future Developments

Projections prepared by SCTA for its SCTM/07 model update, based on ABAG *Projections 2007* information indicate these land uses for 2035:

Table 21
Forecast Year 2035 Land Uses, by SCTM/07 Travel Analysis Zone

Land Use	TAZ 127	TAZ 98	TAZ 110
Single family units	230	574	788
Attached & multi-family units*	76	143	41
Office (sq. ft.)	43,000	35,000	69,700
Strip/highway retail (sq. ft.)	2,200	31,200	62,200
Shopping center retail (sq. ft.)	0	0	41,300
Light industrial (sq. ft.)	0	54,800	0
Warehouse-storage (sq. ft.)	0	110,000	0
School (students)	648	396	1,145
Hotel Rooms	12	0	0

Source: Dowling Associates, and SCTA.
* Includes senior units. Values rounded.

b. Trip Generation from Anticipated Future Developments

Trip generation was forecasted using the latest SCTA travel forecasting model for 2035 conditions. As was done with the general plan forecasts, model volumes were adjusted by adding the model-projected traffic increase (between 2005 and 2035) to the existing counts.

c. Projected Daily Traffic Volumes without Project

The Sonoma County Travel Model (SCTM/07) provides AM and PM peak hour traffic volumes, but not daily volumes.

d. Traffic Volume Projections for Background (No Project) Traffic Growth

The peak hour traffic forecasts for 2020 AM and PM turning volumes are shown in the Appendix, for the no project condition. These have been developed from the SCTM/07 forecasts, using the post-model adjustment process used for all the General Plan forecasts.

e. Potential Impacts on Key Intersections

The 2020 No Project level of service is shown in Table 17. This table also shows the LOS and v/c ratios for the entrances to the site.

f. Potential Impact on Key Roadway Segments

The 2035 No Project and Project (Phase III) level of service for roadway segments is shown in that table below. Note that all of the roadways (after improvement called for in the General Plan) would operate within the County's LOS D or better standard, except eastbound Mark West Springs Road-River Road during the PM peak. This occurs with or without the proposed project.

Table 22 -
2035 Project Phase III Arterial LOS Analysis Results With Ultimate Mitigations

Level of service – rounded speed in mph

	No Project		With Project Phase III	
Arterial Route and Direction	AM	PM	AM	PM
River Rd.-Mark West Springs Rd. EB	D-19.6	**E- 16.9**	D- 18.8	**E- 15.9**
River Rd.-Mark West Springs Rd. WB	D- 19.6	D- 20.7	D- 18.6	D- 19.7
Mendocino-ORH NB	B-31.6	C- 27.2	B-31.6	C- 26.5
Mendocino-ORH SB	D- 19.3	C- 23.3	B-18.6	C- 22.8

Freeway impacts have been based on the traffic volumes developed for the Sonoma US 101 Project Approval/Environmental Documentation project, which is now under construction. These forecasts were originally done for 2030, but have been factored up to 2035 using ABAG *Projections 2007*. These volumes assume addition of an HOV lane in each direction, which would be effective during the peak periods. The No Project traffic volumes, v/c ratios, and LOS are shown in Table 17 below. Under the No Project conditions, Caltrans' objective (v/c ≤ .71) would not be met, even with the added HOV lanes on the freeway.

g. Impact on Volume-to-Capacity Ratios

V/c ratios are shown in the Technical Appendix for this condition.

Table 23 -
2035 No Project Intersection Levels Of Service
Average weekday (includes approved projects and WFC traffic, but no special WFC events; mitigations as noted)

Intersection	AM Peak Hr.	PM Peak Hr.
River Road/Fulton Road *(45) assumes 4L on River & Fulton Roads*	E (53.3)	D (47.2)

Method: *2000 Highway Capacity Manual.* Average control delay, in seconds, is shown in parentheses, rounded to nearest tenth second. "F>100" indicates that the calculated delay exceeded 100 seconds and cannot be reliably estimated. Small number in parentheses is the TRAFFIX network node number.

* Unsignalized intersection; level of service is shown for the STOP controlled movement.

4. Cumulative (2035) Conditions with Project

a. Projected Daily Traffic Volumes with Project

Projected cumulative daily traffic volumes with the project were shown in Figure 14. Turning movements are included in the Technical Appendix. Lane geometrics and traffic controls are shown in Figure 17 with ultimate improvements.

b. Traffic Volume Projections for Background Growth

This information was provided previously in Sections 4c and 4d.

c. Potential Impact on Key Intersections

The 2035 cumulative traffic level of service is shown in Table 19 for the AM and PM peak hour, with the Phase III Sutter medical center project at full occupancy.

d. Potential Impact on Key Roadway Segments

The potential impact on roadway level of service is shown in Table 24.

Table 24 -
2035 with Project Phase III Traffic-- Intersection Level of Service
Average Weekday (includes approved projects per *Sonoma County General Plan 2020*, and WFC traffic but no special WFC events; mitigations same as in Table 18)

* Unsignalized intersection; level of service is shown for the STOP controlled movement.

e. Volume-to-Capacity Ratios

V/c ratios are included in the Technical Appendix. Freeway v/c ratios are shown in Table 17.

D. Site Access Evaluation

1. Requirements for Access to the Development

The project would use but modify the two existing entrances to the WFC, off Mark West Springs Road and East Fulton Road. An additional inbound-only lane would be added at the main project driveway, as well as a shoulder area (which could also be used as a bike lane), to facilitate EVA. The EVA-only entrance would be added on Mark West Springs Road approximately opposite Lavell Road. The main entrance to WFC would be signalized to provide protected left turns into the site.

2. Impact of Access to the Project on Adjoining Neighborhoods

All of the proposed access is via arterial streets, and therefore the impact on adjoining neighborhoods would be minimal. There could be a small amount of traffic using Lavell Road to cut through that neighborhood to (or from) Old Redwood Highway north, but this is expected to be minimal provided that Lavell Road is unsignalized. A proposed mitigation is to prohibit left turns out of Lavell Road (into Mark West Springs eastbound); this would create some inconvenience for a very small number of vehicles presently making this movement, although alternative access is possible and is discussed in this report. See further discussion under Item #9 (below).

3. Left Turn Ingress

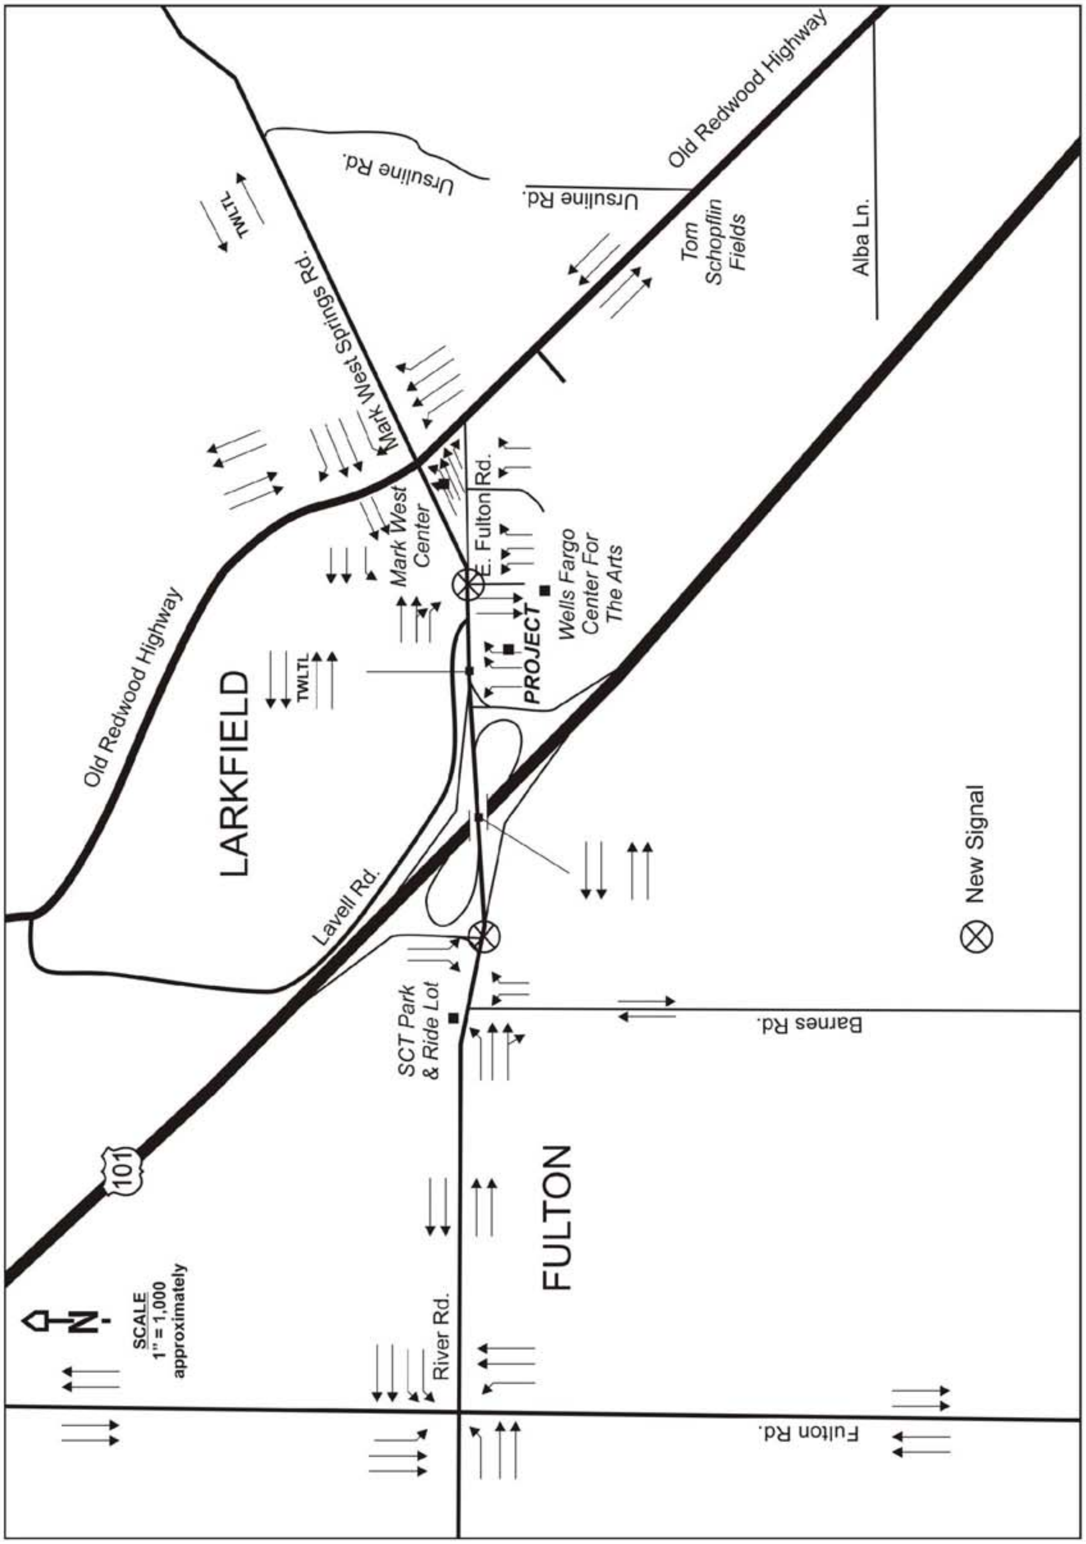
Most inbound traffic would make left turns using the existing left turn pocket on Mark West Springs Road westbound, with the project adding a second left turn lane. The queuing analysis showed this pocket was of sufficient length. The left turn ingress at the E. Fulton Road entrance has no opposing movements, so should suffer no queuing at the unsignalized entry.

4. Right Turn/Deceleration Lane Ingress

The only right turn into the site is at the main WFC driveway, where a right turn only/deceleration lane is proposed.

5. Left Turn Egress Acceleration Lane

Left turns out of the main WFC driveway will be signalized (split phasing) and therefore not require an acceleration lane. Left turns from E. Fulton eastbound into Old Redwood Highway northbound could be permitted, but an acceleration lane here is not feasible because it would conflict with the northbound left turn lane on Old Redwood Highway at Mark West Springs Road.



Dowling Associates, Inc.

Figure 14
Ultimate Proposed Lane Geometries
and Traffic Controls

6. Right Turn Acceleration Lane Egress

Given heavy traffic flows on Mark West Springs Road, it was (conservatively) assumed that all right turns into the project would have to be included in the green time for the left turn out of the project. Right turn acceleration lanes are more often used for unsignalized intersections with higher speed arterials. For the unsignalized right turn from E. Fulton Road into Old Redwood Highway southbound, vehicles would have to accelerate from a stop condition to the 35 mph posted speed. An acceleration lane here would probably not be justified here because of the proximity of the Mark West Springs Road signal just to the north. Also, the Sutter generated traffic makes very little use of this driveway.

7. Sight Distance

Sight distances in the study area are generally not a problem because most of the roadways are relatively tangent. The one exception is the sight distance limitation due to the vertical curvature of the overcrossing of US 101. This may not meet current Caltrans or AASHTO standards and is currently posted at 40 mph.

8. Modern Roundabout at Mark West Springs Road and Old Redwood Highway

At the request of County staff, the potential for replacing the existing signalized control of Mark West Springs Road/Old Redwood Highway with a modern roundabout was investigated. Modern roundabouts have been introduced recently to the United States, although they have been used extensively in other countries for several decades. The three key differentiating factors between modern roundabouts and older style 'traffic circles' or 'rotaries' are:

- YIELD control on entry (vehicles circulating in the roundabout have priority)
- Deflection of entering traffic (traffic must slow to make a turning movement into the roundabout)—this is usually accomplished with a 'splitter island'
- Appropriate geometric curvature to slow speeds within the roundabout

The following are preliminary conclusions based on a planning-level analysis of the potential for a roundabout at this location:

a. Dual (2) entry lanes on all approaches would be required to meet traffic demand in 2020 and beyond. The inscribed circle diameter for an urban roundabout is typically 150 to 180 feet.[10]
b. The exact amount of additional right of way required (compared to the existing intersection) would need to be determined in design work, but it appears that the roundabout could fit within the existing right of way with minimal right of way takes. Design should also include standard (five foot) bike lanes on all approaches.
c. The level of service, as defined by delay, would be poorer with a roundabout than with a traditional traffic signal; using 2035 traffic demands, the signalized average delay would be 67-78 seconds/vehicle, but with a roundabout would be 118 seconds or more.

[10] Federal Highway Administration. *Roundabouts: An Informational Guide.* June 2000.

The relative performance of a roundabout compared to a signalized intersection depends on many factors, including the turning volumes and traffic that conflicts with them; the ability to overlap signal phases, and other factors. Because the roundabout would operate at LOS F in the AM peak hour, with significant queues that might potentially block other driveways/intersection (e.g., the AM southbound queue is projected to be >1,700 feet), a roundabout has not been recommended at this location.

9. Access Changes at Mark West Springs/Lavell Road Intersection

Also at the request of County staff, modification to the Lavell Road intersection has been evaluated. The five options identified would be, 1) to do nothing, but widen Mark West Springs Road; 2) permit right turns in and out to/from westbound Mark West Springs, as well as left turns into Lavell from eastbound Mark West Springs Road; 3) allow right turn in/out only from westbound Mark West Springs; 4) close the intersection entirely; 5) provide a traffic signal at the intersection. Each of these is discussed below:

Lavell-1 Do Nothing. In its earlier traffic study (2005), Dowling Associates reviewed three years of collision data for this intersection. There were 10 reported collisions at the intersection (within 100') in three years, and three more that occurred between 101' and 200' of the intersection. Nine were in or east of the intersection. Most of these were rear-end crashes, but five were broadside (indicating a turning movement). Three involved injury to one or more motorists. None involved pedestrians or cyclists. The calculated collision rates were 1.47 per million entering vehicles in total, and 0.19 per million entering vehicles, if only injury-collisions are concerned. Both of these are significantly above the statewide averages for this type of roadway and intersection control (which are 0.44 for injury and .08 for injuries). Because this is well above the state average, the Do Nothing option is not desirable. With the added lanes on Mark West Springs Road and added traffic, the number of collisions would be likely to increase in the future absent any remedial action. Extremely long delays are projected for left turning vehicles out of Lavell during peak hours with 2035 traffic volumes.

Lavell-2 Right In/Out Access with Left Turns Into Lavell: Because of the collision history, the County T&PW Department proposed that a raised median be provided on Mark West Springs Road that would prohibit left turns out of Lavell Road into Mark West Springs Road eastbound. The inconvenience created by this would be fairly minimal, as only 9 vehicles make this turn in the AM peak hour, and 14 vehicles in the PM peak hour. These vehicles would instead be required to use Lavell Road to the north, and then make a right turn at the Lavell Road/Old Redwood Highway intersection, and then travel south again. For most users, this is unlikely to add more than two minutes to their trip. Vehicles traveling to or from the freeway (US 101) would not be affected by this alternative, and there is no impact on emergency vehicle access.

Lavell-3 Right In/Right Out Only: This alternative is similar to 2 above, but prohibits left turns into Lavell Road from Mark West Springs Road with a raised median. The purpose would be to enhance safety by eliminating an uncontrolled turning movement, where left turning traffic must wait for acceptable gaps in the westbound traffic stream on Mark West Springs Road. It also eliminates the potential for a left turning vehicle not seeing an opposing through vehicle, e.g., if a large vehicle were driving westbound on the inside (median) lane, and another vehicle were proceeding in the adjacent outside lane. However, it should be noted that this type of collision can occur at any uncontrolled intersection between a multi-lane major street and a minor cross street.

Vehicles that formerly made this left turn would be required to make a U-turn (if allowed) at either the WFC main entry (proposed for signalization) or Mark West/Old Redwood Highway (currently signalized, but all U-turns prohibited). This would add to the left turning volumes and queuing distances at whichever intersection the U-turn is made at. However, unlike in alternative 2, there is a modest volume of traffic observed making this movement today: 79 vehicles in the AM peak hour and 163 vehicles in the PM peak hour. There would be minor EV access issues; although the first-response fire station is to the north (and thus wouldn't use this intersection), any secondary response (or first response from the freeway, such as sheriff's vehicle) would be required to make the same U-turn movement as non-emergency vehicles.

Lavell-4 Complete Closure of Lavell: This treatment would cul-de-sac (block) the intersection at Mark West Springs Road. Although this would provide the greatest degree of safety, it would also create the greatest inconvenience to neighborhood residents and visitors. The 92 southbound right turn vehicles in the AM peak hour, and 87 in the PM peak hour, would be diverted to/thru other intersections. It would have EV impacts similar to Lavell-3 above.

Lavell-5 Signalization: This would signalize the intersection, and could allow all turning movements (e.g., southbound lefts from Lavell into Mark West Springs), or just certain turning movements (e.g., eastbound left into Lavell from Mark West Springs). The primary disadvantage of this treatment is the close spacing between Lavell and the WFC main driveway; at least 280 feet of queuing in the eastbound direction would be required, just barely within the 290' of storage distance that would be available. Caltrans may also be concerned about the proximity of this signal to the northbound freeway off-ramp—the storage distance would be less than 500 feet. It is also difficult to provide coordination (synchronization) in both directions when traffic signals are closely spaced. A signal with left turns allowed out of Lavell would tend to encourage cut-thru traffic to avoid the Mark West Springs/Old Redwood Highway intersection. Southbound traffic on Old Redwood could turn right into Lavell Road and use it to reach Mark West Springs Road. Finally, there is the issue of added cost, for both construction as well as maintenance and operation of the signal in the future. Impacts on EVs would be minimal, depending on whether certain turn movements were physically prohibited.

10. Dual Right Turn Lanes at Northbound US 101 Off-Ramp at Mark West Springs Road

The northbound off-ramp of US 101 at Mark West Springs Road will be the project's most heavily used freeway off-ramp. It is currently signalized and has a signal left and right turn lane (two lanes total). One of the important project mitigations proposed for this project is a second right turn lane to accommodate and mitigate the delay impacts of the project. The second lane permits more green time to be allocated to the eastbound through movement, which is constrained by the existing one-lane approach eastbound. This will permit the project to operate prior to the rebuilding and improvement of the interchange, which is likely to be some years in the future.
In the morning peak, the adding a second right turn lane has the benefit of reducing overall

intersection delay from 34.5 seconds/vehicle (LOS C) to 16.5 seconds/vehicle (LOS B). In the afternoon peak, the single right lane results in overall average delay of 37.5 seconds/vehicle (LOS D), but with the second right turn lane, the delay is reduced to 19.2 seconds/vehicle (LOS B).

A right turn green arrow is also recommended as part of the signal modifications, along with a phasing modification that will allow northbound right turns to occur at the same time as westbound through traffic. Because it is uncertain whether Caltrans will allow this phasing modification to occur, this measure has not been assumed in the LOS analysis in the paragraph above.

An additional benefit of the second right turn lane is to increase the effective storage length for this movement, to minimize the possibility of traffic backups onto the mainline. Although backups are not foreseen as a problem on normal weekdays, large WFC events have been known to create backups onto the freeway mainline, and this mitigation would benefit WFC as well as Sutter traffic.

3. Summary of Conclusions

Table 25 presents a tabular summary of conclusions in terms of traffic impacts, mitigations, timing, and significance after mitigation. Table 21 provides a comparison of the intersection level of service for the existing, the 2035 No Project, and the 2035 Project build-out conditions.

Traffic mitigations have been proposed in two phases—Interim and Ultimate—that correspond to the two project phases, but are also tied to the widening of the US 101/River Road overcrossing. The ultimate project would include widening River Road-Mark West Springs Road overcrossing (O/C) of US 101 to two travel lanes in each direction. This project is included in SCTA's countywide transportation plan, but is currently unfunded and is not included in the US 101 widening project from Steele Lane to Windsor that is slated for completion around 2012.

The County's *General Plan 2020* also includes ultimately widening River Road to four lanes between Laughlin Road (Brickway Parkway Extension) and US 101, and Mark West Springs Road between 101 and Old Redwood Highway. Ultimately Fulton Road would be widened, from Old Redwood Highway to the Santa Rosa city limits (in Santa Rosa, Fulton is a four lane divided road south to Highway 12)

In the long-term (20-year) cumulative scenario, it is likely that traffic growth will create the need for additional improvements in the City of Santa Rosa. These improvements are based upon previous traffic studies that have been done in the area:

Mendocino Avenue/ Fountaingrove Pkwy/ 101 O/C

a. Overlap the westbound right turn movement with the southbound left turn

Table 25

Summary of Impacts and Mitigations LTS= Less than significant impact

Intersection or Facility	Impact	Mitigation	Triggered by	Mitigates to LTS?	When Needed
River Rd./Fulton Rd.	Increased delay	Add 2nd EB left turn lane; consider 2-lane modern roundabout if R/W permits	Project & cumulative traffic	N; roundabout may be Y	Project Phase II
River Rd/ Barnes Rd.	LT delay excessive	Signalize after evaluating effects of freeway widening and installation of new signal at southbound ramp	Project & cumulative traffic	Possibly	2020 see discussion
US 101 Southbound Ramp	Project adds to critical movement--SB LT	Signalize	Existing volumes warrant (delay warrant uncertain)	Y	Under construction by Caltrans.
US 101 Northbound Ramp Mark West Spgs Rd.	Increased delay	Add 2nd NB RT lane and widen Mark West Springs Rd.	Project phase II	Y	2014
Mark West Spgs./ Lavell Rd.	Increased delay, esp. for LT vehicles from Lavell	Channelize to permit right in/right out only at Lavell; left turn into Lavell from Mark West Springs Road eastbound.	Project and cumulative traffic	Y	Not applicable.
Mark West Spgs./ WFC Main Entry	Increased delay	Signalize entry; add lanes on Mark West Spgs. Rd., including EB thru and EB right turn only	Project, and to lesser extent cumulative traffic	Y	Project phase I (when heavy trucks access site)
E. Fulton Rd./WFC East Drive	Less than significant	No changes proposed other than for Mark West Center	N/a	Y	N/a
Old Redwood Hwy/ Mark West Spgs. Rd.	Increased delay; 2020 AM LOS E	Intersection physically constrained; add to length of right turn lanes where feasible; add SB RT overlap with EB LT (green RT arrow). Coordinate signal timing with signal at WFC main entry drive.	Project and cumulative traffic	N	2010-2012
E. Fulton Rd./ Old Redwood Hwy	Increased traffic & delay	Separate LT and RT lanes on exit from E. Fulton Road; or prohibit left turn out of E. Fulton Road and allow U-turns eastbound at Mark West/Old Redwood.	Mark West Ctr. circulation changes and cumulative traffic	N	2020
US 101 Northbound/Mendocino Av.	Increased delay	Add RT overlap for NB exit traffic and NB LT from Mendocino Av.	Project, Kaiser, cumulative traffic	Y shorterm N cumulative	2014

Method: *2000 Highway Capacity Manual* using TRAFFIX 7.9. Average control delay, in seconds, is shown in parentheses, rounded to nearest tenth second. "F>100" indicates that the calculated delay exceeded 100 seconds and cannot be reliably estimated.

* Unsignalized intersection; level of service is shown for the STOP controlled movement.
** Overall intersection with signalization; delay is reduced in future by assumed signal in this scenario.

b. Add a 2nd westbound through lane (this has already been proposed as part of the ultimate widening of the overcrossing of 101 to four lanes.

Old Redwood Hwy (Mendocino Ave) / US 101 Northbound On-Ramp

a. Add a southbound through lane
b. Add a second northbound left turn lane

A discussion of some of potential impacts and mitigations is also provided in the text after the table.

River Road/Fulton Road: This intersection lies within the built-up portion of the small community of Fulton. There are limited options to improve its future LOS beyond the widening proposed in the *General Plan 2020*. The intersection operates below standard with or without the proposed Sutter/WFC project in 2014. The heaviest flow is in the north-south direction for vehicles using this as a freeway alternate, but there is no room to accommodate additional through lanes through the community. Adding a second (dual) westbound left turn lane appears physically possible (the northeast corner of the intersection is unbuilt), but would only improve the LOS from F to E. A modern roundabout is also a possibility at this location; it appears a roundabout could result in within-standard LOS. It would need to be a two-lane roundabout and there may not be sufficient right of way to accommodate it. However, further consideration of a roundabout might be given when Fulton or River Road are widened.

River Road/Barnes Road: Barnes Road serves both traffic from the neighborhood centered on San Miguel Road in Santa Rosa, and also freeway bypass traffic. Traffic in this area is constrained by the NWPRR (SMART) tracks to the west; San Miguel Road is the only public road crossing the railroad tracks between Piner Road and River Road. Although the intersection may warrant signalization by 2020, continued monitoring of this intersection is probably the best action. Its proximity to the US 101 interchange makes it an undesirable candidate for signalization; it may also be that gaps created by signalizing the adjacent southbound off-ramp of US 101 will create additional gaps in traffic, and thus reduce the delay for left turns out of this intersection. Left turns into Barnes and right turns out of it will operate acceptably.

US 101 Southbound Off-ramp: This intersection currently meets traffic volume warrants for signalization, but apparently not delay warrants. The intersection can operate well (LOS B) in the ultimate scenario, but until the overcrossing is widened, signalizing this intersection may create queuing problems due to the limited storage distance (only approximately 400 feet) to the upstream southbound on-loop. The southbound loop has moderately high volumes (>600 vph) in the AM peak hour that could create backups if there is only one westbound lane on the overcrossing. A short signal cycle length would minimize queuing, at the trade-off of not being able to coordinate this signal with other adjacent signals with longer cycle lengths.

US 101 Northbound Off-ramp: Without mitigation, this intersection operates at LOS C or D in 2014 with the project. Although this is within Caltrans and County LOS standards, adding a second right turn would improve the intersection delay to approximately the current (2008) delay conditions, and would minimize the potential for backups onto the freeway mainline.

Mark West Springs Road/Lavell Road: In the 2014 with-project scenario, right turns operate acceptably from this intersection but left turns would suffer long delays during peak hours. Signalizing this intersection is a possibility, but is probably undesirable due to its proximity to the main project entry. Southbound left turns from Lavell are currently very low volume, possibly due to the delays associated with such turns. A collision analysis indicated that this intersection is experiencing above-average crash rates. Prohibiting the left turn would result in minimal inconvenience, as motorists headed in the eastbound direction on Mark West Springs Road would have to detour north up to a half mile, but the number of vehicles affected is small.

Mark West Springs/WFC Main Entry: Improvements have been recommended, including signalization, which result in acceptable LOS (A in the AM, B in the PM) in the future with the project. If possible, this signal should be operational by the time large earth fill trucks begin to access the site.

Old Redwood Highway/ Mark West Springs Road: This intersection operates below County standard (LOS D or E) in the peak hours in with the project. There are limited options for adding capacity here due to the existing and approved property development on all four corners. Three mitigations that appear feasible include:

- Lengthening the right turn lanes
- Interconnecting and coordinating the signal with the WFC main drive signal
- Overlapping the northbound right turn with the westbound left turn movement

Nevertheless, this intersection would probably still operate below County standard in 2035, with or without the project.

4. Recommendations

The proposed mitigations include two sets of roadway improvements:

- Interim improvements to mitigate the first phase of project development, which do not require modification to the existing interchange overcrossing structure.

- A set of ultimate mitigations that is contingent upon widening the existing two-lane overcrossing structure to at least four lanes.

The interim improvements would include:

- Signalization of the Main WFC entry on Mark West Springs Road, with interconnect installed to the adjacent signals (Old Redwood Highway, and possibly US 101 northbound).

- Signalization of the southbound US 101 off-ramp at River Road

- Widening of Mark West Springs Road, as shown in the diagram on the following page. This provides for an additional eastbound thru travel lane, plus a right turn only lane into the WFC, a bike lane (Class II), and a shoulder area (minimum of 8') between the

US 101 northbound off ramp and the emergency vehicle access (EVA) on Mark West Springs Road

- Addition of a green arrow (right turn overlap) at the northbound 'hook' off ramp at Mendocino Avenue/Old Redwood Highway (requires Caltrans approval; this is a state-operated signal).

In addition to the interim improvements, the ultimate improvements would include:

- Addition of a second westbound lane on Mark West Springs Road, between Old Redwood Highway and the 101 interchange

- Widening of 101 overcrossing to four lanes

- Widening of US 101 to six lanes, which the two inside lanes reserved for high occupancy vehicles (HOVs) during peak periods

- Widening River Road to four lanes between from Brickway Extension (now Laughlin Road) to US 101

- Widening Fulton Road to four lanes from the Santa Rosa City limits north to Airport Blvd.
- Addition of a second northbound right turn lane, at the 101 northbound exit at Mark West Springs Road

Other Recommendations

Other recommendations of the traffic study are summarized here:

R1. The main entrance roadway on Mark West Springs Road should include two entry (southbound) lanes, and three exiting lanes (two left turn lanes, and a right turn only lane). This will require a curb-to-curb road width of at least 62 feet, plus any landscaping or median treatment. It should provide for two-way circulation (in and out of the site). A shoulder at least 8 feet wide should be provided inbound, to facilitate any emergency vehicles coming from the east and using this entry (although emergency vehicles could also make a left turn into the EVA farther west).

R2. A right turn deceleration lane is provided for traffic traveling eastbound on Mark West Springs Road and turning into the site.

R3. Adequate storage distance for queuing has been included for exiting vehicles, with no intersecting aisles. This queuing "throat" area is more than 800 feet for each of the left and right turn lanes.

R4. A traffic signal would be warranted at the main entry on Mark West Springs Road. This will facilitate left turns into and out of the site, thereby reducing delay; and will also facilitate the crossing of Mark West Springs Road by pedestrians using the westbound bus stop on Old Redwood Highway.

R5. Emergency helicopter operations may be a distraction to motorists, causing traffic to slow. This can be mitigated by providing visual screening of the helipad from US 101. It should be noted that in other areas (e.g., State Route 24, which is immediately adjacent to Oakland Children's Hospital, this has not proven to be a problem once motorists got used to the sight of the helicopters.

R6. The curb to curb width of Mark West Springs Road between US 101 and the project entry will likely need to be 84' to 86', which includes bike lanes and gutter pan. Between the project entry and Old Redwood Highway it can probably be 72'-74' between curbs. Additional right of way would be needed for sidewalks, parkway strip (landscaping), and any public utility easements. It appears that most, or perhaps all, of this widening will need to occur to the south of the existing pavement (i.e., on WFC's property).

R7. Accessible parking spaces should be located against the building so as to minimize the need to cross traffic.

R8. A paved sidewalk connects the building front entrance directly to the bus stop and to the signalized main project driveway, and along the EVA to connect to the bus stop near that location.

Other features proposed by the project sponsor include:

- A pedestrian drop-off next to the main building entry.
- A marked walkway leading directly to the building.
- A bus shelter meeting SCT standards for the bus stop on Mark West Springs Road for the convenience of transit passengers waiting for buses.

APPENDIX D. Study Participants and Persons Contacted

Dowling Associates, Inc.
Steven B. Colman, PTP, Project manager

Nadin Sponamore, Sponamore Associates

Traffic Count Data: Wiltec (Turning movements)
Marks Traffic Data and NDS/ATD (machine counts)

Persons Contacted:

County of Sonoma
- Steve Dee
- Ken Ellison
- Dave Wallace

Wells Fargo Center
- Marc Hagenlacher

Sutter Health
- Tom Minard

APPENDIX E. Not Applicable to this Study

APPENDIX F. Special Events Trip Generation Form

DEFINED EVENTS ON WELLS FARGO CAMPUS BY PHASE

Location	Event Size	Type of Event	# of Events	Day of Week	Duration (# of Days or Weekends)	Time of Day	# of Vehicles/Day	Noise
WFS/East Lawn WFS/East Lawn North Parking Lot	0 - 200 people/day	Corporate Meeting Company Meeting Recycle/Fundraiser	1 1 1	Thursday Saturday Sunday	1 1 1	9 am - 2 pm 5:30 pm - 8:30 pm 9 am - 3 pm	20 50 30	
WFS/East Lawn	201 - 500 people/day	Fashion Show/Fundraiser Motorcycle Group Meeting	1 1	Friday Saturday	1 1	10:30 am - 2:30 pm 9 am - 4 pm	200 160	Yes
WFS/East Lawn	501 - 1,000 people/day	Guitar Festival/Tradeshow Church BBQ Bike Tour/Fundraiser Bike Tour/Fundraiser Foreign Car Club Show Open Heart Symposium High School Graduation	1 1 1 1 1 1 1	Fri - Sun Sunday Saturday Sunday Saturday Sunday Saturday	3 1 1 1 1 1 1	11 am - 6 pm 9:30 am - 1 pm 9 am - 10 pm 4:30 am - 9 pm 10 am - 3 pm 4 pm - 6 pm 10:30 am - 12:00 pm	400 400 320 320 280 280 280	
WFS/East Lawn	1,001 - 1,800 people/day	Corporate BBQ	1	Monday	1	1:30 pm - 4 pm	560	
WFS/East Lawn	2,300 Flow	Bike Rally	1	Saturday	1	4:30 am - 6:30 pm	920	
South Lawn	201 - 500 people/day							
South Lawn	501 - 1,000 people/day	none						
South Lawn	1,001 - 1,800 people/day	P.D. Garage Sale	1	Saturday	1	9 am - 4 pm	1,000	

Note: If there were sound mitigation, WFC would add 6-10 receptions on the East Lawn in addition to the events listed above. Those events would fall between May - October with attendances of 150 - 400 people. Saturday and Sunday would be the most popular days with the events taking place in the afternoons/evenings. These events would generate 75 - 200 cars on campus.

1. WATER

1.1 PROJECTED INDOOR WATER USE FOR SUTTER MEDICAL CENTER CAMPUS

Projections for indoor water use at the new Sutter hospital facilities are calculated utilizing anticipated hospital occupancy levels, plumbing fixture use frequency and flow rates contained in the 1992 Energy Policy Act (cited in LEED WE Credit 3), plus an allowance for areas equipped with specialized fixtures such as surgery, emergency room, food service and janitorial facilities. Table 4 at the back of this report indicates that maximum day water use for the 70-bed Sutter Medical Center Hospital (SMC) will be 177 gpd/bed. Maximum day water use will coincide with full occupancy. Average daily water use is calculated using an 80% occupancy factor which results in 142 gpd/bed. These indoor water use rates are also applied to the 28-bed Physician's Medical Center and potential 29-bed SMC expansion.

Hospitals utilize chillers, cooling towers and boilers instead of conventional (e.g. air-cooled condenser based rooftop package units) heating, ventilation and air conditioning (HVAC) systems for heating and cooling needs. These hospital HVAC systems have water losses from evaporation, bleed-off and periodic replacement of cooling and heating system water. HVAC system water losses for the proposed hospital, Physicians Medical Center and medical office building (MOB) have been calculated based on square footages to average 10,200 gpd, with a peak daily use of 24,700 gpd. HVAC demands will vary with environmental conditions and building occupancy levels. Maximum water use will occur during the hottest days when the hospital is at or near full capacity.

A summary of projected indoor and HVAC water uses, including those for possible future expansions of the SMC are shown in Table 1.

1.2 PROJECTED LANDSCAPE IRRIGATION WATER USE

Approximately 10 acres of the Hospital property will be planted with low water use landscaping. Based on monthly rainfall history and evapotranspiration rates, projected peak day irrigation demand in the first year is calculated to be approximately 88,000 gallons, with a peak annual requirement of about 9,000,000 gallons, assuming a late spring or summer landscape plant installation. As plants become established, irrigation demands will diminish. After plant establishment, annual demand for irrigation is projected to drop to about 6,100,000 gallons.

Landscape irrigation demands need to be included when sizing the water supply system. Irrigation demands generally occur only during the spring and summer months, with the peak usually occurring in July. With irrigation restricted to approximately a 10 to 16 hour period, the flow rate necessary to satisfy the peak day demand is estimated to be 90 gpm in the establishment year, and just under 70 gpm in subsequent years.

1.3 FIRE FLOWS AND FIRE SERVICE

The County Fire Marshal initially indicated that minimum fire flows of at least 3,000 gpm may be required from hydrants around the hospital. To meet the Fire Marshal's requirement, hydraulic computer modeling of the California American Water Company (CalAm) distribution system serving WFC was performed to determine the improvements necessary to achieve 3,000 gpm fire flows. It was determined that the installation of 2,150 feet of 12-inch water main on Lavell Road to complete a piping loop in the off-site distribution system, combined with an 8-inch water main loop around the hospital site would result in available fire flows of over 3,000 gpm.

More recently, in response to changes in building type of construction classifications and related buildings for the new hospital and other fire system enhancements proposed by the applicant, the

Fire Marshal has confirmed a minimum fire flow requirement of 2,500 gpm along the project's Mark West Springs Road frontage would be acceptable.[1] A recent fire flow test, performed by CalAm Water, at a nearby off-site hydrant (near the intersection of Lavell Road and Mark West Springs Road) resulted in a fire flow of 2,500 gpm at an acceptable residual pressure, which eliminates the need to make the previously anticipated off-site improvements.

1.4 WATER SUPPLY

It is anticipated that the water system serving the hospital will be owned and operated by the hospital, and will consist of two groundwater supply wells and associated treatment facilities. The California Department of Public Health (CDPH), the regulating agency for public water systems, classifies the proposed system as a non-transient, non-community public water system under Title 22 of the Public Code.

In order for the water system to meet peak daily demands of both irrigation and domestic water uses, the groundwater supply source would need to be capable of delivering 134,550 gpd for the initial phase of construction in 2013. As the landscaping will have been installed with the initial phase and be mostly established for future phases, only 100,370 gpd will be necessary for complete site buildout. The site buildout peak daily demand equates to a constant flow rate of 70 gpm from the supply source over a 24-hour period; however, standard design practices dictate that peak daily demand be accommodated by pumping for not longer than 16 hours per day. With the initial phase of construction requiring higher irrigation flows, this translates to a maximum pumping flow rate of 140 gpm.

The CDPH requires public water systems to be capable of supplying the peak day demand from their water supply sources. Given that the site buildout peak day demand includes an initial plant establishment landscape irrigation volume that will be substantially diminished as landscaping matures, it is anticipated that a water supply source capable of delivering between 120 and 140 gpm will be sufficient to meet CDPH requirements.

With the anticipated annual hospital occupancy rate of 80%, withdrawal from the aquifer would be approximately 59 acre feet to meet the initial year demands and will diminish to be approximately 58 acre feet per year to meet complete site buildout demands.

Figure XVI-2 shows the location of the primary water system components for the project.

---

[1] Letter to Thomas Jones, Brelje & Race, dated October 6, 2009 from Robert MacIntyre, Fire Marshal, Sonoma County Department of Emergency Services.
Fire service to the new hospital will be provided by CalAm. All on-site fire system piping and hydrants will be privately owned and maintained, and will meet CalAm and Sonoma County Fire Standards.

2. WASTEWATER

2.1 WASTEWATER COLLECTION

The project site is located along the southern boundary of the Airport-Larkfield-Wikiup Sanitation Zone (Sanitation Zone) that is operated by the Sonoma County Water Agency (SCWA). Annexation into the Sanitation Zone is the only viable means of providing public sewer service for the project. Numerous meetings and discussions regarding such service have taken place with Sutter Health (Sutter), Luther Burbank Memorial Foundation (LBMF), and SCWA staff.

The LBMF currently operates wastewater treatment and disposal facilities on site that serve the Wells Fargo Center for the Arts (WFC). The project includes abandoning these facilities and connecting WFC to the Sanitation Zone collection system (sewers). The hospitals and medical office building (MOB) will also contribute wastewater flows to the sewers. Although these additional flows will be completely offset in the majority of the existing trunk system due to implementation of the High-Efficiency Fixture Direct Installation Program (HEFDIP), local collector sewers in the upstream end of the collection system may be impacted by these additional flows (refer to Section 2.4.5 for more information on the HEFDIP). Sewer flow capacity is evaluated using peak wet weather flow (PWWF) criteria under which both hospitals and the MOB are projected to discharge a total of approximately 0.15 cubic feet per second (cfs)[2] to the collection system. Selection of the PWWF to be utilized in evaluating the effects upon the collection system is dependent upon several variables whose values will be determined during the SCWA sewer service application process.

There are two (2) potential points of connection to the collection system that could be utilized by the project. One potential point of connection is to the existing 8-inch sewer in Mark West Springs Road. Preliminary modeling by Brelje & Race indicates that this sewer, installed at a slope of 0.002 for its entire length, is capable of accommodating flows of at least 0.60 cfs before reaching pressure flow conditions.

A second potential point of connection is to the existing 12-inch sewer in Old Redwood Highway just south of Mark West Springs Road. Delivering wastewater to this connection point would likely require construction of a sewage lift station and force main serving the Sutter project. The force main would discharge to a gravity sewer on the project site from which point wastewater would then flow by gravity to the point of connection to the existing collection system.

Application to SCWA for sewer service for the project will include detailed modeling and design studies that will be used to select the preferred alternative for connection to the collection system.

For the location of connection points to the existing sewer system, see Figure XVI-3.

2.2 WASTEWATER TREATMENT

Average dry weather flow (ADWF) is the design parameter that is commonly used to identify the capacity of wastewater treatment facilities. ADWF is defined as the lowest average flow into a treatment facility during any 30-day period. This flow usually occurs during the late summer and is likely to change from year to year. The 2008 ADWF to the Sanitation Zone treatment plant was 0.673 million gallons per day (mgd), which is well below its current rated capacity of 0.900 mgd; however, the ADWF has been higher in past years, reaching a peak of 0.851 mgd in 2006. This peak ADWF, in combination with other unitary treatment process limitations at the plant, indicates that the plant is operating at nearly its current rated capacity.

[2] The average day flows for the hospitals and MOB were multiplied by 3.5 (peaking factor), to which resultant value was added an allowance for inflow and infiltration and a safety factor of 10% to arrive at 0.15 cfs.

Wastewater treatment has recently been improved from secondary to tertiary standards by the addition of filtration and chlorination facilities. Additionally, SCWA has plans for upgrades to the plant that would increase its treatment capacity to an ADWF of 1.2 mgd - the permitted capacity of the plant. These upgrades are currently scheduled to be funded by SCWA in 2015. Given that the treatment plant is currently operating at nearly its current rated capacity, improvements to the plant would need to be realized before significant wastewater flow is added to the system.

Wastewater discharged to the sewer collection system by the project will have BOD (biochemical oxygen demand) and TSS (total suspended solids) concentrations similar to those generated by residential units and commercial uses within the Sanitation Zone Although "zero footprint"[3] achievement will result in no additional wastewater flow entering the Sanitation Zone treatment plant, the project's overall effect on the influent to the plant will likely be a minor increase to the BOD and TSS loading. BOD and TSS are the primary constituents of concern when evaluating the treatment capabilities of the Sanitation Zone treatment plant.

2.2.1 Biochemical Oxygen Demand (BOD)

The BOD concentration of wastewater discharged to the sewer collection system is expected to average 219 mg/l. Table 2 contains BOD concentrations reported for the existing Sutter Hospital on Chanate Road which range between 90 and 250 mg/l over a 5-year period with an average concentration of 175 mg/l. The projected increase from 175 mg/l to 219 mg/l accounts for the fact that the proposed project buildings will be equipped with water conserving fixtures and therefore will likely generate a more concentrated waste stream.

The Sanitation Zone treatment plant processes wastewater during all times of the year such that its effluent BOD concentrations are below the limit established by its current Waste Discharge Requirements. Influent BOD concentrations at the Sanitation Zone plant range between 113 mg/l and 344 mg/l (5th and 95th percentile of data from 2005 to 2009). The BOD projected to be discharged to the sewer collection system by the proposed hospital facilities (48 lbs/day) is estimated to be less than 2% of that capable of being removed by the plant (refer to Table 3). No plant improvements are required to accommodate this slight additional load.

2.2.2 Total Suspended Solids (TSS)

The TSS concentration of wastewater discharged to the sewer collection system is expected to average 201 mg/l. Table 2 contains TSS concentrations reported for the existing Sutter Hospital on Chanate Road which generally range between 60 and 300 mg/l over a 5-year period with an average concentration of 161 mg/l. The increase from 161 mg/l to 201 mg/l accounts for the fact that the proposed project buildings will be equipped with water conserving fixtures and therefore will likely generate a more concentrated waste stream.

The concentration of TSS at the Sanitation Zone treatment plant currently poses intermittent problems when influent flows exceed the microfiltration process capacity necessary to produce effluent to tertiary standards. Influent TSS concentrations at the Sanitation Zone plant generally range between 111 mg/l and 346 mg/l (5th and 95th percentile of data from 2005 to 2009). The TSS projected to be discharged to the sewer collection system by the proposed hospital facilities (44 lbs/day) is estimated to be less than 2% of that entering the plant on an average day (refer to Table 3).

[3] "Zero footprint" means the complete reduction and/or offset of the wastewater flow to be generated by the proposed project by water conservation,or other measures.

The intermittent microfiltration operational problems generally occur during the winter when elevated plant influent flow exceeds the through-put efficiency of the microfilters. In this situation, a portion of the secondary effluent from the settling pond is temporarily diverted to a storage pond. Because of the elevated TSS levels, this diverted water does not meet secondary treatment standards and must therefore be retreated when plant inflow no longer exceeds the threshold that prevents the entire plant flow from being directed through the microfilters.

The Sanitation Zone plant currently operates with four microfiltration modules. The above intermittent microfilter capacity problem (including the effects of added TSS attributable to the project) could be fully addressed through the addition of two additional banks of microfilters to increase the tertiary treatment capacity. Adequate treatment for just the added TSS loading attributable to the project could be provided through alternative means by adding a tank to store and supplement the clean water supply to the microfilter backwash pumps. This would enable higher backwash flow rates that would improve backwash efficiency and allow longer net run times for the existing microfilters.

Adequate space exists within already developed areas at the Sanitation Zone plant to accommodate installation of either of the above improvements.

2.3 WASTEWATER DISPOSAL

Effluent storage and disposal are not considered by SCWA staff to be capacity-limiting issues. There are three effluent storage ponds in the Sanitation Zone system with a total storage capacity of 290 million gallons. Current discussions amongst SCWA, the City of Santa Rosa and the Town of Windsor regarding agreements to share the effluent storage and disposal capabilities of their respective systems are likely to result in there being no need for expansion of effluent storage and disposal facilities in the Sanitation Zone.

2.4 WASTEWATER GENERATION

Sutter plans to take a multi-prong approach to water conservation with the expectation of realizing a "zero footprint" for the project in terms of wastewater services needs. This approach includes the following three primary components:

1. Retrofit the Wells Fargo Center for the Arts with low flow toilets and other indoor water conserving devices.
2. Install low flow fixtures in both hospitals and the medical office building.
3. Achieve offset credits by funding a program to retrofit residential and commercial buildings already connected to the Sanitation Zone with ultra low flow toilets and other indoor water conserving devices.

2.4.1 Wells Fargo Center for the Arts

The current wastewater generated at the WFC has been determined to be an average of approximately 4,900 gallons per day (gpd). This flow was derived from metered water use data for the period October 2007 to October 2008 as shown in Table 4. This bi-monthly water data from billing records of California American Water Company (CalAm), the supplier of potable water to WFC, is reflective of wastewater generation since the LBMF operates its own on-site irrigation well to meet all outdoor irrigation water needs. The CalAm water use data also includes the minimal water needs and wastewater contributions from the HVAC system that serves existing facilities.

Opportunities for reducing the wastewater generated at WFC reside primarily with replacement or retrofit of existing water closets and sink faucets. Reduction is expected to be robust since a very high percentage of the indoor water use comes from toilet/urinal flushing and hand washing, especially during events that utilize the 1,668-seat Pearson Theatre. Plumbing fixture retrofit and replacements should reduce average wastewater generation at WFC to approximately 3,200 gpd. Refer to Table 5.

2.4.2 Hospitals

The domestic wastewater generated by the project hospitals – 99-bed (70 initial beds and a potential 29-bed expansion) Sutter Medical Center (SMC), and 28-bed Physician's Medical Center (PMC) - has been projected using anticipated hospital occupancy levels, plumbing fixture use frequency and flow rates contained in the 1992 Energy Policy Act (cited in LEED WE Credit 3), and an allowance for areas equipped with specialized fixtures such as surgery, emergency room, food service and janitorial facilities. Table 4 (Baseline Case) uses this data for the 70-bed SMC to arrive at a peak day wastewater generation volume of 177 gpd/bed. To determine wastewater discharged during a typical ADWF rating period, an average occupancy factor of 0.8 was applied to project a "worst-case" total baseline wastewater flow of 18,040 gpd (exclusive of flow from water treatment and HVAC facilities) for the the entire 127-bed hospital portion of the project. Refer to the following section for a discussion of wastewater generated by water treatment and HVAC operations.

As a means of comparison, Exhibit "A" of the current Ordinance that establishes criteria for determining sewer connection fees within the Sanitation Zone lists 175 gpd/bed as the hospital flow component.

2.4.3 Water Treatment and HVAC Facilities

Sutter proposes to install its own wells capable of providing domestic water supply. Well water will require treatment. Backwash of the treatment facility to clean and regenerate filter media may generate up to 1,880 gpd of wastewater. Although the facility may include the means to recycle backwash water through the filtration system and avoid discharge to the sewer, an allowance for 1,880 gpd has been made for the purpose of zero footprint calculations.

Although water consumed through HVAC equipment operation can be substantial, the consumption is primarily due to evaporative losses associated with heat rejection from cooling towers. In order to control the solids concentration in the cooling tower water, a small percentage of the circulating water is "bled off" and discharged to the sewer. These bleed losses are estimated to be 10% of the HVAC system water consumed on an average day or 1,320 gpd.

2.4.4 Medical Office Building

The wastewater generated by an 80,000 square foot medical office building (MOB) is projected to be 3,000 gpd at full occupancy. This volume is based on an occupant density of 2.5 persons per 1,000 square feet and a wastewater generation of 15 gpd per occupant. The MOB is projected to be occupied at the above density from Monday through Friday at most times during the year, but largely vacant on weekends. The wastewater discharged during a typical ADWF rating period is therefore expected to be approximately 2,140 gpd (5/7 x. 3,000 gpd).

2.4.5 Retrofit Existing Buildings Connected to Sanitation Zone

As of July 2008, there were 3,622 equivalent single-family residences (ESD) connected to the Sanitation Zone - roughly 65% are residential and 35% are commercial. A large proportion of the buildings in the service area were constructed prior to the advent of low and ultra-low flow fixtures being utilized in construction. Sutter will achieve a zero footprint for wastewater generation. In order to achieve zero footprint for the proposed project, any of the following on-site and off-site measures may occur:

- Installation of water conserving devices required by federal law (low flow toilets, low flow shower heads, and low flow faucets with aerators).
- Installation of water efficient clothes washers.
- Installation of water efficient dishwashers.
- Installation of submeters in multi-family buildings.
- Installation of conservation devices in commercial and institutional buildings.

Conversations with CalAm staff indicate that only about 60 residences within the service area have replaced their older toilets and clothes washing machines with new, lower water consumptive fixtures under their rebate program. As of July 2009, there was no similar rebate program established by SCWA for the Sanitation Zone service area; however, in August 2009, SCWA established the High-Efficiency Fixture Direct Installation Program (HEFDIP) whereby property owners can have their toilets, faucets and showerheads replaced with water conserving fixtures at no cost to the property owner, simply by signing up to have the work completed by a plumber on the approved program list. Sutter will be given the opportunity to fund this program to the extent necessary to achieve zero footprint status for the proposed project.

Although an unknown number of ESD may have already replaced high water use fixtures with low or ulta-low use ones outside of an organized rebate program, the number is likely insignificant compared to the number of connected ESD. Judging from the results of rebate programs in nearby communities (ref. Table C1, *Zero Footprint Design, Water Supply for University District Specific Plan*, Rohnert Park, CA, Jon Olaf Nelson Water Resources Management, December 2004, copy of report attached), it is anticipated that a minimum of 25% or approximately 900 ESD would voluntarily participate in a rebate program to replace their high water use fixtures if it were well-publicized and attractively financed. Since this projected level of participation is based in part upon programs that rebate the property owner with just a portion of the purchase price of water conserving fixtures, a turnkey program that replaces toilets, faucets and showerheads (including all labor) at no cost to the property owner would likely result in a participation level well above the 25% level.

For residential buildings (2.8 persons/ESD), the potential reduction in wastewater generation by replacing toilets, faucets and showerheads is estimated to be 40 gpd/ESD. If clothes washing machines are replaced with higher efficiency appliances, the reduction increases to 56 gpd/ESD (ref. Table ES-3 and Table 8, *Zero Footprint Design,* Nelson).

Due to wide variation in the types and numbers of wastewater generating fixtures present in commercial buildings, a standard reduction for all commercial building types is difficult to predict. For instance, commercial office buildings represent a per ESD reduction opportunity that would be higher than that for a residence since toilet use in an office setting contributes a much higher percentage of the overall wastewater generated than does toilet use in a residence. On the other hand, commercial buildings such as restaurants may not offer as much opportunity for wastewater reduction as does a residence due to the presence of specialized, high water-use kitchen fixtures and dishwashers that would not be likely candidates for replacement or retrofit in a standard water conservation outreach program For the purposes of this report, the potential reduction in wastewater generation for commercial buildings is conservatively estimated to be 28 gpd/ESD, one-half that of the residential figure.

2.5 PROJECTED AVERAGE DRY WEATHER FLOW AND ZERO FOOTPRINT OFFSET CREDITS

To realize a "zero footprint" project in terms of wastewater generation, the total average daily wastewater flow generated by the project will need to be offset by indoor water conservation in the service area. The projected total average daily wastewater flow for all buildings proposed for the initial phase of the project, including the WFC, is 21,700 gpd. The 29-bed SMC expansion would add 4,790 gpd to this figure. Conservative calculation of the number of ESD that would need to participate in a fixture replacement/retrofit program in order to achieve a "zero footprint" project is accomplished using the same proportion of residential and commercial ESD that are currently connected to the Sanitation Zone (65% and 35%, respectively). The resultant number required to completely offset all potential facilities would range between 578 ESD and 742 ESD, well below the projected minimum participation of 900 ESD. The lower end of the above range assumes all ESD retrofits would include a clothes washer whereas the upper end of the range assumes that none of the ESD retrofits would include a clothes washer. The actual number of ESD offsets required will depend upon the relative success of the turnkey (toilet, faucet, showerhead) and rebate (clothes washer) programs. Offsets for each phase of project development will be in place prior to connection of that phase to the District.

Table 7 shows the conceptual plan for how the offsets will be implemented by phase of the project (and by wastewater generation). Sutter will fund the cost of the ESD's offsets, currently estimated at approximately $1,045/ESD.

3. TABLES

Table 1 Sutter Medical Center Projected Average & Maximum Day Domestic Water Needs

LOCATION	WATER Average Day Use Gallons Per Day	WATER Maximum Day Use Gallons Per Day
INITIAL USE (2013)		
Sutter Medical Center Hospital (70 beds) [1]	9,910	12,390
Sutter Medical Center HVAC [2]	10,200	24,700
Water Treatment System Backwash	1,500	1,500
Medical Office Building (80,000 s.f.) [3]	2,140	3,000
Physicians Medical Center (28 beds) [1]	3,960	4,960
Initial Total	27,710	46,550
FUTURE EXPANSIVE USE (2020 +)		
Sutter Medical Center Expansion (29 beds) [1]	4,110	5,130
Expanded HVAC [4]	3,020	7,310
Expanded Water Treatment System Backwash	380	380
Future Total	7,510	12,820
Future Grand Total	35,220	59,370

1 Based on 177 gpd/bed at full occupancy and an 80% average day occupancy factor
2 Based on interview with mechanical engineering contractor for HVAC systems.
3 Based on 2.5 persons per 1,000 square feet and 15 gpd/person.
4 Based on proportional increase in hospital size from 98 beds to 127 beds.

Table 7 Water Offsets Program

PHASE	OFFSETS REQUIRED[1] *In equsivent single family dwelling, ESD's*	PROGRAM *To be verified by a feasibility study*	TIMING OF OFFSETS *In place before the following approval*	MONITORED BY
Phase I (2010 - 2012) - Entitlement, Relocation, Replacement of Utilities and Existing				
Annexation of the entire 53± ac. site to the Airport-Larkfield-Wikiup Sanitation Zone (all existing facilities and site improvements would remain in place)	Zero	Retrofit existing WFC facilities (urinals, toilets, hand sinks) to reduce flows from 4,931 gpd to 3,198 gpd.	Prior to any project approval	WFC
Connection of the existing LBMF facilities to the Airport-Larkfield-Wikiup Sanitation Zone wastewater treatment system;	69 to 89	Under SCWA High-Efficiency Fixture Direct Installation Program (HEFDIP), retrofit existing single family homes, apartment complexes and commercial buildings Sanitation Zone service area with new low flow toilets, low flow shower heads and/or low flow faucets to reduce wastewater generation (water use) by 3,200 gpd.	Prior to connecting to Sanitation Zone collection system	SCWA
Decommissioning of the existing on-site LBMF sewage treatment facility;	Zero			
Demolishing the existing barn (LBMF maintenance facility) on Lot A	Zero			
Relocating the maintenance activities to a newly-constructed Maintenance Facility. The maintenance shop would approximately 3,000.	Zero			

Table 7 Water Offsets Program

Phase II (2010-2013) - Medical Campus Construction of Medical Campus Facilities				
70 licensed bed acute inpatient facility with approximately 126,000 square feet of floor area	269 to 348	Under SCWA High-Efficiency Fixture Direct Installation Program (HEFDIP), retrofit existing single family homes, apartment complexes and commercial buildings Sanitation Zone service area with new low flow toilets, low flow shower heads and/or low flow faucets to reduce wastewater generation (water use) by 12,460 gpd.	Prior to connecting to Sanitation Zone collection system	SCWA
A support facility including an approximately 4,000 square foot Central Utility Plant (CUP), and approximately 4,000 square foot Plant Operations and Maintenance (PO&M) building (to house offices and workshops for the hospital engineering staff), and approximately 500 square foot Water Treatment Facility, and associated chemical/gas storage tanks and 2 hydro-pneumatic tanks of about 1,500 gallons each	Included in above	Included in above		
Medical Office Building (MOB) with approximately 80,000 square feet of floor area including administrative activities and operations.	46 to 60	Under SCWA High-Efficiency Fixture Direct Installation Program (HEFDIP), retrofit existing single family homes, apartment complexes and commercial buildings Sanitation Zone service area with new low flow toilets, low flow shower heads and/or low flow faucets to reduce wastewater generation (water use) by 2,140 gpd.	Prior to connecting to Sanitation Zone collection system	SCWA
Physicians Medical Center (PMC) – an acute care inpatient and outpatient facility providing for inpatient and outpatient surgery and also providing a full range of outpatient hospital services (28 licensed beds) approximately 100,000 square feet of floor area	86 to 111	Under SCWA High-Efficiency Fixture Direct Installation Program (HEFDIP), retrofit existing single family homes, apartment complexes and commercial buildings Sanitation Zone service area with new low flow toilets, low flow shower heads and/or low flow faucets to reduce wastewater generation (water use) by 3,980 gpd.	Prior to receiving certificate of occupancy for PMC	SCWA
LBMF Facilities (no change in buildings or site activities from Phase I)	Zero			

Table 7 Water Offsets Program

Phase III - Future Expansion (2010 or later)				
Sutter may expand the 70-bed Sutter Medical Center hospital by up to 29 beds, including expansion of the Emergency Department in approximately 36,000 square feet of additional floor area.	103 to 134	Under SCWA High-Efficiency Fixture Direct Installation Program (HEFDIP), retrofit existing single family homes, apartment complexes and commercial buildings Sanitation Zone service area with new low flow toilets, low flow shower heads and/or low flow faucets to reduce wastewater generation (water use) by 4,800 gpd.	Prior to receiving certificate of occupancy for SMC expansion	SCWA

Notes:
1. Range for offsets required is dependant upon how many include installation of high efficiency clothes washer.

RE: APPLICATION FOR MITIGATION
SUTTER HOSPITAL PROJECT MARK WEST SPRINGS RD
APN No. 058-040-058 & 058-040-059

Code section to be modified:
Fire Flow Requirements – Sonoma County Code-13-17 / CFC Appendix §B-101.1

Nature of requested modification:

- Improved fire resistance of structures - minimum construction type for buildings (except for Central Utility Plant), shall be I-B. (Central Utility Plant shall be at least Type II-B).
- Installation of hose connections consistent with 1999 NFPA-13 § 5-15.5.2 shall be installed on every floor at each stairwell enclosure, and at the rooftop where the stairwell breaches the roofline.

Specific individual reason strict letter of code is impractical:
Only 67% of the required fire flow can be provided by the water municipality.

The modification requested is approved:
Approved based on general conditions above in addition to specific conditions noted in attached letter from Brelje & Race dated September 21, 2009.

It is believed that the mortifications requested will reduce fire growth, and provides local fire responders with the ability to attack a given fire in less time than if there were no hose connections.

By being able to attack a fire in less time, fire growth is limited, therefore reducing the amount of water that would be required to extinguish a given fire.

Subject: **Request for Alternate Means of Protection under §111.2.4 California Fire Code with regards to the Water Supply for Fire Fighting for the proposed Sutter Medical Center of Santa Rosa (SMCSR) located at 50 Mark West Springs Rd, Santa Rosa**

Assessor's Parcel Numbers 58-040-058 and 059

B&R File No. 3231.01

Gentlemen:

We are requesting approval of our proposed water supply for fire fighting via Alternate Means of Protection under §111.2.4 2007 California Fire Code (CFC) based on the following:

There is an existing 8" diameter fire and domestic water system loop, owned and operated by California American Water Company (Cal Am), serving the Wells Fargo Center (WFC) property. SMCSR proposes a privately owned fire system loop for the medical complex, connected to the Cal Am system in Mark West Springs Road in at least two locations, and to the existing Cal Am system on the WFC property in two additional locations. This highly looped system will provide significant redundancy and therefore reliability in the expanded fire protection system.

The proposal that we offer for your review and approval consists of the following components:

1. Cal Am has confirmed that they can provide a minimum fire flow of 2500 gallons per minute for a duration of 2 hours from their existing water main located in Mark West Springs Road along the project frontage. The calculated basic fire flow for the proposed hospital (SMCSR), future Physician's Medical Center (PMC), and future Medical Office Building (MOB), based upon their size and type of construction, is 3750 GPM. However, §B105 CFC allows the local fire authorities to approve up to a 75% reduction of the required fire flow under certain circumstances, such as providing NFPA 13 fire sprinkler systems in all structures, but in no case less than 1500 GPM. The fire flow available

from Cal Am at the project frontage represents a 34% reduction from the base flow, and is approximately 67% more than the 1500 GPM minimum flow.

2. All medical center buildings will be separated into separate fire areas so that if there were an event in one of the buildings, it will be contained within that building.

3. Providing an improved emergency access to the Wells Fargo Center by widening and improving the main and secondary entrance roadways.

4. SMCSR is currently assisting the Wells Fargo Center in securing necessary permits for a new fire alarm system for the WFC facility. This work is intended to be executed by WFC as their separate project.

5. The proposed hospital, future PMC, and future MOB will all be provided with 2.5" hose connections in all stair enclosures even though fire hose connections are not required in less than 4 story buildings. These facilities provide additional support for the reduction in the base fire flow.

6. The proposed new hospital (125,715 SF; 2 stories) will be of Type I-B Construction rather than Type III-B as allowed by the California Building Code, providing superior fire resistant construction.

7. The proposed future PMC (100,000 SF; 3 stories) will be of Type I-B Construction rather than Type III-B as allowed by the California Building Code, providing superior fire resistant construction.

8. The proposed future MOB (80,000 SF; 3 stories) will be of Type I-B Construction rather than Type III-B as allowed by the California Building Code providing superior fire resistant construction. Alternatively, the owner may propose a smaller 72,000 SF, 3 story building of Type II-A construction if the cost of the Type I-B building is prohibitive.

9. The proposed new Central Utility Plant (CUP, 5,730 SF; 1 story and separate 1256 SF Water Treatment building) will be of Type II-B Construction rather than Type V-B as allowed by the California Building Code, again, providing superior fire resistant construction. The proposed new Plant Operations and Maintenance building (PO&M, 3,140 SF; 1 Story) will be of Type V-B Construction.

An exhibit depicting the locations on the site of the various structures discussed above is attached to assist with your review of the proposal.

We hope that you will agree, this proposal will surpass the intent of §B105 of the California Fire Code. If you are in agreement that this proposal meets the requirements to support an alternate means of protection finding, please sign a copy of this letter in the space provided below and return to us as a confirmation. Thank you very much for your time and consideration of this request.

Very truly yours,

BRELJE & RACE

Thomas R. Jones

3231.01-090918

5-15.4.3* Dry Pipe Systems. A trip test connection not less than 1 in. (25.4 mm) in diameter, terminating in a smooth bore corrosion-resistant orifice, to provide a flow equivalent to one sprinkler of a type installed on the particular system, shall be installed on the end of the most distant sprinkler pipe in the upper story and shall be equipped with a readily accessible shutoff valve and plug not less than 1 in. (25.4 mm), at least one of which shall be brass. In lieu of a plug, a nipple and cap shall be acceptable.

5-15.4.4 Preaction Systems. A test connection shall be provided on a preaction system using supervisory air. The connection used to control the level of priming water shall be considered adequate to test the operation of the alarms monitoring the supervisory air pressure.

5-15.4.5 Deluge Systems. A test connection is not required on a deluge system.

5-15.4.6 Backflow Devices.

5-15.4.6.1* Backflow Prevention Valves. Means shall be provided downstream of all backflow prevention valves for flow tests at system demand.

5-15.4.6.2 When backflow prevention devices are to be retroactively installed on existing systems, a thorough hydraulic analysis, including revised hydraulic calculations, new fire flow data, and all necessary system modifications to accommodate the additional friction loss, shall be completed as a part of the installation.

5-15.5 Hose Connections.

5-15.5.1† Small ($1^1/_2$-in.) Hose Connections.

5-15.5.1.1* Where required by Sections 7-3, 7-4, 7-6, 7-7, and 7-8, small ($1^1/_2$ in.) hose lines shall be available to reach all portions of the storage area. The hose connections shall not be required to meet the requirements of Class II hose systems defined by NFPA 14, *Standard for the Installation of Standpipe and Hose Systems.* Hose connections shall be supplied from one of the following:

(1) Outside hydrants
(2) A separate piping system for small hose stations
(3) Valved hose connections on sprinkler risers where such connections are made upstream of all sprinkler control valves
(4) Adjacent sprinkler systems
(5) In rack storage areas, the ceiling sprinkler system in the same area (as long as in-rack sprinklers are provided in the same area and are separately controlled)

5-15.5.1.2* Hose used for fire purposes only shall be permitted to be connected to wet sprinkler systems only, subject to the following restrictions:

(1) Hose station's supply pipes shall not be connected to any pipe smaller than $2^1/_2$ in. (64 mm).

Exception: For hydraulically designed loops and grids, the minimum size pipe between the hose station's supply pipe and the source shall be permitted to be 2 in. (51 mm).

(2) For piping serving a single hose station, pipe shall be minimum 1 in. (25.4 mm) for horizontal runs up to 20 ft (6.1 m), minimum $1^1/_4$ in. (33 mm) for the entire run for runs between 20 and 80 ft (6.1 and 24.4 m), and minimum $1^1/_2$ in. (38 mm) for the entire run for runs greater than 80 ft (24.4 m). For piping serving multiple hose stations, runs shall be a minimum of $1^1/_2$ in. (38 mm) throughout.
(3) Piping shall be at least 1 in. (25 mm) for vertical runs.
(4) When the pressure at any hose station outlet exceeds 100 psi (6.9 bar), an approved device shall be installed at the outlet to reduce the pressure at the outlet to 100 psi (6.9 bar).

5-15.5.2* Hose Connections for Fire Department Use. In buildings of light or ordinary hazard occupancy, $2^1/_2$-in. (64-mm) hose valves for fire department use are permitted to be attached to wet pipe sprinkler system risers. *[See 7-2.3.1.3(d).]* The following restrictions shall apply:

(1) Sprinklers shall be under separate floor control valves.
(2) The minimum size of the riser shall be 4 in. (102 mm) unless hydraulic calculations indicate that a smaller size riser will satisfy sprinkler and hose stream demands.
(3) Each combined sprinkler and standpipe riser shall be equipped with a riser control valve to permit isolating a riser without interrupting the supply to other risers from the same source of supply.

(For fire department connections serving standpipe and sprinkler systems, refer to Section 3-9.)

5-16 Spray Application Using Flammable and Combustible Materials.

5-16.1 For applicable terms not defined in Chapter 1, the terms defined in NFPA 33, *Standard for Spray Application Using Flammable or Combustible Materials,* shall be used.

5-16.2* The sprinklers for each spray area and mixing room shall be controlled by a separate, accessible, listed indicating valve. Sprinkler systems in stacks or ducts shall be automatic and of a type not subject to freezing. (**33:** 7-2.4)

5-16.3 Sprinklers protecting spray areas and mixing rooms shall be protected against overspray residue so that they will operate quickly in event of fire. If covered, cellophane bags having a thickness of 0.003 in. (0.076 mm) or less, or thin paper bags shall be used. Coverings shall be replaced frequently so that heavy deposits of residue do not accumulate. Sprinklers that have been painted or coated, except by the sprinkler manufacturer, shall be replaced with new listed sprinklers having the same characteristics. (**33:** 7-2.5)

5-17 Storage and Handling of Cellulose Nitrate Motion Picture Film.

5-17.1 For applicable terms not defined in Chapter 1, the terms defined in NFPA 40, *Standard for the Storage and Handling of Cellulose Nitrate Motion Picture Film,* shall be used.

5-17.2 In areas or room where nitrate film is handled, the area that is protected per sprinkler shall not exceed 64 ft^2 (6 m^2) with sprinklers and branch lines not being over 8 ft (2.4 m) apart. (**40:** 3-1.4)

5-17.3 Cabinet Protection. (**40:** 4-2.5)

5-17.3.1 Where cabinets are required to be sprinklered, they shall be provided with at least one automatic sprinkler. (**40:** 4-2.5.1)

5-17.3.2 Where cans are stored on more than one shelf, as shown in Figure 5-17.3.2 and as described in 4-2.6.1 or 4-2.6.2 of NFPA 40, one sprinkler shall be provided for each shelf. (**40:** 4-2.5.2)

APPENDIX M

ENERGY TECHNICAL REPORTS

ENERGY CONSERVATION

The CEQA Statues provide that EIRs shall include a detailed statement on significant effects of a project and "mitigation measures proposed to minimize significant effects on the environment, including, but not limited to, measures to reduce the wasteful, inefficient, and unnecessary consumption of energy" (Public Resources Code §21000(b)(3). CEQA Guidelines Section 15126.2 discusses requirements for an EIR to address potentially significant effects, and although it does not include energy specifically, it mentions use of nonrenewable resources. CEQA Guidelines Section 15126.4(a)(1)(C) requires an EIR to discuss energy conservation measures, if relevant. Appendix F to the Guidelines addresses energy conservation goals, notes that potentially significant energy implications of a project should be considered in an EIR, and contains suggested guidance on the contents of EIR discussions on energy.

Energy is consumed during the construction, operation and maintenance of projects, both directly and indirectly. This section describes the existing energy resources, derived from petroleum products, electricity and natural gas available within the project area and analyzes the impacts related to these resources that would result from the implementation of the Proposed Project.

Environmental Setting

This section addresses the Proposed Sutter Medical Center of Santa Rosa/Luther Burbank Medical Facility's (SMCSR/LBMF) energy sources, as well as the Project's efforts to conserve energy and use energy more efficiently. Although these terms are used interchangeably, it is useful to differentiate between energy efficiency and energy conservation. Energy efficiency means using less energy/electricity to perform the same function. Conservation means "doing without" in order to save energy rather than using less energy to do the same thing. For example, turning off lights, turning down the air conditioner, and making fewer vehicle trips are all conservation measures. Installing lighting that uses less electricity, installing additional insulation, and switching to a vehicle with better gas mileage are energy efficiency measures.

Utility Energy

Pacific Gas & Electric (PG&E) currently provides gas and electric services to the Project site including the existing LBMF facility. PG&E is regulated by the California Public Utilities Commission (CPUC). PG&E's service area extends from Eureka to Bakersfield (north to south) and from the Sierra Nevada to the Pacific Ocean (east to west).

PG&E obtains its energy supplies from power plants and natural gas fields in northern California and from energy purchased outside its service area and delivered through high voltage transmission lines. PG&E purchases both gas and electrical power from various sources, including utility companies in other western states and Mexico (CEC, 2003). To promote the safe and reliable maintenance and operation of utility facilities, the CPUC has mandated specific clearance requirements between utility facilities and surrounding objects or construction activities.

Electricity Energy Consumption

Based upon data and reports compiled by the California Energy Commission and the Energy Information Administration of the U.S. Department of Energy, in 2000, California used over 1,933 kilowatt hours of electricity. This electricity was produced from power plants fueled by natural gas (37%), coal (21%), hydro (16%), nuclear (15%), and renewables (11%).

Approximately 78% of the electricity was generated within California, with the balance imported from other states, Canada, and Mexico.

Electricity usage in California for differing land uses varies substantially by the type of uses in a building, type of construction materials used in a building, and the efficiency of all electricity-consuming devices within a building. The average annual usage of electricity is roughly 13 kWhr/square foot for all commercial buildings. Electricity supply in California involves a complex grid of power plants and transmission lines located in the Western United States, Canada, and Mexico. The issue is complicated by market forces that have become prominent since 1998, which is when a new regulatory environment commonly referred to as “deregulation” took effect in California. Supply is further complicated by the fact that the peak demand for electricity is significantly higher than the off-peak demand. For example, in August 2004, peak electric demand – due in large part to hot weather – reached a record high of 44,497 megawatts, which is almost double the lowest demand period.

In 2000-2001, electric demand exceeded supply on various occasions, which required utilities to institute systematic rotating outages to maintain the stability of the grid and prevent widespread blackouts. Since that time, additional generating capacity has come on-line and upgrades to various transmission lines are occurring. The California Energy Commission’s 2007 Integrated Energy Policy Report (Integrated Energy Report) provides strategies that will increase efficiencies promoting conservation and reducing energy needs over the next 10-20 years.

Natural Gas

In 2007, California used almost 2.2 trillion cubic feet of natural gas. The natural gas was used electricity production (43%), industrial uses (23%), transportation (1%), commercial uses (10%), residential uses (22%) and with net storage losses (2%). Approximately 14% of the natural gas was produced within California, with the balance imported from other states and Canada.

Natural gas usage in California for differing land uses varies substantially by the type of uses in a building, type of construction materials used in a building, and the efficiency of all gas-consuming devices within a building. The average annual usage of natural gas is roughly 37 cubic feet/square foot for commercial buildings. According to the Integrated Energy Policy Report, in order to meet peaking demand, Northern California will need gas infrastructure improvements (e.g., additional pipeline capacity) and increased conservation.

California Energy Supply

California’s major sources of energy are petroleum products (i.e., gasoline, diesel and oil), electricity, and natural gas. The California Energy Commission (CEC) indicates that California petroleum resources in 2007 came from in-state (39.34%), foreign sources (44.88%), and Alaska (15.79%). In 2006, natural gas resources in California came from the Southwest

(40.3%), Canada (23.4%), in-state (13.5%), and the Rocky Mountains (27.7%). Electricity production by resource type in California in 2007 included natural gas at 45.2%, coal at 16.6%, hydroelectric at 11.7%, nuclear at 14.8%, and renewable at 11.8%. Renewable consisted of geothermal (4.5%), biomass (2.1%), small hydro (2.8%), and solar and wind (2.5%). Imports from the northwest and southwest added 8.17% and 22.4%, respectively.[1]

California Energy Use Patterns

State-level and county trends are relied upon to characterize energy consumption locally.

Currently the top three fossil fuels, coal, oil and natural gas, provide more than 85% of all the energy consumed in the United States, nearly two-thirds of our electricity, and virtually all of our transportation fuels. Petroleum products themselves supply more than 40 % of our total energy demands and more than 99% of the fuel we use in our cars and trucks. As for electricity, more than half of the amount generated in the United States derives from coal. It is estimated that for the foreseeable future coal will continue to be the dominant fuel used for electric power production. The next biggest fuel source of electricity is nuclear power which supplies about 20% of the electricity produced in the United States. On the other hand, natural gas is the fastest growing fuel. More than 90% of the power plants to be built in the next 20 years will likely be fueled by natural gas; virtually all of which will be domestically produced.[2] Northern Sonoma County is the site of the world's more significant geothermal fields, The Geysers. The Geysers generates about 5,000,000 megawatt-hours per year. Additional sources within the County include hydroelectric power, methane gas, and solar photovoltaics. Additional opportunities exist for individual and small scale production from other renewable energy sources, including passive solar collection, wind energy, hot water, and biomass. These sources are associated with lower up-front costs, increased efficiency, and minimal environmental impacts.

In California, total statewide energy consumption was 8,420.4 Trillion BTU[3] for 2006. Petroleum use accounted for approximately 47% of all energy consumption, of which approximately 57% was for motor vehicle fuel. Motor gasoline use accounted for about 24% of total use, or 1,999.4 Trillion BTU. The electric power sector accounted for about 19% of all energy consumption, while natural gas accounted for about 28% of all energy consumption. By end-use sectors, transportation was by far the biggest energy consumer, which accounted for approximately 40% of all energy consumption. The other three sectors, industrial, commercial and residential, were about equal consumers accounting for approximately 23%, 19% and 18% of all energy consumption, respectively.[4] Table 1 illustrates California electricity usage in Sonoma County. Table 2 provides natural gas demand figures Statewide.

Regulatory Setting

This section summarizes the federal, State and local laws and regulations applicable to energy resources and energy use.

Federal Agencies

Federal agencies regulate energy production, transmission and consumption through various regulations and programs. Federal agencies, such as the Environmental Protection Agency (EPA), the U.S. Department of Energy (US-DOE), and the U.S. Department of Transportation (USDOT) affect energy consumption in the transportation sector through fuel economy standards, funding for transportation infrastructure and funding for energy related research and development projects. The USDOE also promotes a diverse supply and delivery of reliable, affordable and environmentally sound energy. The Federal Energy Regulatory Commission (FERC) is an independent agency that regulates the interstate transmission of electricity, natural gas, and oil. FERC also reviews proposals to build liquefied natural gas (LNG) terminals and interstate natural gas pipelines as well as licensing hydropower projects.

Energy Policy Act of 2005 (EPACT)

The EPACT is intended to establish a comprehensive, long-range energy policy, and the USDOE is responsible for its implementation. It provides incentives for traditional energy production as well as newer, more efficient energy technologies and conservation. Those incentives come in the form of various tax credits and deductions, which include automobile tax credits, home energy efficiency improvement tax credits, energy efficient commercial building deduction and business tax credits for businesses that produce biodiesel/alternative fuels and manufacture or purchase energy-efficient appliances.[5]

Power Plant and Industrial Fuel Use Act

The Power Plant and Industrial Fuel Use Act is administered by the USDOE. In summary, the purpose of the Act is to reduce the importation of petroleum and increase the Nation's capability to use indigenous energy resources of the United States to the extent such reduction and use further the goal of national energy self-sufficiency and otherwise are in the best interests of the United States; to encourage and foster the greater use of coal and other alternate fuels, in lieu of natural gas and petroleum, as a primary energy source; and to the extent permitted by the Act, to encourage the use of synthetic gas derived from coal or other alternate fuels.[6]

Transportation Equity Act for the 21st Century (TEA-21)

TEA-21 builds on the initiatives established in the *Intermodal Surface Transportation Efficiency Act of 1991(ISTEA)*, which was the last major authorizing legislation for surface transportation. TEA-21, enacted on June 9, 1998, authorizes highway, highway safety, transit, and other surface transportation programs for a six-year period (1998-2003). However, because Congress could not agree on funding levels, the Act has continued past 2003 by means of temporary extensions.[7] TEA-21 continues the program structure established for highways and transit under ISTEA, such as flexibility in the use of funds, emphasis on measures to improve the environment, and focus on a strong planning process as the foundation of good transportation decisions. TEA-21 also provides for investment in research and its application to maximize the performance of the transportation system through, for example, deployment of Intelligent Transportation Systems, to help improve operations and management of transportation systems and vehicle safety.

State and Local Agencies

California Energy Commission (CEC)

The CEC is the State's primary energy policy and planning agency. Created by the Legislature in 1974, the Commission has five major responsibilities: forecasting future energy needs and keeping historical energy data; licensing thermal power plants 50 megawatts or larger; promoting energy efficiency through appliance and building standards; developing energy technologies and supporting renewable energy; and planning for and directing state response to energy emergency. With the signing of the Electric Industry Deregulation Law in 1998 (Assembly Bill 1890), the Commission's role includes overseeing funding programs that support public interest energy research; advance energy science and technology through research, development and demonstration; and provide market support to existing, new and emerging

[7] Transportation Equity Act for the 21st Century. http://en.wikipedia.org/wiki/Transportation_Equity_Act_for_the_21st_Century, 2008.

renewable technologies. California is preempted under federal law from setting state fuel economy standards for new on-road motor vehicles.[8]

California Public Utilities Commission (PUC)

The PUC regulates privately owned electric, telecommunications, natural gas, water and transportation companies, in addition to household goods movers and rail safety. The PUC is responsible for ensuring that customers have safe, reliable utility service at reasonable rates, protecting against fraud, and promoting the health of California's economy.[9]

State and Local Regulations

State of California Energy Action Plan (EAP)

Administered by the California Energy Commission, the EAP was initially created in 2003 and updated in 2005. The EAP established shared goals and specific actions to ensure that adequate, reliable, and reasonably-priced electrical power and natural gas supplies are achieved and provided through policies, strategies, and actions that are cost-effective and environmentally sound for California's consumers and taxpayers. Also incorporated in the EAP are specific actions reflecting the importance of transportation fuels to California's economy and the need to mitigate the environmental impacts caused by their use, as well as the importance of taking actions in the near term to mitigate California's contributions to climate change from the electricity, natural gas and transportation sectors.[10]

California's Energy Efficiency Standards for Residential and Non-residential Buildings of 2005 (Title 24 Building Standards)

The California Energy Commission administers Title 24 Building Standards, which were established in 1978 in response to a legislative mandate to California's energy consumption. Last updated in October 2005, the standards are updated periodically to allow consideration and possible incorporation of new energy efficiency technologies and methods.[11]

Sonoma County General Plan 2020[12]

The following goals and policies are from Sonoma County's General Plan Open Space and Resource Conservation Element and are applicable to the Proposed Project:

GOAL OSRC-14: **Promote energy conservation and contribute to energy demand reduction in the County.**

Objective OSRC-14.1: Increase energy conservation and improve energy efficiency in County government operations.

[8] California energy commission's website. http://www.energy.ca.gov/commission/index.html, 2009.
[9] California Public Utilities Commission's website. http://www.cpuc.ca.gov/PUC/aboutus/, 2009.
[10] California Energy Commission's website. http://www.energy.ca.gov/energy_action_plan/index.html, 2008.
[11] California Energy Commission's website. http://www.energy.ca.gov/title24, 2009.
[12] Sonoma County General Plan 2020. http://www.sonoma-county.org/PRMD/gp2020/index.html, 2008.

Objective OSRC-14.2: Encourage County residents and businesses to increase energy conservation and improve energy efficiency.

Objective OSRC-14.3: Reduce the generation of solid waste and increase solid waste reuse and recycling.

Objective OSRC-14.4: Reduce greenhouse gas emissions by 25% below 1990 levels by 2015.

Policy OSRC-14d: Support Project applicants in incorporating cost effective energy efficiency that may exceed State standards.

Policy OSRC-14f: Use the latest green building certification standards, such as the Leadership in Energy and Environmental Design (LEED) standards, for new development.

Standards of Significance

The Proposed Project would have a significant energy impact if it would result in:

- Wasteful, inefficient and unnecessary usage of energy as identified by CEQA Section 21100(b)(3) and CEQA Guidelines 15126(a)(1); or
- A substantial increase in demand or transmission service, resulting in the need for new or expanded sources of energy supply or new or expanded energy delivery systems or infrastructure.

Impacts and Mitigation Measures

This section discusses the potential impacts of the Proposed Project on overall energy consumption and mitigation processes proposed by the Project.

Impact 1 – Construction Energy Use

Construction

Construction-related energy consumption would result from Project construction and the use of secondary facilities. A secondary facility is defined as any facility that would produce any construction materials that would be used during the construction and maintenance of the Proposed Project. Energy consumed for Project construction would be that used during the construction of the hospital campus (Sutter Medical Center Santa Rosa, Physicians Medical Center, Central Utility Plant and Medical Office Building) and for the transportation of building materials and equipment to and from the work site.

The construction period for the total hospital campus could approach 48 months, and as a result, any energy consumption from construction and transportation of building materials and equipment to and from the work site will be potentially significant. These impacts relate primarily to importation of fill (8,695 truck loads) and roadway completion. Mitigation measures are listed below that will reduce these impacts to less than significant levels.

Secondary facilities

It is assumed that secondary facilities, such as those that would produce construction materials for the Proposed Project would utilize all reasonable energy conservation practices in order to minimize the costs associated with energy use. As such, it can be assumed that construction-related energy consumption by secondary facilities during the construction of the Proposed Project would not result in a wasteful, inefficient and unnecessary usage of energy; or placement of a significant demand on regional energy supply or requirement of substantial additional capacity with regards to energy consumption during the construction phase.

Indirect Consumption

The Proposed Project would generate approximately 328 AM peak hour trips and 467 trips during the PM peak hour.

Based upon the traffic analysis, at least 15% (and possibly as many as 50%) of traffic trips to the Project are diverted trips – trips which occur to the existing Sutter facility in Santa Rosa. The hospitals at full build out would house 127 beds (similar to the current 135 licensed beds at the Chanate Campus in Santa Rosa). Medical offices would likely off set many of the existing medical offices in the Santa Rosa area, and those offices (especially at Sutter's Warrack and Chanate facilities) would like be replaced by non-medical uses, based upon City of Santa Rosa Zoning.

<u>Mitigation Measure for Impact 1:</u>

Fossil fuels used for construction vehicles and other energy consuming equipment would be used during site clearing, grading, and construction for the Project. Fuel energy consumed during construction would be temporary in nature and would not represent a significant demand upon energy resources upon completion of the following measures:

Energy Conservation During Construction

Some incidental energy conservation would occur during construction through implementation of the noise mitigation measures identified in the noise section. For example, there would be some fuel savings resulting from the prohibition of unnecessary idling of vehicles and equipment, and from the requirement that equipment be properly maintained. In addition, the mitigation measures listed in the Air Quality section include several measures that will result in energy conservation including:

- restructuring idling times;
- finding source material for fill that is closest to the site

. Also, the construction materials could include recycled materials and products originating from nearby sources in order to reduce costs of transportation. Also, given current high fuel prices, contractors have a strong financial incentive to avoid wasteful, inefficient and unnecessary consumption of energy during construction.

The Traffic Demand Management (TDM's) incorporated with the Project include on site bike and shower facilities, telecommuting, flexible schedules, off – on-site paths and sidewalks, bikeways, priority for van pools, carpools, recharge stations for electric vehicles (and possibly natural gas) and convenient public transit (including upgraded bus stop adjacent to the site).

All of these measures will reduce vehicle use and increase efficiencies. Additionally, transit ride time to the new hospital is less than to the existing Chanate facility (based upon SCT and SRT schedules).

Impact 2 – Operational Energy Use

The Proposed Project consists of four main components of a medical office complex including the 162,000sf Sutter Medical Center (99 beds after Phase III) and 100,000sf Physicians Medical Center (28 beds), a 11,500sf Central Utility Facility and an 80,000sf Medical Office Building. The LMBF main facilities are not being modified. The auxiliary functions (maintenance shed, parking areas and play fields) will be relocated.

The preliminary electrical and natural gas usage estimates (in annual kWh, therms and cubic feet) for the Sutter Santa Rosa Medical Center campus (Sutter Hospital – 162,000sf, Physicians Medical Center – 100,000sf, MOB – 80,000sf) have been estimated by the mechanical engineers to use 109,337 therms of gas and 6,520,577 kWh of electricity per year.

Although the Proposed Project would result in the consumption of large quantities of energy (typical for a project of this size), several aspects of the Project would help manage the amount and efficiency of energy consumption and would ensure that the related consumption is not inefficient, wasteful or unnecessary or place a significant demand on regional energy supplies.

<u>Mitigation Measures For Impact 2</u>

The following energy conservation measures shall be implemented in order to minimize inefficient energy usage and promote conservation of energy resources throughout the life of the Project:

<u>Daylighting of all buildings 100,000 sf or greater</u>

Each interior public space with access to daylight shall be equipped with a “daylighting system” to reduce use of electricity for area lighting. The daylighting system shall include switching mechanisms to automatically and continuously dim all lights as the daylight contribution increases through use of properly placed windows and skylights.

<u>Night Dimming</u>

Each interior public corridor shall be equipped with an automatic switching system to dim lighting within the corridor to between 60% and 70% illumination between the hours of 10:00 pm and 7:00 am (standard time).

Energy Efficient HVAC Systems

All mechanical equipment provided for the purpose of heating and cooling interior public spaces shall satisfy all California title 24 requirements; in addition, all such equipment shall achieve a minimum EER (energy efficiency ratio) of rating of 10.0 or equivalent.

Central Energy Management for all buildings 100,000 sf or greater

Each campus building as identified on the approved development plan shall be equipped with energy management systems. The direct digital control system for the campus buildings will be networked and meet the typical requirements of an “energy management system.”

Water Heating for buildings 100,000 sf or greater

If applicable or feasible, waste heat shall be captured in order to preheat water for uses requiring heated water.

Cool Roofs

All flat roof surfaces (excluding decorative architectural elements and canopies) shall be provided with a high albedo membrane roof, also known as a cool roof. The solar reflectivity of such roof membrane systems are intended to lower interior cooling loads in the Sonoma County climate zone by roughly 10%, compared to conventional roofing. Solar reflectivity on roofs also reduces the amount of conversion of UV rays to infrared heat, possibly reducing the heat island effect created by most large, developed parcels of land.

Interior Lighting Systems

All interior public spaces shall be provided with lighting systems that utilize high efficiency T-8 or T-5 fluorescent lamps and electronic ballasts, or approved equivalent systems. Fluorescent lamps shall be of the "low-mercury" variety.

LED Interior Signage Illumination for all buildings 100,000 sf or greater

Light emitting diode (LED) lighting, or an approved equivalent, shall be used for all internally illuminated building signage. LED lighting technology is recognized as consuming substantially less electricity than fluorescent or other illumination sources. In addition, the longer lamp life afforded by LED technology substantially reduces need to manufacture and dispose of fluorescent lamps.

Recycled Materials in Building Construction for all buildings 200,000 sf or greater

Recycled Steel: when possible and not resulting in out of area sourcing, a minimum of 80% of the structural steel used in the construction of buildings shall be comprised of recycled materials.

UBC

In addition to the above design features of the Project, the California Building Standards Code, energy conservation requirements in the most current edition of Title 24, Part 6, California Code of Regulations, for non-residential buildings would be applied. The Commission also wanted to emphasize energy efficiency measures that save energy at peak periods and seasons and to improve the quality of installation of energy efficiency measures.

Savings By Design

The Project will participate in PG&E's Savings by Design program which will ensure additional energy efficient measures will be incorporated into the Project.

OSHPD Review

Pursuant to the California Building Standards Code and the Energy Efficiency Standards, both OSHPD and the County shall review the design components of the Project's energy conservation measures when the Project's building plans are submitted. Energy efficient measures could include: insulation; the use of energy efficient heating, ventilation and air conditioning equipment (HVAC); solar-reflective roofing materials; energy-efficient indoor and outdoor lighting systems; the incorporation of skylights, high performance glazing, etc.

Colocation

In terms of energy consumption related to vehicle use, the colocation of the medical services of the Proposed Project would focus the destination of vehicle trips and benefit fuel consumption. The proposed mix of medical services would encourage multi purpose trips and reduce fuel consumption by reducing the number of trips some people might otherwise make between different medical facilities. The Sutter Hospital Project was registered for the Leadership in Energy and Environmental Design (LEED) in 2008. Pursuing LEED certification will further the incorporation of energy conservation and sustainability measures into the Project design. These are summarized in Table 3.

Table 3 lists all pertinent measures included in CARB's Scoping Plan for the state's compliance with AB 32, and presents Sutter's sustainability policies, programs, Project design features and how they comply with the AB 32 Scoping Plan measures.

Table 3
Consistency of the Sutter Project Features with AB 32 Scoping Plan Measures

Scoping Plan Measure	Sutter Policy/Project Feature
SPM-1: California Cap-and-Trade Program linked to Western Climate Initiative	Not applicable.
SPM-2: California Light-Duty Vehicle GHG Standards	Not applicable.
SPM-3: Energy Efficiency	Aggressive conservation efforts and development of renewable power will be fundamental to Project design. Buildings will be designed to consume reduced levels of energy and demand over the current hospital. LEED: The Project has been registered for LEED certification.
SPM-4: Renewables Portfolio Standard	Not applicable
SPM-5: Low Carbon Fuel Standard	Not applicable
SPM-6: Regional Transportation-Related Greenhouse Gas Targets	Develop a coordinated master plan to guide design and implementation of the principal circulation infrastructure, including plans that address streets, on and off site roads, bikeways, pedestrian ways, transit and parking; created a comprehensive, interconnected bicycle and pedestrian circulation system that provides access to major buildings. Work with local and regional transit providers to coordinate transit service, and establish convenient transfers between transit and other modes of travel. Provide priority parking for vanpools, carpools, and energy efficient and low-pollution vehicles, with recharge stations for electric vehicles and provide a natural gas vehicle charging stations, if possible.
SPM-7: Vehicle Efficiency Measures	Not applicable.
SPM-8: Goods Movement	Not applicable.
SPM-9: Million Solar Roofs Program	Sutter is working with PG&E in its Savings By Design program to design feasible methods that optimize solar and thereby minimizing grid connected peak electricity loads by shifting electricity used for cooling away from peak electricity demand periods through a variety of methods that include solar power.
SPM-10: Heavy/Medium-Duty Vehicles	Minimize construction emissions.

Scoping Plan Measure	Sutter Policy/Project Feature
SPM-11: Industrial Emissions	Not applicable.
SPM-12: High Speed Rail	Not applicable.
SPM-13: Green Building Strategy	Buildings will be designed to consume less energy and demand than the existing hospital and surpass Title 24 minimum efficiency standards, and achieve LEED certification. There is a relationship between indoor environmental quality and materials, lighting, thermal comfort, human health & productivity. Accordingly, Sutter Health as a community role model has a vested interest in delivering environments that optimize patient outcomes and provide a “best place to work and practice” environment for its employees. Minimizing and controlling sources of allergens, mutagens, carcinogens and endocrine disruptors, while providing access to daylight and comfortable indoor climate in an accessible setting are fundamental building design goals. Exposure conditions that adversely affect health can only be evaluated in the light of the benefits received and the alternatives available. **Environmental Air Quality Guidelines** • Establish minimum indoor air quality (IAQ) performance to enhance indoor air quality in buildings, thus contributing to the comfort and well-being of the occupants • Minimize production, distribution and exposure to pollutants- provide risk group specific protection where elimination is impossible • Provide occupants with access to natural daylight and healing views • Provide energy efficient thermal comfort within acceptable ranges • Provide occupant controlled zoned environmental controls (light, view, thermal, ventilation) • Manage pathogens and infection transmission with appropriate barriers, air flow, discharge and refresh rates **Environmental Air Quality Strategies** • Ensure high quality indoor air and thermal comfort by meeting or exceeding ASHRAE 62-1999 and ASHRAE 55-1992 as the minimum basis of design • Baseline design with minimum impact methods and materials including low VOC / low toxic finishes and materials i.e. Green Seal-certified paints; composite wood and agrifiber products without urea-formaldehyde resins; carpet systems certified by Carpet & Rug Institute Green Label Program; adhesives meeting local Air Quality Management District guidelines. • Design and specify systems that prevent trapping of water and microbial growth • Define and implement ICRA Infection control plan for all construction

Scoping Plan Measure	Sutter Policy/Project Feature
	and renovation projects • Install entryway systems (e.g., walk off tiles) to trap dirt and particulates • Position building air intakes to prevent contamination from vehicle exhaust and other sources • Assure easy access to inspect and clean filters and ductwork in Air handling systems • Ventilate source areas (smoking areas, housekeeping, copying rooms, hazardous waste) • Buildings not non smoking • Design environments including materials, products, mechanical systems and design features to attenuate sound and vibration within tolerances outlined in Hospital guidelines in ASHRAE Application Handbook.
SPM-14: High GWP Gases	Not applicable.
SPM-15: Recycling and Waste	**Materials Conservation and Resource Efficiency** The healthcare delivery environment is first and foremost concerned with the health and welfare of the patients and staff. Although use of sustainable materials can significantly enhance a building's environmental impacts, there is no room in a critical care setting to compromise the health of our patients. Products and materials used in the healthcare delivery setting must be the best available that is appropriate for the use intended. Total Life Cycle costs associated with operating and maintaining the products and materials proposed must be balanced with the first cost and life cycle environmental impacts of the products considered. Hospital designs must seek to include sustainable harvest material, minimize production of persistent and bioaccumulative toxics (PBTs) and reduce waste. **Materials Conservation and Resource Efficiency Guidelines** • Balance resource depletion reduction objectives with service specific requirements • Reduce embodied energy (use lowest energy density product available) • Reduce toxics generated throughout the life cycle of materials • Reduce waste by including waste evaluations in design choices • Reduce impact of reuse or disposal of building **Materials Conservation and Resource Efficiency Strategies** • Reuse existing structures with minimum demolition practical • Specify materials and methods with reduced (or free from) ozone depleting substances and/or equipment using CFCs, HCFCs, and halons, balancing ozone depletion potential (ODP) with global warming potential (GWP)

Scoping Plan Measure	Sutter Policy/Project Feature
	• Review design alternatives that consider materials that; ❖ are free from toxic chemicals ❖ do not release toxic byproducts throughout their life cycle ❖ do not include toxins that are carcinogenic, persistent or bioaccumulative. (e.g. mercury, arsenic, urea formaldehyde, plasticizers in PVC and asbestos) ❖ are recycled, reused/salvaged, remanufactured or from sustainable sources ❖ are sustainably harvested ❖ are from local sources when available ❖ are easily reusable, recyclable, or biodegradable on disposal ❖ are design for efficient material use (less material use and less waste) ❖ are design for adaptability of building design as needs change (reusable movable) ❖ are designed for disassembly and recycle or reuse at end of building life. • Exterior envelope materials that; ❖ The thermal performances of the buildings are being evaluated including high performance glass and exterior insulating systems. An energy model has been erected to empirically evaluate and optimize the energy performance of the design. • Life cycle costs are being discussed and evaluated throughout the design process.
SPM-16: Sustainable Forests	Not applicable
SPM-17: Water	**Water Efficiency and Conservation** Water efficient design balances water quality and quantity availability and demand, both inside and outside of the building/campus. Water efficient design incorporates available resources and is responsive to the watershed and utility systems capacity as both source and sink. Limitation in utility system capacity and effectiveness demand that water be treated as a constrained and precious resource. Storm and Sanitary Sewer effluent flows can be dramatically impacted by environmentally sound planning and design. **Water Efficiency and Conservation Guidelines** • Optimize the use of potable water resources to conserve water and maintain water quality • Minimize operational impacts to off site treatment of wastewater by avoiding harshest and most problematical chemicals and processes

Scoping Plan Measure	**Sutter Policy/Project Feature**
	• Minimize storm water peak releases from the site, (capture and stage/ meter/ re-use) • Maximize use of on-site water resources, (e.g., rainwater, gray water) where appropriate • Enhance water quality through SWPPP **Water Efficiency and Conservation Strategies** • Use high performance fixtures and equipment: e.g., low flow and pressure assist toilets and urinals; low-flow showerheads and faucets; automatic use activation on sinks, toilets and urinals; Water saving "Energy Star" labeled (or such as an equivalent Dolfin system), dietary housekeeping laundry and mechanical systems equipment. • Minimize boiler, mechanical and cooling tower water blow down chemical loading on sanitary sewer by eliminating water treatment chemicals. When possible evaluate use of non-evaporative condenser heat rejection equipment (air cooled, or ground source – large air cooled systems are not likely to be included in this Project) • Specify native plants that are tolerant of local climate, soils and water • Install drip irrigation and high efficiency irrigation control with moisture sensors, weather based controllers. • Collect and store storm water runoff from roofs and site and use for irrigation, sewage conveyance, toilet flushing and/or HVAC/process makeup water or aquifer recharge • Minimize hardscapes and install site water runoff control and metering systems including permeable peak storage, specialty paving and other pervious surface materials • Create managed wetlands systems to locally recharge underground water flows.
SPM-18: Agriculture	Not applicable.

The SMCSR/LBMF Medical Plan ensures that development within the Project area would be subject to the above identified guidelines to ensure that the Project as well as Title 24 guidelines and regulations are met if not exceeded. Therefore, the Project would be expected to have ***less-than-significant*** impact regarding the wasteful, inefficient or unnecessary consumption of energy.

Impact 3 - Increased Demand on Electric and Natural Gas Infrastructure

The Project site is currently served by electric and gas services. Overhead electric lines with a 12Kv capacity currently extend along the Mark West Springs Road frontages. A 3" natural gas line also extends along the Project frontage.

PG&E has indicated they have adequate power to serve the Proposed Project.

Because the Project would require the extension of existing gas and electric facilities to adequately service the development associated with the Proposed Project it could have a ***potentially significant*** impact. The implementation of the mitigation measures included below would reduce the impacts associated with electric and natural gas services to a ***less-than-significant*** level.

Mitigation Measure for Impact 3:

> The improvement plans shall show the location and method of connection to the existing natural gas supply line located along the Mark West Springs Road frontage of the site.
>
> The improvement plans shall provide for underground installation of all onsite utilities. In addition, improvement plans shall be prepared to provide for the undergrounding of existing overhead utility lines along Mark West Springs Road frontage, as required by the County and utility pole owners.

Cumulative Impacts Related to Increased Energy Consumption from the Proposed Project in Combination with other Foreseeable Projects in the Region

The Project in combination with other future development projects would result in an increased demand on energy resources. Gas and electric service providers would be subject to increased pressure to supply additional energy resources, which could result in the need to expand existing facilities or to build new power plants. PG&E has adequate gas and electric facilities in the area to serve[the Proposed Project and that the Proposed Project would not result in any major conflicts with PG&E's existing gas and electric facilities.

As indicated above, the Project would be subject to the minimum energy conservation requirements of Title 24 of the California Code of Regulations and will participate in PG&E's "Savings by Design" program, which would serve to reduce the amount of energy resources needed to operate the Project. The Project would also be required to fund the necessary infrastructure improvements to ensure that the Project receives adequate energy resources. Because other future developments would also be required to comply with Title 24 and fund the construction of the necessary utility infrastructure improvements, and as this is no evidence indicating that PG&E, through its long-term planning, would not be able to keep pace with increasing demands, cumulative energy impacts would be considered ***less-than-significant***.

ALTERNATIVES SCREENING TECHNICAL REPORTS

Appendix N1

Initial Screening Analysis of Potential Alternatives to the Proposed Sutter Medical Center of Santa Rosa/Luther Burbank Memorial Foundation Project

INITIAL SCREENING ANALYSIS OF POTENTIAL ALTERNATIVES TO THE PROPOSED SUTTER MEDICAL CENTER OF SANTA ROSA/LUTHER BURBANK MEMORIAL FOUNDATION PROJECT

Submitted to Sonoma County, March 24, 2009

I. INTRODUCTION

Sutter Health and its project team of environmental and planning consultants have prepared this initial screening analysis of potential alternatives that could be evaluated in considering the proposed new Sutter Medical Center of Santa Rosa hospital and medical campus (the "Project"). This analysis was prepared to assist Sonoma County and its environmental consultant in its evaluation of potential project alternatives that could be included in the environmental impact report for the Project. This analysis reflects Sutter's consideration of a wide range of possible alternatives, including 19 alternative sites and 7 alternative configurations of the Proposed Project site, and was generated from a number of sources.

In the following sections, we set forth the following introductory information:

- In Section II, a list of the 26 potential project alternatives considered in this screening analysis.
- In Section III, suggested criteria to be applied in the screening of potential alternatives to determine which alternatives should be evaluated in detail in the EIR.
- In Section IV, a description of the bases upon which various potential alternatives were included in this screening analysis.

Following this introductory material, this submission includes a series of tabbed sections with a written screening analysis for each of the potential alternatives.

II. LIST OF POTENTIAL ALTERNATIVES CONSIDERED

The following is a list of the potential alternatives to the Proposed Project and the Proposed Project site considered in this screening analysis, including CEQA's required "No Project" alternative.

Noise Reduction Alternative/No Helistop

Emissions Reduction Alternative/No Soil Surcharge

Reduced Project Alternative I (70 Bed Hospital Without Accompanying Facilities)

Reduced Project Alternative II (All Onsite Facilities Reduced)

Reconfigured Alternative

Chanate Alternative

No Project Alternative (Hospital Closure)

Decentralized Alternative

Airport Business Center Alternate Site

Shiloh Road/101 Alternate Site

Todd Road/Moorland Alternate Site

Wick Property Alternate Site (Santa Rosa/Todd)

Guerneville Road/Lance Drive Alternate Site

Ring Property Alternate Site

101/Todd Road NW Alternate Site

North Point Corporate Center Alternate Site

Fountaingrove Executive Center/Old Redwood Highway Alternate Site

Westwind Business Park Alternate Site

Southwest Corner 101/Shiloh (West) Alternate Site

Southwest Corner 101/Shiloh (East) Alternate Site

Airway Drive Alternate Site

Two Bridges Property Alternate Site

Fountaingrove Winery Alternate Site

Fulton Road Alternate Site

Roseland Shopping Center Alternate Site

Warrack Hospital Alternate Site

West Third Street Properties Alternate Site

III. SUGGESTED SCREENING CRITERIA

This section sets forth suggested criteria for screening the potential alternatives, for the County's consideration. These criteria are based upon factors set forth in CEQA and in the CEQA Guidelines.

The California Environmental Quality Act (CEQA) requires that an EIR compare the effects of a "reasonable range of alternatives" to the effects of the project. The alternatives selected for comparison should be those that would attain most of the basic objectives of the project and avoid or substantially lessen one or more significant effects of the project (CEQA Guidelines § 15126.6). The range of alternatives to be compared is governed by a "rule of reason" which requires the EIR to set forth only those alternatives necessary to permit an informed and reasoned choice by the decision-making body and informed public participation (CEQA Guidelines § 15126.6(f)). CEQA generally defines "feasible" to mean an alternative that is capable of being accomplished in a successful manner within a reasonable period of time, while also taking into account economic, environmental, social, technological, and legal factors. Based upon the CEQA statutory and Guideline provisions governing the reasonable range of alternatives to be evaluated in an EIR, the following factors could be considered by the County in evaluating the potential alternatives and determining which alternatives should be evaluated in the EIR:

1. The extent to which the alternative would accomplish most of the basic objectives of the Proposed Project;

2. The extent to which the alternative would avoid or lessen any of the identified potentially significant environmental effects of the Proposed Project;

3. The feasibility of the alternative, taking into account site suitability, availability of infrastructure, property control (ownership), and consistency with applicable plans and regulatory limitations;

4. The extent to which an alternative contributes to a "reasonable range" of alternatives necessary to permit a reasoned choice; and

5. The requirement of the CEQA Guidelines to consider a “No Project” alternative and to identify an environmental superior alternative in addition to the no-project alternative (CEQA Guidelines § 15126.6(e)).

Project Objectives

Sutter presented its Project Objectives to the County as part of its February 2, 2009 clarified Proposal Statement (now dated March 5, 2009). Although the extent to which an alternative meets Project Objectives is one of the suggested screening criteria based on the CEQA Guidelines, this screening analysis considers a number of potential alternatives and alternate sites which would not meet these objectives or would meet these objectives only to a limited extent. The objectives as set forth in the Proposal Statement are the following:

6. To provide a new Sutter Medical Center of Santa Rosa ("Sutter Medical Center") hospital and Medical Campus in Sonoma County that promotes new, accessible and innovative health care models and that complies with the requirements of the Hospital Facilities Seismic Safety Act (including Senate Bill 1953 and Senate Bill 1661, and the statutory requirements for submission of building plans to the Office of Statewide Health Planning and Development by January 1, 2009 and commencement of construction by January 1, 2011). This level of health care will be made available to Sonoma County residents by incorporating advanced technologies available for diagnosis and treatment in a new, modern hospital through an

integrated Medical Campus that supports the continuous delivery of high quality, cost effective healthcare services.

7. To provide a high-quality integrated development that promotes the interaction of the Medical Campus and the Wells Fargo Center for the Arts in a synergistic manner that incorporates the fine arts as part of the healing process at the Medical Campus. The provision of an integrated Medical Campus and the interaction between that Medical Campus and the Wells Fargo Center are fundamental to attracting physicians and other medical professionals, as well as attracting patients to the Medical Campus.

8. To ensure that the Sutter Medical Center is constructed in a manner that honors the Health Care Access Agreement with Sonoma County, while achieving a level of development intensity that will allow the Medical Campus to be developed in a cost-effective manner.

9. To provide a Medical Campus that is easily accessed by persons living within the primary service area of the Sutter Medical Center.

10. To ensure that the Medical Campus is efficiently designed and of sufficient size, and connectivity to provide the most modern and efficient layout for the integrated delivery of health services, and to promote functional relationships among departments, services and programs, provide functional circulation within the inpatient and outpatient spaces, placement of seating areas, outdoor terraces, and other patient and visitor amenities.

11. To the extent consistent with the fundamental objective of providing integrated delivery of health care services, to construct a Medical Campus that meets the *Sutter Health Facility Planning and Development Building Design Policy for Sustainability* with respect to site selection, water efficiency and conservation, energy efficiency, material and resource efficiency and environmental air quality. The proposed Medical Campus will strive to meet these policies by employing "green" and sustainable design and construction practices to achieve goals including maximizing green space, employing energy efficient hospital design, stressing water conservation and implementing a construction waste management and recycling plan for all construction components. Sutter will seek to partner with public and private service providers such as PG&E to achieve these sustainability goals.

12. To provide a Medical Campus linked to the LBMF in a manner that provides a simple, clear and elegant set of buildings linked by meditative paths, bioswales, outdoor gardens, courtyards and open space that promotes a sense of well-being and healing through a dignified and forward-thinking building plan that will be an inviting and positive healing

environment for patients, families, visitors, staff and all that come in contact with the Medical Campus.

13. To allow for uninterrupted operation of medical services currently provided at Sutter's Chanate campus and maintain continuity of care.

14. To provide an emergency entrance to the Sutter Medical Center close to US 101 and to design the overall Medical Campus in a manner that facilitates ambulance access from US 101.

15. To provide a Medical Campus in Sonoma County on property owned by or available to Sutter, which includes:

   - A 70-bed Sutter Medical Center that complies with the Hospital Facilities Seismic Safety Act and the existing Health Care Access Agreement between Sutter and the County of Sonoma, providing inpatient services including obstetrics, a Level III neonatal intensive care unit, intensive care, emergency services, medical/surgical and diagnostic services, supporting ancillary services, and a full range of women's reproductive health services.

   - A Central Utilities Plant to service the Medical Campus that meets the requirements of the Hospital Facilities Seismic Safety Act.

   - A 28-bed Physicians Medical Center that will comply with the Hospital Facilities Seismic Safety Act and provide 24 hour inpatient care, including medical, nursing, surgical, intensive care, anesthesia, laboratory, radiology, and pharmacy services.

   - A visually unobtrusive helistop that meet the functional needs of the Medical Center, with controlled access to ensure public safety during helicopter landing and take-off, which complies with all applicable regulatory and life safety requirements for helistops and helicopter travel, including, but not limited to, Federal Aviation Administration and Caltrans Division of Aeronautics requirements for flight path obstruction clearance.

   - A Medical Office Building that can accommodate physicians affiliated with Sutter Medical Foundation North Bay, as well as independent physicians, and provide supplemental hospital services to support the Sutter Medical Center and Physicians Medical Center.

16. To further the LBMF's nonprofit mission to enrich, educate, and entertain the community through the arts through accessible and outstanding presentation of fine arts and entertainment performances, contemporary art exhibitions, family and education programs and facility-based services.

17. To revise LBMF's existing Use Permit to allow for certain single-day community events on the East Lawn and certain outdoor sales events on the South Lawn in compliance with the County's General Plan sound limits and County and State permit requirements.

Considerations Regarding Parcel Size, Configuration and Accessibility

In developing suggested criteria for screening the potential alternatives for the County's consideration, Sutter also reviewed its 1999 Sutter Medical Center Master Plan, a document which assessed the parcel size, configuration and accessibility appropriate for a replacement site for the Sutter Medical Center.

The 1999 Master Plan evaluated the potential construction of a 174-bed replacement hospital for Sutter Medical Center of Santa Rosa at its current Chanate Road site, or on a new site. This Master Plan considered only the development of a replacement hospital, and in determining how much land would be needed to construct the hospital on a new site specifically did not evaluate development of a Medical Office Building.

The Master Plan concluded that desirable qualities for a new site would include the following:

- The new site should be located closed to US 101 and be near a freeway exit

- In addition to good freeway access, the site should have access from streets on at least two sides. This would allow for the separation of service and emergency vehicles from patient, visitor and staff traffic.

- Based on the Master Plan study the site should have a minimum of 18 acres to accommodate what was then described as a full program (174 beds and 360,000 SF), allow for expansion and avoid the initial need for parking structures. If a Medical Office Building were desired on the Medical Center site additional land would be required to accommodate the building and its parking.

- The site should have a regular shape. An elongated, narrow shape cannot be as efficiently developed even if it has the required area.

- Sites with extreme topography should be avoided. However, it is not necessary that the site be flat.

Significant Impacts Relevant to Selection of Alternatives

One of the primary considerations in selecting alternatives for evaluation in the EIR should be whether the alternative would avoid or substantially lessen one or more significant effects of the project. The analysis submitted to the County on February 2 in the summary environmental checklist and the various detailed attachments indicates that the Project would result in the following impacts which are anticipated to be significant and unavoidable impacts (i.e., impacts for which no feasible mitigation measures are identified to reduce the impact to a less-than-significant level):

- Helistop Operational Noise Impacts on the Adjacent Land Uses
- Temporary Regional Air Quality Impacts Associated with Importing Fill
- Cumulative Traffic Impacts

In addition, as noted below in section III.C, it may be appropriate to consider alternatives that reduce other potentially significant impacts, even if those impacts are not anticipated at this time to be significant and unavoidable impacts of the project.

Although the primary aim of an alternatives analysis in an EIR is to reduce or avoid significant and unavoidable impacts identified with the Project, the Guidelines generally authorize lead agencies to consider alternatives that "avoid or substantially lessen any of the significant effects of the project." On this basis, it may also be appropriate to consider other environmental impacts in addition to those which have been identified at this point as significance and unavoidable, even if it appears that the impacts can be mitigated to a less than significant level based on the mitigation measures identified in the environmental checklist and accompanying technical studies submitted on February 2. Also, as the County's environmental impact analysis proceeds, the conclusions regarding the significance of various impacts may be revised.

CEQA-Required "No Project" Alternative

As indicated in the discussion of CEQA Guidelines, above, consideration of a "no project" alternative is required. "The purpose of describing and analyzing a 'no project' alternative is to allow decision makers to compare the impacts of approving the proposed project with the impacts of not approving the proposed project." Also, the "no project" alternative is "not the baseline for determining whether the proposed project's environmental impacts may be significant, unless it is identical to the existing environmental setting analysis which does establish that baseline..." (CEQA Guidelines § 15126.6(e).)

A key consideration for the selection of project alternatives to the Project, and for the formulation of the no project alternative required by CEQA, is compliance with the Alquist Act and SB 1953. These statutes mandate the replacement or seismic retrofit of existing acute care hospital facilities that do not meet current earthquake-resistant standards for hospitals. If this requirement is not met, a non-complying acute care hospital must be closed. Under the CEQA Guidelines, if the failure to proceed with the proposed project would not preserve existing environmental conditions, then the no project alternative should identify the practical consequence of not approving the project. (CEQA Guidelines § 15126.6(e)(3)(B).) Under these provisions, the No Project alternative would consist of a decision not to proceed with the construction and development of the proposed Project, and the closure of the existing Sutter Medical Center at Chanate Road.

IV. BASIS FOR INCLUDING POTENTIAL ALTERNATIVES IN THIS SCREENING ANALYSIS

The following discussion summarizes the bases upon which potential alternatives were included in this initial screening analysis. In compiling the potential alternatives to be included in this analysis, the Sutter project team considered a very broad range of potential alternatives and alternate sites, including alternatives which may not substantially meet project objectives and alternatives which may not reduce environmental impacts. The purpose of this screening is to evaluate this broad range of potential alternatives so that the County may determine which of them meet the criteria of the CEQA Guidelines for inclusion and more detailed analysis in the EIR. Those criteria for screening include the extent to which the alternative meets project objectives and reduces environmental impacts. In other words, potential alternatives were not "screened out" of this analysis on the basis that they do not meet project objectives or reduce impacts, but those factors would be a proper basis for the County to apply determining which potential alternatives should be evaluated in detail in the EIR.

CEQA Requirements

As required by CEQA, this analysis includes a “no project” alternative. Under the CEQA Guidelines, the “no project” alternative must describe the circumstance under which the Project does not proceed. The “no project” alternative was also informed by CEQA Guideline section 15126.6(d)(3)(B), which provides that if disapproval of the project under consideration would result in predictable actions by others, that no project consequence should be discussed.

As also required by CEQA, this analysis considers several alternatives developed by Sutter that may avoid or substantially lessen significant effects of the Project. (CEQA Guideline § 15126.6(b).)

Alternatives Suggested By County Environmental Review Staff

During Sutter’s preliminary discussions of potential alternatives, County PRMD staff suggested several potential alternatives that could be considered in the preliminary screening of alternatives for the EIR. Each of these suggestions has been evaluated in this analysis.

Alternate Sites Considered By Sutter’s Siting Advisory Panel

This analysis includes a number of sites which were considered by a Siting Advisory Panel convened by Sutter Health in 2000 and 2001 to discuss possible sites for the location of a new Sutter Hospital for Sonoma County. The sites considered by the Advisory Panel included the Proposed Project site at the Wells Fargo Center. This Advisory Panel was a volunteer panel of local citizens, and the Panel was convened prior to the formulation of the current proposed project. This analysis includes some information on these potential alternate sites that was developed by the Advisory Panel. In response to the County’s suggestion that this screening analysis should include the site evaluated by the Panel, the Sutter project team also conducted its own review for this initial screening analysis, including information relating to the current status of these sites. In some cases, the information available from the Advisory Panel's consideration was limited, as the Panel's records do not always clearly reflect what specific parcels in a given location were under consideration. The Siting Advisory Panel evaluated sites based (i) availability, (ii) proximity to a freeway, (iii) ability to provide helicopter access, (iv) ability to serve the existing Chanate hospital's patient population, (v) accessibility via public transit, (vi) General Plan and Zoning Code designation for medical uses, (vii) suitable infrastructure, and (viii) cost. The Advisory Panel's evaluation was one part of Sutter's thorough evaluation of potential sites, and that overall evaluation by Sutter led to the decision to purchase the Wells Fargo Center site.

Sites Identified By Sutter In 2009

Sutter also developed a further list of alternate sites in order to provide a thorough evaluation of potential alternate sites to be considered in the screening analysis for EIR and those sites are included in this analysis.

INITIAL SCREENING ANALYSIS OF POTENTIAL PROJECT ALTERNATIVES

Noise Reduction Alternative/No Helistop

Alternative Address/Location: 50 Mark West Springs Road, unincorporated Sonoma County, north of Santa Rosa (the Proposed Project Site)

Description of the Alternative: This alternate consists of the Project as proposed, except that the helistop is not included. Patients who would otherwise arrive by helicopter would instead arrive at the Sonoma County airport and would be transported by ambulance to the Medical Campus (Sutter Medical center or Physicians Medical Center).

Reason for Evaluating this Alternative: This alternative is included in the screening analysis because it will reduce two of the potentially significant impacts that would result from development of the project as proposed. Adoption of a project alternative that does not include the helistop would avoid two noise related impacts identified as significant and unavoidable impacts in the summary environmental checklist and supporting materials submitted to the County by Sutter on February 2. These two impacts are helistop operational noise impacts on adjacent land uses resulting from annoyance and sleep disturbance, and helistop operational noise impacts on the project site.

Screening Evaluation:

Environmental Impacts:

As noted above, this alternative would reduce two significant noise related impacts. Most remaining impacts of this alternative would be substantially similar to the impacts of the Proposed Project.

However, elimination of the helistop from the Proposed Project would result in increased ambulance service from the Sonoma County Airport to the Project site, a path which is primarily along Highway 101. This would result in an increase in interruptions (approximately 170 per year) to normal traffic flow along the 4 mile path between the Airport and Sutter Medical Center.

Project Objectives:

Elimination of the helistop from the Proposed Project would result in delay in treatment of patients who would otherwise be brought directly to the Sutter Medical Center or Physicians Medical Center via helicopter. Patients would be diverted to Sonoma County Airport before they could be transported, via ambulance, to the Medical Center. The trip from the Sonoma County Airport to the Project site is 4 miles. This trip, depending upon traffic, can take as little as 7 minutes, or as much as 20 minutes in commute traffic. This could result in negative impacts to patient outcomes and would undermine Sutter's goal to provide high quality care.

This alternative would also substantially reduce Sutter's ability to provide the medical services set forth in the Health Care Access Agreement.

Emissions Reduction Alternative/No Soil Surcharge

Alternative Address/Location: 50 Mark West Springs Road, unincorporated Sonoma County, north of Santa Rosa (the Proposed Project Site)

Description of the Alternative: This alternative consists of the Project as proposed, except that the Project would include driven piles, instead of surcharging the property.

Reason for Evaluating this Alternative: This alternative is included in the screening analysis because it could avoid a potentially significant impact of the project as proposed. As noted in the summary environmental checklist submitted on February 2 (page 8), the daily emissions associated with haul truck trips needed for surcharging the site would be considered significant. By using driven piles to meet seismic safety requirements, instead of soil surcharging, this alternative might avoid that significant impact.

Screening Evaluation:

Environmental Impacts:

This alternative would eliminate some truck trips associated with soil surcharging and therefore would reduce emissions of NOx, ROG and PM_{10} related to those truck trips. Accordingly, the significant and unavoidable air quality impact would be reduced. However, the air quality impact would remain significant and unavoidable. This is because, of the total amount of surcharging (approximately 100,000 cubic yards) required by the Proposed Project, almost 3/4 of that amount would still be required to raise and prepare the site for construction. Given that approximately 75,000 cubic yards of fill would still be required, the air quality impacts related to both NOx and PM_{10} would drop by approximately 1/4, to approximately 180 pounds/day, and ROG to 13.5 pounds/day. Based on the BAAQMD Threshold of Significance for those emissions, this alternative's air quality impacts would remain significant and unavoidable.

Also, to construct OSHPD-compliant structures on the site, an alternative form of seismically safe foundation would be required. This alternative form of foundation construction would involve the drilling of piles. Pile driving would require up to 1,800 driven piles and the time required for pile-driving would be approximately 8 months. Noise and vibration associated with pile driving are significant environmental concerns. Vibration impacts from pile driving have been determined not to be a potentially significant environmental impact as nearby sensitive receptors are located a sufficient distance from the pile driving (see Impact XI.2 in the summary environmental checklist). Noise impacts, however, would be significant and unavoidable (Impact XI.9b in the checklist), even after implementation of mitigation.

Project Objectives:

Surcharging has been approved by OSHPD as part of its review of site design of the Proposed Project related to seismic safety. If surcharging is not an option, then pile driving will be required. This would necessitate complete resubmittal to OSHPD, and would delay the Project by months, if not years.

As a result this alternative would also substantially reduce Sutter’s ability to provide the medical services set forth in the Health Care Access Agreement.

Reduced Project Alternative I (70 Bed Hospital Without Accompanying Facilities)

Alternative Address/Location: 50 Mark West Springs Road, unincorporated Sonoma County, north of Santa Rosa (the Proposed Project Site)

Description of the Alternative: This alternative consists of a proposed 70 bed Sutter Medical Center, a central utilities plant to service the Medical Center, and a helistop to service the Medical Center, but does not include an accompanying Physicians Medical Center or a Medical Office Building.

Reason for Evaluating this Alternative: This alternative is included in this screening analysis at the suggestion of County PRMD staff.

Screening Evaluation:

Environmental Impacts:

Under this alternative, all impacts related to site disturbance and operations (e.g. traffic and parking, operational noise, hydrology and water quality, demand for public services and utilities, etc.) would be reduced by a little more than half (57%). Further, depending upon building locations, impacts to nearby biological resources (on-site wetlands) could be avoided. This alternative would also reduce impacts related to construction, as there would be fewer buildings covering a smaller footprint on the site. However, impacts to geology or soils, cultural resources, land use and planning, mineral resources, population and housing would not be markedly different from that of the proposed project.

This alternative would not eliminate or lessen the significant and unavoidable air quality impacts associated with the surcharging of the Project site, as a significant portion of that fill would still be required. Noise impacts associated with the helistop would remain significant and unavoidable, and traffic impacts, while dispersed over a larger area (including trips to other medical support services such as x-rays, labs, medical offices etc. that would likely be constructed near the 70-bed hospital), would remain regionally significant.

Project Objectives:

This alternative would make it difficult for the Sutter Medical Center to provide integrated care among services in different settings: 1) physician/medical office-based care; 2) outpatient services (e.g. outpatient surgery, outpatient imaging and emergency services); 3) inpatient (hospital services). A single co-located medical campus is more convenient for patients, physicians, visitors and employees and reduces duplications of services.

Reduced Project Alternative II (All Onsite Facilities Reduced)

Alternative Address/Location: 50 Mark West Springs Road, unincorporated Sonoma County, north of Santa Rosa (the Proposed Project Site)

Description of the Alternative: This alternative reduces the intensity of all of the major components of the proposed project. The alternative assumes that soil surcharging would be conducted, as with the Proposed Project, and includes a helistop for purposes of providing access to neonatal intensive care patients and cardiac care patients. For purposes of this screening analysis, this alternative is assumed to consist of each component of the Project reduced by 25% to 50%. Thus, this alternative would include a Sutter Medical Center of 35 to 52 beds, a Physicians Medical Center of 14 to 21 beds, and a Medical Office Building of between 40,000 and 60,000 square feet. This alternative is set forth in this analysis at a conceptual level to evaluate whether a reduced protect alternative of this type would meet CEQA criteria for an alternatives analysis, and thus to determine whether this type of alternative should be formulated in further detail for inclusion in the EIR.

Reason for Evaluating this Alternative: This alternative is included in the screening analysis at a conceptual level because an overall reduced intensity alternative is often considered for evaluation in environmental impact reports as a potential means of reducing environmental impacts.

Screening Evaluation:

Environmental Impacts:

This alternative would reduce all impacts of the project by 25%-50%. It would reduce the cumulative traffic impacts associated with the Proposed Project, as there would be fewer vehicle trips to and from the Project site, but this alternative is not expected to reduce such traffic impacts to a less than significant level. This alternative would not eliminate or lessen the significant and unavoidable air quality impacts associated with the surcharging of the Project site, as that fill would still be required. It would also not eliminate or lessen the significant and unavoidable noise impacts associated with the operation of the helistop. This alternative would thus not avoid any of the significant and unavoidable impacts of the Project, although there would be some reduction in cumulative traffic impacts.

Project Objectives:

This alternative would substantially reduce Sutter's ability to honor the Health Care Access Agreement, as a Sutter Medical Center of 35 to 52 beds is not sufficient to provide the health care services that are envisioned in the Health Care Access Agreement.

Reconfigured Alternative

Alternative Address/Location: 50 Mark West Springs Road, unincorporated Sonoma County, north of Santa Rosa (the Proposed Project Site)

Description of the Alternative: This alternative would consist of a reconfiguration of the proposed components of the Project on the Project site. This alternative is set forth in this screening analysis at a conceptual level of detail in order to determine whether a reconfigured alternative should be developed at a further level of detail and evaluated in the EIR. Typically a reconfigured alternative is evaluated when the location of particular project components results in significant environmental impacts, or when the placement of project components affects particular environmental resources on the Project site. For example, a reconfigured alternative could be developed to avoid the large wetlands identified on the site. Alternatively, a reconfigured alternative could be developed to create greater setbacks from adjacent land uses or otherwise reconfigure the project to avoid aesthetic or land use compatibility issues with adjacent land uses.

Reason for Evaluating this Alternative: A reconfigured project alternative is one of the types of alternatives that are often evaluated for inclusion in EIRs as a potential means of reducing project impacts.

Screening Evaluation:

Environmental Impacts:

A reconfigured project alternative would not reduce any identified significant or significant and unavoidable impacts of the Proposed Project. This is primarily because the impacts of the Proposed Project that are associated with the placement of various elements of the Project on the Project site are already less than significant. For instance, after mitigation, the Project would not result in significant wetland or other biological impacts, or land use compatibility impacts. Addressing such less than significant impacts by reconfiguring the Project to, for instance, increase setbacks, would require either greater building height, or construction of a parking structure, or both. Such changes would increase the aesthetic impacts of the Project. Also, to the extent that the Proposed Project may result in any significant aesthetic impacts, the reconfiguration of multi-story buildings would be unlikely to lessen those impacts, because the medical campus portion of the site would still be converted from a relatively open site to a site developed with several multi-story buildings and parking.

Project Objectives:

A reconfigured alternative would include all of the services of the Proposed Project and so would meet all Project Objectives.

Chanate Alternative

Alternative Address/Location: 3325 Chanate Road, Santa Rosa

Description of the Alternative: Under this alternative, the 1956 and 1972-era structures at the Sutter Medical Center of Santa Rosa on Chanate Road would be seismically retrofitted to meet Structural Performance Category (SPC)[1] 2 and Non-structural Performance Category (NPC) 3.[2] The 1991-era and later acute care buildings would receive non-structural retrofitting. The site's 2002 and 2004-era buildings would continue to be used for patient care and would not be retrofitted. The 1936-era building would be used for non-acute care and office purposes and would not be retrofitted.

Reason for Evaluating this Alternative: This alternative is included in the screening analysis because some members of the community have suggested at various times that the Sutter Medical Center be kept at its current site on Chanate Road. It is also included because a site re-use alternative is often considered for evaluation in environmental impact reports as a potential means of reducing environmental impacts. Also, PRMD staff suggested including this alternative in the screening analysis.

Screening Evaluation:

---

[1] SB 1953 required hospitals to evaluate and apply for ratings to the Office of Statewide Health Planning and Development (OSHPD) for seismic performance and non-structural performance. Structural performance Category (SPC) ranges from SPC-1, non-conforming, SPC-2, conforming to 2030, and SPC-3 through 5, facilities that are authorized for permanent use.. Non-structural Performance Categories (NPC) each cover a different category of non-structural element or different locations with a hospital. NPC 2 through 4 are considered steps towards full compliance and NPC-5 adds further elements that are needed for full compliance.

[2] The 1999 Sutter Master Plan considered the re-use of the Chanate site for a 174-bed replacement hospital. The Master Plan concluded that the need to keep the hospital operational during construction would require phased construction taking approximately 13 years to complete. It also concluded that "the lack of adequate site area, particularly in the initial phases of construction, and the need for up to nine acres of surface parking to support the proposed program demands consideration of a higher-density, more 'urban' alternatives. These alternatives include high rise construction (greater than four floors), large parking structures, and relatively little landscaped open space on the site." However, it did not evaluate the need for construction to the standards imposed by Hospital Facilities Seismic Safety Act and so the Master Plan on-site proposal is not considered as a potential alternative in this Screening Analysis.

- The Chanate campus acute care facilities are subject to the compliance requirements of the Hospital Facilities Seismic Safety Act as amended by Senate Bills 1953 and 1661.
- The Chanate campus is comprised mostly of aged buildings that carry a non-conformance seismic performance rating of SPC-1.
- In 2005, Sutter applied for, and received, extensions on its SB 1953 compliance deadline until January 1, 2013.
- Under SB 1953, if the Chanate campus' acute care facilities are seismically retrofitted to an interim seismic standard of SPC-2 by January 1, 2013, the facilities will be compliant with Hospital Facilities Seismic Safety Act through 2030.
- The seismic retrofit activities required to achieve the interim seismic standard of SPC-2 would require a variety of significantly disruptive activities, including the removal of portions of the exterior walls of the acute care facilities to allow for the welding of steel plates, the construction of internal shear walls, and the filling-in of windows. The activities would also include extensive reworking of infrastructure to achieve an NPC-3 rating at building separations. These activities would require shutting down sections of the hospital during construction, resulting in the displacement of hospital beds and the need to relocate patient care during the duration of the retrofit work.
- In May of 2008, Rutherford & Chekene, the engineering and structural geotechnical firm that evaluated and classified the Chanate campus structures for SB 1953 purposes, submitted an update to Sutter concerning the potential retrofit of the Campus to interim seismic standard SPC-2. They informed Sutter that the Chanate site has been confirmed by the California Geological Survey as having a "high potential for fault rupture," and has been classified by OSHPD to "have potential for fault rupture."
- Rutherford & Chekene have advised Sutter that it would not be able to retrofit the Chanate acute care facilities to interim seismic standard SPC-2 unless it 1) it demonstrates to OSHPD that there are no faults under the acute care facility structures or 2) identifies the location of faults under the acute care facility structures and receives approval from OSHPD for to retrofit those facilities to SPC-2. Extensive (10 feet deep or more) trenching around the entirety of the existing acute care facilities would be necessary to evaluate the potential for fault rupture. If faults were identified, Rutherford and Chekene have advised that obtaining OSHPD approval for retrofit would be "difficult." OSHPD has never approved operation of an acute care facility constructed on a fault.
- The Chanate site is within the "PI" (Public/Institutional) General Plan land use category. Hospitals are appropriate land uses within this category.
- The site is within the "PI" (Public and Institutional) Zone District and hospitals are permitted by Conditional Use Permit. The maximum building height limit is 35 feet.

- This site is surrounded by residential and medical uses.

Environmental Impacts:

Even assuming that OSHPD would permit continued operation of acute care facilities on a fault, this alternative could expose people and structures to potential substantial adverse effects associated with the rupture of earthquake faults.

The noise generated by existing helicopter operations at the Chanate facility would continue. Given that the site it surrounded by residential uses, the construction-period traffic would likely result in significant traffic impacts near the site.

Project Objectives:

Implementation of this alternative would significantly impact Sutter's ability to provide for uninterrupted operation of medical services at Sutter's Chanate campus, and could therefore substantially impede Sutter's ability to maintain continuity of care.

Continued operation of an acute care facility located on a fault has never been approved by OSHPD, nor has OSHPD reviewed a proposal for an interim seismic upgrade to the Chanate campus. If OSHPD would approve such a plan, it would necessitate the submittal to OSHPD of plans for an as-yet-undetermined approach to assure seismic safety for an acute care facility on a fault, and would delay the Project by months, if not years. As a result this alternative would substantially reduce Sutter's the ability to provide the medical services set forth in the Health Care Access Agreement.

Under this alternative, the acute care operations at Chanate will only be in compliance with the Hospital Facilities Seismic Safety Act until 2030.

No Project Alternative (Hospital Closure)

Alternative Address/Location: Under this alternative, no project would be developed at any address or location, and the existing Sutter Medical Center of Santa Rosa at 3325 Chanate Road would be closed.

Description of the Alternative: Under this alternative, the Proposed Project would not be constructed, and the existing Sutter Medical Center of Santa Rosa at 3350 Chanate Road would be closed in accordance with the Hospital Facility Seismic Safety Act and SB 1953. These statutes mandate the replacement or seismic retrofit of existing acute care hospital facilities that do not meet current earthquake-resistant standards for hospitals. If this requirement is not met, a non-complying acute care hospital must be closed.

Reason for Evaluating this Alternative: This alternative is included in the screening analysis because evaluation of the No Project alternative is required by CEQA. Under the CEQA Guidelines, the no project alternative must describe the circumstances under which the project does not proceed. CEQA Guideline § 15126.6(d)(3)(B) states that, if disapproval of the project under consideration would result in predictable actions by others, that "No Project" consequence should be discussed. "Where failure to proceed with the project will not result in preservation of existing environmental conditions, the analysis should identify the practical result of the project's non-approval and not create and analyze a set of artificial assumptions that would be required to preserve the existing physical environment."

Screening Evaluation:

Environmental Impacts:

This alternative eliminates all potential impacts associated with the Proposed Project, as well as eliminating all impacts associated with the operation of the existing Sutter Medical Center on Chanate Road. However, it is expected that the closure of the existing Sutter Medical Center would result in the redistribution of patients to Santa Rosa Memorial Hospital and other regional hospitals. Accordingly, the traffic impacts of the Proposed Project would be redistributed throughout the region. Impacts could be greater at some already impacted locations. Helicopter noise impacts would be transferred to already existing hospitals. Air emissions impacts would be reduced to less than significant levels.

Project Objectives:

The "No Project" alternative would not provide any of the services of the Proposed Project, and so would fail to meet all Project Objectives.

Decentralized Alternative

Alternative Address/Location: Conceptual

Description of the Alternative: This alternative proposes the construction on the Proposed Project site of a 70-bed Sutter Medical Center hospital and a 50,000 square foot medical office building. Additionally, a 28-bed Physicians Medical Center and a 50,000 square foot medical office building would be constructed on an undetermined separate site. Each hospital facility would include a helistop, as it would be needed to provide for patient access. Further, each facility would include a central utility plant (smaller than the one proposed for the Project) and parking facilities, (also smaller than those included in the Proposed Project). This alternative is set forth in this analysis at a conceptual level to evaluate whether an alternative of this type would meet CEQA criteria for an alternatives analysis, and thus to determine whether this type of alternative should be formulated in further detail for inclusion in the EIR.

Reason for Evaluating this Alternative: This alternative is included in this screening analysis because consideration of split site or dispersed alternatives for possible inclusion in the EIR was suggested to Sutter by County PMRD staff.

Screening Evaluation:

Environmental Impacts:

Development of this alternative would require the construction of facilities at two locations. It will result in increased development and may increase traffic over the levels of the Proposed Project where patients must make trips to both locations. It will also result in dispersed as well as possibly increased helicopter use (with its associated noise impacts), a decrease in energy savings (as construction of two facilities will eliminate many of the efficiencies that are possible under the Proposed Project based on the co-location of related medical uses), and increased emission of greenhouse gases (due to increased traffic and decreased site development efficiencies).

Project Objectives:

This alternative would significantly undermine Sutter’s ability to construct an efficiently designed Medical Campus of sufficient size, and connectivity to provide the most modern and efficient layout for the integrated delivery of health services. It will reduce Sutter’s ability to promote functional relationships among departments, services and programs, and will not allow for the provisions of functional circulation within the inpatient and outpatient spaces.

This alternative would undermine Sutter’s ability to construct a Medical Campus that meets the *Sutter Health Facility Planning and Development Building Design Policy for Sustainability*. The construction of two facilities at different locations will eliminate the efficiencies Sutter would have otherwise achieved through the integrated design of the Proposed Project. Specifically, it will substantially reduce Sutter’s ability to employ “green” and sustainable design and construction practices to achieve goals including maximizing green space, employing energy efficient hospital design, stressing water conservation and implementing a construction waste management and recycling plan for all construction components.

Airport Business Center Alternate Site

Alternative Address/Location: 1631 Airport Boulevard. The site is in the unincorporated area of Sonoma County, but within a designated urban services area. The area is commonly known as the Airport Specific Plan area of the County

Description of the Alternative: Under this alternative, the Proposed Project (Sutter Medical Center hospital, Central Utility Plant, Physicians Medical Center, and Medical Office Building) would be constructed on this 24.3 acre vacant site. This site on the north side of Airport Boulevard, has access off Skylane Boulevard via Aviation Boulevard. The site is still vacant, but has received a Tentative Map entitlement, and final map approval and recording is expected by June, 2009. The site is comprised of 2 parcels and is narrow (500' wide) and 2,500± feet long. This site is not owned by Sutter

Reason for Evaluating this Alternative: This alternative is included in this screening analysis because this site is one of the sites that was initially considered by the Siting Advisory Panel convened by Sutter in 2000-2001. Since that time, the site has been sold and, as noted above, is currently being considered for development as part of the larger business park.

Screening Evaluation:

Sutter's preliminary evaluation of the site's suitability for development of the Proposed Project, including consideration of information from the prior reviews, as well as further review in 2009 yielded the following information:

- The site is currently the subject of an active development application that is being processed through Sonoma County PRMD by a developer to subdivide into individual lots for business/industrial park development.
- There is a Tentative Map for the site, for Business Park uses with a pending Final Map.
- The site is not located along Highway 101 corridor and is not visible from Highway 101.
- The site is long and narrow and is not conducive to a hospital campus configuration. Altering this would require assemblage of adjoining parcels under separate ownership. The adjacent parcels have historically not been for sale.
- Development of this site would potential require a General Plan Amendment (GPA). Airport Land Use Commission (ALUC) approval would also be required as the site is within the airport Turning Pattern Zone (TPZ).
- The site contains potential wetlands acreage on its north area, and so a detailed Biological Assessment would be required.
- The site would be split by the County's planned future extension of Aviation Boulevard.

- While utility services are available, upgrades or extension of all utilities would be required.
- The site's surrounding uses consist of a moderately dense business park.
- The site is close to Sonoma County Airport and this is subject to high airport noise levels.
- The site has possible liquefaction issues.
- The site is accessible by Sonoma County Transit via a transit stop at Airport Boulevard at Brickway (approximately 500' from the site).
- Development of this site would not displace any residences.

Environmental Impacts:

This alternative would not reduce any identified significant or significant and unavoidable impacts of the Proposed Project. It would not eliminate or lessen the significant and unavoidable air quality impacts associated with the surcharging of the Project site, as that work would still be required on the alternative site. It would also not eliminate or lessen the significant and unavoidable noise impacts associated with the operation of the helistop, as a helistop would still be required. Finally, it would likely have similar cumulative traffic impacts to the Proposed Project.

Given the unusual configuration of the site, the site may need to be developed a density greater than indicated in Sutter's Project Proposal. Accordingly, development of the Proposed Project on this site would likely require substantially increased building heights and smaller setbacks, and potentially the addition of a parking structure, all of which may result in land use compatibility and aesthetic impacts.

Project Objectives:

Implementation of this alternative would significantly undermine Sutter's objective to provide a Medical Campus that is easily accessed by persons living within the primary service area of the Sutter Medical Center and one that is close to and visible from Highway 101.

Given the narrowness of the site, implementation of this alternative would impede Sutter's ability to ensure that the Medical Campus is efficiently designed and of sufficient connectivity to provide the most modern and efficient layout for the integrated delivery of health services, and to promote functional relationships among departments, services and programs, provide functional circulation within the inpatient and outpatient spaces, placement of seating areas, outdoor terraces, and other patient and visitor amenities.

The constrained nature of the site could also impair Sutter's ability to develop the Medical Campus in a manner that provides a simple, clear and elegant set of buildings linked by meditative paths, bioswales, outdoor gardens, courtyards and open space that promotes a sense of well-being and healing through a dignified and forward-thinking building plan that will be an inviting and positive healing environment for patients, families, visitors, staff and all that come in contact with the Medical Campus.

Shiloh Road/101 Alternate Site

Alternative Address/Location: On Shiloh Road at the southeast corner of Shiloh Road at Highway 101. The site is within Town of Windsor limits, and is a part of the Shiloh Corridor Vision Plan.

Description of the Alternative: Under this alternative, the Proposed Project (Sutter Medical Center hospital, Central Utility Plant, Physicians Medical Center, and Medical Office Building) would be constructed on this 27 acre site is vacant with limited agricultural uses. The site is still undeveloped and is presumed available. This site is not owned by Sutter.

Reason for Evaluating this Alternative: This alternative is included in this screening analysis because this site is one of the sites that was initially considered by the Siting Advisory Panel convened by Sutter in 2000-2001.

Screening Evaluation:

Sutter's preliminary evaluation of the site's suitability for development of the Proposed Project, including consideration of information from the prior reviews as well as further review in 2009, yielded the following information:

- The site contains 14.3 acres of confirmed wetlands, seasonal streams, and creek setbacks.
- The site may contain California Tiger Salamander and other protected species including nesting birds.
- A detailed biological assessment would be required.
- The floodplain encroaches on the site, such that development would require fill and offset of lost flood plain storage volume at another location.
- Development of the Proposed Project at the site would require the construction of significant local and regional road improvements, including the replacement and widening of Shiloh Road where it crosses over Highway 101, as well as related off-ramp and signal improvements.
- The Windsor Zoning Map on the Town's website shows approximately the western half of the property as RMU (Regional Mixed Use), the northeastern corner of the property as BMU (Boulevard Mixed Use) and the southeastern corner of the property at CR-24 (Compact Residential, 12-24 units). Section 27.10.020 of the Windsor Zoning Ordinance refers to RMU and BMU as general plan designations, with Regional Commercial and Boulevard Commercial as the comparable zoning designations. Under the Zoning Code, hospitals are allowed with a use permit in the regional commercial and boulevard commercial zones, but heliports are not allowed. Neither a hospital nor a heliport is allowed in the CR zone.

- The site has possible liquefaction issues.
- While utility services are available, upgrades or extension of all utilities would be required.
- The site has agricultural potential.
- Development of this site would not displace any residences.
- The site is accessible by Sonoma County Transit at Shiloh Road at Old Redwood Highway (approximately 1,000' from the site) with no sidewalk access.
- The site adjoins Highway 101 and has good visibility and access.

Environmental Impacts:

Development of this site would likely result in significant biological impacts related to impacts to wetlands, bird species, and California Tiger Salamander habitat. It would likely result in increased construction impacts associated with the replacement of the existing Highway 101 overpass that would be necessary to provide adequate access to the site. There might also be a variety of additional construction impacts associated with the fill required to raise the site above the floodplain (and off-site offsets to result in zero net fill).

This alternative would not reduce any identified significant or significant and unavoidable impacts of the Proposed Project. It would not eliminate or lessen the significant and unavoidable air quality impacts associated with the surcharging of the Project site, as that work would still be required on the alternative site. It would not eliminate or lessen the significant and unavoidable noise impacts associated with the operation of the helistop, as a helistop would still be required. Finally, it would likely have similar cumulative traffic impacts to the Proposed Project.

Project Objectives:

Assuming that all elements of the Proposed Project can be developed on this alternative site, it would appear to generally meet the Project Objectives.

Todd Road/Moorland Alternate Site

Alternative Address/Location: 801, 3809 & 3901 Moorland Avenue. The site is under County jurisdiction, but within the Urban Growth Boundary of the City of Santa Rosa.

Description of the Alternative: Under this alternative, the Proposed Project (Sutter Medical Center hospital, Central Utility Plant, Physicians Medical Center, and Medical Office Building) would be constructed on this 19.9 acre site. The site is mostly vacant, with existing limited agricultural uses. The site is not owned by Sutter.

Reason for Evaluating this Alternative: This alternative is included in this screening analysis because this site is one of the sites that was initially considered by the Siting Advisory Panel convened by Sutter in 2000-2001. The Panel considered the site to be too far south.

Screening Evaluation:

Sutter's preliminary evaluation of the site's suitability for development of the Proposed Project, including consideration of information from the prior reviews as well as further review in 2009, yielded the following information:

- The site has an awkward modified "L" configuration.
- The site contains an identified breeding pool for California Tiger Salamander and so a detailed Biological Assessment would be required.
- The site is zoned M1 SR VOH and M3 VOH and designated under the General Plan as Rural Residential. These General Plan and zoning designations do not permit hospital uses.
- The site is surrounded by agricultural, light and heavy industrial uses.
- The site is subject to potential noise from passing Northwestern Pacific Railroad (NWPRR) train traffic, although there is no direct train service access to the site.
- Development of the site will require annexation into the City of Santa Rosa in order to obtain utility services.
- While utility services are available, upgrades or extension of all utilities would be required.
- Development of the site would like require widening of Moorland Ave and related signal reconfigurations.
- Development of this site would not displace any residences.
- There is room for expansion of this site to adjacent parcels which are vacant.
- The site is accessible by Sonoma County Transit at Todd Road at Moorland Avenue.

- The site has good visibility from Highway 101, and workable freeway access.

Environmental Impacts:

Development of this site could result in potentially significant impacts to California Tiger Salamander (CTS) and CTS habitat. This alternative would also not reduce any identified significant or significant and unavoidable impacts of the Proposed Project. It would not eliminate or lessen the significant and unavoidable air quality impacts associated with the surcharging of the Project site, as that work would still be required on the alternative site. It would also not eliminate or lessen the significant and unavoidable noise impacts associated with the operation of the helistop, as a helistop would still be required. There is also potential for increased noise impacts from the nearby operations of the Northwestern Pacific Railroad (NWPRR). As well, it would likely have similar cumulative traffic impacts to the Proposed Project.

Because the site is significantly smaller than the 25 acres needed to construct the Proposed Project at the density indicated in Sutter's Project Proposal, which includes structures ranging in height from 2 to 3 stories that are served by surface parking, development of the Proposed Project on this site would likely require substantially increased building heights and smaller setbacks, and potentially the addition of a parking structure, all of which may result in land use compatibility and aesthetic impacts.

Project Objectives:

Given the less than optimal configuration of the site, and unless additional acreage was available for development, implementation of this alternative could impede Sutter's ability to ensure that the Medical Campus is efficiently designed and of sufficient connectivity to provide the most modern and efficient layout for the integrated delivery of health services, and to promote functional relationships among departments, services and programs, provide functional circulation within the inpatient and outpatient spaces, placement of seating areas, outdoor terraces, and other patient and visitor amenities.

The constrained nature of the site could also impair Sutter's ability to develop the Medical Campus in a manner that provides a simple, clear and elegant set of buildings linked by meditative paths, bioswales, outdoor gardens, courtyards and open space that promotes a sense of well-being and healing through a dignified and forward-thinking building plan that will be an inviting and positive healing environment for patients, families, visitors, staff and all that come in contact with the Medical Campus.

Wick Property Alternate Site (Santa Rosa/Todd)

Alternative Address/Location: This site is located south of Todd Road east of Santa Rosa Avenue. The site is in unincorporated Sonoma County, outside the City of Santa Rosa's city limits but within the City's Urban Growth Boundary.

Description of the Alternative: Under this alternative, the Proposed Project (Sutter Medical Center hospital, Central Utility Plant, Physicians Medical Center, and Medical Office Building) would be constructed on the 11.6± acre site is vacant and appears landlocked. The site is not owned by Sutter and is currently vacant. The site was recently sold to a new buyer who has no desire to sell at this time.

Reason for Evaluating this Alternative: This alternative is included in this screening analysis because this site is one of the sites that was initially considered by the Siting Advisory Panel convened by Sutter in 2000-2001.

Screening Evaluation:

Sutter's preliminary evaluation of the site's suitability for development of the Proposed Project, including consideration of information from the prior reviews as well as further review in 2009, yielded the following information:

- The site has no frontage on Santa Rosa Avenue or Todd Road. As a result, access is very restricted. The site is not visible from Highway 101.
- Even if the site was for sale, acquisition of additional parcels adjacent to the site necessary to provide sufficient acreage to develop the Proposed Project at the density currently proposed would require purchasing land under multiple ownerships.
- Development of the site would require significant local and regional utility and roadway improvements.
- The site is zoned RR10 and designated under the General Plan as Diverse Agriculture. The General Plan and zoning designations do not permit hospital uses.
- The site is surrounded by a mixture of "car lots," automotive services and some retail properties.
- The site is accessible by Sonoma County Transit at Santa Rosa Avenue at Todd Road (approximately 1,600 feet from the site).
- Development of this site would not displace any residences.

Environmental Impacts:

This alternative would not reduce any identified significant or significant and unavoidable impacts of the Proposed Project. It would not eliminate or lessen the significant and unavoidable air quality impacts associated with the surcharging of the Project site, as that work would still be required on the alternative site. It would also not eliminate or lessen the significant and unavoidable noise impacts associated with the operation of the helistop, as a helistop would still be required. This alternative would likely have similar cumulative traffic impacts to the Proposed Project.

Further, because the site is significantly smaller than the 25 acres needed to construct the Proposed Project at the density indicated in Sutter's Project Proposal, which includes structures ranging in height from 2 to 3 stories that are served by surface parking, development of the Proposed Project on this site would likely require substantially increased building heights and smaller setbacks, and potentially the addition of a parking structure, all of which may result in land use compatibility and aesthetic impacts.

Project Objectives:

Implementation of this alternative would significantly undermine Sutter's objective to provide a Medical Campus that is easily accessed by persons living within the primary service area of the Sutter Medical Center and one that is close to and visible from Highway 101.

Unless additional acreage was available for development, implementation of this alternative could impede Sutter's ability to ensure that the Medical Campus is efficiently designed and of sufficient connectivity to provide the most modern and efficient layout for the integrated delivery of health services, and to promote functional relationships among departments, services and programs, provide functional circulation within the inpatient and outpatient spaces, placement of seating areas, outdoor terraces, and other patient and visitor amenities.

Guerneville Road/Lance Drive Alternate Site

Alternative Address/Location: 1601 & 1696 Lance Drive. The site is comprised of two lots and is an island of unincorporated County territory surrounded by the City of Santa Rosa. This site includes one home with limited agricultural use.

Description of the Alternative: Under this alternative, the Proposed Project (Sutter Medical Center hospital, Central Utility Plant, Physicians Medical Center, and Medical Office Building) would be constructed on this 18.5 acre site. The site will require annexation into the City of Santa Rosa. The site is not visible from Highway 101. The site is not owned by Sutter and is owned by a historically reluctant seller.

Reason for Evaluating this Alternative: This alternative is included in this screening analysis because this site is one of the sites that was initially considered by the Siting Advisory Panel convened by Sutter in 2000-2001.

Screening Evaluation:

Sutter's preliminary evaluation of the site's suitability for development of the Proposed Project, including consideration of information from the prior reviews as well as further review in 2009, yielded the following information:

- The site is currently zoned AR B6 5, VOH (Valley Oak Habitat) and has been pre-zoned by the City as R1. That City zoning designation does not allow hospital uses.
- In order to provide utility services to the site it would need to be annexed into Santa Rosa, which will require LAFCO approval
- Helicopter service to the site would require overflight of residential areas.
- The site is believed to contain wetlands and would require a detailed Biological Assessment.
- Development of the site would require significant local and regional utility and roadway improvements.
- There is an existing well and septic system on the site.
- The site has agricultural potential.
- The site is accessible by Santa Rosa Transit at Guerneville Road at Lance Drive (approximately 700 feet from the site).

Environmental Impacts:

Development of this site could result in potentially significant biological impacts related to potential wetlands on the site. This alternative would not reduce any identified significant or significant and unavoidable impacts of the Proposed Project. It would not eliminate or lessen the significant and unavoidable air quality impacts associated with the surcharging of the Project site, as that work would still be required on the alternative site. It would also not eliminate or lessen the significant and unavoidable noise impacts associated with the operation of the helistop, as a helistop would still be required. Instead, this alternative would likely result in greater noise impacts due to the need for helicopters arriving and leaving the site to fly directly over residential areas. This alternative would likely have similar cumulative traffic impacts to the Proposed Project.

Further, because the site is significantly smaller than the 25 acres needed to construct the Proposed Project at the density indicated in Sutter's Project Proposal, which includes structures ranging in height from 2 to 3 stories that are served by surface parking, development of the Proposed Project on this site would likely require substantially increased building heights and smaller setbacks, and potentially the addition of a parking structure, all of which may result in land use compatibility and aesthetic impacts.

Project Objectives:

Implementation of this alternative would significantly undermine Sutter's objective to provide a Medical Campus that is easily accessed by persons living within the primary service area of the Sutter Medical Center and one that is close to and visible from Highway 101.

Ring Property Alternate Site

Alternative Address/Location: 1700 Hampton Way, Santa Rosa. The site is within the City limits of Santa Rosa.

Description of the Alternative: Under this alternative, the Proposed Project (Sutter Medical Center hospital, Central Utility Plant, Physicians Medical Center, and Medical Office Building) would be constructed on a 18.5± acres site south of and adjacent to Highway 12 and Stony Point Road (old driving range site and adjoining parcels). The site is not visible from Highway 101. The site is not owned by Sutter.

Reason for Evaluating this Alternative: This alternative is included in this screening analysis because this site is one of the sites that was initially considered by the Siting Advisory Panel convened by Sutter in 2000-2001.

Screening Evaluation:

Sutter's preliminary evaluation of the site's suitability for development of the Proposed Project, including consideration of information from the prior reviews as well as further review in 2009, yielded the following information:

- The site is comprised of two parcels, one long and narrow, and a second in an awkward "L" shape. Neither parcel is conducive to a hospital campus configuration. The two parcels which comprise the site are bisected by a public bicycle path, the Joe Rodota Trail. Altering this would require assemblage of adjoining parcels under separate ownership and these adjoining parcels are not for sale.
- The site is difficult to access. Currently it is accessed via Hampton Way, though there are possible easement issues. Development of this site would require supplemental access from Sebastopol Road or Stony Point Road.
- One of the two parcels which make up this site is currently in use as an "auto dismantler" which could suggest possible environmental remediation issues.
- The site is zoned R-3-15 and designated in the General Plan as General Commercial. Neither the zoning nor General Plan designations permit hospital uses.
- Helicopter service to the site would require overflight of residential areas.
- The site is accessible by Santa Rosa Transit at Stony Point Road at Highway 12, and by Sonoma County Transit at Sebastopol Road at Hampton Way, both adjacent to the site.

Environmental Impacts:

This alternative would not reduce any identified significant or significant and unavoidable impacts of the Proposed Project. It would not eliminate or lessen the significant and unavoidable air quality impacts associated with the surcharging of the Project site, as that work would still be required on the alternative site. It would also not eliminate or lessen the significant and unavoidable noise impacts associated with the operation of the helistop, as a helistop would still be required. Instead, this alternative would likely result in greater noise impacts due to the need for helicopters arriving and leaving the site to fly directly over residential areas. This alternative would likely have similar cumulative traffic impacts to the Proposed Project.

Further, because the site is significantly smaller than the 25 acres needed to construct the Proposed Project at the density indicated in Sutter's Project Proposal, which includes structures ranging in height from 2 to 3 stories that are served by surface parking, development of the Proposed Project on this site would likely require substantially increased building heights and smaller setbacks, and potentially the addition of a parking structure, all of which may result in land use compatibility and aesthetic impacts.

Project Objectives:

Implementation of this alternative would significantly undermine Sutter's objective to provide a Medical Campus that is easily accessed by persons living within the primary service area of the Sutter Medical Center and one that is close to and visible from Highway 101.

Given the awkward configuration of the site, implementation of this alternative could impede Sutter's ability to ensure that the Medical Campus is efficiently designed and of sufficient connectivity to provide the most modern and efficient layout for the integrated delivery of health services, and to promote functional relationships among departments, services and programs, provide functional circulation within the inpatient and outpatient spaces, placement of seating areas, outdoor terraces, and other patient and visitor amenities.

Further, the constrained nature of the site could also impair Sutter's ability to develop the Medical Campus in a manner that provides a simple, clear and elegant set of buildings linked by meditative paths, bioswales, outdoor gardens, courtyards and open space that promotes a sense of well-being and healing through a dignified and forward-thinking building plan that will be an inviting and positive healing environment for patients, families, visitors, staff and all that come in contact with the Medical Campus.

101/Todd Road NW Alternate Site

Alternative Address/Location: 237 Todd Road in unincorporated Sonoma County. The site is not within the City of Santa Rosa's city limits, but is within the City's Urban Growth Boundary.

Description of the Alternative: Under this alternative, the Proposed Project (Sutter Medical Center hospital, Central Utility Plant, Physicians Medical Center, and Medical Office Building) would be constructed on 11.1± acres of vacant land in the county. The site is not owned by Sutter. Since the original evaluation of this site, it has been sold and is now fully developed, making it no longer available for the project. The site is not visible from Highway 101 and not easily served by Highway 101.

Reason for Evaluating this Alternative: This alternative is included in this screening analysis because this site is one of the sites that was initially considered by the Siting Advisory Panel convened by Sutter in 2000-2001.

Screening Evaluation:

Sutter's preliminary evaluation of the site's suitability for development of the Proposed Project, including consideration of information from the prior reviews as well as further review in 2009, yielded the following information:

- Development of this site would likely impact California Tiger Salamander breeding pools and habitat.
- Helicopter service to the site would require overflight of residential areas.
- The site is adjacent to Recycling Center which could result in noise and odor impacts to the Medical Campus.
- The site is zoned M2 VOH and designated in the General Plan as Rural Residential. Neither the zoning nor General Plan designations permit hospital uses.
- The site is subject to potential noise levels from passing Northwestern Pacific Railroad (NWPRR) train traffic, although there is no direct train access to the site.
- The site is accessible by Sonoma County Transit at Todd Road at Mooreland Avenue (900 feet away).
- Development of this site would not displace any residences.

Environmental Impacts:

Development of this site could result in potentially significant impacts to California Tiger Salamander (CTS) and CTS habitat. This alternative would not reduce any identified significant or significant and unavoidable impacts of the Proposed Project. It would not eliminate or lessen the significant and unavoidable air quality impacts associated with the surcharging of the Project site, as that work would still be required on the alternative site. It would also not eliminate or lessen the significant and unavoidable noise impacts associated with the operation of the helistop, as a helistop would still be required. Instead, this alternative would likely result in greater noise impacts due to the need for helicopters arriving and leaving the site to fly directly over residential areas. There is also potential for increased noise impacts from the nearby operations of the Northwestern Pacific Railroad (NWPRR). This site would likely have similar cumulative traffic impacts to the Proposed Project.

Because the site is significantly smaller than the 25 acres needed to construct the Proposed Project at the density indicated in Sutter's Project Proposal, which includes structures ranging in height from 2 to 3 stories that are served by surface parking, development of the Proposed Project on this site would likely require substantially increased building heights and smaller setbacks, and potentially the addition of a parking structure, all of which may result in land use compatibility and aesthetic impacts.

Project Objectives:

Implementation of this alternative would significantly undermine Sutter's objective to provide a Medical Campus that is easily accessed by persons living within the primary service area of the Sutter Medical Center and one that is close to and visible from Highway 101.

Unless additional acreage was available for development, implementation of this alternative could impede Sutter's ability to ensure that the Medical Campus is efficiently designed and of sufficient connectivity to provide the most modern and efficient layout for the integrated delivery of health services, and to promote functional relationships among departments, services and programs, provide functional circulation within the inpatient and outpatient spaces, placement of seating areas, outdoor terraces, and other patient and visitor amenities.

North Point Corporate Center Alternate Site

Alternative Address/Location: Challenger Way, Mercury Way and Apollo Way, Santa Rosa. The site is within the City limits of the City of Santa Rosa.

Description of the Alternative: Under this alternative, the Proposed Project (Sutter Medical Center hospital, Central Utility Plant, Physicians Medical Center, and Medical Office Building) would be constructed on 19.96 acres in the Northpoint Corporate Center Business Park. The site is composed of seven parcels. The central parcel has now been developed with office uses by Nokia. The resulting split in the available parcels results in an available northern development area of 11.96 acres. The 14.2 acres south of Mercury Way that were originally available have now also been partially built out. The remaining 8 separate parcels total 13.7 acres. The site is not visible from Highway 101. The site is not owned by Sutter.

Reason for Evaluating this Alternative: This alternative is included in this screening analysis because this site is one of the sites that was initially considered by the Siting Advisory Panel convened by Sutter in 2000-2001. Since that time, as noted above, several of the individual parcels which make up this site have been developed.

Screening Evaluation:

Sutter's preliminary evaluation of the site's suitability for development of the Proposed Project, including consideration of information from the prior reviews as well as further review in 2009, yielded the following information:

- Hospitals are not a permitted use in any Residential, Business Park or Industrial Zone District within the City of Santa Rosa. This would effectively preclude a Hospital in the area along Corporate Center Parkway, all within the "BP" (Business Park) Zone District within the "Santa Rosa Corporate Center" (identified by the 2000/2001 Siting Advisory Panel as "Northpoint Corporate Center").
- Helicopter service to the site would require overflight of residential areas.
- While utility services are available, upgrades or extension of all utilities would be required.
- The site is accessible by Santa Rosa Transit at Corporate Center Parkway at Apollo Way, adjacent to the southeasterly portion of the split site.
- Development of this site would not displace any residences.

Environmental Impacts:

This alternative would not reduce any identified significant or significant and unavoidable impacts of the Proposed Project. It would not eliminate or lessen the significant and unavoidable air quality impacts associated with the surcharging of the Project site, as that work would still be required on the alternative site. It would also not eliminate or lessen the significant and unavoidable noise impacts associated with the operation of the helistop, as a helistop would still be required. Instead, this alternative would likely result in greater noise impacts due to the need for helicopters arriving and leaving the site to fly directly over residential areas. This site would likely have similar cumulative traffic impacts to the Proposed Project.

Because the site is significantly smaller than the 25 acres needed to construct the Proposed Project at the density indicated in Sutter's Project Proposal, which includes structures ranging in height from 2 to 3 stories that are served by surface parking, development of the Proposed Project on this site would likely require substantially increased building heights and smaller setbacks, and potentially the addition of a parking structure, all of which may result in land use compatibility and aesthetic impacts.

Project Objectives:

Implementation of this alternative would significantly undermine Sutter's objective to provide a Medical Campus that is easily accessed by persons living within the primary service area of the Sutter Medical Center and one that is close to and visible from Highway 101.

Unless additional acreage was available for development, implementation of this alternative could impede Sutter's ability to ensure that the Medical Campus is efficiently designed and of sufficient connectivity to provide the most modern and efficient layout for the integrated delivery of health services, and to promote functional relationships among departments, services and programs, provide functional circulation within the inpatient and outpatient spaces, placement of seating areas, outdoor terraces, and other patient and visitor amenities.

Fountaingrove Executive Center/Old Redwood Highway Alternate Site

<u>Alternative Address/Location</u>: 3700 Old Redwood Highway/3569 Round Barn Circle, Santa Rosa. The site is within the City of Santa Rosa.

<u>Description of the Alternative</u>: Under this alternative, the Proposed Project (Sutter Medical Center hospital, Central Utility Plant, Physicians Medical Center, and Medical Office Building) would be constructed on this 15.59± acre site. This site is located at the western edge of the Fountaingrove Executive Center, on the portion of the Fountaingrove Executive Center that fronts Old Redwood Highway. A substantial portion, approximately three-quarters, of the northern end of this site has been developed since 2001. The site is not owned by Sutter.

<u>Reason for Evaluating this Alternative</u>: This alternative is included in this screening analysis because this site is one of the sites that was initially considered by the Siting Advisory Panel convened by Sutter in 2000-2001. The site was ruled out from further consideration by the Panel as being too expensive, with too much slope on the land, and not being compatible with other development in the area.

<u>Screening Evaluation</u>:

Sutter's preliminary evaluation of the site's suitability for development of the Proposed Project, including consideration of information from the prior reviews as well as further review in 2009, yielded the following information:

- The remaining portion of the site that is available for development is awkwardly configured.
- The site is zoned and designated in the General Plan for Retail and Business Services. The General Plan and zoning designations do not permit hospital uses.
- The site's extreme topography is incompatible with hospital needs/uses
- The site is adjacent to an existing Cancer Center
- The site accessible by Santa Rosa Transit at Round Barn Boulevard at Round Barn Circle
- The site is visible from the Highway 101 and has acceptable access.
- Development of this site would not displace any residences.

<u>*Environmental Impacts:*</u>

This alternative would not reduce any identified significant or significant and unavoidable impacts of the Proposed Project. It would not eliminate or lessen the significant and unavoidable air quality impacts associated with the surcharging of the Project site, as that work would still be required on the alternative site. It would also not eliminate or lessen the significant and unavoidable noise impacts associated with the operation of the helistop, as a helistop would still be required. As well, it would likely have similar cumulative traffic impacts to the Proposed Project.

Because the remaining developable portion of the site is significantly smaller than the 25 acres needed to construct the Proposed Project at the density indicated in Sutter's Project Proposal, which includes structures ranging in height from 2 to 3 stories that are served by surface parking, development of the Proposed Project on this site would likely require substantially increased building heights and smaller setbacks, and potentially the addition of a parking structure, all of which may result in land use compatibility and aesthetic impacts.

Project Objectives:

It is not clear that, even with increased building heights and reduced setbacks, the full program proposed by Sutter in its Project Proposal could be developed on this site. Accordingly, implementation of this alternative would likely significantly undermine Sutter's ability to provide the medical services set forth in the Health Care Access Agreement, and to meet any of the Project Objectives associated with development of a Sutter Medical Center, Sutter Medical Center hospital, Central Utility Plant, Physicians Medical Center, and Medical Office Building.

Westwind Business Park Alternate Site

Alternative Address/Location: 3355 Westwind Boulevard in an unincorporated area of Sonoma County, but within a designated Urban Services area.

Description of the Alternative: Under this alternative, the Proposed Project (Sutter Medical Center hospital, Central Utility Plant, Physicians Medical Center, and Medical Office Building) would be constructed on 19.2± acres of vacant land within Westwind Business Park. The site is not visible from Highway 101. Several of the parcels which comprise this site have recently been developed. The site is not owned by Sutter.

Reason for Evaluating this Alternative: This alternative is included in this screening analysis because this site is one of the sites that was initially considered by the Siting Advisory Panel convened by Sutter in 2000-2001.

Screening Evaluation:

Sutter's preliminary evaluation of the site's suitability for development of the Proposed Project, including consideration of information from the prior reviews as well as further review in 2009, yielded the following information:

- The site is zoned MP 2 VOH and designated in the General Plan as General Industrial. The General Plan and zoning designations do not permit hospital uses.
- Airport Land Use Commission (ALUC) approval would also be required as site is within Turning Pattern Zone (TPZ)
- Development on the site would be subject to airport noise.
- While utility services are available, upgrades or extension of all utilities would be required.
- Development of this site would not displace any residences.
- The site is accessible by Sonoma County Transit at Copperhill Parkway at Westwind Boulevard (approximately 500 feet from the site).

Environmental Impacts:

This alternative would not reduce any identified significant or significant and unavoidable impacts of the Proposed Project. It would not eliminate or lessen the significant and unavoidable air quality impacts associated with the surcharging of the Project site, as that work would still be required on the alternative site. It would also not eliminate or lessen the significant and unavoidable noise impacts associated with the operation of the helistop, as a helistop would still be required. This alternative would likely have similar cumulative traffic impacts to the Proposed Project.

Further, because the remaining developable portion of the site is significantly smaller than the 25 acres needed to construct the Proposed Project at the density indicated in Sutter's Project Proposal, which includes structures ranging in height from 2 to 3 stories that are served by surface parking, development of the Proposed Project on this site would likely require substantially increased building heights and smaller setbacks, and potentially the addition of a parking structure, all of which may result in land use compatibility and aesthetic impacts

Project Objectives:

Implementation of this alternative would significantly undermine Sutter's objective to provide a Medical Campus that is easily accessed by persons living within the primary service area of the Sutter Medical Center and one that is close to and visible from Highway 101.

Southwest Corner 101/Shiloh (West) Alternate Site

Alternative Address/Location: Pruitt Ave and Caletti Ave; no specific addresses assigned. The site is within the limits of the Town of Windsor.

Description of the Alternative: Under this alternative, the Proposed Project (Sutter Medical Center hospital, Central Utility Plant, Physicians Medical Center, and Medical Office Building) would be constructed on this 33± acres site at Southwest corner of Highway 101 and Shiloh Road. The site has difficult access off Shiloh Road and the development area is located south of Standard Structures, necessitating driving past the industrial facility. A portion of the site was recently subdivided, and one parcel was recently developed with FedEx Ground distribution center. Another parcel has been leased to Mead Clark Lumber. The site is highly visible from Highway 101. The site is not owned by Sutter.

Reason for Evaluating this Alternative: This alternative is included in this screening analysis because this site is one of the sites that was initially considered by the Siting Advisory Panel convened by Sutter in 2000-2001. The Panel deemed the site to be too far north

Screening Evaluation:

Sutter's preliminary evaluation of the site's suitability for development of the Proposed Project, including consideration of information from the prior reviews as well as further review in 2009, yielded the following information:

- Development of this site would likely require replacement and widening of the Shiloh Road overcrossing of Highway 101, as well as upgrading of interchange ramps and signals.
- The site is designated Heavy Industrial in the General Plan and zoning ordinances. The zoning and General Plan designations do not permit hospital uses.
- Development of this site would require relocation of operating industrial uses.
- Development of this site would not displace any residences.
- Given that some of the parcels which make up this site contain existing industrial uses, there may be environmental remediation issues.
- Limited flooding issues exist on north and south ends that would require mitigation through channel capacity improvements.
- The site is subject to potential noise levels from passing Northwestern Pacific Railroad (NWPRR) train traffic, although there is no direct train access to the site.
- While utility services are available, upgrades or extension of all utilities would be required including replacement/extensions of existing private utility systems with public systems.

- The site has only marginal freeway access due to configuration of main intersection at Shiloh Road.
- The site is accessible by Sonoma County Transit at Shiloh Road at Conde Lane (approximately 1000 feet from the northwest corner of the site).

Environmental Impacts:

This alternative would not reduce any identified significant or significant and unavoidable impacts of the Proposed Project. It would not eliminate or lessen the significant and unavoidable air quality impacts associated with the surcharging of the Project site, as that work would still be required on the alternative site. It would also not eliminate or lessen the significant and unavoidable noise impacts associated with the operation of the helistop, as a helistop would still be required. There is also potential for increased noise impacts from the nearby operations of the Northwestern Pacific Railroad (NWPRR). As well, it would likely have similar cumulative traffic impacts to the Proposed Project.

Project Objectives:

It is not clear that, even with increased building heights and reduced setbacks, the full program proposed by Sutter in its Project Proposal could be developed on this site. Accordingly, implementation of this alternative would likely significantly undermine Sutter's ability to provide the medical services set forth in the Health Care Access Agreement, and to meet any of the Project Objectives associated with development of a Sutter Medical Center, Sutter Medical Center hospital, Central Utility Plant, Physicians Medical Center, and Medical Office Building.

Unless additional acreage was available for development, implementation of this alternative could impede Sutter's ability to ensure that the Medical Campus is efficiently designed and of sufficient connectivity to provide the most modern and efficient layout for the integrated delivery of health services, and to promote functional relationships among departments, services and programs, provide functional circulation within the inpatient and outpatient spaces, placement of seating areas, outdoor terraces, and other patient and visitor amenities.

Southwest Corner 101/Shiloh (East) Alternate Site

Alternative Address/Location: Pruitt Ave and Caletti Ave; no specific addresses assigned. The site is within the limits of the Town of Windsor.

Description of the Alternative: Under this alternative, the Proposed Project (Sutter Medical Center hospital, Central Utility Plant, Physicians Medical Center, and Medical Office Building) would be constructed on this 45.4± acre site. The site is at Southwest corner of Highway 101 and Shiloh Road. It is currently vacant, and has recently undergone a Master Planning process at the Town of Windsor. The site is triangular in shape and shares similar access problems with Alternative S (the adjacent parcel). The site is zoned heavy industrial. The site is highly visible from Highway 101. The site is not owned by Sutter.

Reason for Evaluating this Alternative: This alternative is included in this screening analysis because this site may[3] have been one of the sites that was initially considered by the Siting Advisory Panel convened by Sutter in 2000-2001. The Panel deemed the site to be too far north.

Screening Evaluation:

Sutter's preliminary evaluation of the site's suitability for development of the Proposed Project, including consideration of information from the prior reviews as well as further review in 2009, yielded the following information:

- Development of this site would likely require replacement and widening of the Shiloh Road overcrossing of Highway 101 as well as upgrading of interchange ramps and signal, and either a westerly offsite roadway extension to Shiloh and Conde Lane or a southerly offsite roadway extension to Aviation Boulevard.
- The site is zoned and designated Heavy Industrial and Light Industrial in the General Plan. The zoning and General Plan designations do not permit hospital uses.
- The site is subject to potential noise levels from passing Northwestern Pacific Railroad (NWPRR) train traffic, although there is no direct train access to the site.
- Limited flooding issues exist on north and south ends that would require mitigation through channel capacity improvements.
- Given that some of the parcels which make up this site contain existing industrial uses, there may be environmental remediation issues.
- Development of this site would not displace any residences.

---

[3] In reviewing the Site Advisory Panel's records it was not clear whether this site, or an adjacent parcel, was considered by the Panel. Accordingly, Sutter has included both sites in the screening analysis (see prior analysis of Alternative S).

- The site has only marginal freeway access due to configuration of main intersection at Shiloh Road.
- The triangular layout of the site is not conducive to a hospital campus configuration.
- While utility services are available, upgrades or extension of all utilities would be required including replacement/extensions of existing private utility systems with public systems.
- The site is accessible by Sonoma County Transit at Shiloh Road at Conde Lane (approximately 1000 feet from the northwest corner of the site).

Environmental Impacts:

This alternative would not reduce any identified significant or significant and unavoidable impacts of the Proposed Project. It would not eliminate or lessen the significant and unavoidable air quality impacts associated with the surcharging of the Project site, as that work would still be required on the alternative site. It would also not eliminate or lessen the significant and unavoidable noise impacts associated with the operation of the helistop, as a helistop would still be required. There is also potential for increased noise impacts from the nearby operations of the Northwestern Pacific Railroad (NWPRR). Finally, it would likely have similar cumulative traffic impacts to the Proposed Project.

Project Objectives:

Given the awkward triangular configuration of the site, implementation of this alternative could impede Sutter’s ability to ensure that the Medical Campus is efficiently designed and of sufficient connectivity to provide the most modern and efficient layout for the integrated delivery of health services, and to promote functional relationships among departments, services and programs, provide functional circulation within the inpatient and outpatient spaces, placement of seating areas, outdoor terraces, and other patient and visitor amenities.

The configuration of the site could also impair Sutter’s ability to develop the Medical Campus in a manner that provides a simple, clear and elegant set of buildings linked by meditative paths, bioswales, outdoor gardens, courtyards and open space that promotes a sense of well-being and healing through a dignified and forward-thinking building plan that will be an inviting and positive healing environment for patients, families, visitors, staff and all that come in contact with the Medical Campus.

Airway Drive Alternate Site

Alternative Address/Location: 3833, 3737, 3745, and 3731 Airway Drives, and 1021 Hopper Avenue, Santa Rosa. The site is within the City of Santa Rosa.

Description of the Alternative: Under this alternative, the Proposed Project (Sutter Medical Center hospital, Central Utility Plant, Physicians Medical Center, and Medical Office Building) would be constructed on this 22.9 acre site, which is comprised of 5 parcels. Sutter Medical Center operates several medical uses in the northerly parcel (in the "Landmark" Building). The southern most parcel is the site of a self-storage facility and two parcels north of that facility is a residential unit. The site is comprised of several parcels and bisected by a creek. The site is only partially controlled by Sutter and the remaining portions are under multiple ownerships, including at least one historically reluctant seller. The site is visible from Highway 101

Reason for Evaluating this Alternative: This alternative is included in this screening analysis because this site is one of the sites that was initially considered by the Siting Advisory Panel convened by Sutter in 2000-2001.

Screening Evaluation:

Sutter's preliminary evaluation of the site's suitability for development of the Proposed Project, including consideration of information from the prior reviews as well as further review in 2009, yielded the following information:

- Helicopter service to the site would require overflight of residential areas.
- The site is zoned Office Commercial and designated General Commercial in the City's General Plan.
- A portion of the site is bisected by a creek and will require setbacks.
- A detailed Biological Assessment would be required as development of the site could potentially impact nesting birds, steelhead and wetlands.
- Development of the site would displace at least one residence.
- Development of the site would require significant local and regional utility and roadway improvements.
- It appears that there is a large midden on the northerly parcel such that development of the site could result in potential impacts to cultural resources.
- The site is accessible by Santa Rosa Transit by Hopper Lane at Airway Drive adjacent to the southeasterly parcel.

Environmental Impacts:

Development of this site could result in potentially significant biological impacts related to steelhead salmon, wetlands and potentially sensitive plant habitat. It may also result in potential significant and unavoidable impacts to cultural resources which could extend onto the site. This alternative would also to reduce any identified significant or significant and unavoidable impacts of the Proposed Project. It would not eliminate or lessen the significant and unavoidable air quality impacts associated with the surcharging of the Project site, as that work would still be required on the alternative site. It would also not eliminate or lessen the significant and unavoidable noise impacts associated with the operation of the helistop, as a helistop would still be required. This alternative would likely have similar cumulative traffic impacts to the Proposed Project.

Project Objectives:

Given the awkward configuration of the site, implementation of this alternative could impede Sutter's ability to ensure that the Medical Campus is efficiently designed and of sufficient connectivity to provide the most modern and efficient layout for the integrated delivery of health services, and to promote functional relationships among departments, services and programs, provide functional circulation within the inpatient and outpatient spaces, placement of seating areas, outdoor terraces, and other patient and visitor amenities.

The configuration of the site could also impair Sutter's ability to develop the Medical Campus in a manner that provides a simple, clear and elegant set of buildings linked by meditative paths, bioswales, outdoor gardens, courtyards and open space that promotes a sense of well-being and healing through a dignified and forward-thinking building plan that will be an inviting and positive healing environment for patients, families, visitors, staff and all that come in contact with the Medical Campus.

Two Bridges Property Alternate Site

Alternative Address/Location: 300, 303, 400, 410 and 425 Elnoka Lane, Santa Rosa. This site is within the City of Santa Rosa.

Description of the Alternative: Under this alternative, the Proposed Project (Sutter Medical Center hospital, Central Utility Plant, Physicians Medical Center, and Medical Office Building) would be constructed on a portion of this 66.8± acre site. The site is located on Highway 12 at the site of the former Two Bridges Project. The level portion of the site, 12.8 acres, is the subject of an active development application for a senior development. The remainder of the site is too steep for the uses anticipated by the Proposed Project. The site is not owned by Sutter.

Reason for Evaluating this Alternative: This alternative is included in this screening analysis because this site was identified by Sutter in 2009, as part of Sutter's further evaluation of potential alternate sites, as a potential alternate site that should be considered in the screening analysis in order to provide a thorough basis for evaluating which alternatives should and should not be considered in detail in the EIR.

Screening Evaluation:

Sutter's preliminary evaluation of the site's suitability for development of the Proposed Project, including consideration of information from the prior reviews as well as further review in 2009, yielded the following information:

- Helicopter service to the site would require overflight of residential areas.
- The ridge lines and terrain issues on the site limit the ability to develop that portion of the site which is not already the subject of a development application.
- The site is zoned "PD" and Medium Density Residential and designated in the General Plan as Law and Medium Residential. The Zoning and General Plan designations do not permit hospital uses.
- Access to the southern half of the site is very difficult.
- The site is not visible from Highway 101 and has no direct access route to Highway 101.
- A creek runs through the site and would require setbacks.
- The site is accessible by Sonoma County Transit at Melta Road at Highway 12 (approximately 700 feet from the site).

Environmental Impacts:

This alternative would not reduce any identified significant or significant and unavoidable impacts of the Proposed Project. It would not eliminate or lessen the significant and unavoidable air quality impacts associated with the surcharging of the Project site, as that work would still be required on the alternative site. It would also not eliminate or lessen the significant and unavoidable noise impacts associated with the operation of the helistop, as a helistop would still be required. Instead, this alternative would likely result in greater noise impacts due to the need for helicopters arriving and leaving the site to fly directly over residential areas. This alternative would likely have similar cumulative traffic impacts to the Proposed Project.

Given the limited portions of the site which can be developed due to its steep terrain, the site is significantly smaller than the 25 acres needed to construct the Proposed Project at the density indicated in Sutter's Project Proposal, which includes structures ranging in height from 2 to 3 stories that are served by surface parking. Accordingly, development of the Proposed Project on this site would likely require substantially increased building heights and smaller setbacks, and potentially the addition of a parking structure, all of which may result in land use compatibility and aesthetic impacts.

Project Objectives:

Given the development limitations imposed by the terrain of the site, it is not clear that, even with increased building heights and reduced setbacks, the full program proposed by Sutter in its Project Proposal could be developed on this site. Accordingly, implementation of this alternative would likely significantly undermine Sutter's ability to provide the medical services set forth in the Health Care Access Agreement, and to meet any of the Project Objectives associated with development of a Sutter Medical Center, Sutter Medical Center hospital, Central Utility Plant, Physicians Medical Center, and Medical Office Building.

Implementation of this alternative would also significantly undermine Sutter's objective to provide a Medical Campus that is easily accessed by persons living within the primary service area of the Sutter Medical Center and one that is close to and visible from Highway 101.

Fountaingrove Winery Alternate Site

Alternative Address/Location: Round Barn Road, Santa Rosa, within the city limits of the City of Santa Rosa. This site is a part of the Fountaingrove Planned Community.

Description of the Alternative: Under this alternative, the Proposed Project (Sutter Medical Center hospital, Central Utility Plant, Physicians Medical Center, and Medical Office Building) would be constructed on this 36.1± acre site. The site is vacant, with the exception of the historic Fountaingrove Winery. The site is effectively two development areas which, while contiguous, would be impossible to access internally, thereby reducing the developable acreage, or resulting in a split development with two separate accesses off Round Barn Road. The eastern portion of the property has been developed to provide overflow parking for the near by Medtronics plant; the western portion remains undeveloped. The site is not visible from Highway 101 and is only accessible to the Highway via a circuitous route. The site is not owned by Sutter.

Reason for Evaluating this Alternative: This alternative is included in this screening analysis because this site was identified by Sutter in 2009, as part of Sutter's further evaluation of potential alternate sites, as a potential alternate site that should be considered in the screening analysis in order to provide a thorough basis for evaluating which alternatives should and should not be considered in detail in the EIR.

Screening Evaluation:

Sutter's preliminary evaluation of the site's suitability for development of the Proposed Project, including consideration of information from the prior reviews as well as further review in 2009, yielded the following information:

- The site is within the "Business Park' General Plan land use category and within the "PD" (Planned Development) Zone District.
- The site is within "HC" (Highway Tourist Commercial) land use area and the "Winery" portion is within the "Historic Combining Area."
- The land use/development standards are governed by "Fountaingrove Ranch Planned Community District", which consists of a Policy Statement, Land Use and Circulation Plan, and a Development Concept Plan adopted in 1981. The site is shown on the Development Concept Plan as having two separate developable areas, separated by the winery site and by topographic features. The list of permitted uses does not include Hospital. There is a maximum 35' height limit for development on the site.
- The variable topography and ridgelines/tree cover and existing designated open space will constrain site any development of the site, even one structured to accommodate a split site configuration.
- Helicopter service to the site would require overflight of residential areas.

- The site is adjacent to a Cancer Center.
- Development of this site would not displace any residences.
- The site is accessible by Santa Rosa Transit at Round Barn Blvd. at Round Barn Circle.
- Given the slope of the site, development will require construction of a foundation using driven piers.
- The closest public transit is Santa Rosa Transit on Round Barn Boulevard at Round Barn Circle opposite the southwesterly end of the site. There is a second stop at Round Barn Boulevard and Unocal Court adjoining the northwesterly end of the site.

Environmental Impacts:

Development on this alternative site could result in impacts to historic resources on near the site, as well as possibly to the adjacent Cancer Center as a result of the pile driving that would be necessary to construct Proposed Projects on this site. Pile driving would be necessary in order to develop a seismically compliant foundation compatible with OSHPD requirements resulting in fewer emissions and a less than significant air quality impact. This alternative would not eliminate or lessen the significant and unavoidable noise impacts associated with the operation of the helistop, as a helistop would still be required. This alternative would likely have similar cumulative traffic impacts to the Proposed Project.

Project Objectives:

Implementation of this alternative would significantly undermine Sutter's objective to provide a Medical Campus that is easily accessed by persons living within the primary service area of the Sutter Medical Center and one that is close to and visible from Highway 101.

Unless additional acreage was available for development, implementation of this alternative could impede Sutter's ability to ensure that the Medical Campus is efficiently designed and of sufficient connectivity to provide the most modern and efficient layout for the integrated delivery of health services, and to promote functional relationships among departments, services and programs, provide functional circulation within the inpatient and outpatient spaces, placement of seating areas, outdoor terraces, and other patient and visitor amenities.

Fulton Road Alternate Site

Alternative Address/Location: 1615 Fulton Road, Santa Rosa; within the City limits of the City of Santa Rosa, at the western edge of the urban boundary.

Description of the Alternative: Under this alternative, the Proposed Project (Sutter Medical Center hospital, Central Utility Plant, Physicians Medical Center, and Medical Office Building) would be constructed on this 37.9± acre site on the eastern side of Fulton Road. The site is almost across the road from Piner High School. The site is not owned by Sutter and is the site of a recently approved tentative map for the Fox Hollow 178-unit residential development. Access to the "Fox Hollow" development is extremely limited, with one very narrow stub street/bridge over SCWA channel proposed. The site is not visible from Highway 101. The site is split into two parcels by a major drainage canal reducing its developable acreage by almost half. The "front" or eastern site is 22.7± acres and the "rear" site is 15.2± acres. The site is not owned by Sutter.

Reason for Evaluating this Alternative: This alternative is included in this screening analysis because this site was identified by Sutter in 2009, as part of Sutter's further evaluation of potential alternate sites, as a potential alternate site that should be considered in the screening analysis in order to provide a thorough basis for evaluating which alternatives should and should not be considered in detail in the EIR.

Screening Evaluation:

Sutter's preliminary evaluation of the site's suitability for development of the Proposed Project, including consideration of information from the prior reviews as well as further review in 2009, yielded the following information:

- The site has split zoning. The "front" (22.7± acre) site is designated "Low Density Residential" in the General Plan and is located in the "R-1-6" (Single Family Residential) District. The "rear" 15.2± acres is designated "Very Low Density Residential" in the General Plan and is located in the RR-40 District. Hospitals are not permitted in either the R-1-6 or the RR-40 district.
- Overflight of residential and school areas would be required to access the Helistop.
- The site is within a California Tiger Salamander habitat area and also may contain wetlands. A detailed Biological Assessment would be required.
- The site is split by drainage channel which would make development of the west portion of the property difficult
- While utility services are available, upgrades or extension of all utilities would be required including extensions.
- The site has agricultural potential.

- The site is accessible by Santa Rosa Transit at Fulton Road at Piner High School (approximately 300' from the site).

Environmental Impacts:

This alternative would not reduce any identified significant or significant and unavoidable impacts of the Proposed Project. It would not eliminate or lessen the significant and unavoidable air quality impacts associated with the surcharging of the Project site, as that work would still be required on the alternative site. It would also not eliminate or lessen the significant and unavoidable noise impacts associated with the operation of the helistop, as a helistop would still be required. This alternative would likely have similar cumulative traffic impacts to the Proposed Project, with potentially additional traffic impacts due to the addition of Project-related traffic to roadways which appear undersized for that volume of traffic.

Given the limited portions of the site which can be developed due to its configuration and existing development plans, the developable portion of the site is significantly smaller than the 25 acres needed to construct the Proposed Project at the density indicated in Sutter's Project Proposal, which includes structures ranging in height from 2 to 3 stories that are served by surface parking. Accordingly, development of the Proposed Project on this site would likely require development of the Project with substantially increased building heights and smaller setbacks, both of which may result in land use compatibility and aesthetic impacts.

Project Objectives:

It is not clear that, even with increased building heights and reduced setbacks, the full program proposed by Sutter in its Project Proposal could be developed on this site. Accordingly, implementation of this alternative would likely significantly undermine Sutter's ability to provide the medical services set forth in the Health Care Access Agreement, and to meet any of the Project Objectives associated with development of a Sutter Medical Center, Sutter Medical Center hospital, Central Utility Plant, Physicians Medical Center, and Medical Office Building.

Implementation of this alternative would also significantly undermine Sutter's objective to provide a Medical Campus that is easily accessed by persons living within the primary service area of the Sutter Medical Center and one that is close to and visible from Highway 101.

Roseland Shopping Center Alternate Site

Alternative Address/Location: 561, 565, 665 and 673 Sebastopol Road, Santa Rosa. The site is in unincorporated area of Sonoma County, but within a designated urban services area and within the City's sphere of influence.

Description of the Alternative: Under this alternative, the Proposed Project (Sutter Medical Center hospital, Central Utility Plant, Physicians Medical Center, and Medical Office Building) would be constructed on this 10.83± acre site. The site is the front side of a shopping center and is located on the north side of Sebastopol Road, east of Dutton Avenue. The site adjoins the Santa Rosa city-limits. Sutter does not own the site, which is owned by multiple parties. The site is not visible from Highway 101, but is accessible to Highway 12 via congested streets.

Reason for Evaluating this Alternative: This alternative is included in this screening analysis because this site was identified by Sutter in 2009, as part of Sutter's further evaluation of potential alternate sites, as a potential alternate site that should be considered in the screening analysis in order to provide a thorough basis for evaluating which alternatives should and should not be considered in detail in the EIR.

Screening Evaluation:

Sutter's preliminary evaluation of the site's suitability for development of the Proposed Project, including consideration of information from the prior reviews as well as further review in 2009, yielded the following information:

- The site is currently designated in the County's General Plan as "Mixed Use/Community Shopping Center." The County's General Plan policies and objectives include requirements for "mixed use" pedestrian-oriented and neighborhood-serving commercial uses, and hospitals are not identified as permitted/appropriated uses.
- If the property were annexed to the City, the Zone District which would be applied to the property would be required by Government Code to be consistent with the General Plan.
- It is anticipated that the City zoning district applicable to the property would be the "CSC" (Community Shopping Center) Zone District. While the CSC District permits Hospitals by Conditional Use Permit (CUP), it requires all development in that District (including, presumably Hospitals) "to be a mixed use project with a residential component," unless otherwise approved by the Planning Commission. The "mixed use" and related requirements would likely preclude a Hospital on the site given, for instance, that the addition of residential uses to a hospital project would result in substantial land compatibility issues.

- Development of the site would require annexation to City of Santa Rosa. However, LAFCO's position has been that they will not approve any annexations in the Roseland/Southwest area until the City and County have agreed on an overall plan/strategy of annexation, including agreement as to cost/revenue sharing. This limitation on annexations is not anticipated to be resolved in the near future.
- Overflight of residential and school areas will be required to access helistop.
- Development of this site would not displace any residences.
- The site is accessible by Santa Rosa Transit and Sonoma County Transit at Sebastopol Road at Dutton Avenue.

Environmental Impacts:

This alternative would result in new impacts related to the demolition of the existing shopping center on the site. This alternative would not reduce any identified significant or significant and unavoidable impacts of the Proposed Project. It would not eliminate or lessen the significant and unavoidable air quality impacts associated with the surcharging of the Project site, as that work would still be required on the alternative site. It would also not eliminate or lessen the significant and unavoidable noise impacts associated with the operation of the helistop, as a helistop would still be required. Instead, this alternative would likely result in greater noise impacts due to the need for helicopters arriving and leaving the site to fly directly over residential areas. This alternative may result in greater cumulative traffic impacts than the Proposed Project given that the site is accessible to Highway 12 only via already congested streets.

Further, given the limited portions of the site which can be developed due to its configuration and existing development plans, the site is significantly smaller than the 25 acres needed to construct the Proposed Project at the density indicated in Sutter's Project Proposal, which includes structures ranging in height from 2 to 3 stories that are served by surface parking, development of the Proposed Project on this site would likely require substantially increased building heights and smaller setbacks, and potentially the addition of a parking structure, all of which may result in land use compatibility and aesthetic impacts.

Project Objectives:

It is not clear that, even with increased building heights and reduced setbacks, the full program proposed by Sutter in its Project Proposal could be developed on this site. Accordingly, implementation of this alternative would likely significantly undermine Sutter's ability to provide the medical services set forth in the Health Care Access Agreement, and to meet any of the Project Objectives associated with development of a Sutter Medical Center, Sutter Medical Center hospital, Central Utility Plant, Physicians Medical Center, and Medical Office Building.

Implementation of this alternative would also significantly undermine Sutter's objective to provide a Medical Campus that is easily accessed by persons living within the primary service area of the Sutter Medical Center and one that is close to and visible from Highway 101.

Warrack Hospital Alternate Site

Alternative Address/Location: 2449 Summerfield Road, Santa Rosa, within the city limits of the City of Santa Rosa.

Description of the Alternative: Under this alternative, the Proposed Project (Sutter Medical Center hospital, Central Utility Plant, Physicians Medical Center, and Medical Office Building) would be constructed on this 11.2 acre 12 parcel site. The site is the current location of the former Warrack Hospital and various medical offices at the southeast corner of Summerfield Road and Hoen Avenue. The site is not visible from Highway 101 and only indirectly accessible to Highway 12 via congested streets. Sutter owns the ground underlying approximately 85 to 90 percent of the site, although a portion of this ownership is subject to ground leases to third parties. The remainder of the site is in a mix of separate ownerships. The mix of separate ownerships and ground leases on the site would require a difficult assemblage of parcels and interests to allow for the development of the Proposed Project on the site.

Reason for Evaluating this Alternative: This alternative is included in this screening analysis because this site was identified by Sutter in 2009, as part of Sutter's further evaluation of potential alternate sites, as a potential alternate site that should be considered in the screening analysis in order to provide a thorough basis for evaluating which alternatives should and should not be considered in detail in the EIR.

Screening Evaluation:

Sutter's preliminary evaluation of the site's suitability for development of the Proposed Project, including consideration of information from the prior reviews as well as further review in 2009, yielded the following information:

- The site has been zoned by the City of Santa Rosa as Planned Community development and designated as Public/Institutional and Office in the General Plan.
- The site is zoned for Mixed Use, Planned Development and Office Commercial.
- Overflight of residential and school areas will be required to access Helistop
- The site is surrounded by residential areas.
- Development of this site would not displace any residences.
- The site is served by surrounding infrastructure.
- The site is accessible by Santa Rosa Transit at Summerfield Road at Hoen Avenue (at the site).

Environmental Impacts:

This alternative would not reduce any identified significant or significant and unavoidable impacts of the Proposed Project. It would not eliminate or lessen the significant and unavoidable air quality impacts associated with the surcharging of the Project site, as that work would still be required on the alternative site. It would also not eliminate or lessen the significant and unavoidable noise impacts associated with the operation of the helistop, as a helistop would still be required. Instead, this alternative would likely result in greater noise impacts due to the need for helicopters arriving and leaving the site to fly directly over residential areas. This alternative may result in greater cumulative traffic impacts than the Proposed Project given that it can only accessed via already congested streets.

Further, given the limited portions of the site which can be developed due to its configuration and existing development plans, the site is significantly smaller than the 25 acres needed to construct the Proposed Project at the density indicated in Sutter's Project Proposal, which includes structures ranging in height from 2 to 3 stories that are served by surface parking, development of the Proposed Project on this site would likely require substantially increased building heights and smaller setbacks, and potentially the addition of a parking structure, all of which may result in land use compatibility and aesthetic impacts.

Project Objectives:

It is not clear that, even with increased building heights and reduced setbacks, the full program proposed by Sutter in its Project Proposal could be developed on this site. Accordingly, implementation of this alternative would likely significantly undermine Sutter's ability to provide the medical services set forth in the Health Care Access Agreement, and to meet any of the Project Objectives associated with development of a Sutter Medical Center, Sutter Medical Center hospital, Central Utility Plant, Physicians Medical Center, and Medical Office Building.

Implementation of this alternative would also significantly undermine Sutter's objective to provide a Medical Campus that is easily accessed by persons living within the primary service area of the Sutter Medical Center and one that is close to and visible from Highway 101.

West Third Street Properties Alternate Site

Alternative Address/Location: 691 and 414 West Third Street, Santa Rosa. The sites are entirely within the city limits of the City of Santa Rosa.

Description of the Alternative: Under this alternative, the Proposed Project (Sutter Medical Center hospital, Central Utility Plant, Physicians Medical Center, and Medical Office Building) would be constructed on this 27.5 acre site. The site is comprised of three parcels houses Imwalle Gardens (13.5 acres) and a vacant parcel (10.4 acres). Imwalle Gardens is an existing urban agricultural operation that has been in business since 1886. The sites are on the north side of West Third Street, east of Dutton Avenue. The site is not owned by Sutter.

Reason for Evaluating this Alternative: This alternative is included in this screening analysis because this site was identified by Sutter in 2009, as part as Sutter's further evaluation of potential alternate sites, as a potential alternate site that should be considered in the screening analysis in order to provide a thorough basis for evaluating which alternatives should and should not be considered in detail in the EIR.

Screening Evaluation:

Sutter's preliminary evaluation of the site's suitability for development of the Proposed Project, including consideration of information from the prior reviews as well as further review in 2009, yielded the following information:

- The site is subject to mixed Residential zoning, R1-6 & R3-18 and designated in the General Plan as Medium to Low Density Residential. The General Plan and zoning designations do not allow hospital uses.
- The sites are not visible from Highway 101 and only indirectly accessible to the freeway via congested streets.
- Overflight of residential and school areas will be required to access Helistop
- Development of the site would require significant local and regional utility and roadway improvements.
- The site is agricultural.
- The site is accessible by Santa Rosa Transit at W. Third Street at Rusch Court (approximately 1,400' away).

Environmental Impacts:

This alternative would not reduce any identified significant or significant and unavoidable impacts of the Proposed Project. It would not eliminate or lessen the significant and unavoidable air quality impacts associated with the surcharging of the Project site, as that work would still be required on the alternative site. It would also not eliminate or lessen the significant and unavoidable noise impacts associated with the operation of the helistop, as a helistop would still be required. Instead, this alternative would likely result in greater noise impacts due to the need for helicopters arriving and leaving the site to fly directly over residential areas. As well, it would likely have similar, if not greater, cumulative traffic impacts to the Proposed Project. Finally, development of this site may result in a significant impact to agricultural resources.

Project Objectives:

Implementation of this alternative would also significantly undermine Sutter's objective to provide a Medical Campus that is easily accessed by persons living within the primary service area of the Sutter Medical Center and one that is close to and visible from Highway 101.

BB. Air Center Site

Alternative Address/Location: No addresses have been assigned to these undeveloped parcels at this time. The site is located to the north of the west end of Northpoint Parkway in the southwest area of the City of Santa Rosa.

Description of the Alternative: Under this alternative, the Proposed Project (Sutter Medical Center hospital, Central Utility Plant, Physicians Medical Center, and Medical Office Building) would be constructed on this 31 acre site. The site is comprised of two parcels under common ownership, and is a portion of the old Santa Rosa Air Center site used by the armed forces during World War II. The site can be accessed at its southeast corner from Northpoint Parkway but, as the site is at the "dead end" of Northpoint Parkway, there is no other readily available secondary access point. The site is not visible from Highway 101 and there is no there is no direct access to Northpoint Parkway from Highway 101.

To access the site from Highway 101, patients, visitors and staff would have to exit Highway 101 at Hearn Avenue, travel approximately 1.4 miles west to Sebastopol Road, turn north for 0.3 mile, and then turn left onto Northpoint Parkway and travel approximately 1.3 miles to the site. Alternately, they could exit Highway 101 at State Highway 12, take Highway 12 1.6 miles to Stony Point Road and from there travel 1.0 mile to Northpoint Parkway, and then 1.2 miles to the site. Patients, visitors and staff coming from the west would likely take Highway 101 to Highway 12 and exit at Fulton/South Wright Road. From there they would travel 1.1 miles to Corporate Center Parkway, 0.8 miles to Northpoint Parkway, and then 0.3 miles to the site.

The site is not owned by Sutter.

Reason for Evaluating this Alternative: This alternative is included in this screening analysis because, following Sutter's initial submission of information for the screening analysis of various sites, County PRMD staff suggested evaluation of this site in order to provide a thorough basis for evaluating which alternatives should and should not be considered in detail in the EIR.

Screening Evaluation:

Sutter's preliminary evaluation of the site's suitability for development of the Proposed Project yielded the following information:

- The site contains significant acreage of concrete and asphalt surfaces that were previously used as runways and taxiways.
- The entire site is within the designated California Tiger Salamander (CTS) study zone, but limited development has been permitted on other portions of the old Santa Rosa Air Center that were covered with hard surfacing.
- Development of areas not currently surfaced will likely result in CTS habitat impacts; extensive biological assessments would be required.

- A review of the aerial photographs of the site suggests that there are at least two potential wetlands areas on the site. A wetlands evaluation would be required.
- Assuming that development of the site will likely be limited to those areas currently covered by former development because of biological constraints (see attached map of the site), only approximately 14 acres of the site are likely to be developable, and these portions of the site form an awkward configuration for development of a hospital or medical campus.
- The site is within 4 General Plan residential land use categories: Low Density, Medium Low Density, Medium Density and Medium High Density Residential. Hospitals are not noted as being permitted land uses in any of those General Plan categories.
- The site is within a Planned Development District. The Development Plan and Policy Statement for that District are dated 1994/1995. The Policy Statement allows for "Health Care Facilities" by Conditional Use Permit. However, those documents were prepared pursuant to the Zoning Code in effect at that time, which defined "Health Care Facilities" to include "hospitals." The Zoning Code currently in effect, and which has been in effect since its adoption in 2004, no longer includes "hospitals" as part of that definition. The current Zoning Code would not permit a hospital anywhere within that "PD" District. Hospitals are not permited in any of the City's Residential zoning districts.
- The site is surrounded by existing and proposed residential uses, so helicopter service to the site would require overflight of residential areas.
- Drainage infrastructure in this portion of Santa Rosa is extremely limited, and likely will require the extensive use of onsite detention due to drainage system capacity limitations to the west and south.
- The site is marginally served by Santa Rosa Transit, with the nearest stop being approximately 1/3 miles away at Corporate Center Parkway just north of Northpoint Parkway. Only two buses service this stop per hour.
- Sewer and water utilities are available at the southeast corner of the site, and would require extension onto the site to provide service.
- Development of this site would not displace any residences.

Environmental Impacts:

Development of this site could result in potentially significant impacts to California Tiger Salamander (CTS) and CTS habitat and to wetlands. This alternative would not reduce any identified significant or significant and unavoidable impacts of the Proposed Project. It would not eliminate or lessen the significant and unavoidable air quality impacts associated with the surcharging of the Project site, as that work would still be required on the alternative site. It would also not eliminate or lessen the significant and unavoidable noise impacts associated with the operation of the helistop, as a helistop would still be required. Instead, this alternative would likely result in greater noise impacts due to the need for helicopters arriving and leaving the site to fly directly over residential areas.

While Northpoint Parkway is a four lane (two lanes each way) divided parkway from Corporate Center Parkway east to Stony Point Road, from Stony Point Road south to Hearn Avenue, it is only wide two lane roadway. Further, Hearn Avenue east to Highway 101 is a only a two-lane roadway. Existing traffic congestion becomes increasingly significant as drivers approach Highway 101 and the Hearn Avenue/Highway 101 interchange is an awkward, offset configuration both north and southbound. The two lane overcrossing at Hearn Avenue is currently heavily overtaxed with traffic during peak travel periods and on the weekends, as it is the main interchange for numerous commercial areas on the east side of the Freeway, as well as for Auto Row on the west side of the freeway. The main alternate route to the site (Highway 101 to Highway 12 to Stony Point to Northpoint Parkway) is also already congested, particularly from West Third Street south to Hearn Avenue. Further, the planned widening of Stony Point Road, south of Sebastopol Road, was recently placed on hold by the Santa Rosa City Council. Accordingly, the cumulative traffic impacts of this alternative are likely similar if not greater than those of the proposed Project.

Project Objectives:

Implementation of this alternative would significantly undermine Sutter's objective to provide a Medical Campus that is easily accessed by persons living within the primary service area of the Sutter Medical Center and one that is close to and visible from Highway 101.

Due to the presence of CTS habitat on the site, the portion of the site that is likely to be available for development significantly smaller than the 25 acres needed to construct the Proposed Project at the density indicated in Sutter's Project Proposal, which includes structures ranging in height from 2 to 3 stories that are served by surface parking. Accordingly, development of the Proposed Project on this site would likely require substantially increased building heights and smaller setbacks, and potentially the addition of a parking structure, all of which may result in land use compatibility and aesthetic impacts.

Given the less than optimal configuration of the site, and unless additional acreage was available for development, implementation of this alternative could impede Sutter's ability to ensure that the Medical Campus is efficiently designed and of sufficient connectivity to provide the most modern and efficient layout for the integrated delivery of health services, and to promote functional relationships among departments, services and programs, provide functional circulation within the inpatient and outpatient spaces, placement of seating areas, outdoor terraces, and other patient and visitor amenities.

The constrained nature of the site could also impair Sutter's ability to develop the Medical Campus in a manner that provides a simple, clear and elegant set of buildings linked by meditative paths, bioswales, outdoor gardens, courtyards and open space that promotes a sense of well-being and healing through a dignified and forward-thinking building plan that will be an inviting and positive healing environment for patients, families, visitors, staff and all that come in contact with the Medical Campus.

Sutter Medical Center Project Requested Information Concerning Project Alternatives

Sutter Medical Center Project
Requested Information Concerning Project Alternatives

Information Requested By County Regarding Alternatives

The County has determined that it is appropriate to analyze the following alternatives, in the Environmental Impact Report ("EIR") for the Sutter Santa Rosa Medical Center/ Luther Burbank Memorial Foundation Project, as described in the Administrative Draft EIR Project Description:

1. No Project

2. Shiloh Road Alternative Site

3. Todd Road/ Moorland Alternative Site

4a Decentralized Alternative (Physicians Medical Center (PMC) and Medical Office Building (MOB) at Mark West Springs site, and Santa Rosa Medical Center hospital (SMRC) and MOB at Todd/Road Moorland site)

4b Decentralized Alternative (PMC/MOB at Mark West Springs site and SRMC/MOB at Ring Property site)

5. No Helistop Alternative

6. 70-Bed SRMC Only Alternative

7. Overall Reduced Project Alternative

County staff has requested that Sutter provide the County with a details regarding the scope of certain of these alternatives, as well as qualitative information regarding the potential environmental impacts of development of certain of these alternatives. County staff has not requested any information from Sutter regarding Alternatives 1 or 5. As well, County staff has informed Sutter that the County will collect the data necessary to complete the analysis of the Project Alternatives for the EIR with respect to the following environmental impact categories: Aesthetics, Biological Resources, Cultural Resources, Hazards and Hazardous Materials, Land Use and Planning, Population and Housing, Public Services, and Recreation. Accordingly, the following discussion describes the scope of Alternatives 2, 3, 4a, 4b, 6 and 7**,** and also provides the information requested by the County with regard to the potential environmental impacts of development the alternatives.

2. Shiloh Road Alternative Site

Description of Shiloh Road Alternative

The Shiloh Road Alternative site is at the southeast corner of Shiloh Road at Highway 101. The site is within Town of Windsor limits, and is a part of the Shiloh Corridor Vision Plan. Under this alternative, the Proposed Project (Sutter Medical Center hospital, Central Utility Plant, Physicians Medical Center, and Medical Office Building) would be constructed on this vacant 27 acre site. The site is not owned by Sutter.

The Shiloh Road Alternative would include:

- Sutter Medical Center hospital with a building footprint of approximately 75,000 square feet, two stories, with a maximum height of 42 feet, including roof screens.
- Central Utility Plant with a building footprint of approximately 14,000 square feet, one story, with a maximum height of 24 feet.
- Physicians Medical Center with a building footprint of approximately 50,000 square feet, three stories, with a maximum height of 58 feet, including roof screens.
- Medical Office Building with a building footprint of approximately 30,000 square feet, three stories, with a maximum height of 58 feet, including roof screens.

The buildings would be developed as laid out in the attached site plan ("Shiloh Road Alternative Site Plan"), which also shows that the helistop would be located, at grade, near the south edge of the site, and that access to the site would be off of Shiloh Road.

Analysis of Environmental Impacts

Agricultural Resources

The site is designated as Farmland of Local Importance.

Air Quality

In order to assist the County in assessing the potential air quality impacts of development of this alternative, Sutter has confirmed with ENGEO that, from a preliminary geotechnical perspective, given the location of the Shiloh site with respect regional geologic conditions, the overall measures and strategies to mitigate geologic and geotechnical hazards for future land development to an acceptable-level are anticipated to be similar to those proposed for the Mark West Springs site. Accordingly, it is expected that the air quality impacts associated with the surcharging and construction of foundations for this site will be similar to those associated with surcharging and construction of foundation at the Mark West Springs site. (ENGEO)

Geology/Soils

The site is shown to consist of a parcel encompassing approximately 25 acres. The site is currently undeveloped and occupied by seasonal vegetation. Topography is relatively flat at the site.

The site is located within the Coast Ranges geologic province of California, a series of northwest trending ridges and valleys. It is underlain by Holocene-Pleistocene Alluvium (Wagner and Bortugno, 1982). This alluvium consists of unconsolidated deposits of sand, silt, gravel, and clay likely derived from the bedrock uplands and older unconsolidated deposits. According to USDA soil maps, the site is underlying by Clear Lake Clay (CfA) and Huichica Loam (HwB). Soil chemical properties of these surficial soils have a pH of ranging from 5.3 to 6.5. Plasticity Indices associated with these soils range from 10 to 36 percent. The ABAG regional liquefaction maps for this area show variability in the proximity of this site; generally high potential for liquefaction along stream courses or channels, and moderate to low potential outside of creek areas along the terrace areas.

The site is not located within the State of California Fault Hazard Zone; however, it is situated in a region that contains numerous active and potentially active earthquake faults. The active Rodgers Creek fault is located approximately 2.0 miles east of the project area. It should therefore be expected that the site will experience one or more episodes of strong ground shaking during the design life of the proposed improvements.

From a feasibility level assessment, the main geologic and geotechnical considerations at this site include: seismicity and liquefaction potential, potential compressible soils and/or expansive soils, and presence of relatively shallow groundwater.

From a preliminary geotechnical perspective, given the location of the Shiloh, site with respect regional geologic conditions, the overall measures and strategies to mitigate geologic and geotechnical hazards for future land development to an acceptable-level are anticipated to be similar to those proposed for the Mark West Springs site. A site specific geotechnical study would be necessary to characterize subsurface conditions of the with respect to project plans, define site specific hazards and to provide recommendations for mitigation, as necessary. For this site, if compressible or potentially liquefiable soils present a significant concern, then the use of treatment or mitigation, such as pre-consolidation or surcharging, or other various ground improvement techniques may be most appropriate. Also, depending on the structural loads at the sites and the subsurface soils, it is possible that deep foundations may be called for and suitable to provide support for planned buildings. Of the available deep systems pre-cast driven piles or cast-in-place piers may be appropriate. If soils conditions and building loads are favorable to allow for structural loads to be supported on shallow foundation systems, then the use of spread and continuous footings combined with floor slabs-on-grade, or structural reinforced mats may be appropriate. If expansive or corrosive soils are encountered then grading and design measures to mitigate these conditions would also be warranted. (ENGEO)

Hydrology and Water Quality

According to FEMA Flood Insurance Rate Mapping, 80 – 85% of the Shiloh Road site lies within the 100-year flood plain of Pruitt Creek, which is located along the southern boundary of the parcel. The majority of the site is tributary to a culvert leading into the Shiloh Road Interchange right of way surface drainage system. It is subject to the hydraulic restriction of the culvert, and the combined site and highway drainage must travel overland and cross Caletti Avenue prior to entering the natural channel of Pruitt Creek west of the highway.

Currently, flooding regularly occurs within the US 101 Shiloh Road freeway interchange as well as along Shiloh Road west of the freeway, even during moderate storm events. Any development plan submitted to the Town of Windsor for the Shiloh Road site will be conditioned to at least not worsen, and likely improve, existing flooding conditions in the area downstream that will be affected by development of this parcel. In addition the volumetric displacement of overbank flood plain capacity by any proposed site improvements involving fill within the flood plain will be required to be replaced within the length of the adjacent reach of Pruitt Creek with an equivalent volume of available overbank storage for flood events. Such overbank storage replacement requirements are not present at the Mark West Springs site. The required setback from the creek bank is 2.5 horizontal feet to every 1 foot vertical plus 30 feet. Brelji and Race therefore estimates that an approximately a 50 foot setback would be required along Pruitt Creek.

It is also likely that creek capacity improvements will have to be implemented in conjunction with the development of the site to allow the creek channel to convey the 100 year storm flow with freeboard, as required by Town of Windsor development standards. Creating this capacity would likely take the form of creating a bypass channel parallel to the north side of the creek that would leave the existing creek and its banks in tact, except where the bypass channel leaves and re-enters the stream. This bypass channel would likely consume another 75 feet of land including setbacks.

As with the Mark West Springs site, the Shiloh Road site is undeveloped agricultural land (less than 50% impervious). Post-Construction the Best Management Practices applied to this site would be very similar to those proposed for the Mark West Springs site. The site plan would include vegetated bio-swales and structural filter units for runoff from roofs and pavements, and the stormwater detention facilities would also contribute. However, because this site is smaller in area, and without the advantage of an adjacent property (as is true at the Mark West Springs site) on the downstream side to share the space necessary for detention facilities, it may be necessary to detain stormwater runoff in underground reservoirs, rather than in open-air basins, to allow adequate space for parking lots. Although effective for siltation removal, underground reservoirs do not have the advantage of plant life to contribute to bio-remediation of the detained runoff, and typically will need mechanical (pumping) assistance to discharge runoff back into the creek channel. Regular maintenance will also be necessary to remove silt from the reservoir wet well and to service the pumping equipment. (Brelje & Race)

Mineral Resources

The site has not been assigned a Mineral Resource Zone (MRZ) in publication SR 146 by the California Department of Mines and Geology; as such no significant resources are present at the site. (ENGEO)

Noise

Illingworth and Rodkin, in coordination with Mead & Hunt Inc., considered the noise impacts of development of the Proposed Project on the Shiloh Road site. Under this alternative the helistop would be located at grade near the south edge of the site and adjacent to the emergency room of the Sutter Medical Center hospital. The flight paths from the helistop would move to be toward the northwest and then south to fly with each path then following along Highway 101. The nearby land uses to the site are freeway and industrial to the southwest and commercial to the north, with no nearby residential land uses along the expected flight routes. Keeping the approach/departure path of the helicopter along Highway 101 will minimize noise impacts. There are no nearby noise-sensitive land uses. The noise contours created by the flight path are reflected in the attached diagram ("Shiloh Road Alternative Noise Contour Map").

Transportation and Traffic

The north side of the site is bounded by Shiloh Road, a major collector road at the southern Town limits. There is an older style interchange for Shiloh Road on Highway 101, with a two lane overcrossing of the freeway. The northbound off-ramp, which would provide the primary access for a hospital use on this site, was widened and improved with the development of the adjacent north Wal-Mart/Home Depot shopping center complex. The adopted Shiloh Village Vision Plan calls for Shiloh Road right of way to be expanded by 13 feet on each side, to allow for the street to be configured with a center median/left turn lane, a single travel lane in each direction, parallel in-street parking, and a flanking bike lane. It is possible that this configuration will change to accommodate an emergency vehicle access to the site, associated with the northbound off-ramp, similar to what is being provided at the Mark West Springs site. The northbound off-ramp intersection with Shiloh Road is currently signalized, and minor modifications will likely be required to this signal for this project. The southbound off-ramp is scheduled to be signalized with the Highway 101 project currently under construction.

The currently three-way intersection of Shiloh Road and Hembree Lane is also signalized. The main entrance to a hospital project at the Shiloh site would likely need to occur at this location, which would require converting the intersection to four-way operation, and modifying the signal accordingly. Other minor connections to Shiloh Road would likely be permitted by the Town of Windsor, but may be restricted by the proposed median to be right turn in/out only.

The site is accessible by Sonoma County Transit at Shiloh Road at Old Redwood Highway. (Brelje & Race)

[Mark Crane to provide operational characteristics of interchanges near site. County Public Works Department to provide available information on existing LOS conditions when intersections are identified.]

Utilities and Service Systems

Sewer System

The Shiloh Road site is within the Town limits. Development of the site for gateway commercial uses has been anticipated in sewer system planning. Based upon the Town of Windsor Master Sewer Plan, the trunk sewers serving this site should have capacity to serve development under this alternative. They are part of the Conde Trunk Line and a 15 inch line is located within Shiloh Road. The Shiloh Center commercial project, located directly to the north, will likely use less sewer capacity than originally projected given that it was developed a lower level of intensity that anticipated under the Town's Master Sewer Plan. As well, based upon the Master Sewer Plan, the Shiloh site was projected to generate 37,000 gallons of sewage per day. Assuming that the currently proposed full program is constructed at this site, sewage flow is expected to be just over 22,000 gallons per day, significantly below the original allocation to this site. Because sewer system capacity is largely a function of peak flows, and as peak hospital flows are not expected to directly correspond with currently experienced peak flow times, sewer capacity at this site is expected to be sufficient at this site. The treatment plant currently has sufficient capacity for anticipated growth; however, effluent storage and disposal capacity is currently limited. The Town has recently entered into an agreement with the City of Santa Rosa to construct a connection to the City's Geyser's pipeline project, which conveys treated wastewater to the Geyser's steam fields for injection into steam wells. This connection, when implemented, is anticipated to resolve the storage and disposal limitations. (Brelje & Race)

Water System

The Shiloh Road site is within the Town limits. Development of this site for gateway commercial uses has been anticipated in water system planning. The Town is currently in the process of updating their Water System Master Plan document. The Town has a well field along the Russian River and other well sources; however these have a finite capacity. Currently, supply approximates demand during peak periods. The Town is pursuing capacity improvements at several existing well sites, and continues to explore opportunities for additional wells. There is currently no moratorium on new connections to the system for properties such as this one which are within the service area but are currently unserved. As with all new municipal well projects, demand for water at this site raises questions as to whether these potential sites will prove to provide sufficient water supplies and requires permitting and environmental review with regard to the selected groundwater well locations. The Town's system currently has adequate storage to serve this use, although they are pursuing further storage capability increases to address peak demand situations. While water system infrastructure is in place in Shiloh Road along the project frontage, it will need to be looped through the site for domestic and fire protection purposes. (Brelje & Race)

3. Todd Road/Moorland Alternative Site

Description of Todd/Road Moorland Alternative

The Todd Road/Moorland Alternative is located at 801, 3809 & 3901 Moorland Avenue. The site is under County jurisdiction, but within the Urban Growth Boundary of the City of Santa Rosa. Under this alternative, the Proposed Project (Sutter Medical Center hospital, Central Utility Plant, Physicians Medical Center, and Medical Office Building) would be constructed on this mostly vacant 19.9 acre site. The site is not owned by Sutter.

The Todd Road/Moorland Alternative would include:

- Sutter Medical Center hospital with a building footprint of approximately 75,000 square feet, two stories, with a maximum height of 42 feet, including roof screens.
- Central Utility Plant with a building footprint of approximately 14,000 square feet, one story, with a maximum height of 24 feet.
- Physicians Medical Center with a building footprint of approximately 50,000 square feet, three stories, with a maximum height of 58 feet, including roof screens.
- Medical Office Building with a building footprint of approximately 30,000 square feet, three stories, with a maximum height of 58 feet, including roof screens.
- Structured Parking with a building footprint of approximately 38,000 square feet, three stories in height.

The buildings would be developed as laid out in the attached site plan ("Todd Road/Moorland Alternative Site Plan"), which also shows that the helistop would be located on top of the Structured Parking, and that access to the site would be off of Moorland Avenue.

Analysis of Environmental Impacts

Agricultural Resources

The site contains some Farmland of Local Importance.

Air Quality

In order to assist the County with its assessment of the potential air quality impacts of development of this alternative, Sutter has confirmed with ENGEO that, from a preliminary geotechnical perspective, given the location of the Todd Road/Mooreland site with respect regional geologic conditions, the overall measures and strategies to mitigate geologic and geotechnical hazards for future land development to an acceptable-level are anticipated to be similar to those proposed for the Mark West Springs site. Accordingly, it is expected that the air quality impacts associated with the surcharging and construction of foundations for this site will be similar to those associated with surcharging and construction of foundation at the Mark West Springs site. (ENGEO)

Geology/Soils

The site is shown to consist of 4 parcels encompassing approximately 20 acres. Majority of the site is currently undeveloped with a paved area used for parking located at the northern portion of the site. In general the topography at the site is relatively flat.

The site is located within the Coast Ranges geologic province of California, a series of northwest trending ridges and valleys. It is underlain by Holocene-Pleistocene Alluvium (Wagner and Bortugno, 1982). The site is shown to be underlain by alluvial fan and fluvial terrace deposits. According to USDA soil maps, the site is underlying by Wright Loam (WhA). Soil chemical property of the near-surface soils have a pH rating of 5.8. Plasticity Index associated with the soil is rated at 0 percent. The ABAG regional liquefaction map for the area shows that the site has a low susceptibility to liquefaction and the USGS liquefaction susceptibility map (1998) suggests that the area is underlying by material that has a very low susceptibility to liquefaction.

The site is not located within the State of California Fault Hazard Zone; however, it is situated in a region that contains numerous active and potentially active earthquake faults. The active Rodgers Creek fault is located approximately 3 miles east of the project area. The Rodgers Creek fault is capable of creating earthquakes with a moment magnitude of M7.0 (Blake, 1996).

From a feasibility level assessment, the main geologic and geotechnical considerations at this site include: seismicity, potential compressible soils and/or expansive soils, and presence of relatively shallow groundwater.

From a preliminary geotechnical perspective, given the location of the Todd Road/Mooreland site with respect regional geologic conditions, the overall measures and strategies to mitigate geologic and geotechnical hazards for future land development to an acceptable-level are anticipated to be similar to those proposed for the Mark West Springs site. A site specific geotechnical study would be necessary to characterize subsurface conditions of the with respect to project plans, define site specific hazards and to provide recommendations for mitigation, as necessary. For this site, if compressible or potentially liquefiable soils present a significant concern, then the use of treatment or mitigation, such as pre-consolidation or surcharging, or other various ground improvement techniques may be most appropriate. Also, depending on the structural loads at the sites and the subsurface soils, it is possible that deep foundations may be called for and suitable to provide support for planned buildings. Of the available deep systems pre-cast driven piles or cast-in-place piers may be appropriate. If soils conditions and building loads are favorable to allow for structural loads to be supported on shallow foundation systems, then the use of spread and continuous footings combined with floor slabs-on-grade, or structural reinforced mats may be appropriate. If expansive or corrosive soils are encountered then grading and design measures to mitigate these conditions would also be warranted. (ENGEO)

Hydrology and Water Quality

The Todd Mooreland site lies directly east of a constructed channel next to the SMART railroad right-of-way known as Moorland Creek, which runs along the western boundary of the site. The site is largely undeveloped except for a small paved parking lot and access road. There are existing surface drainage features carrying public street runoff from South Moorland Avenue directly west across the site to Moorland Creek which will need to be accounted for in any development design, as the runoff they convey will need to be routed around new structures. The Sonoma County Water Agency's tributary map for Moorland Creek indicates that commercial development of these parcels was anticipated in the design of the constructed natural channel of Moorland Creek along the SMART railroad right-of-way. Moorland Creek connects into the Todd Flood Control Channel just south of the site. The site is likely to need fill in order to create sufficient fall from the buildings to the drainage-way, especially for any piped drainage. While there are no published flood designations for this site, the topography is flat, it does adjoin flood control channels, and is in the southwest area of Santa Rosa, which is known for high water table conditions in typical winter seasons, as well as generally poor surface drainage.

Post-Construction Best Management Practices applied to this site would be very similar to those proposed for the Mark West Springs Road site. The site plan would include vegetated bio-swales and structural filter units for runoff from roofs and pavements, and the storm-water detention facilities could also contribute to the treatment train. For storm-water quality control purposes, the post-construction 2-year peak runoff from the site must be limited to pre-construction values, similar to the criteria that is to be applied to the Mark West Springs Road site, and would be addressed by employing detention basins to control peak runoff. However, because this site is smaller in area than the Mark West Springs Road site it may be necessary to detain storm-water runoff in underground reservoirs, rather than in open-air basins, to allow adequate space for parking lots. Although effective for siltation removal, underground reservoirs do not have the advantage of plant life to contribute to bio-remediation of the detained runoff, and typically will need mechanical (pumping) assistance to discharge runoff back into the creek channel. Regular maintenance will also be necessary to remove silt from the reservoir wet well and to service the pumping equipment. (Brelje & Race)

Mineral Resources

The area within the project site is mapped as MRZ-1 or MRZ-4 by California Department of Mines and Geology in publication SR 146. MRZ-1 is identified as an area either adequate information indicating that no significant mineral deposits are present or where it is judged that little likelihood exists for their presence. MRZ-4 is identified by an area where available information is inadequate for assignment of any mineral resource zone. (ENGEO)

Noise

Illingworth and Rodkin, in coordination with Mead & Hunt Inc., considered the noise impacts of development of the Proposed Project on the Todd Road/Moorland site. Under this alternative the helistop would be located on the roof of the three-story parking garage with access to the Sutter Medical Center hospital's emergency room via elevator from the roof and then across the parking lot. The flight paths from the helistop would be toward the north and southeast and then both paths would follow Highway 101. The nearby land uses to the site are freeway to the east, rail line to the west, industrial in all directions and some residential across Todd Road to the north. Helicopter operations would be potentially audible to some of the residential areas to the north, but freeway and future SMART train noise would be dominant. Keeping the approach/departure paths of the helicopters along Highway 101 will minimize noise impacts. The noise impacts to residences would be similar to those at the Proposed Project. The noise contours created by the flight paths are reflected in the attached diagram ("Todd Road/Moorland Alternative Noise Contour Map").

Transportation and Traffic

Access to the site is provided by Mooreland Avenue, a minimally improved two-lane County-owned and maintained roadway. Along the project frontage, there are currently no curbs, gutters, or sidewalks, and there are moderately deep roadside ditches adjoin both sides of the roadway. The site lies immediately to the south of the Todd Road overcrossing of Highway 101. It is likely that the right of way of Mooreland Avenue transitions into Caltrans right of way at the northeast corner of the site. It is also likely that Mooreland Avenue south of the overcrossing would need to be widened and improved if the hospital program was constructed at this site. There is an overhead high voltage electrical transmission line along the west side of the street that would have to be relocated or placed underground with the widening of the street. This would be a significant expense, especially given the lengthy frontage of the site along Mooreland Avenue. The northern portion of the widening would be in Caltrans right of way.

The intersection of Mooreland Avenue and the overcrossing is currently signalized. The overcrossing is two lanes, and Mooreland Avenue north of the overcrossing to Todd Road is four lanes. The intersection of Mooreland Avenue and Todd Road is also signalized and is under Caltrans control. There are no sidewalks anywhere in the vicinity of the project along the west side of the freeway. Particularly, where the Mooreland Ave right-of-way directly adjoins the freeway fence, all widening would have to be on the project side, and would require the removal of existing mature trees, as well as the filling of the existing roadside ditch, which is likely a jurisdictional feature such as a wetland. South of the subject site, Mooreland Avenue continues to parallel the freeway right of way, then makes a sharp turn to the west and becomes Scenic Avenue, another marginally improved two-lane rural roadway owned and maintained by the County of Sonoma. Scenic Avenue extends westerly to an intersection with Stony Point Road. Neither Scenic Ave or Mooreland Avenue south of the subject site would provide suitable access to the site for patients or emergency vehicles. Improvements to these roadways would be constrained by the freeway right of way and existing private property improvements.

The site is accessible by Sonoma County Transit at Todd Road at Mooreland Avenue. (Brelje & Race)

[Mark Crane to provide operational characteristics of interchanges near site. County Public Works Department to provide available information on existing LOS conditions when intersections are identified.]

Utilities and Service Systems

Sewer System

The site is within the City of Santa Rosa's urban boundary, but is not adjacent to the current City limits, which are currently just south of Bellevue Avenue along Dutton Avenue, nearly one mile north of the Todd Road/Moorland site. LAFCO's policies prohibit non-contiguous annexations, and the City's Utility Certificate policy prohibits extending city services to parcels, unless they can be annexed to the City, or unless there is a documented health issue with a failed septic system. Therefore, providing service to this site would require a special exception to the City's Utility Certificate policy, which would have to be approved by the City Council, and would require the approval by LAFCO of an Outside Service Area Agreement with no near term possibility of annexation.

The city does have a relatively new sewer trunk line located in Todd Road, just to the north of the site. There are currently no sewer collection systems in Mooreland Avenue south of Todd Road. It is not certain if the trunk line would be sufficiently deep to allow for a gravity sewer main to be extended south in Mooreland Avenue to the site and through the site to serve the proposed buildings without construction of an onsite sewage lift station. However, a gravity extension in Mooreland Avenue to the project frontage appears feasible. The is capacity in the wastewater system now for the Project, but over time Santa Rosa will need to implement increases in capacity and/or storage. The property to the immediate north of the subject site is within the Southpark Sanitation District. (Brelje & Race)

Water System

The site is within the City of Santa Rosa's urban boundary, but is not adjacent to the current city limits, which are currently just south of Bellevue Avenue along Dutton Ave, nearly one mile north of the subject site. LAFCO's policies prohibit non-contiguous annexations, and the City's Utility Certificate policy prohibits extending city services to parcels unless they can be annexed to the City, or there is a documented health issue with a contaminated water supply. Therefore, providing service to this site would require a special exception to the City's Utility Certificate policy, which would have to be approved by the City Council, and would require the approval by LAFCO of an Outside Service Area Agreement with no near term possibility of annexation.

Unlike with sewer service, several properties adjoining the Todd/Road Moorland site do currently receive water service from the City of Santa Rosa water system, though for fire protection services only. There is a 14 inch diameter City water line in Mooreland Avenue south of Todd Road that extends along and beyond the project frontage. It is likely that this line could provide adequate flow to serve the domestic and fire protection needs of the development, but it would be essentially a dead-end line, with very limited possibility of looping to provide two sources of water in the event of an emergency. Any such connection would require an easement from the adjoining north owner, and a possible reconfiguration of their onsite fire protection system. It is also likely that the available water pressure in this location is less than 60 psi static, which would likely require a booster pump for fire and domestic uses. (Brelje & Race)

4a. Decentralized Alternative A

Description of Decentralized Alternative A

The Decentralized Alternative One proposes the construction on the Proposed Project site of a 28-bed Physicians Medical Center, a 50,000 square foot medical office building and a 10,00 square foot central utility plant ("Mark West Site"). The 70-bed Sutter Medical Center hospital, a 50,000 square foot medical office building and a central utility plant would be constructed on the Todd Road/Moorland Site.

The Todd Road/Moorland Site is located at 801, 3809 & 3901 Moorland Avenue. The site is under County jurisdiction, but within the Urban Growth Boundary of the City of Santa Rosa. The site is mostly vacant and is 19.9 acres in size. The site is not owned by Sutter.

The Todd Road/Moorland Site Element of Decentralized Alternative One would include:

- Sutter Medical Center hospital with a building footprint of approximately 75,000 square feet, two stories, with a maximum height of 42 feet, including roof screens.
- Central Utility Plant with a building footprint of approximately 14,000 square feet, one story, with a maximum height of 24 feet.
- Medical Office Building with a building footprint of approximately 25,000 square feet, two stories, with a maximum height of 42 feet, including roof screens.

The buildings would be developed as laid out in the attached site plan ("Decentralized Alternative One"), which also shows that the helistop would be located, at grade, in the southwest quadrant of the site, and that access to the site would be off of Moorland Avenue.

The Mark West Site Element of Decentralized Alternative One would include:

- Physicians Medical Center with a building footprint of approximately 75,000 square feet, two stories, with a maximum height of 42 feet, including roof screens.
- Medical Office Building with a building footprint of approximately 25,000 square feet, two stories, with a maximum height of 42 feet, including roof screens.
- Central Utility Plant with a building footprint of approximately 10,000 square feet, one story, with a maximum height of 24 feet.

The buildings would be developed as laid out in the attached site plan ("Decentralized Alternative A"), which also shows that the helistop would be located at grade, and that access to the site would be off of Mark West Road.

Analysis of Environmental Impacts

Agricultural Resources

The Todd Road/Moorland Site and the Mark West site contains some Prime Farmland and some Farmland of Local Importance.

Air Quality

In order to assist the County with its assessments of the potential air quality impacts of development of this alternative, Sutter has confirmed with ENGEO that, from a preliminary geotechnical perspective, given the location of the Todd Road/Mooreland site with respect regional geologic conditions, the overall measures and strategies to mitigate geologic and geotechnical hazards for future land development to an acceptable-level are anticipated to be similar to those proposed for the Mark West Springs site. Accordingly, it is expected that the air quality impacts associated with the surcharging and construction of foundations for this site will be similar to those associated with surcharging and construction of foundation at the Mark West Springs site. (ENGEO)

Geology/Soils

The Todd Road/Moorland site is shown to consist of 4 parcels encompassing approximately 20 acres. Majority of the site is currently undeveloped with a paved area used for parking located at the northern portion of the site. In general the topography at the site is relatively flat.

The site is located within the Coast Ranges geologic province of California, a series of northwest trending ridges and valleys. It is underlain by Holocene-Pleistocene Alluvium (Wagner and Bortugno, 1982). The site is shown to be underlain by alluvial fan and fluvial terrace deposits. According to USDA soil maps, the site is underlying by Wright Loam (WhA). Soil chemical property of the near-surface soils have a pH rating of 5.8. Plasticity Index associated with the soil is rated at 0 percent. The ABAG regional liquefaction map for the area shows that the site has a low susceptibility to liquefaction and the USGS liquefaction susceptibility map (1998) suggests that the area is underlying by material that has a very low susceptibility to liquefaction.

The site is not located within the State of California Fault Hazard Zone; however, it is situated in a region that contains numerous active and potentially active earthquake faults. The active Rodgers Creek fault is located approximately 3 miles east of the project area. The Rodgers Creek fault is capable of creating earthquakes with a moment magnitude of M7.0 (Blake, 1996).

From a feasibility level assessment, the main geologic and geotechnical considerations at this site include: seismicity, potential compressible soils and/or expansive soils, and presence of relatively shallow groundwater.

From a preliminary geotechnical perspective, given the location of the Todd Road/Mooreland site with respect regional geologic conditions, the overall measures and strategies to mitigate geologic and geotechnical hazards for future land development to an acceptable-level are anticipated to be similar to those proposed for the Mark West Springs site. A site specific geotechnical study would be necessary to characterize subsurface conditions of the with respect to project plans, define site specific hazards and to provide recommendations for mitigation, as necessary. For this site, if compressible or potentially liquefiable soils present a significant concern, then the use of treatment or mitigation, such as pre-consolidation or surcharging, or other various ground improvement techniques may be most appropriate. Also, depending on the structural loads at the sites and the subsurface soils, it is possible that deep foundations may be called for and suitable to provide support for planned buildings. Of the available deep systems pre-cast driven piles or cast-in-place piers may be appropriate. If soils conditions and building loads are favorable to allow for structural loads to be supported on shallow foundation systems, then the use of spread and continuous footings combined with floor slabs-on-grade, or structural reinforced mats may be appropriate. If expansive or corrosive soils are encountered then grading and design measures to mitigate these conditions would also be warranted. (ENGEO)

Hydrology and Water Quality

The Todd Road Mooreland site lies directly east of a constructed channel next to the SMART railroad right-of-way known as Moorland Creek, which runs along the western boundary of the site. The site is largely undeveloped except for a small paved parking lot and access road. There are existing surface drainage features carrying public street runoff from South Moorland Avenue directly west across the site to Moorland Creek which will need to be accounted for in any development design, as the runoff they convey will need to be routed around new structures. The Sonoma County Water Agency's tributary map for Moorland Creek indicates that commercial development of these parcels was anticipated in the design of the constructed natural channel of Moorland Creek along the SMART railroad right-of-way. Moorland Creek connects into the Todd Flood Control Channel just south of the site. The site is likely to need fill in order to create sufficient fall from the buildings to the drainage-way, especially for any piped drainage. While there are no published flood designations for this site, the topography is flat, it does adjoin flood control channels, and is in the southwest area of Santa Rosa, which is known for high water table conditions in typical winter seasons, as well as generally poor surface drainage.

Post-Construction Best Management Practices applied to the Todd Road/Moorland site would be very similar to those proposed for the Mark West Springs Road site. The site plan would include vegetated bio-swales and structural filter units for runoff from roofs and pavements, and the storm-water detention facilities could also contribute to the treatment train. For storm-water quality control purposes, the post-construction 2-year peak runoff from the site must be limited to pre-construction values, similar to the criteria that is to be applied to the Mark West Springs Road site, and would be addressed by employing detention basins to control peak runoff. However, because this site is smaller in area than the Mark West Springs Road site it may be necessary to detain storm-water runoff in underground reservoirs, rather than in open-air basins, to allow adequate space for parking lots. Although effective for siltation removal, underground reservoirs do not have the advantage of plant life to contribute to bio-remediation of the detained runoff, and typically will need mechanical (pumping) assistance to discharge runoff back into the creek channel. Regular maintenance will also be necessary to remove silt from the reservoir wet well and to service the pumping equipment. (Brelje & Race)

Mineral Resources

The area within the Todd Road/Moorland site is mapped as MRZ-1 or MRZ-4 by California Department of Mines and Geology in publication SR 146. MRZ-1 is identified as an area either adequate information indicating that no significant mineral deposits are present or where it is judged that little likelihood exists for their presence. MRZ-4 is identified by an area where available information is inadequate for assignment of any mineral resource zone. (ENGEO)

Noise

Illingworth and Rodkin, in coordination with Mead & Hunt Inc., considered the noise impacts of development of the Proposed Project on the Todd Road/Moorland site as configured in the Decentralized Alternative. Under this alternative the helistop would be located at grade on the east side of the site with access to the Sutter Medical Center hospital's emergency room across the parking lot. The flight paths from the helistop would be toward the north and southeast and then both paths would follow Highway 101. The nearby land uses to the site are freeway to the east, rail line to the west, industrial in all directions and some residential across Todd Road to the north. Helicopter operations would be more audible to some of the residential areas to the north than under Alternative 3 due to the operations being slight lower to the ground as the helistop would be located at grade. However, the noise impacts to residences would be still be similar to those that would be experienced under the Proposed Project. The noise contours created by the flight path are reflected in the attached diagram ("Todd Road/Moorland Decentralized Alternative Noise Contour Map").

Transportation and Traffic

Access to the Todd Road/Moorland site is provided by Mooreland Avenue, a minimally improved two-lane County-owned and maintained roadway. Along the project frontage, there are currently no curbs, gutters, or sidewalks, and there are moderately deep roadside ditches adjoin both sides of the roadway. The site lies immediately to the south of the Todd Road overcrossing of Highway 101. It is likely that the right of way of Mooreland Avenue transitions to Caltrans right of way at the northeast corner of the site. It is also likely that Mooreland Avenue south of the overcrossing would need to be widened and improved if the hospital program was constructed at this site. There is an overhead high voltage electrical transmission line along the west side of the street that would have to be relocated or placed underground with the widening of the street. This would be a significant expense, especially given the lengthy frontage of the site along Mooreland Avenue. The northern portion of the widening would be in Caltrans right of way.

The intersection of Mooreland Avenue and the overcrossing is currently signalized. The overcrossing is two lanes, and Mooreland Avenue north of the overcrossing to Todd Road is four lanes. The intersection of Mooreland Avenue and Todd Road is also signalized and is under Caltrans control. There are no sidewalks anywhere in the vicinity of the project along the west side of the freeway. Particularly, where the Mooreland Ave right-of-way directly adjoins the freeway fence, all widening would have to be on the project side, and would require the removal of existing mature trees, as well as the filling of the existing roadside ditch, which is likely a jurisdictional feature such as a wetland. South of the subject site, Mooreland Avenue continues to parallel the freeway right of way, then makes a sharp turn to the west and becomes Scenic Avenue, another marginally improved two-lane rural roadway owned and maintained by the County of Sonoma. Scenic Avenue extends westerly to an intersection with Stony Point Road. Neither Scenic Ave or Mooreland Avenue south of the subject site would provide suitable access to the site for patients or emergency vehicles. Improvements to these roadways would be constrained by the freeway right of way and existing private property improvements.

The site is accessible by Sonoma County Transit at Todd Road at Mooreland Avenue. (Brelje & Race)a

[Mark Crane to provide operational characteristics of interchanges near site. County Public Works Department to provide available information on existing LOS conditions when intersections are identified.]

Utilities and Service Systems

<u>Sewer System</u>

The Todd Road/Moorland site is within the City of Santa Rosa's urban boundary, but is not adjacent to the current City limits, which are currently just south of Bellevue Avenue along Dutton Avenue, nearly one mile north of the Todd Road/Moorland site. LAFCO's policies prohibit non-contiguous annexations, and the City's Utility Certificate policy prohibits extending city services to parcels, unless they can be annexed to the City, or unless there is a documented health issue with a failed septic system. Therefore, providing service to this site would require a special exception to the City's Utility Certificate policy, which would have to be approved by the City Council, and would require the approval by LAFCO of an Outside Service Area Agreement with no near term possibility of annexation.

The City does have a relatively new sewer trunk line located in Todd Road, just to the north of the site. There are currently no sewer collection systems in Mooreland Avenue south of Todd Road. It is not certain if the trunk line would be sufficiently deep to allow for a gravity sewer main to be extended south in Mooreland Avenue to the site and through the site to serve the proposed buildings without construction of an onsite sewage lift station. However, a gravity extension in Mooreland Avenue to the project frontage appears feasible. The is capacity in the wastewater system now for the Project, but over time Santa Rosa will need to implement increases in capacity and/or storage. The property to the immediate north of the subject site is within the Southpark Sanitation District. (Brelje & Race)

<u>Water System</u>

The Todd Road/Moorland site is within the City of Santa Rosa's urban boundary, but is not adjacent to the current city limits, which are currently just south of Bellevue Avenue along Dutton Ave, nearly one mile north of the subject site. LAFCO's policies prohibit non-contiguous annexations, and the City's Utility Certificate policy prohibits extending city services to parcels unless they can be annexed to the City, or there is a documented health issue with a contaminated water supply. Therefore, providing service to this site would require a special exception to the City's Utility Certificate policy, which would have to be approved by the City Council, and would require the approval by LAFCO of an Outside Service Area Agreement with no near term possibility of annexation.

Unlike with sewer service, several properties adjoining the Todd/Road Moorland site do currently receive water service from the City of Santa Rosa water system, though for fire protection services only. There is a 14 inch diameter City water line in Mooreland Avenue south of Todd Road that extends along and beyond the project frontage. It is likely that this line could provide adequate flow to serve the domestic and fire protection needs of the development, but it would be essentially a dead-end line, with very limited possibility of looping to provide two sources of water in the event of an emergency. Any such connection would require an easement from the adjoining north owner, and a possible reconfiguration of their onsite fire protection system. It is also likely that the available water pressure in this location is less than 60 psi static, which would likely require a booster pump for fire and domestic uses. (Brelje & Race)

4b. Decentralized Alternative Two

Description of Decentralized Alternative B

The Decentralized Alternative B proposes the construction on the Proposed Project site of a 28-bed Physicians Medical Center, a 50,000 square foot medical office building and a 10,00 square foot central utility plant ("Mark West Site"). The 70-bed Sutter Medical Center hospital, a 50,000 square foot medical office building and a central utility plant would be constructed on the Ring site.

The Ring site is located at 1700 Hampton Way in Santa Rosa. The site is approximately 18.5 acres in size and is located south of and adjacent to Highway 12 and Stony Point Road. The site is not owned by Sutter.

The Ring Property Site Element of Decentralized Alternative One would include:

- Sutter Medical Center hospital with a building footprint of approximately 60,000 square feet, three stories, with a maximum height of 58 feet, including roof screens.
- Central Utility Plant with a building footprint of approximately 14,000 square feet, one story, with a maximum height of 24 feet.
- Medical Office Building with a building footprint of approximately 25,000 square feet, two stories, with a maximum height of 42 feet, including roof screens.

The buildings would be developed as laid out in the attached site plan ("Decentralized Alternative Two"), which also shows that the helistop would be located on the roof of the Sutter Medical Center, and that access to the site would be off of Sebastopol Road.

The Mark West Site Element of Decentralized Alternative One would include:

- Physicians Medical Center with a building footprint of approximately 75,000 square feet, two stories, with a maximum height of 42 feet, including roof screens.
- Medical Office Building with a building footprint of approximately 25,000 square feet, two stories, with a maximum height of 42 feet, including roof screens.
- Central Utility Plant with a building footprint of approximately 10,000 square feet, one story, with a maximum height of 24 feet.

The buildings would be developed as laid out in the attached site plan ("Decentralized Alternative B"), which also shows that the helistop would be located at grade in the southwest corner of the site, and that access to the site would be off of Mark West Road.

Analysis of Environmental Impacts

Agricultural Resources

The Ring Site contains no significant farmland, and the Mark West site contains some Prime Farmland and some Farmland of Local Importance.

Air Quality

In order to assist the County with its assessment of the potential air quality impacts of development of this alternative, Sutter has confirmed with ENGEO that, from a preliminary geotechnical perspective, given the location of the Ring Property site with respect regional geologic conditions, the overall measures and strategies to mitigate geologic and geotechnical hazards for future land development to an acceptable-level are anticipated to be similar to those proposed for the Mark West Springs site. Accordingly, it is expected that the air quality impacts associated with the surcharging and construction of foundations for this site will be similar to those associated with surcharging and construction of foundation at the Mark West Springs site. (ENGEO)

Geology/Soils

The Ring Property site is shown to consist of 5 parcels encompassing approximately 19 acres. The site is currently occupied by commercial and industrial developments and paved parking areas with portions of the site occupied by undeveloped space consisting of seasonal vegetation and flat topographic relief.

The site is located within the Coast Ranges geologic province of California, a series of northwest trending ridges and valleys. It is underlain by Holocene-Pleistocene Alluvium (Wagner and Bortugno, 1982). The site is shown to be underlain by alluvial fan and fluvial terrace deposits. According to USDA soil maps, the site is underlying by Yolo Gravelly Loam (YrB) and Zamora Silty Clay Loam (ZaA). Soil chemical properties of these surficial soils have a pH of 6.7. Plasticity Indices associated with these soils range from 10 to 15 percent. The ABAG regional liquefaction map for the area shows that the site has a low susceptibility to liquefaction; however, USGS liquefaction susceptibility map (1998) suggests that the area is underlying by material that has a moderate susceptibility to liquefaction.

The site is not located within the State of California Fault Hazard Zone; however, it is situated in a region that contains numerous active and potentially active earthquake faults. The active Rodgers Creek fault is located approximately 2 ½ miles east of the project area. The Rodgers Creek fault is capable of creating earthquakes with a moment magnitude of M7.0 (Blake, 1996). It should be expected that the site will experience one or more episodes of strong ground shaking during the design life of the proposed improvements.

From a feasibility level assessment, the main geologic and geotechnical considerations at this site include: seismicity and liquefaction potential, potential compressible soils and/or expansive soils, possible undocumented fills from current site uses, and presence of relatively shallow groundwater.

From a preliminary geotechnical perspective, given the location of the Ring Property site with respect regional geologic conditions, the overall measures and strategies to mitigate geologic and geotechnical hazards for future land development to an acceptable-level are anticipated to be similar to those proposed for the Mark West Springs site. A site specific geotechnical study would be necessary to characterize subsurface conditions of the with respect to project plans, define site specific hazards and to provide recommendations for mitigation, as necessary. For this site, if compressible or potentially liquefiable soils present a significant concern, then the use of treatment or mitigation, such as pre-consolidation or surcharging, or other various ground improvement techniques may be most appropriate. Also, depending on the structural loads at the sites and the subsurface soils, it is possible that deep foundations may be called for and suitable to provide support for planned buildings. Of the available deep systems pre-cast driven piles or cast-in-place piers may be appropriate. If soils conditions and building loads are favorable to allow for structural loads to be supported on shallow foundation systems, then the use of spread and continuous footings combined with floor slabs-on-grade, or structural reinforced mats may be appropriate. If expansive or corrosive soils are encountered then grading and design measures to mitigate these conditions would also be warranted. (ENGEO)

Hydrology and Water Quality

The Ring Property site sits on high ground several feet above the adjacent freeway (State Route 12) cut, and therefore has a very low likelihood for flooding. The parcel north of the multi-use path and south of State Route 12 has functioned recently as a golf driving range, therefore the majority of the site is turf, along with a small parking lot and clubhouse, that drain to the southeast into the upstream end of the Burbank Avenue storm drain main. The drain main carries runoff about 0.6 miles south before discharging into Roseland Creek. The parcels to the south of the multi-use path are undeveloped, except that one of them contains a vehicle dismantling business with a high potential for pollutants of concern. The lots have only one or perhaps two adjacent underground storm drains leading to surrounding public street systems which might have capacity available for connection to a private system. The site recently was approved for a medium-density residential development suggests that there is likely to be sufficient capacity. It is likely that the downstream storm drainage systems have inadequate capacity for the development, necessitating a storm water detention system similar to that proposed at the Mark West Springs site.

Post-Construction Best Management Practices applied to this site would be governed by the City Mark West Spring site. The site plan would include vegetated bio-swales and structural filter units for runoff from roofs and pavements, and the storm-water detention facilities could also contribute to improving water quality. For storm-water quality control purposes, the post-construction 2-year peak runoff from the site must be limited to pre-construction values, similar to the criteria that is to be applied to the Mark West Spring site, and would be addressed by employing detention basins to control peak runoff. However, due to the size and awkward configuration of the site, it may be necessary to detain storm-water runoff in underground reservoirs, rather than in open-air basins, to allow adequate space for parking lots. Although effective for siltation removal, underground reservoirs do not have the advantage of plant life to contribute to bio-remediation of the detained runoff, and may need mechanical (pumping) assistance to discharge runoff into the storm drain system. Regular maintenance will also be necessary to remove silt from the reservoir wet well and to service the pumping equipment. (Brelje & Race)

Mineral Resources

The area within the Ring site is mapped as MRZ-1 or MRZ-4 by California Department of Mines and Geology in publication SR 146. MRZ-1 is identified as an area either adequate information indicating that no significant mineral deposits are present or where it is judged that little likelihood exists for their presence. MRZ-4 is identified by an area where available information is inadequate for assignment of any mineral resource zone. (ENGEO)

Noise

Illingworth and Rodkin, in coordination with Mead & Hunt Inc., considered the noise impacts of development of the Proposed Project on the Ring Property site under the Decentralized Alternative. Under this alternative the helistop would be located on the roof of the three-story Sutter Medical Center hospital, with access to the emergency room via elevator from the roof. The primary flight path from the helistop would be north to Highway 12, with a secondary path to the south over an auto-wrecking yard. The nearby land uses to the site are freeway and residential to the north, a mobile home park adjacent on the southeast, and a mixture of commercial and industrial uses (mini-storage and auto-wrecking) in other directions. Helicopter operations would potentially overfly residential areas to the north and the mobile home park to the southeast, though the noise impacts will be somewhat masked by freeway noise. The noise impacts to area residences are expected to be greater than those that would be experienced under the Proposed Project. The noise contours created by the flight paths are reflected in the attached diagram ("Ring Property Decentralized Alternative Noise Contour Map").

Transportation and Traffic

Access to the Ring Property site is currently provided by several different streets, depending upon the individual parcel in question. The two main parcels, parallel to and south of Highway 12, take access from the north end of Hampton Way, off Sebastopol Road. This is a narrow, poorly maintained local street serving existing light industrial uses that directly front the roadway. Its use as the main or even secondary access for the hospital complex would be unsatisfactory from a functionality and visibility standpoint, given that the other existing uses take direct access from the roadway. Two of the other parcels that make up the site directly abut Sebastopol Road and currently have direct driveway access. The final parcel fronts on Stony Point Road immediately south of the Highway 12 eastbound on ramp from Stony Point Road. This parcel is located approximately mid-way between the existing signalized intersections at the entrance to two existing commercial centers, and the eastbound off/on ramps to Highway 12.

The proximity of these two existing signals would make signalizing of a new intersection at this parcel impractical. From a location standpoint, this would be the ideal location for an emergency vehicle entrance to the hospital. However, traffic congestion in this area, and the awkward configuration of such an access to the existing Stony Point/off-on ramp intersection would likely present operational challenges, and prevent its use as a main entrance to the hospital. It is more likely that development at this site would take its primary access from Sebastopol Road, ideally along the east property line of APN 125-071-014, as this location would be approximately equidistant between the existing signal at Sebastopol/Stony Point Road, and the currently proposed signal at Sebastopol Road/Burbank Avenue. Signal proximity may still be an issue at this location, and, at a minimum, any new signal at the Sutter entrance would have to be interconnected with the signals to the east and west. This location would not be intuitive as a main entrance to the hospital complex, as it is not visible from the freeway, and the site is surrounded by existing commercial development, making branding of the hospital site difficult.

Both Stony Point Road and Sebastopol Roads are major arterial roadways, with two travel lanes in each direction, and turn lanes. Stony Point Road has sections of raised center median. The site is located at the southeast corner of the interchange between Highway 12 and Stony Point Road. The interchange is fully improved, with the Stony Point overcrossing being two travel lanes in each direction, plus turn lanes. All off/on ramps are fully signalized. This is an area of heavy traffic congestion during both the morning and evening commute periods, with traffic at the Stony Point Road/Sebastopol Rd intersection experiencing the heaviest congestion. A plan to expand Stony Point Road south of Sebastopol Road from two lanes to four lanes was recently delayed by the City Council for a major redesign.

The site is accessible by Santa Rosa Transit at Stony Point Road at Highway 12, and by Sonoma County Transit at Sebastopol Road at Hampton Way. (Brelje & Race)

[Mark Crane to provide operational characteristics of interchanges near site. County Public Works Department to provide available information on existing LOS conditions when intersections are identified.]

Utilities and Service Systems

Sewer System

The Ring Property site is within the City limits of Santa Rosa and is eligible for service upon payment of the applicable fees. There is a 6 inch sewer main stubbed to within 50 feet of the property on Hampton Way, a 12 inch sewer line in Sebastopol Road, and a 6 inch sewer line in Stony Point Road. The 6 inch line in Hampton Way may be able to provide limited service to minor uses on the hospital site, but is smaller than the currently permitted minimum main size of 8 inch. Given that this 6 inch line serves the existing uses on Hampton Way, capacity available to serve any portion of the development would be limited. Similarly, the 6 inch main in Stony Point Road could likely provide minor service to a portion of the site, but would not be capable of serving the entire development. Therefore, it is likely that a new sewer line would need to be constructed from Sebastopol Road, in the new site access road, to serve the majority of the hospital development. There are no other constraints to providing sewer service to the site. (Brelje & Race)

Water System

The site is currently within the City limits of Santa Rosa, and is eligible for service upon payment of the applicable fees. The site is well served by water at the present time, with a 12” public water main looping along the perimeter of the site from east to west, then south to Sebastopol Road. Static pressure in the area is approximately 67 psi. It may be desirable to increase the reliability of the system by constructing a secondary loop connection from the site out to Stony Point Road. At the present time, there are no restrictions on new connections to the City’s water system, and the City has more supply available from their own wells and from their contract with Sonoma County Water Agency, than current demands. However, the State Water Resources Control Board has mandated a 25% reduction in use for all users supplied by Sonoma County Water Agency for the summer of 2009 due to the lack of normal rainfall during the 2008/2009 season. Ongoing water supply shortages to the Sonoma County Water Agency system resulting from extended draught conditions in the basin could lead to future restrictions on connections to new users. (Brelje & Race)

6. 70-Bed Hospital Only Alternative

Description of 70-Bed Hospital Only Alternative

This alternative proposes the construction on the Proposed Project site of a 70-bed Sutter Medical Center hospital, a central utility plant and a helistop on the Mark West Springs site.

The 70-Bed Hospital Alternative would include:

- Sutter Medical Center hospital with a building footprint of approximately 37,750 square feet, two stories, with a maximum height of 42 feet, including roof screens.
- Central Utility Plant with a building footprint of approximately 8,000 square feet, one story, with a maximum height of 24 feet.

The buildings would be developed as laid out in the attached site plan ("70-Bed Hospital Only"), which also shows that the helistop would be located at grade at the same location proposed for the Project, and that access to the site would be off of Mark West Road.

Analysis of Environmental Impacts

Transportation and Traffic

Development of this Alternative would likely require only a single lane ramp at Highway 101 and Mark West Springs Road, if Caltrans permits a change in signal phasing by adding a right-turn green arrow. However, during events at the Wells Fargo Center, there are still likely to be back-ups onto the freeway mainline which Caltrans disfavors. Further, the improvements to Mark West Springs Road that are required under the Proposed Project will still be required under this Alternative. (Steve Colman)

7. Overall Reduced Project Alternative

Description of Overall Reduced Project Alternative

This alternative would include an overall the reduction in the proposed project of 33 percent with a Sutter Medical Center of 46 beds, a Physicians Medical Center of 19 beds, a Medical Office Building of 27,000 square feet, a central utility plant, and a helistop.

Sutter Medical Center Hospital: The Sutter Medical Center hospital would have a building footprint of approximately 59,200 square feet, two stories, with a maximum height of 42 feet, including roof screens. From an operational standpoint this alternative can be configured in one of two manners:

Across-the Board Reductions: Reduce the number of licensed beds, and service lines by 33% for all proposed hospital services.

This alternative would include 46 licensed beds with reductions in the following types of licensed beds: medical surgical, obstetrical/post partum/woman's services, intensive care (ICU), neonatal intensive care (NICU), and labor, delivery, recovery, post partum. It would also include a reduction in non-licensed services such as the universal care unit, emergency room beds, cat scans, radiology rooms, nuclear medicine, operating rooms, and special procedures.

Eliminate Specific Services: Reduce the hospital's size by eliminating or reducing specific services to achieve the 33% reduction.

This alternative would include 46 licensed beds. The reduction in beds could be accomplished by eliminating all medical surgical beds and reducing NICU beds, or by eliminating all labor, delivery, recovery, post partum beds and reducing NICU beds. In either event, this approach would also include the same types of reductions in the non-licensed services categories that would be required under the "Across-The-Board" approach.

Physicians Medical Center: The PMC would have a building footprint of approximately 37,750 square feet, two stories, with a maximum height of 42 feet, including roof screens.

The proposed project PMC would have 28 beds comprised of 24 medical surgical beds and 4 intensive care beds. Accordingly, a 33% reduction in beds would result in a 18 bed hospital. As this hospital is a joint venture in the process of syndication, it is not currently know what mix of beds might be for a reduced size alternative. In addition the number of non-licensed services is unknown at this time, so it is not possible to determine which non-licensed services would have to eliminated or reduced.

Medical Office Building: The MOB would have a building footprint of approximately 27,000 square feet, two stories, with a maximum height of 42 feet, including roof screens.

Central Utility Plant: The CUP would have a building footprint of approximately 12,000 square feet, one story, with a maximum height of 24 feet.

The buildings would be developed as laid out in the attached site plan (“Overall Reduced Project”), which also shows that the helistop would be located at grade in the southwest corner of the site, and that access to the site would be off of Mark West Road. This Alternative would require 654 parking spaces.

Analysis of Environmental Impacts

Transportation and Traffic

Development of this Alternative would generate 67% of the traffic of the Proposed Project, or 1908 trips per day.

Development of this Alternative would likely require only a single lane ramp at Highway 101 and Mark West Springs Road, if Caltrans permits a change in signal phasing by adding a right-turn green arrow. However, during events at the Wells Fargo Center, there are still likely to be back-ups onto the freeway mainline which Caltrans disfavors. Further, the improvements to Mark West Springs Road that are required under the Proposed Project will still be required under this Alternative. (Steve Colman)

POTENTIAL INDIRECT ENVIRONMENTAL AFFECTS TECHNICAL REPORTS

Analysis of Potential Indirect Environmental Effects of the Proposed Sutter Medical Center of Santa Rosa on Other Area Hospitals

Prepared by Sutter Medical Center of Santa Rosa
For Submission to Sonoma County

October 2009

Analysis of Potential Indirect Environmental Effects of the Proposed Sutter Medical Center of Santa Rosa on Other Area Hospitals

Prepared by Sutter Medical Center of Santa Rosa[1]

During the time Sonoma County has been preparing the EIR evaluating the proposed Sutter Medical Center of Santa Rosa, questions have been raised in public forums regarding the health care impact of the proposed project, and in particular the impact of the project on other hospitals in Sonoma County. On July 20, 2009, the Board of Supervisors reviewed a preliminary staff analysis of SMCSR's 2008 Revised Business Plan and determined that the plan could comply with the Health Care Access Agreement. The Board directed County staff to finalize its report and return to the Board for further consideration of this issue. Sutter understands that this further consideration of the business plan and health care issues will be conducted by the Board following certification of this EIR.

The purpose of the County's EIR is to evaluate environmental impacts. The environmental issue that is suggested by these comments is the question of whether claimed or potential impacts on health care could lead to potentially significant adverse impacts on the environment. For the reasons stated below, no foreseeable, potentially significant adverse environmental impacts are anticipated as a result of any potential impact the proposed project may have on other hospitals or on the overall delivery of health services in the County.

The CEQA Guidelines provide that "economic and social effects of a project shall not be treated as significant effects on the environment." (CEQA Guidelines § 15131.) Instead, CEQA is concerned only with a project's economic impacts where there is the potential for such impacts to result in an indirect physical impact to the environment. Accordingly, CEQA Guideline section 15131 provides that "intermediate economic or social changes need not be analyzed in any detail greater than necessary to trace the chain of cause and effects. The focus of the analysis shall be on the physical changes." Further, "economic or social effects of a project may be used to determine the significance of physical changes caused by a project."

During consideration of SMCSR's Revised Business Plan, the County received comments expressing concern that the proposed size of the new SMCSR, and its proposed allocation of beds, could result in the redistribution of an increased number of patients, including charity care or low-income government funded patients, to other hospitals in the County, potentially creating economic pressures on other hospitals. Any such increase or redistribution that might occur would be a potential *economic* effect of the proposed project, rather than an environmental impact. The following discussion evaluates whether such a potential economic impact may result in reasonably foreseeable physical impacts that would be indirect or secondary environmental impacts of the proposed project.

---

[1] This analysis was prepared by Bridget L. Brown, Strategy & Business Development Manager, Sutter Health, and Michael Zischke and Sarah Owsowitz, Cox Castle & Nicholson, LLP, with substantive input and review from Robin Hagenstad, RN, MS, MSN, Chief Nursing Officer, Sutter Medical Center of Santa Rosa, Nadin Sponamore, Sponamore & Associates, and Tom Minard, Senior Project Manager, Sutter Medical Center of Sutter Rosa.

As explained below, Sutter's analysis shows that the proposed project is not likely to result in the distribution of a significant number of new patients to other hospitals in the County, nor is it expect to alter the so called "payer mix" of patients at those hospitals – the mix of patients covered by commercial insurance and Medicare as compared to those patients who are charity care or low-income government funded. The potential economic impact of the proposed project on other hospitals consists of the possible redistribution of a few patients per day to other hospitals in the County, and the payer mix is anticipated to be similar to the current payer mix at other hospitals. This is an insubstantial economic impact, and is not anticipated to result in any potentially significant environmental impacts.

A. Capacity of the Proposed Sutter Medical Center Santa Rosa

The Sonoma County Department of Health Services prepared a Preliminary Analysis of SMCSR's 2008 Revised Business Plan (the "Preliminary County Analysis"), which was presented to the Board of Supervisors on July 20, 2009[2]. The Preliminary County Analysis included an assessment of future hospital services demands prepared by Deloitte Financial Advisory Services. The Preliminary County Analysis concludes that: "If Sutter builds a 70-bed hospital, 29-bed expansion and 28-bed [Physicians Medical Center ("PMC")], Sutter will likely have adequate capacity to provide services to its 2007 market share (trended forward) including uninsured patients and those in government funded projects." (Preliminary County Analysis at p. 5.)

Even conservatively making a worst case assumption that SMCSR determined not to build the 29-bed expansion to the 70-bed SMCSR or the PMC, and only built the 70-bed hospital, the proposed project is still not likely to result in the distribution of a significant number of new patients, including charity care or low-income government funded patients, to other hospitals in the County. Under a 70-bed scenario, the new SMCSR would consist of 20 medical/surgical (med/surg) beds, 8 intensive care unit (ICU) beds, 30 perinatal beds, and 12 neonatal intensive care unit (NICU) beds. The Preliminary County Analysis concludes there will be sufficient perinatal beds and NICU beds, but that "the size of the facility and the division of the beds by services will likely require some of SMCSR's existing med-surg and ICU patient share to be redistributed to other area hospitals." (Preliminary County Analysis at p. 5.)

Accordingly, the Preliminary County Analysis projects that a 70-bed only SMCSR may result in a shortfall of 21 beds in 2014 and 33 beds in 2021. (*Id.*) The Preliminary County Analysis concludes that there would be sufficient capacity to serve SMCSR's 2007 market share of government and charity patients in the future, if those patients could be admitted on a priority basis. (Preliminary County Analysis at p. 28.) However, because it is not possible to predict by payer which patients will be hospitalized at SMCSR, the Preliminary County Analysis concludes that it is possible that some med/surg and ICU patients will have to be seen at other facilities. (*Id.*)

---

[2] Although Sutter disagrees with the bed demand figures in the Preliminary County Analysis, Sutter used these figures in reparing this analysis of potential indirect environmental effects in order to provide a conservative analysis.

B. Potential Redistribution of Patients

In 2014, the 21 bed shortfall set forth in the Preliminary County Analysis (33 bed Med Surg and 4 bed ICU shortfalls and a 16 bed perinatal surplus) represents 4.1 patients per day based upon an average length of stay of 5.1 (based upon 2008 OSHPD Acute Care Patient Level Discharge Set for SMCSR excluding NICU and OB days).

In 2021, the 33 bed shortfall set forth in the Preliminary County Analysis 41 bed Med Surg and 6 bed ICU shortfalls and a 14 bed perinatal surplus) represents 6.5 patients per day based upon an average length of stay of 5.1 (based upon 2008 OSHPD Acute Care Patient Level Discharge Set for SMCSR excluding NICU and OB days). The County's five other hospitals (Healdsburg District Hospital, Palm Drive Hospital, Petaluma Valley Hospital, Sonoma Valley Hospital (collectively the "Sonoma District Hospitals") and Santa Rosa Memorial Hospital), each are projected, through 2021, to have med/surg bed occupancy rates under 85%.[3] (Preliminary County Analysis at p. 24.) Based on this analysis, the potential redistribution of between 4.1 and 6.5 patients a day among those five hospitals is not considered significant because the County's other hospitals are projected to have ample capacity to absorb such a potential redistribution if it were to occur.

C. Payer Mix of Redistributed Patients

The Preliminary County Analysis determined that, in 2007, 70% of Sutter's inpatient days for med/surg beds and ICU (excluding invasive cardiology) were covered by commercial insurance and Medicare, while only 30% of inpatient days were charity care or low-income government funded. (Preliminary County Analysis at p. 28) Assuming that any redistributed patients will have the same payer mix as those currently served in SMCSR's med/surg and ICU beds, 70% of those patients would be covered by commercial insurance or Medicare. This is similar to the Sonoma District and Santa Rosa Memorial Hospitals' current payer mix, which is 77% commercial and Medicare reimbursed. (*Id*.). However, the Preliminary County Analysis notes that "patients are admitted according to medical need, and it is not possible to predict by payer which patients will be hospitalized at Sutter and which will have to be seen at other facilities."

The Preliminary County Analysis also notes that two-thirds of the currently operating SMCSR's government funded and charity days are Medi-Cal days. (Preliminary County Analysis at p. 29.) A Medi-Cal reimbursed day may be preferable to a hospital than having an empty bed. (*Id*.) The value of Medi-Cal reimbursement could improve under the new Partnership HealthPlan of California managed care program which is coming to Sonoma County. (*Id*.) Medi-Cal managed care is expected to reduce Medi-Cal inpatient days by a minimum of 15% based on improved access to primary care and a reduction in preventable hospitalizations. (*Id*.) Thus, Medi-Cal managed care has the potential to decrease Medi-Cal days, increase Medi-Cal revenue and generally lessen the impact of any redistribution of a 70-bed SMCSR's med/surg and ICU days. (*Id*.)

---

[3] The Kaiser Foundation Hospital in Santa Rosa is a membership system, and may not accept any patients from SMCSR.

The Preliminary County Analysis states that Sutter's new maternity and NICU services will be more than adequate to handle projected demand, so that the potential for redistribution exists mainly for med/surg and ICU patients. (Preliminary County Analysis at p. 28). The Preliminary County Analysis concludes "in summary, it appears that any future redistribution from SMCSR would not be in the maternal and child services days which are disproportionately government funded and charity care cases, but of med/surg and ICU days which are 70% commercially and Medicare insured and 20% Medi-Cal covered."

Accordingly, Sutter concludes that the payer mix of any redistributed patients will not differ substantially from the current payer mix at the Sonoma District and Santa Rosa Memorial Hospitals. Based on this, the potential redistribution of between 4.1 and 6.5 patients a day among those hospitals is not expected to impose significant new costs or result in substantial economic or health care services impacts. In the context of the overall health care delivery system in Sonoma County, the economic impact of the proposed project on other hospitals is anticipated to be minimal.

D. Environmental Impacts

The potential redistribution of up to 4.1 and 6.5 patients per day to other Sonoma County hospitals is an insubstantial potential change. Accordingly, there is not anticipated to be any potentially significant environmental impact resulting from the potential impact of the proposed project on other hospitals in Sonoma County.

NOTICE OF AVAILABILITY OF DRAFT ENVIRONMENTAL IMPACT REPORT AND PUBLIC HEARING

PROJECT DESCRIPTION: The Sonoma County Permit and Resource Management Department has received application **PLP05-0002** from Sutter Medical Center of Santa Rosa and the Luther Burbank Memorial Foundation requesting a new Sutter Hospital and Luther Burbank Memorial Foundation Joint Master Plan on an approximately 53 acre site located at 50 Mark West Springs Road, Santa Rosa, Supervisorial District 4, to include:

1) A General Plan Amendment to include the approximately 53 acre site (APN's 058-040-058, -059, -060 and -061), and one additional 1.41 acre parcel (058-040-036) inside the Larkfield-Wikiup urban service boundary, and a potential General Plan text amendment to limit allowed uses on the Sutter/Luther Burbank site, and

2) Use Permits for:

A. The new Sutter Hospital Master Plan on APN's 058-040-058 and -059, consisting of:

1. 70 bed Sutter Hospital, in a two story approximately 126,000 square foot building
2. Central utilities plant in an approximately 11,000 square foot building and associated maintenance buildings and storage tank area
3. 25 bed Physicians Hospital, in a 3 story approximately 100,000 square foot building
4. Helistop
5. Medical offices, in a 3 story approximately 80,000 square foot building
6. Setback reduction pursuant to Code Section 26-88-040G to allow reduce building setbacks and connections between the medical buildings
7. Building height increase above 35 feet pursuant to Code Section 26-52-050(A)(1) to allow three story buildings
8. A future hospital expansion of up to 29 beds
9. Parking facilities to serve the project

B. The Luther Burbank Memorial Foundation Master Plan on APN's 058-040-060 and -061, including relocation of the maintenance building, playground, and playing fields, construction of a permanent sound berm east of the existing buildings, and limitations on allowed outdoor uses,

C. Public water wells to serve only the Sutter property, and

3) A Minor Lot Line Adjustment between two parcels of approximately 10 acres (APN 059-040-059) and 25 acres (APN 058-040-060), resulting in two parcels of approximately 10 acres and 25 acres, and

4) A Major Subdivision of two parcels (APN's 058-040-058 and -059) totaling approximately 25 acres, creating five parcels and a Parcel "A", and

5) Design Review of all physical changes/improvements to the site

The project includes annexation of the property into the local sewer district and connection to public sewer. Zoning of the Sutter and Luther Burbank parcels (APN's 058-040-058, -059, -060 and -061) is PF (Public Facilities) - SR (Scenic Resources) - SD - (Scenic Design) - VOH (Valley Oak Habitat). Zoning of the adjacent Rural Residential parcel (058-040-036) is RR (Rural Residential) - B6 - 1 acre density - VOH.

ENVIRONMENTAL IMPACT REPORT: a Draft Environmental Impact Report (DEIR) has been prepared and is available for public review and comment. The DEIR identifies potentially significant impacts and ways to reduce or mitigate those impacts, as well as alternatives to the project, including alternative development sites. Potentially significant impacts of the project have been identified in the aesthetics, air quality, biology, cultural resources, geology and soils, hazards and hazardous materials, hydrology and water quality, land use and planning, noise, public services, transportation and traffic, and utilities and service systems sections of the DEIR. Mitigation Measures have been identified to reduce impacts to less than significant, except for certain significant and unavoidable impacts identified under the air quality, noise, and transportation and traffic sections of the DEIR.

There is a 51 day public review period for comments on the DEIR beginning November 25, 2009 through January 14, 2010.

WHERE TO REVIEW THE DEIR: A copy of the DEIR and referenced documents are available for review during regular office hours at the Sonoma County Permit and Resource Management Department (PRMD) public counter, 2550 Ventura Avenue, Santa Rosa, CA 95403-2829 and online at the PRMD website,
http://www.sonoma-county.org/prmd/divpages/projrevdiv.htm
http://www.sonoma-county.org/prmdThe DEIR can also be purchased from PRMD on compact disc (CD) for $5.00.

In addition, a hard copy of the DEIR is available for public review at:

Santa Rosa Central Library, at Third and E Streets, Santa Rosa
Windsor Public Library, at 9291 Old Redwood Hwy, Bldg 100, Windsor
Sutter Hospital Library, at 3325 Chanate Rd., Santa Rosa

County offices and the Santa Rosa Central Library are closed during the week of December 28. The Windsor Public Library and the Sutter Hospital Library are open during this week.

HOW TO COMMENT ON THE DEIR: Written comments on the adequacy of the DEIR in identifying potential impacts and feasible mitigation measures may be made during the comment period and must be received on or before 5:00 p.m. on January 14, 2010. Written comments should be addressed to Steve Dee, Environmental Review Division, Sonoma County PRMD, 2550 Ventura Avenue, Santa Rosa, Ca 95403-2829 or can be emailed to sdee@sonoma-county.org or faxed to Steve Dee at 707-565-1103. Written and verbal comments may also be presented at the public hearing on the DEIR.

PUBLIC HEARINGS: The Planning Commission will conduct two public hearings on the adequacy of the DEIR. The first Public Hearing will be at 1:40 p.m. on December 10, 2009. The second public hearing will be at 1:05 p.m. on January 14, 2010. Both hearings will be held in the Board of Supervisors Chambers at 575 Administration Drive Room 102A.

After the close of the public review and comment period, responses to comments will be prepared in a Final EIR. The Final EIR will be presented to the Planning Commission and a hearing on the merits of the project proposal will be scheduled and noticed to all interested parties. After consideration of the Final EIR and the testimony received, the Planning Commission will make a recommendation to the Board of Supervisors. The Board of Supervisors will also hold a hearing on the Final EIR and the merits of the project at a time and date to be announced before considering whether to certify the Final EIR and approve the proposed project.

If you challenge the decisions on the project in court, you may be limited to raising only those issues previously raised at one of the project's hearings, or submitted in writing during the comment period to Steve Dee, PRMD Environmental Review Division.

FOR FURTHER INFORMATION: If you have questions regarding the DEIR, or the public hearings, please contact either Steve Dee at sdee@sonoma-county.org or call at (707-565-8350) or fax to 707-565-1103, or contact Ken Ellison at kellison@sonoma-county.org.

Date: November 25th, 2009
