1.1 INTRODUCTION AND PROJECT LOCATION

This initial study has been prepared in accordance with the State CEQA Guidelines and the County of Sonoma CEQA Guidelines. Sutter Medical Center of Santa Rosa (Sutter) and the Luther Burbank Memorial Foundation (LBMF) propose a Joint Master Plan that would accommodate expansion of LBMF facilities and replacement of two Sutter hospital facilities (proposed project). The Joint Master Plan would describe development of an approximately 79-acre property at 50 Mark West Springs Road in the City of Santa Rosa, Sonoma County, California (project site). The project site is in the southeast quadrant of the U.S. Highway 101/Mark West Springs Road interchange and is bordered to the east by the Old Redwood Highway and residential land uses (Figure 1). LBMF and Sutter currently own the property, which consists of the six legal parcels summarized in Table 1 and shown of Figure 2.

Table 1 Land Use and Zoning of the Project Site

					Area (Acres)
1	58-040-023	LBMF	Limited Commercial	Commercial Office	1.25
2	58-040-058	Sutter	Public/Quasi-Public	Public Facilities Scenic Design; Scenic Resources	15.00
3	58-040-059	Sutter	Public/Quasi-Public	Public Facilities Scenic Design; Scenic Resources	10.00
4	58-040-060	LBMF	Public/Quasi-Public	Public Facilities Scenic Design; Scenic Resources	25.01
5	58-040-061	LBMF	Public/Quasi-Public	Public Facilities	3.01
6	58-040-050	Sutter	Land Intensive Agriculture (20-acre minimum lot size)	Land Intensive Agriculture B6/20 SR	24.36
Total					**78.63**

As shown in Table 1, LBMF owns 29.27 acres of the project site and Sutter owns 49.36 acres.

The LBMF does business on the project site as the Wells Fargo Center for the Arts (WFC), a nonprofit performing arts and cultural center founded in 1981. WFC buildings and facilities occupy most of the LBMF's 29.27 acres; the rest of the LBMF property is vacant. For a number of years, the LBMF has envisioned an expansion of the facilities, which would include the establishment of a compatible facility or facilities.

Sutter operates two medical facilities in Santa Rosa: Warrack Hospital on Summerfield Road and the Main Hospital Campus on Chanate Road. Sutter has determined that replacing both facilities

URS Corporation: L:\Projects\Sutter_Medical_Center_26815637\Maps\Current Working Documents\Parcel_Boundaries.mxd 101807 cxbente0 is one option for achieving long-range compliance with the Hospital Seismic Safety Act (Senate Bill [SB] 1953). Accordingly, Sutter is proposing to build new hospital facilities on its portion of the project site to replace the two existing facilities.

The Joint Master Plan would accommodate expansion of LBMF facilities on Parcels 1, 4 and 5, and construction of new Sutter hospital facilities on Parcels 2 and 3. Parcel 6, a vineyard, would remain in its current use.

1.2 PROJECT OBJECTIVES

The design and operation of the Sutter/LBMF Joint Master Plan and development seek to achieve the following objectives:

1. Provide a high-quality integrated campus development that will provide sufficient space to accommodate the expansion needs of the Sutter Medical Center of Santa Rosa and the Well Fargo Center for the Arts.
2. Achieve Sutter's primary community objective to maintain continuous provision of health care services to the citizens of Sonoma County.
3. Be located on a site that is easily accessed by persons living within the primary service area of the Sutter Medical Center of Santa Rosa.[1]
4. Construct the hospital and medical office buildings of a sufficient size, design, and connectivity to meet the most modern efficient hospital layouts.
5. Construct buildings of a high visual quality that will promote the recognition of the Sutter Hospital as viewed from US 101 and Mark West Springs Road.
6. Positively impact the local economy through the creation of local job opportunities in medical technology, arts, and entertainment and an increase in the local tax base.
7. Provide an emergency entrance to Sutter as close to US 101 as possible. Most of the emergency traffic is expected to arrive via ambulance exiting off US 101; therefore, vehicular access that facilitates ambulances exiting Mark West Springs Road as quickly as possible defines the layout of the hospital site planning.
8. Continue to honor the Healthcare Access Agreement with Sonoma County that requires Sutter to provide health care to the citizens of Sonoma County.
9. Expand the LBMF's nonprofit mission to enrich, educate, and entertain the community through the arts, and to provide accessible and affordable assembly spaces for other nonprofit arts and community-based organizations by:
    - Using the current site, which:
        - is well-established, well-known, and beloved by audiences throughout the region
        - is highly visible and very accessible from US 101

[1] Defined by the Postal ZIP Code areas that originate 75 to 80 percent of the hospital's patient population.

  - o provides for expansion of the WFC's free parking to accommodate greater use by the community

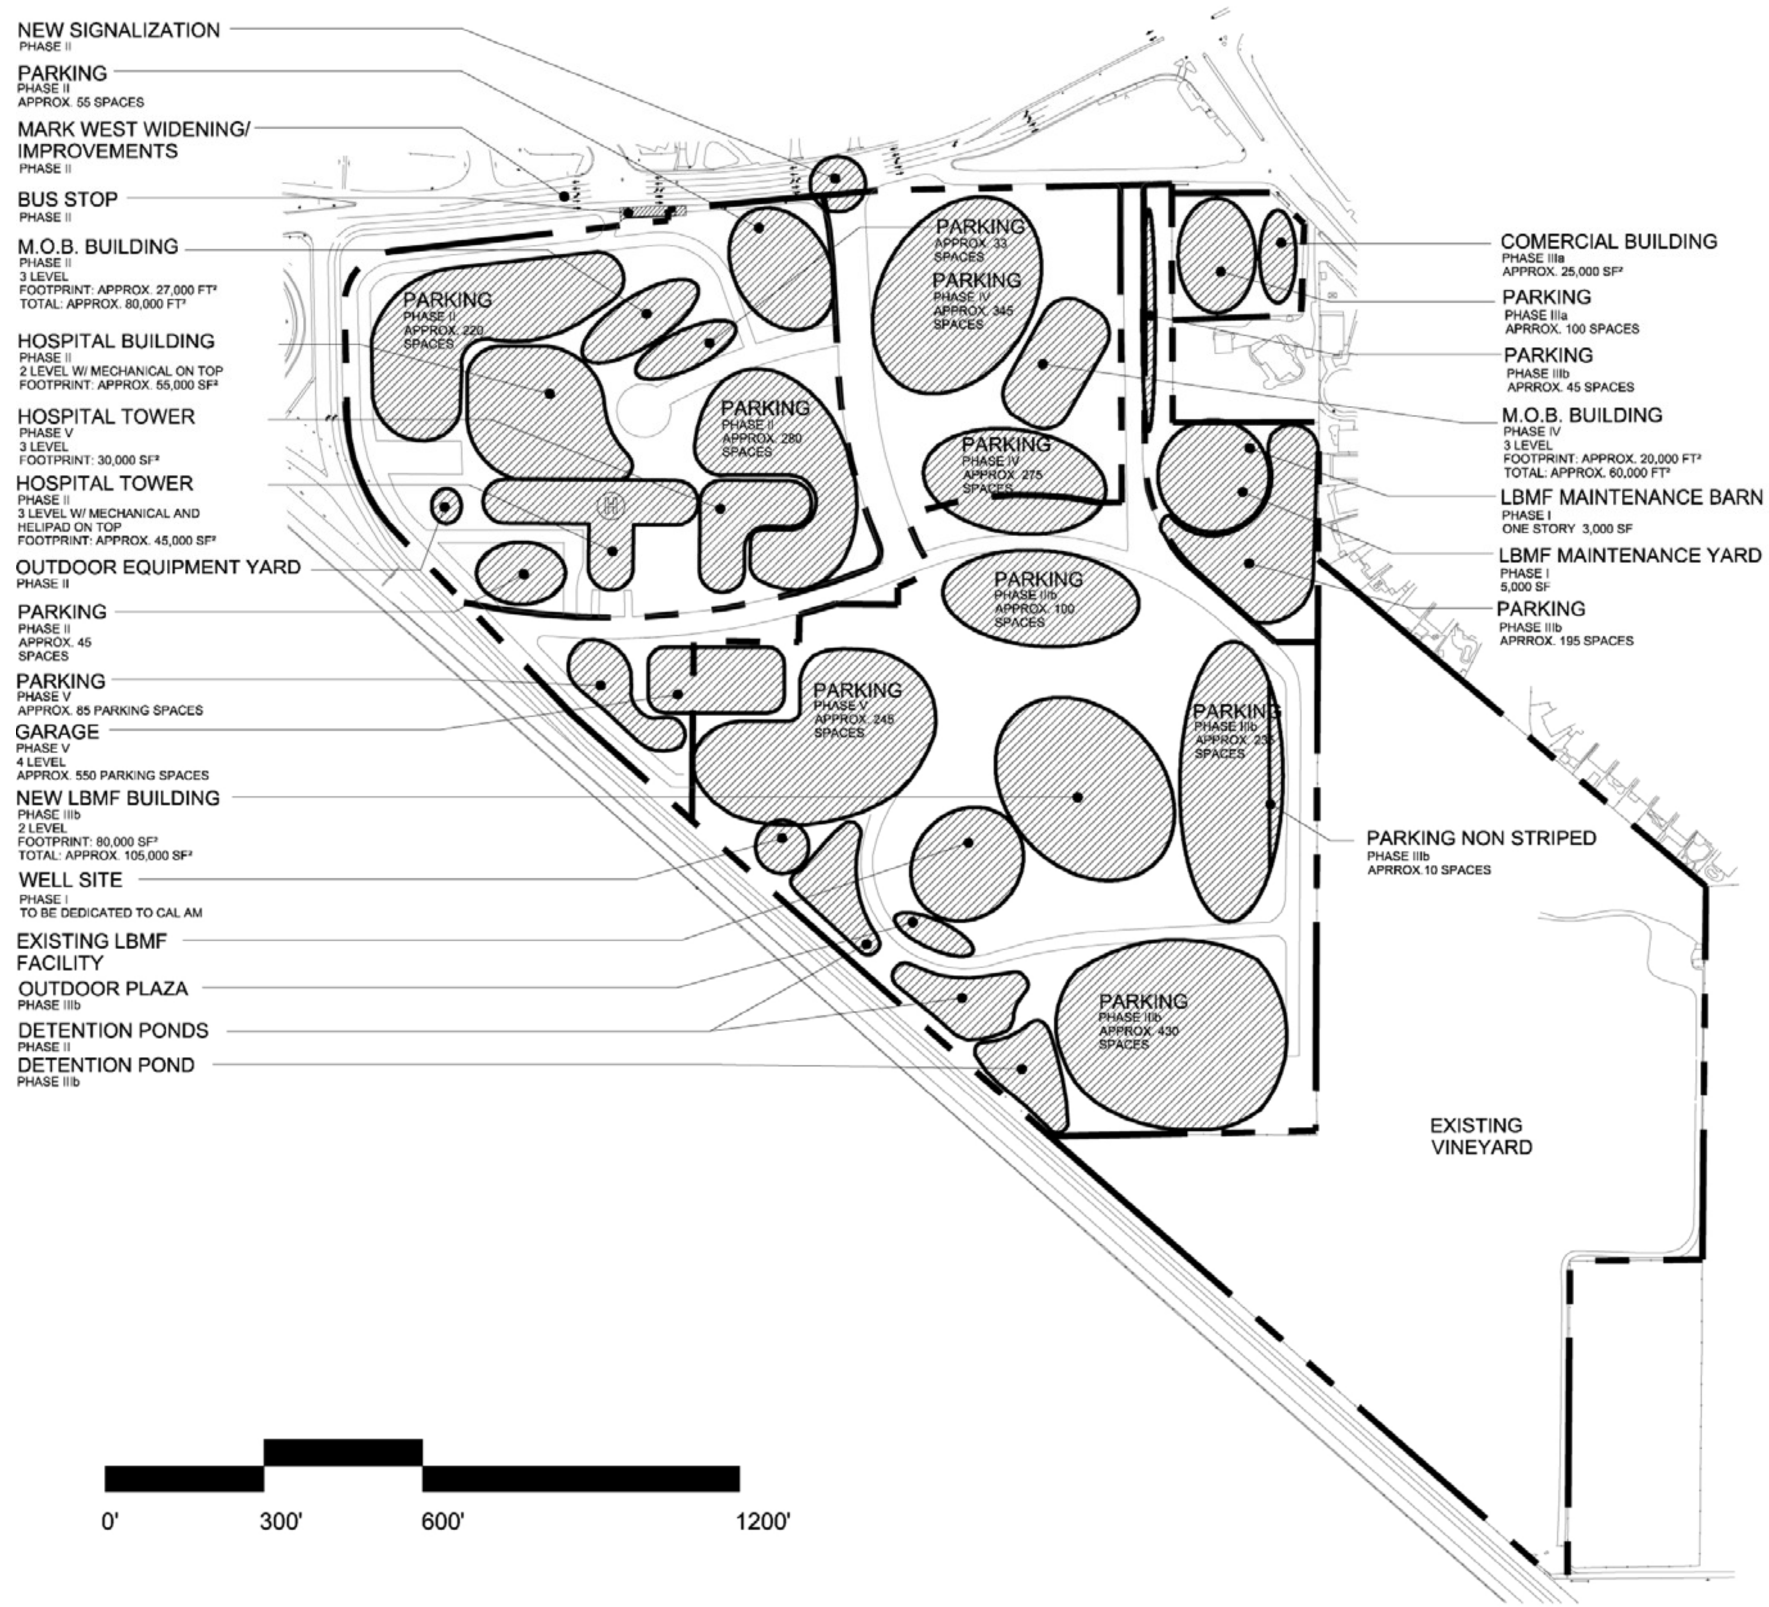
- Developing a multiple-venue, state-of-the-art center for arts, culture, education and community assembly that will:
  - o provide for the most flexibility in staging, for load-in, and for patron comfort and accessibility
  - o accommodate performances currently not possible in other Sonoma County venues, such as touring Broadway, opera and ballet
  - o allow for expansion of the WFC's education-through-the-arts programming to include on-site, hands-on instruction and participation
  - o supply a wider variety of affordable rental spaces for local performing arts companies and visual artists, as well as provide much-needed meeting and special event space for a variety of businesses and organizations throughout the region
  - o provide enough space to continue providing long-term, leased space at below-market rates for educational and other nonprofit organizations

1.3 PROJECT DESCRIPTION

The project would be built over time in several phases, described below. The Sutter facilities would exclusively occupy approximately 15 acres of the project site (Parcel 2). The WCF facilities would exclusively occupy approximately 29 acres of the site (Parcels 1, 4 and 5). Approximately 10 acres (Parcel 3) would be devoted to shared parking facilities for Sutter and WFC facilities. The vineyard on the remaining 24 acres (Parcel 6) would remain in agricultural use. A conceptual site layout is shown on Figure 3.

The California-American Water Company (CalAm) provides potable water to the site, except for the vineyard property, which uses water from an existing on-site well. CalAm would continue to provide water for all domestic and fire suppression purposes for all existing uses and future development proposed by the Joint Master Plan. CalAm has provided a "Will Serve" letter dated June 26, 2006, subject to the development and transmission of additional new on-site water source(s). Water for landscape irrigation would be provided by the existing well in Parcel 6.

Wastewater is currently treated and disposed of on-site, via a private treatment and disposal facility. To ensure the long-term viability of the Joint Master Plan and future facilities, all of the proposed facilities would be connected to Sonoma County's Airport-Larkfield-Wikiup Sanitation Zone wastewater treatment system. Wastewater from the proposed hospital would be stored underground on-site and then pumped to the Sanitation Zone treatment facility during off-peak hours.



Sutter/LBMF Joint Master Plan	Conceptual Site Plan	Figure 3
26815637		

1.3.1 Project Phasing

Phase I (2009-2011)—Relocation/Replacement of Utilities/Existing Facilities

Amend Urban Service Area boundary to include project site with the exception of the vineyard property (058-040-050) within the Community Separator.

Phase I(a)

1. Annex parcels 2, 3, 4, and 5 to the Airport-Larkfield-Wikiup Sanitation Zone.
2. Leave in place all existing facilities and site improvements, including 1,605 parking spaces (901 paved and striped spaces, 52 paved but unstriped spaces, and 652 unpaved, unstriped [“overflow”] spaces).

Phase I(b)

1. Connect the existing LBMF facilities to the Airport-Larkfield-Wikiup Sanitation Zone wastewater treatment system.
2. Decommission the existing on-site LBMF sewage treatment facility.
3. Improve and expand the existing connection to CalAm by:
   - Dedicating to CalAm a new groundwater well source with a minimum capacity of 200 gallons per minute
   - Providing piping to pump the raw (untreated) water from the new groundwater well to the closest existing CalAm raw water main, which is located at the intersection of Lavell Road and Mayfield Drive[2]
   - Constructing a new potable water pipe line in Lavell Road to complete a “loop” on the CalAm water system to satisfy fire suppression needs of the proposed Joint Master Plan development
4. Demolish the existing barn (maintenance facility) and residence.
5. Relocate the maintenance activities to a newly constructed Maintenance Facility within Parcel 5, which would include the following.
   - Single-story building, with storage mezzanine, of approximately 3,000 square feet of floor area, connected to water and sewer service to accommodate:
     - Equipment storage, including two small vehicles
     - Chemical storage (gasoline, diesel, cleaning products)
     - Archival storage
     - Workshop

---

[2] All new water transmission piping would be located on-site and/or within existing public roadway rights-of-way.

- Offices for Maintenance Supervisor plus up to two employees
- Open yard area with fenced boundary of approximately 5,000 square feet in area to accommodate garden/maintenance staging area

6. Develop approximately 0.5 acre of wetlands on the vineyard property or off-site in an approved wetland bank to mitigate the potential loss of wetlands on-site.
7. Retain all existing LBMF facilities (approximately 140,000 square feet):
   - Person Theatre—1,668 person occupancy, including standing room
   - Carston Cabaret—220 seats/264 maximum room audience capacity
   - Fireside Room (banquet)—200 seats
   - Merlo Theatre/East Wing Theatre—400 seats
   - East Wing Classrooms—300 student capacity
   - Conference Facility—approximately 50,000 square feet
   - Mechanical Structures—approximately 5,000 square feet
   - Lobby and Administration Area—1,200 square feet
   - 1,605 parking spaces
8. Retain the existing athletic fields adjacent to Main and East drives, if feasible. If not feasible, a small athletic field would be developed in the southwestern corner of Parcel 4. Should such field be developed, it would be removed as part of Phase III(b).
9. Maintain South Field (3.5–4 acres) for periodic events that benefit most from freeway exposure. Typical events include merchandise shows and sales such as for RVs or automobiles, bike rallies, fundraising receptions, church barbecues, carnivals, seasonal sales events for pumpkins and Christmas trees, and school graduations. It is anticipated that there would be approximately 6 events per year permitted through a Special Event Zoning permit process on a case-by-case basis. A small restroom facility may be constructed in this area, if required. This field is available year-round and can accommodate a daily attendance of about 3,500 people and about 1,000 vehicles. Event times range from early morning to late evening.
10. East Lawn
    - No large-scale outdoor concerts
    - Other activities will continue to occur as allowed by the current Use Permit , such as:
      - Civic/education/community-based functions
      - Private receptions/events
      - Nonprofit fund raising events
      - Limited amplified sound within General Plan parameters. Amplified sound consists of an arrangement of microphones, electronic signal processors, amplifiers, and loudspeakers that make live or prerecorded sounds—usually

music or speech— louder, or which distributes the sound to a larger or more distant audience.

11. Supersede the existing LBMF use permit. Since Phase I is essentially a site preparation phase, all existing facilities would be retained and there would be no expansion of existing facilities or intensification of current activities or events as allowed by existing Use Permit 10520.

Phase II (2011-2016)—Medical Center Construction

Sutter Facilities

1. Construct a hospital building by 2013 with the following characteristics:
   - Full range of comprehensive inpatient and outpatient treatment and diagnostic services, including all ancillary and support services required
   - 116-bed acute inpatient facility
   - Approximately 240,000 square feet of floor area
   - Approximately 100,000 square foot building footprint
   - Three to four stories plus rooftop mechanical equipment enclosure(s) and helistop to transport patients (approximately 67 to 83 feet overall height) day or night, on a year-round basis
   - Limited commercial kitchen for the preparation of meals for patients, staff, and hospital visitors
2. Construct a medical office building (MOB) with the following characteristics:
   - Approximately 80,000 square feet of floor area, physically connected to the hospital (approximately 27,000 square foot building footprint)
   - Three stories plus rooftop mechanical equipment enclosures (approximately 45 feet overall height)
   - Approximately 50 physician offices, with each office having, on average, four staff persons
   - Medical center administrative activities and operations
3. Construct on-site surface parking: 633 paved, striped spaces[3]

LBMF Facilities

1. No change in buildings or site activities from Phase I.
2. 1,349 parking spaces (861 paved and striped, 19 paved but unstriped, and 469 unpaved, unstriped spaces)**.**
3. Probable removal of one or both of the existing athletic fields.

---

[3] Parking numbers used throughout this project description are initial estimates and may vary by 5 percent.

Site Improvements

1. Widen/improve Mark West Springs Road.
2. Signalize entry road/driveway; entry road will be two lanes inbound and three lanes outbound.
3 Construct US 101 off-ramp improvements.
4. To provide new water service off Mark West Springs Road, construct new on-site water supply “loop” that includes fire hydrants, and interconnect new “loop” with existing on-site water mains.
5. Construct new wastewater collection system, including a lift station, to collect and pump wastewater to existing sewers in Mark West Springs Road. Lift station to include underground wastewater detention basins for off-peak pumping when required by Sanitation Zone.
6. Add 475 paved, striped “shared” parking spaces to 27 pre-existing nonpaved spaces (502 total spaces), to be shared with LBMF during evenings and weekends, bringing the total parking available to LBMF to 1,851 (1,349 + 502).
7. Possibly develop the vineyard parcel with walking/jogging/nature trails, managed to protect both the biotic preserve and the vineyards. Picnic areas may be also proposed.
8. Two interconnected detention basins acting as one.

Upon completion of Phase II, there would be a total of 2,484 surface parking spaces on the site.

Phase III (2009 or later)—Arts Center Expansion

Sutter Facilities

No change from Phase II.

LBMF Facilities

Expansion of the LBMF facilities would occur in two sub-phases.

Phase III(a) (2009 or later)

1. Construct an office/commercial building of approximately 25,000–30,000 gross square feet of floor area with on-site parking on Parcel 1. This parcel is currently within the “LC” General Plan land use category within the “Commercial Office” zone district, and is within the General Plan “Urban Service Boundary.” Development of the commercial office building will be consistent with the zoning regulations for the site and would be permitted pursuant to design review approval only.

2. Retain 2,484 on-site Phase II parking spaces.

Phase III(b) (2016 or later)

1. Demolish existing “pods” (east of West Wing performance complex, estimated to reduce the size of the existing facility by 90,000 square feet).
2. Retain existing West Wing performance complex (main WFC building), estimated to retain 65,000 square feet as follows:

a. Person Theater – 1,668 seats

b. Carston Cabaret – 220 seats/264 maximum room audience capacity

c. Fireside Room – 200 person capacity

d. Lobby and Administration area (lobby – 1,200 person capacity)

3. Create new outdoor plaza on west side of exterior with sound wall to attenuate noise from US 101.
4. Construct new building:
   - 30,000 square foot/1,500 person capacity conference facility
   - 7,500 square foot/700 person capacity education facility
   - 7,500 square foot administration facility
   - 2,500-seat theater with lobby and stage (estimated to be 60,000 square feet).
5. Eliminate 9 paved, unstriped and 469 unpaved, unstriped parking spaces; add 484 paved, striped parking spaces.
6. If developed in an earlier phase, remove the athletic field from Parcel 4.
7. Construct a storm water detention basin to attenuate peak storm water runoff. The detention basin will be constructed near the US 101 right-of-way on both Parcels 4 and 6.

Upon completion of Phase III, there would be 2,490 surface parking spaces on the site; 1,857 of the spaces would be available to LBMF (502 of those would be "shared" spaces available during evenings and weekends).

Phase IV (2020 or later)

Sutter Facilities

Develop a second MOB (approximately 60,000 square feet of floor area).

LBMF Facilities

No change from Phase III. No additional expansion of LBMF facilities proposed.

Site Improvements

1. Remove 27 unpaved, unstriped parking spaces; develop approximately 270 paved, striped "shared" surface parking spaces for the MOB that would be available to LBMF during evenings and weekends.
2. Upon completion of Phase IV, there would be 2,733 (2,490 + 270 – 27) surface parking spaces on the site. Approximately 2,100 (1,857 + 270 – 27) of the spaces would be available to LBMF; 745 (502 + 270 – 27) of those would be "shared" spaces available during evenings and weekends).

Phase V (2020 or later)

Sutter Facilities

1. Construct a 60-bed, four-story hospital tower with approximately 100,000 square feet of floor area.

2. Construct a four-level parking structure, approximately 35 feet in height, containing 550 spaces, approximately half of which (275) would be available to LBMF on a shared basis. (Construction of the garage would necessitate the removal of approximately 115 surface spaces.)

LBMF Facilities

No change from Phase III; further expansion of LBMF facilities is proposed.

Upon completion of Phase V, there would be 3,168 parking spaces (not including parking for the commercial building on Parcel 1) on the site (2,618 surface spaces plus 550 parking structure spaces). Approximately 2,260 of the parking spaces would be available to LBMF (approximately 905 [745 – 115 + 275]) of those would be "shared" spaces available during evenings and weekends.

The number of off-street parking spaces proposed by the Joint Master Plan is based on a comprehensive traffic and parking analysis prepared by Dowling Associates and will be further reviewed in the EIR. Actual parking use will be evaluated on an ongoing basis. This evaluation would study the effectiveness of shared parking goals and scheduling events at WFC to minimize parking impacts. If the number of parking spaces provided is found to be excessive, the number developed in subsequent phases may be reduced pursuant to the County of Sonoma Design Review approval process.

1.4 CONSISTENCY WITH GENERAL PLAN, ZONING, AND APPLICABLE LAND USE CONTROLS

The project site is divided into six parcels. Most of the parcels have a Sonoma County land use designation of Public/Quasi-Public (PQP) and are zoned Public Facilities (PF) within Scenic Design (SD) and Scenic Resources (SR) combining districts. Parcel 1 is zoned Commercial Office with a Limited Commercial (LC) land use designation. Parcel 6 is zoned Land Intensive Agriculture (LIA) (B6/20 SR) with a 20-acre minimum lot size LIA land use designation. Table 1 lists the parcels in the project site and their corresponding land use and zoning designations. Figure 2 shows parcels in the project site and corresponding zoning designations.

The bulk of the project would be built on the PQP-designated land, consistent with the General Plan and zoning designations. The LBMF office/commercial building and its associated parking, proposed to be developed in Phase III(a), would be built on Parcel 1, within the LC land use category and Commercial Office zoning district.

The LBMF and Sutter Medical Center will need to acquire the following approvals to proceed with their Joint Master Plan:

1. Certification of the Environmental Impact Report (EIR)
2. Approval from the Sonoma County Local Agency Formation Commission (LAFCO)
3. Annexation of Parcels 2, 3, 4, and 5 to the Airport-Larkfield-Wikiup Sanitation Zone
4. An amendment to the Sonoma County General Plan to include the 53 acres within the Urban Service Boundary

5. A "companion" amendment to the 1984 Larkfield-Wikiup Area Plan to place the project property within the "Ultimate Sewer Service Area" to maintain consistency with the General Plan
6. Use Permits for approval of Phases I and II the *Sutter Medical Center of Santa Rosa/Luther Burbank Memorial Foundation Joint Master Plan.* Implementation of Phase III(a) is expected to be undertaken pursuant to future Design Review approval, subject to future environmental review. Implementation of Phases III(b) through V is expected to be undertaken pursuant to future Use Permit application(s), also subject to future environmental review.

In addition to the above, a general plan text amendment may be implemented to restrict uses consistent with those of the master plan.

1.5 OTHER REQUIRED APPROVALS

In addition to the land use approvals discussed in Section 1.4, major permits or approvals that will likely be required for the proposed project include:

- National Pollutant Discharge Elimination System (NPDES) Permit from the North Coast Regional Water Quality Control Board (RWQCB)
- Section 401 Water Quality Certification from the North Coast RWQCB
- Section 404 Permit from the U.S. Army Corps of Engineers (USACE)
- Permit to Operate from the Bay Area Air Quality Management District (BAAQMD)
- Approval from the California Department of Transportation (Caltrans)
- Approved SUSMP Requirements and Stormwater Mitigation Plan from North Coast Regional Water Quality Control Board

In addition, consultation will be required with the U.S. Fish and Wildlife Service (USFWS) and California Department of Fish and Game (CDFG) regarding potential impacts to federally and state-listed sensitive species.

INITIAL STUDY AND ENVIRONMENTAL CHECKLIST FORM

Project Title:	Sutter Medical Center of Santa Rosa/Luther Burbank Memorial Foundation Joint Master Plan
Lead Agency's Name and Address:	County of Sonoma Permit Resource Management Department 2550 Ventura Avenue Santa Rosa, California 95403
Lead Agency Contact:	Steve Dee
Project Location:	50 Mark West Springs Road, Santa Rosa, Sonoma County, CA
General Plan Land Use Designation	Limited Commercial, Public/Quasi-Public, Land Intensive Agriculture (20-acre minimum lot size)
Zoning	Commercial Office; Public Facilities Scenic Design; Scenic Resources, Public Facilities; Land Intensive Agriculture B6/20 SR
Description:	See Project Description, Section 1.3
Agencies Whose Approval Is Required: Sonoma County Planning Commission, Sonoma County Board of Supervisors, Sonoma LAFCO, USACE, North Coast RWQCB, BAAQMD, Caltrans	
Surrounding Land Uses: See Introduction and Project Location, Section 1.1	

Environmental Factors Potentially Affected

The environmental factors checked below would be potentially affected by this project, involving at least one impact that is a "Potentially Significant Impact" as indicated by the checklist on the following pages.

☒ Aesthetics	☐ Agricultural Resources	☒ Air Quality
☒ Biological Resources	☒ Cultural Resources	☐ Geology /Soils
☒ Hazards & Hazardous Materials	☒ Hydrology / Water Quality	☒ Land Use / Planning
☐ Mineral Resources	☒ Noise	☒ Population / Housing
☒ Public Services	☒ Recreation	☒ Transportation/Traffic
☒ Utilities / Service Systems	☒ Mandatory Findings of Significance	

Determination

On the basis of this initial evaluation:

☐ I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.

☐ I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because revisions in the project have been made by or agreed to by the project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared.

☒ I find that the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.

☐ I find that the proposed project MAY have a "potentially significant impact" or "potentially significant unless mitigated" impact on the environment, but at least one effect 1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and 2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.

☐ I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier Environmental Impact Report (EIR) or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required.

3.1 AESTHETICS

Would the project:	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less-Than-Significant Impact	No Impact
a. Have a substantial adverse effect on a scenic vista?				X
b. Substantially damage scenic resources, including but not limited to trees, rock outcroppings, and historic buildings within a state scenic highway?				X
c. Substantially degrade the existing visual character or quality of the site and its surroundings?	X			
d. Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?	X			

DISCUSSION:

a and b) No Impact

Though the project would have a substantial effect on the current visual character of the area, the project site is not part of a scenic vista and the segment of US 101 flanking the property is not designated as a state scenic highway. Therefore, the project would not have a substantial effect on a scenic vista.

As the project is not near a state scenic highway, it would not impact previously designated scenic resources, including but not limited to trees, rock outcroppings, and historic buildings located within a state scenic highway.

These issues will not be discussed further in the EIR.

c and d) Potentially Significant Impact

The project would significantly alter current visual impressions of the site. The site is visible from two roads, Mark West Springs Road and US 101. Though the site is currently part of the US 101 county-designated scenic corridor, annexation into the Urban Service Area would eliminate the scenic corridor setback requirements that currently apply. Notwithstanding, the hospital facilities would have a substantially larger height and mass than existing structures in the project area. The project's potential effects on the existing visual character or quality of the site and its surroundings will be analyzed in the EIR using Permit & Resource Management Department's Visual Assessment Guidelines.

The vineyard is a scenic resource that is visible from US 101. The vineyard is in the Scenic Resource Combining District, which is intended to preserve the visual character and scenic resources of Sonoma County. No development is proposed on the vineyard site with the exception of a small area of wetlands and potential trails and picnic facilities.

The proposed parking areas, buildings, and helistop and the special events that would take place at the expanded WFC facilities would increase the amount of light and glare from the site. Project construction activities would temporarily increase light and glare. The potential effects of this new source of light and glare will be addressed in the EIR.

3.2 AGRICULTURAL RESOURCES

In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and project site Assessment Model (1997) prepared by the California Dept. of Conservation as an optional model to use in assessing impacts on agriculture and farmland. Would the project:	**Potentially Significant Impact**	**Less Than Significant With Mitigation Incorporated**	**Less-Than-Significant Impact**	**No Impact**
a. Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?	X			
b. Conflict with existing zoning for agricultural use, or a Williamson Act contract?				X
c. Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use?				X

DISCUSSION:

a) Potentially Significant Impact

The project site includes Prime Farmland in parcels 050-040-023 and 050-040-061 and Unique Farmland in parcel 058-040-050. This issue will be discussed further in the EIR.

b) No Impact

As the vineyard parcel will be retained and will continue in agricultural use, the project does not contain any elements that would conflict with existing zoning for agricultural use or a Williamson Act contract. This issue will not be discussed further in the EIR.

c) No Impact

The project would create approximately 0.5 acre of wetlands and may create paths and picnic areas on the vineyard property in areas that are not under agricultural production. All existing vineyards will remain. No other changes in the existing environment are proposed that, due to their location or nature, could result in conversion of farmland to nonagricultural use. This issue will not be discussed further in the EIR.

3.3 AIR QUALITY

Where available, the significance criteria established by the applicable air quality management or air pollution control district may be relied upon to make the following determinations. Would the project:	**Potentially Significant Impact**	**Less Than Significant With Mitigation Incorporated**	**Less-Than-Significant Impact**	**No Impact**
a. Conflict with or obstruct implementation of the applicable air quality plan?			X	
b. Violate any air quality standard or contribute substantially to an existing or projected air quality violation?			X	
c. Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is in non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?	X			
d. Expose sensitive receptors to substantial pollutant concentrations?	X			
e. Create objectionable odors affecting a substantial number of people?				X

DISCUSSION:

a and b) Less than Significant Impact

The BAAQMD adopted CEQA guidelines to assist local agencies in evaluating the significance of air quality impacts, which rely on planned land use established by local general plans. The BAAQMD's Clean Air Plan contains a list of transportation control measures intended to reduce emissions from vehicle travel, the primary source of air pollution. Among the list are seven measures that the BAAQMD relies on local jurisdictions to implement through General Plan policies. Sonoma County is currently updating the General Plan to include new protections and policies to address regional air quality concerns and Clean Air Plan transportation control measures. This project is anticipated to serve the needs of forecasted population growth in the region. Both current General Plan and zoning allow for the proposed development types and intensity of land use. An amendment to the Sonoma County General plan and zoning is being requested as part of the project to include the site within the Urban Service Boundary. Development of the project site is not anticipated to interfere with population projections used in the Clean Air Plan.

Carbon monoxide (CO) emissions from traffic generated by the project would be the pollutant of greatest concern. The intersection of Mark West Springs Road and Old Redwood Highway would be the most affected by project traffic and would have the highest CO concentrations. In 2004, a worst-case scenario air quality model was developed to analyze the project's impact at this location (Illingworth & Rodkin 2004). The results indicate that CO concentrations would remain below ambient air quality standards. The proposed project is not expected to result in a conflict with an air quality plan or violate any air quality standards. However, this issue will be discussed further in the EIR.

c) Potentially Significant Impact

The Bay Area is in nonattainment of federal and state standards for ground-level ozone and of state standards for particulate matter less than 10 microns in diameter (PM_{10}). The project would increase the release of PM_{10}. The project would also increase the release of ozone precursors into the atmosphere in the form of reactive organic gases and nitrous oxides. These releases would be generated primarily from traffic and facility central plant boilers.

The BAAQMD significance threshold for the ozone precursors and PM_{10} is 80 pounds per day. Emission rates above the threshold are considered to be a considerable net increase. The project's emission rates and potential impacts relative to criteria pollutants will be analyzed in the EIR.

No CEQA thresholds of significance have been established for greenhouse gases (GHG). However, in September 2006, California Assembly Bill (AB) 32 called for the California Air Resources Board (CARB) to adopt regulations requiring the reporting and verification of statewide GHG emissions and that a limit equivalent to the statewide GHG emissions in 1990 be achieved by year 2020. GHG emissions associated with the proposed project are primarily associated with energy consumption for operating the hospital facility and expanded WFC site and motor vehicles traveling to and from the project site. This will result in an increase in the generation of GHG over existing conditions. This issue will be analyzed in the EIR.

d) Potentially Significant Impact

As discussed in Items a and b above, traffic-generated pollutants resulting from the project are not anticipated to increase CO concentrations above ambient air quality standards. However, temporary impacts are expected to result from construction activity. Dust would be generated during demolition, grading, and construction. The amount of dust would depend on size of the area disturbed, amount of activity, soil conditions, and meteorological conditions. Nearby residences and the school could be adversely affected by dust generated during construction activities. These activities are expected to occur over a relatively short period of time; therefore, impacts are considered to be less than significant if reasonable available control measures are applied. This issue will be discussed further in the EIR.

The project includes the installation of an emergency generator powered by diesel fuel. Diesel particulate matter from exhaust could pose a health risk to nearby sensitive receptors (hospital patients, staff, WFC patrons, students, and local residents). The BAAQMD would require permits for the generator system. Under BAAQMD permitting requirements, the applicant must demonstrate that diesel exhaust particulate matter would not cause a significant health risk. This issue will be discussed further in the EIR.

e) No Impact

The project would not generate a significant amount of odiferous compounds that would be released into the atmosphere. Therefore, it is not likely to expose people to objectionable odors. This issue will not be addressed further in the EIR.

3.4 BIOLOGICAL RESOURCES

Would the project:	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less-Than-Significant Impact	No Impact
a. Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	X			
b. Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	X			
c. Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including but not limited to marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	X			
d. Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?			X	
e. Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	X			
f. Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	X			

DISCUSSION:

a, b, and c) Potentially Significant Impact

The Santa Rosa Plain Conservation Strategy (SRPCS) identifies the project area as being within the area of potential presence of endangered California tiger salamander (CTS) and rare plants. Though the project area is outside of the 1.3-mile range of known breeding sites for CTS, the species is considered to be potentially present.

Botanical surveys were conducted by plant biologist C. Patterson for the project site in 1998, 1999, and 2004. Additionally, Mr. Bill Cox and Mr. Allan Buckmann of the CDFG were consulted regarding the various wildlife species of concern for the greater Santa Rosa region. The results are documented in the *Biological Resources Report for the Sutter Medical and Luther Burbank Center for the Arts* (Patterson 2004). No rare, endangered, or otherwise sensitive plant species were identified at the project site. Moreover, the site lacks suitable habitat for the California red-legged frog or the Pacific freshwater shrimp. There were reported sightings of the CTS within 5 miles of the project boundaries but none reported on or near the project site. The SRPCS requires projects within the area of potential presence to mitigate for loss of habitat by contributing to a species fund. The project area contains 0.46 acre of wetlands and other waters of the U.S. Some portion of these may be considered jurisdictional under Section 404 of the Clean Water Act. Mitigation may be required by the USACE.

Impacts to special-status plant and animal species, as well as wetlands within the project area, will be discussed in further detail in the EIR.

d) Less-Than-Significant Impact

The project site and its surrounding area are characterized by highly developed and altered landscapes that provide poor habitat for wildlife. Because of the developed nature of the project site and area and the presence of the adjacent freeway, wildlife use of the site, especially by large mammals, is minimal. Even the use by transitory birds is limited, due to the scarcity of wetland habitat. Given the extremely small and poor quality of on-site habitats and developed character of the surrounding area, the project would have a less-than-significant impact on movement of migratory species. This issue will be discussed further in the EIR.

e and f) Potentially Significant Impact

The Resource Conservation Element of the Sonoma County General Plan provides County policies for protection of several types of biotic resources. Protection of trees is addressed by policies laid out in the Conservation of Biotic Resources section of the Resource Conservation Element. Moreover, the Sonoma County Code contains two ordinances that would reduce potential impacts to trees. The Sonoma County Tree Ordinance (No. 4044) regulates the removal of certain designated trees. The Sonoma County Heritage Tree ordinance (No. 3651) provides for the identification and protection of designated heritage trees. The project site has a number of oak trees according to the inventory performed in June 2006 by Horticultural Associates. County policy RC-5c makes the preservation of significant native oaks and other native trees a primary consideration in the review of development projects.

3.5 CULTURAL RESOURCES

Would the project:	Potentially Significant Impact	Less-Than-Significant With Mitigation Incorporated	Less-Than-Significant Impact	No Impact
a. Cause a substantial adverse change in the significance of a historical resource as defined in Section 15064.5?	X			
b. Cause a substantial adverse change in the significance of an archaeological resource pursuant to Section15064.5?		X		
c. Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	X			
d. Disturb any human remains, including those interred outside of formal cemeteries?		X		

DISCUSSION:

a) Potentially Significant Impact

No historical resources were identified during the 2004 cultural resources survey (Tom Origer and Associates 2004). However, one dwelling, a tank house, and a shed were observed and identified as potential historic resources and subsequently recommended for formal evaluation. Qualified architectural historians will evaluate this complex as well as another building that appears to date from the 1950s or earlier. Findings of this survey and impacts to potential historic resources will be discussed in further detail in the EIR.

Parcel 6 (APN 058-040-050) is subject to a conservation easement in favor of the Sonoma County Agricultural and Open Space Preservation District. A 3-acre parcel to the southeast (058-040-051), which is not part of the proposed project site, was set aside exclusively for the preservation of dogbane. Native Americans used dogbane fiber to weave netted bags, fish nets and snares, tumplines, dresses and bowstrings. Members of the Native American community, in conjunction with the Open Space District, continue to work to maintain the site. Potential affects from the proposed project on this resource will be discussed further in the EIR.

b) Less Than Significant With Mitigation Incorporated

No archaeological resources were identified in the 2004 cultural resources survey. In the event archaeological resources are discovered during project construction, work will be halted in the vicinity of the find until a qualified archaeologist can evaluate the find pursuant to CEQA Guidelines Section 15064.5(f). Impacts to potential archaeological resources will be discussed in further detail in the EIR.

c) Potentially Significant Impact

The project area is underlain by alluvial formations dating from the Holocene and Pleistocene periods. As Pleistocene period alluvial deposits have been known to contain paleontological resources, their presence at the project site cannot be ruled out without further research. Accordingly, the potential for encountering paleontological resources during project construction will be discussed in further detail in the EIR.

d) Less Than Significant With Mitigation Incorporated

No human remains were identified during the 2004 survey. In the event human remains are discovered during project construction, work will be halted in the vicinity of the find and the county coroner contacted, pursuant to CEQA Guidelines Section 15064.5(d). If the coroner determines the remains are Native American, the coroner will contact the Native American Heritage Commission who will identify a Most Likely Descendant. The Most Likely Descendant will coordinate with the landowner and make recommendations regarding the appropriate treatment of the remains. Implementation of these measures will reduce any potential impact to a less-than-significant level. This issue will be discussed further in the EIR.

3.6 GEOLOGY AND SOILS

Would the project:	**Potentially Significant Impact**	**Less Than Significant With Mitigation Incorporated**	**Less-Than-Significant Impact**	**No Impact**
a. Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:				
i. Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Pub. 42.			X	
ii. Strong seismic ground shaking?		X		
iii. Seismic-related ground failure, including liquefaction?			X	
iv. Landslides?				X
b. Result in substantial soil erosion or the loss of topsoil?			X	
c. Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse?			X	
d. Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?			X	
e. Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?				X

DISCUSSION:

a.i) Less-Than-Significant Impact

The project site is approximately 0.75 mile to the west of the nearest fault, the Rodgers Creek fault, and does not cross any lines as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist. Moreover, a search for other fault lines in the area confirms that the site is not located on any other fault. As a result, the likelihood that earthquake fault rupture will occur at the site is low. This issue will be discussed further in the EIR.

a.ii) Less Than Significant With Mitigation Incorporated

The active Rodgers Creek fault is located approximately 0.75 mile to the east of the project area, and therefore there is a significant probability that the site will experience strong seismic shaking during the design life of the facilities. This issue will be discussed further in the EIR.

a.iii) Less-Than-Significant Impact

Preliminary geotechnical investigations at the site indicate that, in general, the soils at the site have low liquefaction potential and associated ground deformations, but additional investigations are required to further evaluate liquefaction susceptibility. The proposed hospital facilities (building 1.1 Phase II, building 1.2 Phase II, and building 1.1 Phase V) would be designed and constructed at a minimum to the seismic design requirements for ground shaking specified in the Office of Statewide Health Planning and Development seismic design requirements. All other structures would be designed and constructed at a minimum to the Uniform Building Code for seismic zone 4. These include building standards to accommodate higher force levels, structural connection details, and design for increased lateral support. Additionally, in order to satisfy the provisions of the California Building Code, these facilities would have to be designed to withstand ground motions equating to approximately a 500-year return period (10 percent probability of exceedance in 50 years). Because of these design features, impacts from strong ground shaking and seismic-related ground failure would be less than significant.

This issue will be discussed in further detail in the EIR.

a.iv) No Impact

The project site is on essentially level ground and is surrounded by level ground. Therefore, no landslides will affect the project. This issue will not be discussed further in the EIR.

b) Less-Than-Significant Impact

Exposure of native and engineered soils during construction activities could make them particularly prone to erosion due to rainfall runoff. Erosion and sediment control practices are mandated by the Clean Water Act and require implementation of measures before, during, and after grading activities. These mandated measures will be conducted by the project applicant, which will make these potential impacts less than significant. These potential impacts will be discussed further in the EIR.

c and d) Less-Than-Significant Impact

Preliminary investigations indicate that soils on the project site are not susceptible to subsidence or collapse and that the topography will not produce landslides or lateral spreading. These investigations also indicate that soils at the site have low liquefaction potential and associated ground deformations, but additional investigations are required to further evaluate liquefaction susceptibility.

The preliminary investigations concluded that the near-surface soils at the site have a potential for shrink/swell behavior, and can be therefore classified as expansive. Potential impacts from unstable and/or expansive soils will be discussed in further detail in the EIR.

e) No Impact

Septic systems are not planned for the project. However, two detention basins are proposed in the southern portion of the project near the US 101 right-of-way on either side of the Outdoor Plaza (Phase II). All facilities would be connected to the Airport-Larkfield-Wikiup Sanitation Zone. This issue will not be discussed further in the EIR.

3.7 HAZARDS AND HAZARDOUS MATERIALS

Would the project:	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less-Than-Significant Impact	No Impact
a. Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	X			
b. Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	X			
c. Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	X			
d. Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would create a significant hazard to the public or the environment.				X
e. For a project located within an airport land use plan or, where such a plan has not been adopted, within 2 miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?				X
f. For a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?				X
g. Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	X			
h. Expose people or structures to a significant risk of loss, injury, or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?				X

DISCUSSION:

a and b) Potentially Significant Impact

Construction of the proposed project would involve using some hazardous materials such as petroleum fuels, paints, and welding gases. During operation, the hospital facilities would use medical gases and radioactive materials and would generate biohazardous materials and sharps such as needles. These materials could present potentially significant impacts, if not managed correctly. Potential impacts associated with the transport, use, and disposal of these hazardous materials will be discussed in further detail in the EIR.

c) Potentially Significant Impact

The school at the WFC will continue to operate with the proposed project. Although the project will not necessarily emit hazardous materials, they will be handled at the site on a regular basis; therefore, potential effects of handling these materials in proximity to a school will be addressed in the EIR.

d through f) No Impact

The project site is not included on a list of California Government Code Section 65962.5 hazardous materials sites (Cortese List). The project site is not located within an airport land use plan or within 2 miles of a public airport, or in the vicinity of a private airstrip. The nearest airport is the Charles M. Schulz Sonoma County Airport, which is 3.25 miles from the project site. Although the proposed project is not located within 2 miles of an airport, the project does include a helistop on the roof of the hospital. The project's proposed helistop will require coordination with the Federal Aviation Administration, the California Department of Transportation (Caltrans) Aeronautics Division, and the Charles M. Schulz Sonoma County Airport Control Zone. These issues will be addressed further in the EIR.

g) Potentially Significant Impact

During commute periods, unacceptable delays at several intersections along Mark West Springs Road and River Road could delay emergency vehicle access to the proposed medical facility as well as delay non-project-related emergency vehicle response times along local roadways as well as to/from US 101. These potential impacts will be discussed in further detail in the EIR.

h) No Impact

The project site is located in a substantially altered agricultural and rural residential area; therefore, it would not expose people or structures to risk involving wildland fires. This issue will not be discussed further in the EIR.

3.8 HYDROLOGY AND WATER QUALITY

Would the project:	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less-Than-Significant Impact	No Impact
a. Violate any water quality standards or waste discharge requirements?			X	
b. Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?	X			
c. Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on or off-site?			X	
d. Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on or off-site?	X			
e. Create or contribute runoff water which would exceed the capacity of existing or planned storm water drainage systems or provide substantial additional sources of polluted runoff?	X			
f. Otherwise substantially degrade water quality?	X			
g. Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?				X
h. Place within a 100-year flood hazard area structures which would impede or redirect flood flows?				X
i. Expose people or structures to a significant risk of loss, injury, or death involving flooding, including flooding as a result of the failure of a levee or dam?				X
j. Inundation by seiche, tsunami, or mudflow?				X

DISCUSSION:

a) Less-Than-Significant Impact

During grading and development activities, the loss of vegetative cover may increase erosion and sediment transport to off-site areas, potentially resulting in a violation of water quality standards. Erosion and sediment control practices are mandated by the Clean Water Act and require implementation of measures before, during, and after grading activities. These mandated measures will be conducted by the project applicant, which will make these potential impacts less than significant. These measures will be included as conditions of the applicants' NPDES Permit. These potential impacts will be discussed further in the EIR.

b) Potentially Significant Impact

The proposed project includes development of a new groundwater well source with a minimum capacity of 200 gallons per minute. This new well has the potential to affect groundwater supplies or interfere with groundwater recharge. This issue will be analyzed in the EIR.

c) Less-Than-Significant Impact

Because the site is generally flat, the project will not substantially alter the site's existing drainage pattern and result in substantial erosion or siltation on- or off-site. The site grading plan must be approved by Sonoma County. This issue will be discussed further in the EIR.

d) Potentially Significant Impact

The site generally drains from east to west into three shallow pipe culverts under US 101. The pipe culverts discharge to the west into agricultural lands currently cultivated as vineyards. The project will greatly increase the amount of impervious surface area on the site, consequently increasing the amount and rate of surface water runoff. Increased site runoff could potentially increase flooding on- and off-site. This issue will be analyzed further in the EIR.

e) Potentially Significant Impact

The increase in impervious surface area on the site will increase the amount and rate of surface water runoff. Increased site runoff could potentially exceed the capacity of existing on-site and off-site drainage systems. This issue will be analyzed further in the EIR.

Surface water runoff from the site will be directed to vegetated swales before leaving the site to minimize pollutant runoff. Effectiveness of swales in reducing pollutant load in surface water runoff will be discussed further in the EIR.

f) Potentially Significant Impact

Water quality could potentially be affected during construction (see Item a) and from surface water runoff after project completion (see Item d). These issues will be discussed further in the EIR.

g and h) No Impact

According to the Federal Emergency Management Agency (FEMA) Flood Map for the project area, the project site and its surroundings are not located within or near a 100-year flood hazard area. This issue will not be discussed further in the EIR.

i and j) No Impact

The site is not within a 100-year flood hazard area or within an area subject to flooding from a dam or levee failure. The project site is not at risk of inundation from a seiche, tsunami, or mudflow. These issues will not be discussed further in the EIR.

3.9 LAND USE AND PLANNING

Would the project:	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less-Than-Significant Impact	No Impact
a. Physically divide an established community?				X
b. Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect.	X			
c. Conflict with any applicable habitat conservation plan or natural community conservation plan?	X			

DISCUSSION:

a) No Impact

The project site is surrounded by open space and agricultural land to the south, US 101 to the west, and unincorporated residential development to the north and east. Development of the project site would introduce new land uses between US 101 and residential areas to the east. As a result, the project would not divide any existing community. This issue will not be discussed further in the EIR.

b) Potentially Significant Impact

Annexation into the Urban Service Area would be required for the proposed project site to be served by the public sewer system. The project is consistent with the Sonoma County General Plan land use designation of PQP; however, the General Plan would have to be amended to include the 53 acres within the Urban Service Area. In addition, a “companion” amendment to the 1984 Larkfield-Wikiup Area Plan to place the project property within the “Ultimate Sewer Service Area” is required to make the project consistent with the General Plan.

Isolated and irregular noise events resulting from helicopter transport to the medical center may coincide with events at the WFC. These disruptions could compromise attendees’ enjoyment of WFC events. While these potential noise impacts do not conflict with any applicable land use plans, policies, or regulations of an agency with jurisdiction over the project, this issue will be further discussed under the noise element of the EIR.

As stated previous, annexation into the Urban Service Area would eliminate the Scenic Corridor setback requirements due to the project’s proximity to US 101. The vineyard property is also located in the Scenic Resources Combining District. These issues will be discussed further in the EIR.

c) Potentially Significant Impact

The SRPCS identifies the project area as being within the area of potential presence of endangered CTS and rare plants. The project's consistency with the SRPCS will be evaluated in the EIR.

3.10 MINERAL RESOURCES

Would the project:	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less-Than-Significant Impact	No Impact
a. Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?				X
b. Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?				X

DISCUSSION:

a and b) No Impact

According to the Sonoma County General Plan Resource Conservation Element, the project site is not in an area that contains a mineral resource deposit. Therefore, the project would not result in the loss of availability of a known mineral resource of value to the region or residents of the state or result in the loss of availability of a locally important mineral resource recovery site. These issues will not be discussed further in the EIR.

3.11 NOISE

Would the project result in:	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less-Than-Significant Impact	No Impact
a. Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	X			
b. Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?			X	
c. A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?	X			
d. A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?	X			
e. For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?				X
f. For a project located within the vicinity or a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?				X

DISCUSSION:

a) Potentially Significant Impact

The entire project site is exposed to noise levels exceeding 60 dBA L_{dn},[4] the Sonoma County General Plan's Noise Element threshold of acceptability for noise-sensitive development. The highest noise levels occur along the US 101 frontage where the existing noise exposure level at the approximate setback of the proposed hospital is approximately 70 dBA L_{dn}. Because the noise exposure levels are approximately 70 dBA L_{dn} at the facade of the proposed hospital building, there is the potential for interior levels to exceed the interior noise limit with windows closed for noise control. Noise resulting from hospital mechanical equipment, including

4 The A-weighted noise level (dBA) is the sound pressure level, in decibels, as measured on a sound level meter using the A-weighting filter network. The A-weighting filter de-emphasizes the very low and very high frequency components of the sound in a manner similar to the frequency response of the human ear, and correlates well with subjective reactions to noise. Day/night noise level (L_{dn}) is the average dBA during a 24-hour day, obtained after addition of 10 decibels to levels measured in the night between 10:00 p.m. and 7:00 a.m.

emergency generators, if not enclosed or attenuated, could exceed noise limits in the Noise Element of the Sonoma County General Plan at the nearest residential property lines. In addition, noise from helicopter landings, take-offs, and over-flights of neighborhoods as well as noise from ground-transport emergency vehicles will be analyzed further in the EIR. Outdoor events with amplified sound may also conflict with noise standards established in the General Plan.

b) Less-Than-Significant Impact

Construction of proposed facilities may include pile driving. Pile driving can generate perceptible groundborne vibration levels within 50 feet. No sensitive receptors exist within 50 feet of this potential activity. No other groundborne vibration or noise would occur from the project. This impact would be temporary and limited to the construction period. Vibration from pile driving will be discussed further in the EIR.

c) Potentially Significant Impact

Noise from parking and on-site circulation may be annoying or disturbing to residents adjacent to the proposed parking lot along the east property boundary. Noise from helicopter landings, take-offs, and overflights could impact hospital patients, WFC events, and neighboring residents. Operation of the proposed helistop could result in high enough interior noise levels during WFC events and at the proposed hospital to result in a significant disturbance. These potentially significant noise impacts will be analyzed further in the EIR.

d) Potentially Significant Impact

Construction of the proposed facilities will temporarily increase noise levels at nearby residences. Since construction will occur over several years, construction activities will not typically be located adjacent to a particular receptor during the entire construction period. In addition, the noise generated from periodic helicopter flights as well as periodic noise from ambulances accessing the hospital could impact residents. This issue will be discussed further in the EIR.

e and f) No Impact

The project site is not located within an airport land use plan, within 2 miles of a public airport, or in the vicinity of a private airstrip. The closest airport is the Charles M. Schulz Sonoma County Airport, approximately 3.25 miles from the project site. Therefore, the project would not expose people residing or working in the project area to excessive noise levels from these sources. This issue will not be discussed further in the EIR.

3.12 POPULATION AND HOUSING

Would the project:	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less-Than-Significant Impact	No Impact
a. Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	X			
b. Displace substantial amounts of existing housing, necessitating the construction of replacement housing elsewhere?			X	
c. Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?			X	

DISCUSSION:

a) Potentially Significant Impact

The project would not create permanent new housing. It would relocate existing hospital facilities within Santa Rosa (Sutter Medical Center at 3325 Chanate Road and Sutter Warrack Hospital at 2449 Summerfield Road) to a new location in Sonoma County (50 Mark West Springs Road) and expand the existing WFC. The project would require a General Plan amendment to include the project site within the Urban Service Boundary; a “companion” amendment to the 1984 Larkfield-Wikiup Area Plan to place the project property within the “Ultimate Sewer Service Area” to maintain consistency with the General Plan; and annexation of Parcels 2, 3, 4, and 5 to the Airport-Larkfield-Wikiup Sanitation Zone. While these actions are requested only for the project site, it is possible that expansion of these boundaries could induce nearby development.

The potential for indirect growth inducement will be discussed in further detail in the EIR.

b and c) Less-Than-Significant Impact

One residence and household will be displaced by the project. This is not a substantial amount of housing or number of people. This would not necessitate the construction of new housing elsewhere. Although this will result in an inconvenience to the current residents, it is not considered a significant environmental impact. This issue will not be addressed further in the EIR.

3.13 PUBLIC SERVICES

Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the following public services:	**Potentially Significant Impact**	**Less Than Significant With Mitigation Incorporated**	**Less-Than-Significant Impact**	**No Impact**
a. Fire Protection?	X			
b. Police Protection?			X	
c. Schools?		X		
d. Parks?			X	
e. Other public facilities?			X	

DISCUSSION:

a) Potentially Significant Impact

The project site is located in the Rincon Valley Fire Protection District (RVFD). The new and expanded project facilities would rely on the RVFD for fire protection services, which could potentially require new or physically altered facilities.

The potential impacts to the RVFD will be discussed in further detail in the EIR.

b) Less-Than-Significant Impact

Both Sutter Hospital and the LBMF employ security forces to police their facilities, and will continue to do so once the proposed facilities are in use. Accordingly, the need for additional police protection services is expected to be minimal and impacts to local police protection, provided by the Sonoma County Sheriff’s Department, are expected to be less than significant.

c) Less Than Significant With Mitigation Incorporated

The existing school at the WFC will continue and expand with the project. School districts have adopted a standard impact fee system. The project’s potential impacts to the Sonoma County School District will be discussed in the EIR.

d) Less-Than-Significant Impact

The nearest park to the project site is Coffey Park, approximately 1.5 miles to the south. It is unlikely that the project would substantially increase the use of existing neighborhood and regional parks or other recreational facilities and require the need for new facilities. Therefore, this issue will not be discussed further in the EIR.

e) Less-Than-Significant Impact

Electricity, gas, and telephone services will be required for the project. These services are available along Mark West Springs Road. Pacific Gas and Electric Company (PG&E) is scheduled to complete a new substation in 2008 to serve the project area, which will relieve service loads on the PG&E Fulton Station. The project applicant will provide proof of available service by PG&E before issuance of a building permit from Sonoma County. This issue will be discussed further in the EIR.

3.14 RECREATION

	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less-Than-Significant Impact	No Impact
a. Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facilities would occur or be accelerated?			X	
b. Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?			X	

DISCUSSION:

a) Less-Than-Significant Impact

The project may provide walking/jogging/nature trails on the vineyard parcel as well as picnic areas, which could be used by employees and WFC attendees. However, this project element is uncertain. Other than Coffey Park, approximately 1.5 miles to the south of the project site, no existing neighborhood and regional parks or other recreational facilities are in close proximity to the project area. Therefore, the project would have a less-than-significant impact on the level of use of recreational facilities in the area. These issues will be discussed in further detail in the EIR.

b) Less-Than-Significant Impact

The proposed hospital may provide on-site recreational facilities for staff and clients in the form of outdoor areas as well as hiking trails across the site and in the vineyard parcel. These issues will be discussed in further detail in the EIR.

3.15 TRANSPORTATION/TRAFFIC

Would the project:	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less-Than-Significant Impact	No Impact
a. Cause an increase in traffic which is substantial in relation to the existing traffic load and capacity of the street system (i.e., result in a substantial increase in either the number of vehicle trips, the volume to capacity ratio on roads, or congestion at intersections)?	X			
b. Exceed, either individually or cumulatively, a level of service standard established by the county congestion management agency for designated roads or highways?	X			
c. Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?	X			
d. Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	X			
e. Result in inadequate emergency access?	X			
f. Result in inadequate parking capacity?	X			
g. Conflict with adopted policies, plans, or programs supporting alternative transportation (e.g., bus turnouts, bicycle racks)?	X			

DISCUSSION:

a, b, c, and d) Potentially Significant Impact

The proposed medical center component of the project will be constructed in phases as identified in Section 1. Phase II of the medical center is projected to generate 7,668 daily two-way trips, with 562 morning peak hour and 660 afternoon/evening peak hour trips on a weekday. Phase V of medical center development is expected to generate 11,124 daily two-way trips with 802 morning peak hour and 906 afternoon/evening peak hour trips. In addition, the adjacent WFC would be expected to generate 310 morning peak hour trips and 203 afternoon/evening peak hour trips on a weekday without any special event in progress. Most intersections close to the project site as well as the US 101 freeway and the Mark West Springs Road/US 101 interchange are projected to experience significant impacts due to project traffic. The project includes improvements to Mark West Springs Road and the northbound US 101/Mark West Springs Road off-ramp. Improvements to the off-ramp must be coordinated with Caltrans. Even after anticipated freeway off-ramp and roadway widening, some freeway and intersection impacts would remain significant and unavoidable.

Many intersections close to the project site as well as some segments of US 101 would exceed Sonoma County and/or Caltrans minimum acceptable operating criteria for year 2020 or year 2030 weekday morning and/or afternoon/evening peak hour commute conditions, even after planned improvements.

These impacts will be discussed further in the EIR.

The Sutter Medical Center will move its current medical emergency helicopter service (now active at its Chanate Road facility) to the proposed Mark West Springs Road campus. Procedures will be developed to coordinate the relocated helicopter flight patterns with the landing and takeoff flight activity at the nearby Charles M. Schulz Sonoma County Airport, about 3.25 miles to the northwest. The new medical facility will be about 50 percent closer to the airport than the Chanate Road operation. These impacts will be discussed in further detail in the EIR.

Increased traffic volumes due to the proposed project could potentially cause a backup on the River Road/Mark West Springs Road overcrossing of US 101 that may result in decreased safety for eastbound traffic if the stopping site distance is deficient over the vertical crest of the overcrossing. This issue will be analyzed further in the EIR.

e, f, and g) Potentially Significant Impact

During commute times, unacceptable delays at several intersections along Mark West Springs Road and River Road could delay emergency vehicle access to the proposed medical facility as well as delay non-project-related emergency vehicle response times along local roadways and to/from US 101. These impacts will be discussed in further detail in the EIR.

Proposed parking will be adequate for project Phase II development, assuming a shared use parking management plan is instituted. However, Phase II proposed parking would not meet Sonoma County code requirements or shared use demand when a major special event is being held at the WFC. These impacts will be discussed in further detail in the EIR.

The applicants' preliminary information indicates a willingness to work with local transit agencies to provide acceptable and safe bus stops. Although internal design plans are still in process, bicycle parking is recommended to meet County code, and some internal roads are recommended to include wide shoulder areas to facilitate bicyclists. However, the project would have potentially significant impacts to bicyclists along local off-site roadways due to the greatly increased traffic volumes. These impacts will be discussed in further detail in the EIR.

3.16 UTILITIES AND SERVICE SYSTEMS

Would the project:	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less-Than-Significant Impact	No Impact
a. Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?	X			
b. Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?	X			
c. Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?	X			
d. Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?	X			
e. Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?			X	
f. Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?	X			
g. Comply with federal, state, and local statutes and regulations related to solid waste?			X	

DISCUSSION:

a) Potentially Significant Impact

The LBMF currently operates wastewater treatment and disposal ponds on-site. This system will be abandoned and the hospital facilities and expanded WFC will connect to the public sewer system. The project will be annexed into Airport-Larkfield-Wikiup Sanitation Zone operated by the Sonoma County Water Agency (SCWA). Connecting the project to these public sewer facilities could exceed loading capacities in these sewers. The hospital and medical office building are proposed to be connected to holding tanks and a lift station to allow for off-peak pumping as determined necessary by SCWA. This issue will be analyzed further in the EIR.

b) Potentially Significant Impact

The project would include abandoning existing wastewater facilities and connecting the WFC and new hospital facilities to the Airport-Larkfield-Wikiup Sanitation Zone operated by the SCWA. The Airport-Larkfield-Wikiup Sanitation Zone treatment plant has existing capacity to treat 900,000 gallons per day (gpd) of wastewater. The current flow to the plant is 800,000 gpd.

Phase I project activities are anticipated to contribute an additional maximum 13,054 gpd of wastewater to the treatment plant. As a result, no new upgrades to SCWA facilities would be needed. However, upgrades would be needed to accommodate the project through Phase II and beyond.

The SCWA has future plans to upgrade the treatment plant to its full, permitted 1.2 million gpd capacity to serve the region regardless of the proposed project. However, the project could hasten the need to upgrade the system. These upgrades are not currently scheduled. Advance payment of Sanitation Zone connection fees would be needed to help fund the upgrades. In addition, the SCWA would ask for water conservation strategies implemented within the Sanitation Zone to offset future project flows.

The SCWA does not anticipate the need to upgrade its effluent storage and disposal facilities to accommodate the project. The existing capacity of the Airport-Larkfield-Wikiup Sanitation Zone effluent storage is 290 million gallons. The ability of this storage to accommodate the proposed project will be discussed in the EIR.

Further analysis needs to be conducted to determine whether existing sanitary sewer conveyance facilities can accommodate the proposed project. If it is determined that the sanitary sewer conveyance facilities need to be upgraded as a result of the proposed project, then the effects of those construction activities, including disrupting traffic and disturbing soils, will be addressed in the EIR. The potential effects of the project on wastewater conveyance and treatment facilities capacity will be analyzed in the EIR.

c) Potentially Significant Impact

The project would result in the construction of new and possible expansion of existing stormwater drainage facilities. The project would result in a significant area of new impervious surface that would require the collection of stormwater runoff.

Impacts associated with the construction and possible expansion of these facilities will be discussed in further detail in the EIR.

d) Potentially Significant Impact

The project site is currently supplied domestic water by the California-American Water Company (CalAm). CalAm obtains water from four wells that have an approximate capacity of 1,000 gallons per minute (gpm), and from a connection to the SCWA aqueduct. The aqueduct provides CalAm with an additional approximate capacity of 800 gpm.

CalAm is planning to construct a new well and upgrade storage facilities to a total of 400,000 gallons. While the permitting process for these facilities has started, it is uncertain when construction will actually take place.

The project would require up to 77,176 gpd at full buildout, after Phase V. As a result, new water and storage facilities are needed. The proposed project includes construction of a new well. Pumping from the new well can potentially affect the hydraulic gradient of the aquifer and other water supplies associated with the aquifer.

The potential impacts that may result from the construction of additional water service and storage facilities will be discussed further in the EIR.

e) Less-Than-Significant Impact

The Airport-Larkfield-Wikiup Sanitation Zone operated by SCWA has indicated that the wastewater treatment plant has capacity to serve the first phase of the project. Expansion of the wastewater treatment plant would not be required to serve subsequent project phases. The wastewater treatment plant is planned for expansion with or without the project. This issue will be discussed further in the EIR.

f) Potentially Significant Impact

The project would build new hospital facilities and expand the current WCF. These operations would generate substantial amounts of solid waste, including specialized waste such as hazardous medical and radiological waste. Although the new facilities are being built to replace two hospital facilities in the same vicinity, the impacts of project construction and operation on solid waste landfills will be further discussed in the EIR.

g) Less-Than-Significant Impact

The project would be subject to state and local regulations regarding the disposal and treatment of solid waste and would be expected to comply with those regulations, including those for the disposal of medical and other hazardous waste. Waste disposal regulations for the project and how the project is expected to comply with those regulations will be further discussed in the EIR.

3.17 MANDATORY FINDINGS OF SIGNIFICANCE

	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less-Than-Significant Impact	No Impact
a. Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or wildlife community, reduce the number or restrict the range of an endangered, rare or threatened plant or wildlife, or eliminate important examples of the major periods of California history or prehistory?	X			
b. Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?	X			
c. Does the project have environmental effects which would cause substantial adverse effects on human beings, either directly or indirectly?		X		

DISCUSSION:

a) Potentially Significant Impact

The SRPCS identifies the project site as being within the area of potential presence of endangered CTS and rare plants. Sightings of CTS were reported within 5 miles of the project boundaries but none were reported on or near the project site. The SRPCS requires projects within the area of potential presence to mitigate for loss of habitat by contributing to a species fund. The project site contains 0.46 acre of wetlands and other waters of the U.S., some portion of which may be considered jurisdictional under Section 404 of the Clean Water Act. Mitigation may be required by the USACE.

The project site has a number of oak trees according to the inventory performed in June 2006 by Horticultural Associates. Sonoma County policy RC-5c makes the preservation of significant native oaks and other native trees a primary consideration in the review of development projects. The Resource Conservation Element of the Sonoma County General Plan sets County policies for protection of several types of biotic resources. Protection of trees is addressed by policies in the Conservation of Biotic Resources section of the Resource Conservation Element. Moreover, the Sonoma County Code contains two ordinances that would reduce potential impacts to trees. The Sonoma County Tree Ordinance (No. 4044) would continue to regulate the removal of certain designated trees. The Sonoma County Heritage Tree ordinance (No. 3651) would continue to provide for the identification and protection of designated heritage trees.

One dwelling, a tank house, and a shed were observed and identified as potential historic resources, and subsequently recommended for formal evaluation. Qualified architectural historians will evaluate this complex as well as another building that appears to date from the 1950s or earlier.

These issues will be addressed in the EIR.

b) Potentially Significant Impact

The Bay Area is in nonattainment for ground-level ozone under both the federal and state standards and is in nonattainment for PM_{10} under state standards. The project would cause an increase in the release of ozone precursors into the atmosphere in the form of reactive organic gases and nitrous oxides and an increase in the release of $PM_{10.}$

No CEQA thresholds of significance have been established for GHG. However, in September 2006, AB 32 called for the California Air Resources Board to adopt regulations requiring the reporting and verification of statewide GHG emissions and that a limit equivalent to the statewide GHG emissions in 1990 be achieved by year 2020. GHG associated with the proposed project are primarily associated with energy consumption for operating the hospital facility and expanded WFC site and with motor vehicles traveling to and from the project site. This will result in an increase in the generation of GHG over existing conditions.

Current commute traffic, especially at morning and afternoon/evening peak hours, is increasing. The proposed project has the potential to increase traffic in the project area and cause further traffic delays. Many intersections close to the project site as well as some segments of US 101 would exceed the County and/or Caltrans minimum acceptable operating criteria for year 2020 or year 2030 weekday morning and/or afternoon/evening peak hour commute conditions (even after planned improvements).

The project will increase the amount of impervious surface area on the site, increasing the amount and rate of surface water runoff. Increased site runoff could potentially increase flooding on- and off-site. Increased site runoff could also potentially exceed the capacity of existing on-site and off-site drainage systems.

These issues will be discussed in the EIR.

c) Less Than Significant With Mitigation Incorporated

The active Rodgers Creek fault is located approximately 0.75 mile to the east of the project area, and therefore there is a significant probability that the site will experience strong seismic shaking during the design life of the facilities. The preliminary geotechnical investigations at the site indicate that, in general, the soils at the site have low liquefaction potential and associated ground deformations, but additional investigations are required to further evaluate liquefaction susceptibility. The proposed hospital facilities (building 1.1 Phase II, building 1.2 Phase II, and building 1.1 Phase V) would be designed and constructed at a minimum to the seismic design requirements for ground shaking specified in the Uniform Building Code for seismic zone 4. All other structures would be designed and constructed at a minimum to the Office of Statewide Health Planning and Development seismic design requirements.

These potential impacts will be discussed in further detail in the EIR.

This Initial Study was prepared by a multidisciplinary team of environmental and engineering specialists.

County of Sonoma

The following individuals were involved in management, oversight, and review of the Initial Study.

County Counsel

Sally McGough	Deputy County Counsel

Permit and Resource Management Department

Jennifer Barrett	Deputy Planning Director
Scott Briggs, Ph.D.	Environmental Review Division Manager
Steve Dee, AICP	Senior Environmental Specialist
Ken Ellison	Supervising Planner
Lisa Newman	Contract Planner
Denise Peter, AICP	Planner III

Transportation and Public Works

Ken Giovannetti	Engineer
John Maitland	Engineer

Consultant Team

The following consultant team members were responsible for the preparation of the IS and its technical reports.

URS Corporation

David Fee	Project Management, Environmental Document Coordination
Anna Davis	Land Use and Planning, Population and Housing
Jason Jones	Aesthetics, Public Services, Recreation, Environmental Document Coordination

Sarah La Belle	Air Quality, Environmental Document Preparation and Review, Land Use
Brian Hatoff	Cultural Resources
Mark Mazzola	Agricultural Resources
Eric Rivero-Montes	Air Quality
Rosemary Laird	Biological Resources
Phillip Meymand	Geology and Soils, Mineral Resources
Joe Morgan	Hazards and Hazardous Materials
Lynn McIntyre	Technical Editing, Document Preparation
Deborah Fournier	Word Processing

Crane Transportation Group

Mark Crane	Transportation/Traffic

APPENDIX B

NOTICE OF PREPARATION AND RESPONSES

COUNTY OF SONOMA
PERMIT AND RESOURCE MANAGEMENT DEPARTMENT
2550 Ventura Avenue, Santa Rosa, CA 95403-2829
(707) 565-1900 FAX (707) 565-8358

NOTICE OF PREPARATION
OF A DRAFT ENVIRONMENTAL IMPACT REPORT
and
NOTICE OF PUBLIC SCOPING MEETING

Project Title: Sutter Medical Center of Santa Rosa/Luther Burbank Memorial Foundation Joint Master Plan

Project Applicant: Sutter Medical Center of Santa Rosa and the Luther Burbank Memorial Foundation

The Sonoma County Permit and Resource Management Department has received an application from Sutter Medical Center of Santa Rosa and the Luther Burbank Memorial Foundation for the Sutter Medical Center of Santa Rosa/Luther Burbank Memorial Foundation Joint Master Plan Project. Sonoma County will be the lead agency and will prepare an Environmental Impact Report (EIR) for the above project. We are asking for your views regarding the scope of environmental issues that should be addressed in the EIR.

The Initial Study, with project description and figures, is contained in the attached materials for your consideration. If you wish to comment on the environmental issues that should be addressed in the EIR, please send written comments to Steve Dee at the address on the letterhead.

If you are a responsible agency, we need to know the views of your agency as to the scope and content of the environmental information, which is germane to your agency's statutory responsibilities in connection with the proposed project. Your agency will need to use the EIR prepared by the County when considering your permit or other approval for the project.

Due to the time limits mandated by State Law, your response must be sent at the earliest possible date, but not later than 30 days after receipt of this notice.

Public Scoping Meeting: The Permit and Resource Management Department will hold a public scoping meeting from **7:00 pm to 9:00 pm** on **February 21, 2008.** This meeting will allow an opportunity for the public to express views regarding the scope of the environmental issues to be addressed in the EIR. These comments will be considered by the County during preparation of the EIR. The meeting will be held at the Wells Fargo Center for the Arts, Carston Cabaret, 50 Mark West Springs Road, Santa Rosa.

Date: February 3, 2008

Mr. Steve Dee
Sonoma County PRMD
2550 Ventura Avenue
Santa Rosa, CA 95403-2829

Dear Mr. Dee:

Sutter Medical Center of Santa Rosa/ Luther Burbank Memorial Foundation – Notice of Preparation

Thank you for continuing to include the California Department of Transportation (Department) in the environmental review process for the proposed project. Please find our comments on the NOP below:

Traffic Analysis

The Department is primarily concerned with impacts of the proposed project on US 101 and its on- and off-ramps in the vicinity of the project site, here in particular the US 101/MarkWest Springs intersection. Since our April 2005 review of the Use Permit Application and Intial Study for this project (see letter dated April 18, 2005 attached), almost three years have passed and the project scope has been revised. However, several of our comments provided in this letter are still relevant and should be addressed in the updated traffic analysis. Furthermore, the traffic impact study to be prepared should include but not be limited to the information detailed below:

1. Information on the project's traffic impacts in terms of trip generation, distribution, and assignment. The assumptions and methodologies used in compiling this information should be addressed. The study should clearly show the percentage of project trips assigned to US 101 and its on- and off-ramps.

2. Current (2006) Average Daily Traffic (ADT) and AM and PM peak hour volumes on all significantly affected streets, highway segments and intersections.

3. Schematic illustration and level of service (LOS) analysis for the following scenarios: 1) existing, 2) existing plus project, 3) cumulative and 4) cumulative plus project for the roadways and intersections in the project area.

4. Calculation of cumulative traffic volumes should consider all traffic-generating developments, both existing and future, that would affect the State highway facilities being evaluated.

5. The procedures contained in the 2000 update of the Highway Capacity Manual should be used as a guide for the analysis. We also recommend using the Department's *"Guide for the Preparation of Traffic Impact Studies";* it is available on the following web site: http://www.dot.ca.gov/hq/traffops/developserv/operationalsystems/reports/tisguide.pdf .

6. Mitigation measures should be identified where plan implementation is expected to have a significant impact. Mitigation measures proposed should be fully discussed, including financing, scheduling, implementation responsibilities, and lead agency monitoring.

7. Mitigation measures should consider highway and non-highway improvements and services. Special attention should be given to the development of alternate solutions to circulation problems that do not rely on increased highway construction, such as:
   - Implementing bicycle- and pedestrian-friendly design solutions;
   - Planning for transit service improvements and expansion.

We look forward to reviewing the traffic study, technical appendices and Draft EIR for the Sutter Medical Center of Santa Rosa/ Luther Burbank Memorial Foundation project. We do expect to receive a copy from the State Clearinghouse, but in order to expedite our review please send two copies in advance to:

Ina Gerhard
Office of Transit and Community Planning
Department of Transportation, District 4
P.O. Box 23660
Oakland, CA 94623-0660

Please be aware that before the Department will issue an encroachment permit for the proposed work within State right-of-way, the applicant and City must adequately address all of the comments and concerns contained in this letter.

Encroachment Permit

Please be advised that any work or traffic control that encroaches on State ROW requires an encroachment permit issued by the Department. Further information is available on the following website: http://www.dot.ca.gov/hq/traffops/developserv//permits/. To apply, a completed encroachment permit application, environmental documentation, and five (5) sets of plans clearly indicating State ROW must be submitted to the following address:

Julie Hsu, Branch Chief
Office of Permits
California DOT, District 4
P.O. Box 23660
Oakland, CA 94623-0660

Should you require further information or have any questions regarding this letter, please call or email Ina Gerhard of my staff at (510) 286-5737 or ina_gerhard@dot.ca.gov .

Sincerely,

Timothy C. Sable

TIMOTHY C. SABLE
District Branch Chief
IGR/CEQA

Mr. Ken Ellison
Sonoma County
Permit and Resource Management Department
2550 Ventura Avenue
Santa Rosa, CA 95403

Dear Mr. Ellison:

PLP05-0002, Sutter Medical Center of Santa Rosa/ Luther Burbank Center of the Arts - Use Permit Application & Initial Study

Thank you for including the California Department of Transportation (Department) in the environmental review process for the proposed project. We have reviewed the above-referenced documents and have the following comments to offer:

1. Provide a plan showing the interim improvements to the US 101 northbound off-ramp at Mark West Springs Road. Show and label the State right-of-way line, lane and shoulder widths.

2. Describe the timeline and funding for how each of the ultimate transportation improvements will be built. What are the County's plans for the ultimate improvements on Mark West Springs Road? We suggest the County and project sponsor contact Mr. Manny Caluya at (510) 286-4645 to discuss implementing mitigation for impacts to the US 101 off-ramp at Mark West Springs Road. Mr. Caluya provides design oversight for locally funded highway projects for the Department.

3. Traffic operations at the US 101 northbound ramps/ Mark West Springs Road intersection are critical because they will affect operations at the US 101 southbound ramps/River Road intersection to the west. However, "available distance" rows are blank in the Queuing Analysis shown in Table 3 and Table 29 for this intersection. Please provide this information for our review. Mitigation measures should be proposed if operations at the northbound off-ramps would affect operations at the southbound ramps.

4. The US 101 southbound off-ramp at River Road currently operates at level of service (LOS) F according to the Department's traffic study completed for the US 101 High-Occupancy Vehicle (HOV) Lane Widening project. What mitigation measures are proposed for project impacts to this ramp?

5. Page 70 of the traffic study states that the actual predicted volumes for the US 101 northbound off-ramp at River Road are less than 1500 equivalent passenger cars per hour (vph). However, the 2020 Saturday Event PM LOS Computation Report shows that the off-ramp volume will exceed 1500 vph. Please reconcile this difference.

6. Table 24 and Table 26 use 4700 vph as freeway roadway capacities; in our opinion, the 4700 vph capacity is too high for the analysis. Is there any field data to back up this assumption? Theoretically, if the actual freeway capacities are lower than that used in the report (i.e. 4300 vph or lower), a bottleneck would occur in the southbound direction of the freeway. Since "a large portion of traffic (59%) is expected to use US 101" (page 5), and Table 26 shows that traffic significantly increases on the southbound freeway mixed lanes between the Mendocino/Hopper ramps and the River Road ramps with proposed project during 2030 PM peak hour, mitigation measures should be proposed for that bottleneck location.

7. The State right-of-way along US 101 adjacent to the proposed project site has been previously surveyed by the Department and there are no known archaeological sites within the State right-of-way. If ground disturbing activities take place as part of this project within State right-of-way and there is an inadvertent find, all construction within 35 feet of the find shall cease until the Department's Cultural Resource Study Office is alerted and a staff archaeologist can evaluate the finds. The Cultural Resource Study Office contact person is Brian Ramos. He can be reached at (510) 286-5613.

8. At the bottom of page 54 of the traffic study, change the title of Figure 13 to Figure 15.

9. As part of the Department's US 101 HOV Lane Widening project, which is currently in the environmental study phase, the Mark West Creek Structure will be widened.

10. Any widening of Mark West Springs Road may require dedication of right-of-way (in fee) to the State, per the Department's design requirements.

The applicant will need an encroachment permit from the Department to construct the driveway approach onto State Route (SR) 116 and to complete any other required work or traffic control within State right-of-way. To apply for an encroachment permit, the applicant must submit a completed encroachment permit application, environmental documentation, and five (5) sets of plans (in metric units) which clearly indicate State right-of-way to the following address:

Mr. Sean Nozzari, District Office Chief
Office of Permits
California Department of Transportation, District 04
P. O. Box 23660
Oakland, Ca 94623-0660

To request a copy of the Department's right-of-way maps call (510) 286-5257 and leave a message or send an e-mail to **d4rwerec@dot.ca.gov**.

Please be aware that before the Department will issue an encroachment permit for the proposed work within State right-of-way, the applicant and City must adequately address all of the comments and concerns contained in this letter.

Should you require further information or have any questions regarding this letter, please call Maija Cottle of my staff at (510) 286-5737.

Sincerely,

Timothy C. Sable

COUNTY OF SONOMA

Steve Dee
Sonoma County Permit and Resource
Management Department
2550 Ventura Avenue
Santa Rosa, CA 95403-2829

Dear Mr. Dee:

Subject: Sutter Medical Center of Santa Rosa/Luther Burbank Memorial Foundation
Joint Master Plan; SCH# 2008022012, City of Santa Rosa, Sonoma County

The Department of Fish and Game (DFG) has reviewed the documents provided for the subject project, and we have the following comments.

Please provide a complete assessment (including but not limited to type, quantity and locations) of the habitats, flora and fauna within and adjacent to the project area, including endangered, threatened, and locally unique species and sensitive habitats. The assessment should include the reasonably foreseeable direct and indirect changes (temporary and permanent) that may occur with implementation of the project. Rare, threatened and endangered species to be addressed should include all those which meet the California Environmental Quality Act (CEQA) definition (see CEQA Guidelines, Section 15380). DFG recommended survey and monitoring protocols and guidelines are available at
http://www.dfg.ca.gov/wildlife/species/survey_monitor.html.

Please be advised that a California Endangered Species Act (CESA) Permit must be obtained if the project has the potential to result in take of species of plants or animals listed under CESA, either during construction or over the life of the project. Issuance of a CESA Permit is subject to CEQA documentation; therefore, the CEQA document must specify impacts, mitigation measures, and a mitigation monitoring and reporting program. If the project will impact CESA listed species, early consultation is encouraged, as significant modification to the project and mitigation measures may be required in order to obtain a CESA Permit.

If you have any questions, please contact Mr. Patrick Moeszinger, Environmental Scientist, at (707) 944-5596 or Mr. Liam Davis, Habitat Conservation Supervisor, at (707) 944-5529.

Sincerely,

Charles Armor
Regional Manager

RE: SCH# 2008022012 Sutter Medical Center of Santa Rosa/Luther Burbank Memorial Foundation Joint Master Plan; Sonoma County.

Dear Mr. Dee:

The Native American Heritage Commission (NAHC) has reviewed the Notice of Preparation (NOP) referenced above. The California Environmental Quality Act (CEQA) states that any project that causes a substantial adverse change in the significance of an historical resource, which includes archeological resources, is a significant effect requiring the preparation of an EIR (CEQA Guidelines 15064(b)). To comply with this provision the lead agency is required to assess whether the project will have an adverse impact on historical resources within the area of project effect (APE), and if so to mitigate that effect. To adequately assess and mitigate project-related impacts to archaeological resources, the NAHC recommends the following actions:

✓ Contact the appropriate regional archaeological Information Center for a record search. The record search will determine:
  - If a part or all of the area of project effect (APE) has been previously surveyed for cultural resources.
  - If any known cultural resources have already been recorded on or adjacent to the APE.
  - If the probability is low, moderate, or high that cultural resources are located in the APE.
  - If a survey is required to determine whether previously unrecorded cultural resources are present.

✓ If an archaeological inventory survey is required, the final stage is the preparation of a professional report detailing the findings and recommendations of the records search and field survey.
  - The final report containing site forms, site significance, and mitigation measurers should be submitted immediately to the planning department. All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum, and not be made available for pubic disclosure.
  - The final written report should be submitted within 3 months after work has been completed to the appropriate regional archaeological Information Center.

✓ Contact the Native American Heritage Commission for:
  - A Sacred Lands File Check. **USGS 7.5-minute quadrangle name, township, range, and section required.**
  - A list of appropriate Native American contacts for consultation concerning the project site and to assist in the mitigation measures. **Native American Contacts List attached.**

✓ Lack of surface evidence of archeological resources does not preclude their subsurface existence.
  - Lead agencies should include in their mitigation plan provisions for the identification and evaluation of accidentally discovered archeological resources, per California Environmental Quality Act (CEQA) §15064.5(f). In areas of identified archaeological sensitivity, a certified archaeologist and a culturally affiliated Native American, with knowledge in cultural resources, should monitor all ground-disturbing activities.
  - Lead agencies should include in their mitigation plan provisions for the disposition of recovered artifacts, in consultation with culturally affiliated Native Americans.
  - Lead agencies should include provisions for discovery of Native American human remains in their mitigation plan. Health and Safety Code §7050.5, CEQA §15064.5(e), and Public Resources Code §5097.98 mandates the process to be followed in the event of an accidental discovery of any human remains in a location other than a dedicated cemetery.

Sincerely,

Katy Sanchez

Santa Rosa, Ca. 95403-2829

Dear Mr. Dee,

This is to follow up with the conversation we had on February 25 about the Sutter Project on Mark West Springs Road and the Wells Fargo Performing Arts Center. My only concern about this additional growth on the north side of Santa Rosa is the increase in traffic in the area. Our family owns and farms property on Alba Lane which is between the new Kaiser buildings on Old Redwood Highway and Mark West Springs Road running between the Old Redwood Highway and the 101 Freeway. There are only three homes on this little country road however, the residents are in and out at various times of the day and as you know the traffic on that stretch is very heavy during commute and starting as early as 3:00 when the Catholic schools located there are finished with their day. My request is that the County puts in a turn lane on that piece of highway for the people going in and out of Alba Lane and also Angela Drive. It is very dangerous to have to turn left and constantly watch that the traffic coming up behind you is aware of your stopping in that busy area.

Thank you for your consideration in this matter. It would make for safer travel for all those who use the Old Redwood Highway north of Mendocino Avenue.

Sincerely,

Paulette Carroll

Imported Engineered Fill Sources, Sutter Hospital Santa Rosa

CONSTRUCTION
GHILOTTI
Since • COMPANY • 1914

January 27, 2009

Unger Construction
910 "X" Street
Sacramento, CA 95818

Attention: Ken Harrison

Regarding: Imported Engineered Fill Sources
Sutter Hospital, Santa Rosa

Dear Ken,

As per your request, Ghilotti Construction is please to provide you with a few Import Fill Sources for the Sutter Hospital project on Mark West Springs Road, Santa Rosa:

North of Sutter Hospital:

- Geysers Rd, Cloverdale (35.1 mi) – import fill available 50,000 cy +

West of Sutter Hospital:

- Hwy 116, Forestville (10.1 mi) – import fill available 100,000 cy +

East of Sutter Hospital:

- Porter Creek Rd, Santa Rosa (9.4 mi) – import fill available 100,000 cy +

South of Sutter Hospital:

- Ghilotti Ave, Santa Rosa (9.2 mi) – import fill available 50,000 cy +
- Petaluma Hill Rd, Santa Rosa (7.9 mi) – import fill available 100,000 cy +

As outlined above, the import fill sources to the north are limited – however at any given time, there could be an additional 15,000 – 25,000 cy of fill available within the North 101 corridor (Windsor to Cloverdale). Both of the imported fill sources identified to the east and west are from producing quarries and import fill would always be available in quantities sufficient to meet the needs of your project. The two imported fill sources to the south of your project would generally be able to meet the needs of this project – but both are subject to fluctuations in availability depending on other regional needs.

Because this project is not slated for construction in the immediate future, it is our recommendation that several of the identified import fill sources should be included in your planning of this project. Per your request, we have included haul routes from each of the abovementioned fill sources.

Although any one source could supply the entire import fill needs for the project, for planning purposes, Ghilotti Construction has based its analysis on the following:

Total Import Fill required for the Project = 100,000 cy

Total Truck Trips required for the Project = 8,695 loads

Anticipated Number of days for import = 45 days (185-210 truck trips per day)

Anticipated Number of trucks/cycle time = 24 Double Bottom Trucks with a 53 minute cycle time per load (based on fill source within 8 - 12 mile radius of the Project).

Thank you in advance, for your prompt consideration of this matter. Ghilotti Construction looks forward to providing you any additional pricing and/or engineering constructability issues you may have on this project. If you have any questions with regard to this or any other matter, please do not hesitate to contact the undersigned at (707) 585-1221.

Sincerely,

Bradford D. Simpkins
Vice President
Private & Commercial Construction

Petaluma, CA 94952
(707) 766-7700

Job No. 04-135rev

Introduction

Sutter Medical Center of Santa Rosa (Sutter) plans to develop a new hospital and medical office on the 77±-acre site at 50 Mark West Springs Road. This report presents the findings of Illingworth &Rodkin Inc.'s (I&R) assessment of potential environmental air quality impacts associated with this proposed project in Sonoma County, California. This air quality analysis was prepared in accordance with the Bay Area Air Quality Management District (BAAQMD) CEQA Guidelines[1].

The site is located along US Route 101, just north of Santa Rosa (in the southeast quadrant of the US 101/Mark West Springs-River Road interchange). The scope of this study encompasses the relocation of the existing Sutter Hospital from its existing site on Chanate Road in the City of Santa Rosa, along with a new medical office building. The existing Chanate Road facilities would be re-used, probably for family medicine, but are not part of this study.

The proposed project includes the following phases:

Phase	Years of Activities	Description
I	2010-2011	Annexation, demolition, import of fill material, and infrastructure improvements
II	2010 to 2013	Medical Center Construction 126 thousand square foot (ksf) hospital (70 beds) 80 ksf medical office building 100 ksf Physicians Medical Center (28 beds)
III	2010 - or later	Medical Center Construction Expansion of hospital by 29 beds Expansion of LBMF (fly loft)

[1] Bay Area Air Quality Management District (BAAQMD). 1999. BAAQMD CEQA Guidelines: Assessing the Air Quality Impacts of Projects and Plans. December.

SETTING

Air Pollution and Air Quality Standards

The Federal and California Clean Air Acts establish ambient air quality standards for different pollutants. National ambient air quality standards (NAAQS) were established by the federal Clean Air Act of 1970 (amended in 1977 and 1990) for six criteria pollutants. These criteria pollutants include carbon monoxide (CO), ozone (O_3), nitrogen dioxide (NO_2), particulate matter with a diameter less than 10 microns (PM_{10}), sulfur dioxide (SO_2), and lead (Pb). Recently, EPA added fine particulate matter or $PM_{2.5}$ as a criteria pollutant. Air quality studies generally focus on five pollutants that are most commonly measured and regulated: CO, O_3, NO_2, SO_2, and suspended particulate, i.e., PM_{10} and $PM_{2.5}$.

California established ambient air quality standards as early as 1969 through the Mulford-Carrol Act. Pollutants regulated under the California Clean Air Act are similar to those regulated under the Federal Clean Air Act. In many cases, California standards are more stringent than the national ambient air quality standards. Federal and State air quality standards are shown in **Table 1**. Both the national and California ambient air quality standards have been adopted by the BAAQMD.

Criteria Air Pollutants

<u>Carbon Monoxide</u>. CO, a colorless and odorless gas, interferes with the transfer of oxygen to the brain. It can cause dizziness and fatigue, and can impair central nervous system functions. CO is emitted almost exclusively from the incomplete combustion of fossil fuels. Automobile exhaust and residential wood burning in fireplaces and woodstoves emit most of the CO in the Bay Area. CO is a non-reactive air pollutant that dissipates relatively quickly, so ambient CO concentrations generally follow the spatial and temporal distributions of vehicular traffic. The highest CO concentrations measured in the Bay Area are typically recorded during the winter.

<u>Ozone</u>. O_3, a colorless toxic gas, is the chief component of urban smog. O_3 enters the blood stream and interferes with the transfer of oxygen, depriving sensitive tissues in the heart and brain of oxygen. O_3 also damages vegetation by inhibiting growth. Although O_3 is not directly emitted, it forms in the atmosphere through a chemical reaction between reactive organic gas (ROG) and nitrogen oxides (NO_X) under sunlight. ROG and NOx are primarily emitted from automobiles and industrial sources. O_3 is present in relatively high concentrations within portions of the Bay Area. Highest O_3 concentrations occur during summer and early autumn, on days with low wind speeds or stagnant air, warm temperatures, and cloudless skies.

<u>Nitrogen Dioxide</u>. NO_2, a reddish-brown gas, irritates the lungs. Exposure to NO_2 can cause breathing difficulties at high concentrations. Clinical studies suggest that NO_2 exposure to levels near the current standard may worsen the effect of allergens in allergic asthmatics, especially in children. Similar to ozone, NO_2 is not directly emitted, but is formed through a reaction between nitric oxide (NO) and atmospheric oxygen. NO and NO_2 are collectively referred to as nitrogen oxides (NO_x) and are major contributors to ozone formation. NOx is emitted from combustion of fuels, with higher rates at higher combustion temperatures. NO_2 also contributes to the

Table 1: Ambient Air Quality Standards

Pollutant	Averaging Time	California Standards	National Standards [a]	
			Primary [b,c]	Secondary [b,d]
Ozone	8-hour	0.070 ppm	0.075 ppm	—
	1-hour	0.09 ppm	—[e]	Same as primary
Carbon monoxide	8-hour	9.0 ppm	9 ppm	—
	1-hour	20 ppm	35 ppm	—
Nitrogen dioxide	Annual	0.03 ppm	0.053 ppm	Same as primary
	1-hour	0.18 ppm	0.030 ppm	—
Sulfur dioxide	Annual	—	0.03 ppm	—
	24-hour	0.04 ppm	0.14 ppm	—
	3-hour	—	—	0.5 ppm
	1-hour	0.25 ppm	—	—
PM_{10}	Annual	20 µg/m^3	--[f]	Same as primary
	24-hour	50 µg/m^3	150 µg/m^3	Same as primary
$PM_{2.5}$	Annual	12 µg/m^3	15 µg/m^3	
	24-hour	—	35 µg/m^3 [f]	
Lead	Calendar quarter	—	1.5 µg/m^3	Same as primary
	30-day average	1.5 µg/m^3	—	—

a) Standards, other than for ozone and those based on annual averages, are not to be exceeded more than once a year. The ozone standard is attained when the expected number of days per calendar year with maximum hourly average concentrations above the standard is equal to or less than one.
b) Concentrations are expressed first in units in which they were promulgated. Equivalent units given in parenthesis.
c) Primary Standards: The levels of air quality necessary, with an adequate margin of safety to protect the public health. Each state must attain the primary standards no later than 3 years after that state's implementation plan is approved by the EPA.
d) Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.
e) The national 1-hour ozone standard was revoked by U.S. EPA on June 15, 2005. A new 8-hour standard was established in May 2008.The annual PM_{10} standard was revoked by U.S. EPA on September 21, 2006 and a new $PM_{2.5}$ 24-hour standard was established.

Source: California Air Resources Board 2009

formation of PM_{10} (see discussion of PM_{10} below). Monitored levels in the Bay Area are well below ambient air quality standards.

Sulfur Oxides. Sulfur oxides, primarily SO_2, are a product of high-sulfur fuel combustion. The main sources of SO_2 are coal and oil used in power stations, in industries, and for domestic heating. Industrial chemical manufacturing is another source of SO_2. SO_2 is an irritant gas that attacks the throat and lungs. It can cause acute respiratory symptoms and diminished ventilator function in children. Due to the lack of sources, SO_2 is found at low concentrations in the North Bay region.

Suspended Particulate Matter. Respirable particulate matter (PM_{10}), and fine particulate matter ($PM_{2.5}$) consist of particulate matter that is ten microns or less in diameter and 2.5 microns or less in diameter, respectively. PM_{10} and $PM_{2.5}$ represent fractions of particulate matter that can be inhaled and cause adverse health effects. PM_{10} and $PM_{2.5}$ are a health concern, particularly at levels above the federal and State ambient air quality standards. $PM_{2.5}$ (including diesel exhaust particles) is thought to have greater effects on health because minute particles are able to penetrate to the deepest parts of the lungs. Scientific studies have suggested links between fine particulate matter and numerous health problems including asthma, bronchitis, acute and chronic respiratory symptoms such as shortness of breath and painful breathing. Children are more susceptible to the health risks of $PM_{2.5}$ because their immune and respiratory systems are still developing. Very small particles of certain substances (e.g., sulfates and nitrates) can also directly cause lung damage or can contain absorbed gases (e.g., chlorides or ammonium) that may be injurious to health. PM_{10} and $PM_{2.5}$ pose a greater health risk than larger-size particles because these tiny particles can penetrate the human respiratory system's natural defenses and damage the respiratory tract, increasing the number and severity of asthma attacks, cause or aggravate bronchitis and other lung diseases, and reduce the body's ability to fight infections. Whereas larger particles tend to collect in the upper portion of the respiratory system, $PM_{2.5}$ are so miniscule and can penetrate deeper into the lungs and damage lung tissues. Suspended particulates also damage and discolor surfaces on which they settle, as well as produce haze and reduce regional visibility. The U.S. EPA recently adopted a new more stringent standard of 35 $\mu g/m^3$ for 24-hour exposures based on a review of the latest new scientific evidence. At the same time, U.S. EPA revoked the annual PM_{10} standard due to a lack of scientific evidence correlating long-term exposures of ambient PM_{10} with adverse health effects. Most stations in the Bay Area report elevated PM_{10} and $PM_{2.5}$ levels on similar fall/winter days, indicating a regional air quality problem. The primary sources of these pollutants are wood smoke and traffic. Meteorological conditions that are common during this time of the year result in calm winds and strong surface-based inversions that trap pollutants near the surface. The buildup of these pollutants is greatest during the evenings and early morning periods. The high levels of PM_{l0} result in not only health effects, but also reduced visibility.

Particulate matter pollution consists of very small particles suspended in the air, which can include smoke, soot, dust, salts, acids, and metals. Particulate matter also forms when industry and gaseous pollutant undergo chemical reactions in the atmosphere. Respirable particulate matter (PM_{10}) and fine particulate matter ($PM_{2.5}$) represent fractions of particulate matter. PM_{10} refers to particulate matter less than 10 microns in diameter and $PM_{2.5}$ refers to particulate matter that is 2.5 microns or less in diameter. Major sources of $PM_{2.5}$ results primarily from diesel fuel combustion (from motor vehicles, power generation, industrial facilities), residential fireplaces, and wood stoves. PM_{10} include all $PM_{2.5}$ sources as well as emissions from dust generated by construction, landfills, and agriculture; wildfires and brush/waste burning, industrial sources, windblown dust from open lands, and atmospheric chemical and photochemical reactions.

Toxic Air Contaminants (TAC)

Besides the "criteria" air pollutants, there is another group of substances found in ambient air referred to as Hazardous Air Pollutants (HAPs) under the Federal Clean Air Act and Toxic Air Contaminants (TACs) under the California Clean Air Act. These contaminants tend to be localized and are found in relatively low concentrations in ambient air. However, they can result in adverse chronic health effects if exposure to low concentrations occurs for long periods. They are regulated at the local, State, and Federal level.

HAPs are the air contaminants identified by US EPA as known or suspected to cause cancer, serious illness, birth defects, or death. Many of these contaminants originate from human activities, such as fuel combustion and solvent use. Mobile source air toxics (MSATs) are a subset of the 188 identified HAPS. Of the 21 HAPs identified by EPA as MSATs, priority lists of six HAPs were identified that include: diesel exhaust, benzene, formaldehyde, acetaldehyde, acrolein, and 1,3-butadiene. While vehicle miles traveled in the United States is expected to increase by 64 percent over the period 2000 to 2020, emissions of MSATs are anticipated to decrease substantially as a result of efforts to control mobile source emissions (by 57 percent to 67 percent depending on the contaminant)[2].

California developed a program under the Tanner Toxics Act (AB 1807) to identify, characterize and control toxic air contaminants (TACs). Subsequently, AB 2728 incorporated all 188 HAPs into the AB 1807 process. TACs include all HAPs plus other contaminants identified by CARB. These are a broad class of compounds known to cause morbidity or mortality (cancer risk). TACs are found in ambient air, especially in urban areas, and are caused by industry, agriculture, fuel combustion, and commercial operations (e.g., dry cleaners). TACs are typically found in low concentrations, even near their source (e.g., diesel particulate matter near a freeway). Chronic exposure to TACs can result in adverse health effects. Like criteria air pollutants, TACs are regulated at the regional, State, and Federal level.

Particulate matter from diesel exhaust is the predominant TAC in urban air and was estimated to represent about two-thirds of the cancer risk from TACs (based on the statewide average in 2000). According to CARB, diesel exhaust is a complex mixture of gases, vapors and fine particles. This complexity makes the evaluation of health effects of diesel exhaust a complex scientific issue. Some chemicals in diesel exhaust, such as benzene and formaldehyde, have been previously identified as TACs by CARB, and are listed as carcinogens either under State Proposition 65 or under the Federal Hazardous Air Pollutants programs.

CARB reports that recent air pollution studies have shown an association that diesel exhaust and other cancer-causing toxic air contaminants emitted from vehicles are responsible for much of the overall cancer risk from TACs in California. Diesel particulate matter (DPM) emitted by diesel-fueled engines was found to comprise much of that risk. DPM can be distributed over large regions, thus leading to widespread public exposure. The particles emitted by diesel engines are coated with chemicals, many of which have been identified by EPA as HAPs, and by CARB as TACs. Diesel engines emit particulate matter at a rate about 20 times greater than comparable gasoline engines. The vast majority of diesel exhaust particles (over 90 percent) consist of $PM_{2.5}$, which are particles that can be inhaled deep into the lung. Like other particles of this size, a portion will eventually become trapped within the lung possibly leading to adverse health effects. While the gaseous portion of diesel exhaust also contains TACs, CARB's 1998 action was specific to DPM, which accounts for much of the cancer-causing potential from diesel exhaust. California has adopted a comprehensive diesel risk reduction program to reduce DPM

[2] Federal Highway Administration, 2006. Interim Guidance on Air Toxic Analysis in NEPA Documents.

emissions 85 percent by 2020. The U.S. EPA and CARB adopted low sulfur diesel fuel standards in 2006 that reduce diesel particulate matter substantially.

Smoke from residential wood combustion can also be a source of TACs. Wood smoke is typically emitted during wintertime when dispersion conditions are poor. Localized high TAC concentrations can result when cold stagnant air traps smoke near the ground and, with no wind; the pollution can persist for many hours, especially in sheltered valleys during winter. Wood smoke also contains a significant amount of PM_{10} and $PM_{2.5}$. Wood smoke is an irritant and is implicated in worsening asthma and other chronic lung problems.

Air Pollution Potential

The clear skies with relatively warm conditions that are typical in summer combine with localized air pollutant emissions to elevate O_3 levels. Air quality standards for O_3 traditionally are exceeded when relatively stagnant conditions occur for periods of several days during the warmer months of the year. Weak wind flow patterns combined with strong inversions substantially reduces normal atmospheric mixing. Key components of ground-level O_3 formation are sunlight and heat; therefore, significant O_3 formation only occurs during the months from late spring through early fall. Air pollution potential in the project area is not as high as other parts of the Bay Area because winds generally do not transport enough of the precursor pollutants into that area (highest concentrations occur at monitoring stations in the eastern and southern portions of the Bay Area that are usually downwind of the major urban areas). However, pollutants emitted in the Santa Rosa area can be transported down-wind and contribute to air quality problems in those areas. Light winds that are common in winter combine with strong surface-based inversions, caused by cold air trapped near the surface, to trap pollutants such as particulates (e.g., wood smoke) and carbon monoxide. This can lead to localized high concentrations of these pollutants.

Air Monitoring Data

The BAAQMD monitors air quality conditions at over 30 locations throughout the Bay Area. The Santa Rosa Monitoring Station on Fifth Street is closest and most representative of the project site. Criteria pollutants monitored include O_3, CO, NO_2, hydrocarbons, PM_{10}, and $PM_{2.5}$. The gaseous pollutants (i.e., O_3, CO and NO_2) are monitored continuously while particulate matter (i.e., PM_{10} and $PM_{2.5}$) are sampled for 24-hours every sixth day. A summary of the data recorded at this station is shown in **Table 2** for the period 2003 through 2007

Table 3 shows the number of days per year that air pollutant levels exceeded national or state standards in Santa Rosa and the entire Bay Area monitoring network. No exceedances of the NAAQS for O_3 (1- or 8-hour concentrations) were recorded at this station. Measured concentrations of CO and NO_2 did not exceed the NAAQS or CAAQS. However, measured concentrations of O_3 and PM_{10} exceeded the State standards during the 5-year period. The State standard for O_3 was exceeded on one day in 2003. The State standard for PM_{10} was exceeded on two sampling days in 2006. There was one exceedance of the NAAQS for $PM_{2.5}$ in 2006. Both PM_{10} and PM2.5 are sampled once every 6 days in Santa Rosa, so the PM_{10} standard was estimated to be exceeded about 12 days in 2006 and exceedances of the $PM_{2.5}$ standard were estimated at 6 days.

Data from all stations throughout the Bay Area indicate that the national ambient air quality standard for 8-hour O_3 concentrations was exceeded 0 to 12 days annually. The more stringent State 1-hour O_3 standard was exceeded on 7 to 19 days annually and the recent 8-hour O3 standard was exceeded on 9 to 22 days annually. The State PM_{10} standard was exceeded on 6 to 15 sampling days annually and the new $PM_{2.5}$ national standard was exceeded on 10 to 14 days annually.

Table 2 Highest Measured Air Pollutant Concentrations

Pollutant	**Average Time**	**Measured Air Pollutant Levels**				
		2003	**2004**	**2005**	**2006**	**2007**

Attainment Status for State and Federal Ambient Air Quality Standards

Areas that do not violate ambient air quality standards are considered to have attained the standard. Violations of ambient air quality standards are based on air pollutant monitoring data and are judged for each air pollutant. The Bay Area as a whole does not meet State or federal ambient air quality standards for ground level O_3 and State standards for particulate matter (both PM_{10} and $PM_{2.5}$). Recently (December 2008) EPA designated the entire Bay Area as nonattainment for the 24-hour $PM_{2.5}$ NAAQS. Violations of the NAAQS at the Vallejo and San Jose stations prompted this action. The final EPA order formally designating the Bay Area as nonattainment with the federal $PM_{2.5}$ standard becomes effective in April 2009. The Bay Area will then have until April 2012 to develop a plan for meeting the standard and will have until April 2014 to achieve compliance with the standard.

Under the Federal CAA, the U.S. EPA has classified the region as marginally nonattainment for the 1997 8-hour ozone standard. U.S. EPA required the region to attain the standard by 2007. The U.S. EPA determined that the Bay Area has met this standard, but a formal redesignation request and maintenance plan would have to be submitted before formal redesignation could be made. In May 2008, U.S. EPA lowered the 8-hour ozone standard from 0.08 to 0.075 ppm. Final designations based upon the new 0.075 ppm standard will be made by March 2010. The Bay Area has met the federal CO standards for over a decade and is classified attainment maintenance by the U.S. EPA. The U.S. EPA grades the region unclassified for all other air pollutants, which includes PM_{10}.

At the State level, the region is considered *serious non-attainment* for ground level O_3 and *non-attainment* for PM_{10} and $PM_{2.5}$. As noted earlier, California ambient air quality standards are more stringent than the national ambient air quality standards. The region is required to adopt plans on a triennial basis that show progress towards meeting the State O_3 standard. The area is considered attainment or unclassified for all other pollutants. While plans to reduce particulate matter are not required under the California CAA, the BAAQMD proposes to address these pollutants in the next Clean Air Plan update.

Air Quality Regulations

The Federal Clean Air Act governs air quality in the United States. In addition to being subject to federal requirements, air quality in California is also governed by more stringent regulations under the California Clean Air Act. At the Federal level, the United States Environmental Protection Agency (US EPA) administers the Clean Air Act (CAA). The California Clean Air Act is administered by the California Air Resources Board (CARB) at the State level and by the Air Quality Management Districts at the regional and local levels. The Bay Area Air Quality Management District (BAAQMD) regulates air quality at the regional level, which includes much of the nine-county Bay Area.

United States Environmental Protection Agency The USEPA is responsible for enforcing the Federal CAA. The USEPA is also responsible for establishing the National Ambient Air Quality Standards (NAAQS). The NAAQS are required under the 1977 CAA and subsequent amendments. The USEPA regulates emission sources that are under the exclusive authority of the federal government, such as aircraft, ships, and certain types of locomotives. The agency has jurisdiction over emission sources outside state waters (e.g., beyond the outer continental shelf) and establishes various emission standards, including those for vehicles sold in states other than California. Automobiles sold in California must meet the stricter emission standards established by the CARB.

California Air Resources Board The CARB, part of the California Environmental Protection Agency, is responsible for meeting the state requirements of the Federal CAA, administering the California CAA, and establishing the California Ambient Air Quality Standards (CAAQS). The California CAA, as amended in 1992, requires all air districts in the State to endeavor to achieve and maintain the California Ambient Air Quality Standards (CAAQS). The CAAQS are more stringent than the corresponding federal standards and incorporate additional standards for sulfates, hydrogen sulfide, vinyl chloride and visibility reducing particles. The CARB regulates mobile air pollution sources, such as motor vehicles. The agency is responsible for setting emission standards for vehicles sold in California and for other emission sources, such as consumer products and certain off-road equipment. The CARB established passenger vehicle fuel specifications, which became effective on March 1996. The CARB oversees the functions of local air pollution control districts and air quality management districts, which in turn administer air quality activities at the regional and county level. The CARB also monitors ambient air quality throughout the State.

Bay Area Air Quality Management District In 1955, the California Legislature created the Bay Area Air Quality Management District (BAAQMD). The agency is primarily responsible for assuring that the National and State ambient air quality standards are attained and maintained in the Bay Area. The BAAQMD is also responsible for adopting and enforcing rules and regulations concerning air pollutant sources, issuing permits for stationary sources of air pollutants, inspecting stationary sources of air pollutants, responding to citizen complaints, monitoring ambient air quality and meteorological conditions, awarding grants to reduce motor vehicle emissions, conducting public education campaigns, as well as many other activities. The BAAQMD does not have authority to regulate emissions from motor vehicles.

Air Quality Planning

The BAAQMD and other agencies prepare clean air plans in response to the State and Federal Clean Air Acts. The City of Santa Clara also includes General Plan policies that encourage development that reduces air quality impacts. In addition, BAAQMD has developed CEQA Guidelines to assist local agencies in evaluating and mitigation air quality impacts.

Regional Clean Air Plans

2001 Ozone Attainment Plan

The Bay Area 2001 Ozone Attainment Plan was prepared by BAAQMD, the Metropolitan Transportation Commission (MTC), and the Association of Bay Area Governments (ABAG). This plan is a proposed revision to the Bay Area’s part of the State Implementation Plan, or SIP to achieve the NAAQS for the 1-hour ozone standard. The plan was prepared in response to US EPA's partial approval and partial disapproval of the Bay Area's 1999 Ozone Attainment Plan. Although the U.S. EPA revoked the 1-hour NAAQS, commitments made in that plan along with emissions budgets remain valid until the region develops an attainment demonstration/maintenance plan for the 8-hour NAAQS for ozone. The U.S. EPA has determined that the region met the 1997 8-hour ozone standard. However, the region will be required to submit a maintenance plan and demonstration of attainment with a request for redesignation to U.S. EPA when the 8-hour ozone NAAQS is met. BAAQMD will likely not act on this submittal for a few years. In addition, the U.S. EPA’s new, slightly more stringent, 8-hour standard was recently established. The U.S. EPA will be making new attainment designations based on that standard in about 3 years and eventually revoking the older standard. A Carbon Monoxide Maintenance Plan was approved in 1998 by EPA, which demonstrated how NAAQS for carbon monoxide standard would be maintained.

1991 Clean Air Plan

In 1991, BAAQMD, MTC and ABAG prepared the Bay Area 1991 Clean Air Plan or CAP. This air quality plan addresses the California Clean Air Act. Updates are developed approximately every three years. The plans are meant to demonstrate progress toward meeting the more stringent 1-hour ozone CAAQS. The latest update to the plan, which was adopted in January 2006, is called the *Bay Area 2005 Ozone Strategy*. This plan includes a comprehensive strategy to reduce emissions from stationary, area, and mobile sources. The plan objective is to indicate how the region would make progress toward attaining the stricter state air quality standards, as mandated by the California Clean Air Act. The plan is designed to achieve a region-wide reduction of ozone precursor pollutants through the expeditious implementation of all feasible measures. The plan proposes expanded implementation of transportation control measures (TCMs) and programs such as Spare the Air. Spare the Air is a public outreach program designed to educate the public about air pollution in the Bay Area and promote individual behavior changes that improve air quality. Some of these measures or programs rely on local governments for implementation. An update to the plan is currently being developed and should be available by 2009.

PM_{10} and $PM_{2.5}$ Plans

The clean air planning efforts for ozone will also reduce PM_{10} and $PM_{2.5}$, since a substantial amount of this air pollutant comes from combustion emissions such as vehicle exhaust. In addition, BAAQMD adopts and enforces rules to reduce particulate matter emissions and develops public outreach programs to educate the public to reduce PM_{10} and $PM_{2.5}$ emissions (e.g., Spare the Night Program). SB 656 requires further action by CARB and air districts to reduce public exposure to PM_{10} and $PM_{2.5}$. Efforts identified by BAAQMD in response to SB656 are primarily targeting reductions in wood smoke emissions and adoption of new rules to further reduce NOx and particulate matter from internal combustion engines and reduce particulate matter from commercial charbroiling activities. BAAQMD recently adopted a rule addressing residential wood burning. The rule restricts operation of any indoor or outdoor fireplace, fire pit, wood or pellet stove, masonry heater or fireplace insert on specific days during the winter when air quality conditions are forecasted to exceed the NAAQS for $PM_{2.5}$. The rule would also limits excess visible emissions from wood burning devices and require clean burning technology for wood burning devices sold (or resold) or installed in the Bay Area. NOx emissions contribute to ammonium nitrate formation that resides in the atmosphere as particulate matter, so a reduction in NOx emissions would reduce wintertime $PM_{2.5}$ levels. The Bay Area experiences the highest PM_{10} and $PM_{2.5}$ in winter when wood smoke and ammonium nitrate contributions to particulate matter are highest.

Sonoma County General Plan

The Open Space and Resource Conservation Element of the Sonoma County General Plan 2020 has the following goals, objectives and policies pertaining to this project and air quality:

Goal: OSRC-16 Preserve and maintain good air quality and provide for an air quality standard that will protect human health and preclude crop, plant and property damage in accordance with the requirements of the Federal and State Clean Air Acts.

Objective OSRC-16.1: Minimize air pollutant and greenhouse gas emissions.

Objective OSRC-16.2: Encourage reduced motor vehicle use as a means of reducing resultant air pollution.

The following policies, in addition to those of the Circulation and Transit Element, shall be used to carry out these objectives:

> **Policy OSRC-16a:** Require that commercial and industrial development projects be designed to minimize air emissions. Reduce direct emissions by decreasing the need for space heating.
>
> **Policy OSRC-16c:** Refer projects to the local air quality districts for their review.
>
> **Policy OSRC-16d:** Review proposed changes in land use designations for potential deterioration of air quality and deny them unless they are consistent with the air quality levels projected in the general plan EIR.
>
> **Policy OSRC-16h:** Require that development within the Bay Area Air Quality Management District that generates high numbers of vehicle trips, such as shopping centers and business parks, incorporate air quality mitigation measures in their design.
>
> **Policy OSRC-16i:** Ensure that any proposed new sources of toxic air contaminants or odors provide adequate buffers to protect sensitive receptors and comply with applicable health standards. Promote land use compatibility for new development by using buffering techniques such as landscaping, setbacks, and screening in areas where such land uses abut one another.
>
> **Policy OSRC-16k:** Require that discretionary projects involving sensitive receptors (facilities or land uses that include members of the population sensitive to the effects of air pollutants such as children, the elderly, and people with illnesses) proposed near the Highway 101 corridor include an analysis of mobile source toxic air contaminant health risks. Project review should, if necessary, identify design mitigation measures to reduce health risks to acceptable levels.

Applicable BAAQMD Rules and Regulations

The BAAQMD regulates air quality in the southern portion of Sonoma County where the project will be located. Certain stationery and area emission sources are subject to BAAQMD Regulations and Rules. Mobile sources, both off-and on-road are not subject to BAAQMD authority. The District's rules and regulations that may apply to the proposed hospital facility are described below.

- Permitting Rule 2-1-301 requires that any person installing, modifying, or replacing any equipment, the use of which may reduce or control the emission of air contaminants, shall first secure written authorization from the Air Pollution Control Officer (APCO). Equipment that may require permitting includes the boiler, cooling tower, chillers, and diesel-fueled emergency generator. Rule 2-1-302 requires that written authorization from the APCO be secured before any such equipment is used or operated.

- New Source Review Rule 2-2, New Source Review (NSR), applies to all new and modified sources or facilities that are subject to the requirements of Rule 2-1-301. The purpose of the rule is to provide for review of such sources and to provide mechanisms by which no net increase in emissions will result.

- Best Available Control Technology Rule 2-2-301 requires that an applicant for an Authority to Construct (ATC) or Permit to Operate (PTO) apply best available control technology (BACT) to any new or modified source that results in an increase in emissions and has emissions of precursor organic compounds, non-precursor organic compounds, NO_x, SO_2, PM_{10}, or CO of 10.0 pounds or more per highest day.

- Equipment Specific Requirements Both the boiler and emergency generator would be to equipment-specific requirements.

  - *Boiler Requirements* - The boiler will be subject to Rule 9-7, Nitrogen Oxides and Carbon Monoxide From Industrial, Institutional, and Commercial Boilers, Steam Generators, and Process Heaters, which applies to boilers and other equipment with a rated heat input of 10 million Btus per hour (MMBtu) or greater. The rule includes minimum emission limits for NO_x and CO to be met, as well as monitoring, record keeping and reporting requirements. The boiler would also be subject to the federal New Source Performance Standards (NSPS) for boilers, which have been adopted by the BAAQMD under Regulation 10, Standards of Performance for New Stationary Sources.

  - *Diesel Fueled Engines* – Rule 9-8, Nitrogen Oxides and Carbon Monoxide From Stationary Internal Combustion Engines, includes NO_x and CO emission limits for internal combustion engines, as well as operating, monitoring, record keeping, and reporting requirements for emergency generators. In addition to Rule 9-8, diesel-fueled engines that emit diesel exhaust particulate matter are subject to the District's Risk Management Policy for Diesel-Fueled Engines in addition to the standard permitting requirements. The applicant must demonstrate through air dispersion modeling that the diesel exhaust particulate matter would not cause a significant health risk. The acceptable health risk is an increased cancer risk of one in one million (1×10^{-6}), unless the engine used Best Available Control Technology for Toxics (TBACT), in which case the acceptable risk is 10 in one million (10×10^{-6}).

- Prohibitory Rules - Regulation 6 pertains to particulate matter and visible emissions and limits the quantity of particulate matter emitted into the atmosphere through the establishment of limitations on emission rates, concentration, visible emissions, and opacity. Visible emissions from a source are required to be less than 20% opacity (No. 1 Ringelmann) for any period aggregating to 3 minutes in any one hour. Additionally, for heat transfer operations (e.g., the boiler), the particulate matter emissions are not to exceed 0.15 grains per dry standard cubic foot, corrected to 6% oxygen. Although, the engine for the emergency generator will be fired with diesel fuel, the BAAQMD will require that the engine be a modern, low emissions engine, and is not expected to exceed the opacity limit. For the boiler, since it will be fired on natural gas, no visible emissions are expected and particulate matter emissions will be negligible.

Specific requirements, including emission control technology requirements and emission limitations, as well as operating, monitoring, record keeping, and reporting requirements for the equipment that need to be permitted by the BAAQMD would be determined during the permitting process prior to installation of the applicable equipment. Compliance with BAAQMD permit requirements would ensure that individual impacts from stationary sources of air pollutants would be less than significant.

IMPACTS AND MITIGATION

Air Quality. Would the project result in:	**Potentially Significant Impact**	**Less Than Significant With Mitigation Incorporation**	**Less Than Significant Impact**	**No Impact**
A. Conflict with or obstruct implementation of the applicable air quality plan?	☐	☐	☑	☐

The Bay Area Air Quality Management District (BAAQMD) is the regional agency responsible for overseeing compliance with State and Federal laws, regulations, and programs within the San Francisco Bay Area Air Basin. The BAAQMD has prepared and/or implements specific plans to meet the applicable laws, regulations, and programs. The Bay Area 2005 Ozone Strategy is the latest adopted plan (adopted in January 2006). This plan describes the Bay Area's strategy for compliance with State one-hour ozone standard planning requirements. The BAAQMD has also developed CEQA guidelines to assist lead agencies in evaluating the significance of air quality impacts.

In formulating compliance strategies, the BAAQMD relies on planned land uses established by local general plans. When a project proposes to change planned uses, by requesting a general plan amendment (GPA), the project may depart from the assumptions used to formulate clean air plan strategies in such a way that the cumulative result of incremental changes may hamper or prevent the Plan from achieving the goals. This is because land use patterns influence transportation needs, and motor vehicles are the primary source of air pollution. Projects proposed in jurisdictions with general plans that are consistent with the BAAQMD's *Clean Air Plan* and projects that conform to the applicable general plan would not have significant cumulative impacts. The BAAQMD's Clean Air Plan also contains a list of transportation control measures that are intended to reduce emissions from vehicles travel. Among this list are 7 measures that the BAAQMD relies on local jurisdictions such as the County to implement through General Plan policies. The County is currently updating the General Plan. This update would include new projections and policies to address regional air quality concerns and Clean Air Plan transportation control measures.

This project is anticipated to serve the needs of forecasted population growth in the region. Both the current General Plan and the zoning allow for the proposed development and land use. An amendment to the Sonoma County General Plan is being requested as part of the project to include the site within the Urban Service Boundary. Development of the project is not anticipated to interfere with population projections used in Clean Air Plans.

The project includes modifications to the U.S. 101 off ramp to Mark West Springs Road. Consultation would be required with Caltrans to identify whether or not the project would be exempt from regional air quality conformity analysis. If the project is not exempt from regional conformity, then it would have to be included in the MTC's latest Regional Transportation Improvement Program (TIP) that would be required to be found to conform with the State Implementation Plan. A local air quality conformity analysis would likely be necessary, because the project is adding capacity the off-ramp. That analysis would address hot-spot CO impacts at localized intersections and qualitatively address PM_{10}, $PM_{2.5}$, mobile source air toxics (MSAT) impacts. This analysis would be subject to Caltrans review.

Air Quality. Would the project result in:	**Potential Significant Impact**	**Less Than Significant Impact With Mitigation Incorporation**	**Less Than Significant Impact**	**No Impact**
B. Violate any air quality standard or contribute substantially to an existing or projected air quality violation?	☐	☐	☑	☐

Carbon monoxide emissions from traffic generated by the project would be the pollutant of greatest concern at the local level. The intersection of Mark West Springs Road and Old Redwood Highway would be most affected by project traffic that could lead to the highest carbon monoxide concentrations at sensitive receptors (i.e., residences). Congested intersections with a large volume of traffic have the greatest potential to cause high-localized concentrations of carbon monoxide. Carbon monoxide concentrations would be the highest at this interchange. There are 1- and 8-hour standards for carbon monoxide. The 8-hour standard is the most stringent and historically has always been exceeded if the 1-hour standard is exceeded. Therefore, this analysis evaluated impacts against the 8-hour standard.

Carbon monoxide concentrations were modeled using screening methods recommended by the BAAQMD that are based on the Caline4 Line-Source dispersion model. This method uses traffic volumes, emissions, meteorology, and the roadway/receptor geometry. For this assessment, meteorological conditions most conducive for high carbon monoxide concentrations in the Bay Area, peak-hour traffic conditions (i.e., evening period), slow traffic speeds and emission factors generated by the California Air Resources Board emission factor model (i.e., EMFAC2002) were used as input to the model. Modeled concentrations were added to background levels to predict total carbon monoxide concentrations. This assessment was conducted for existing conditions (2008) and both background build-out with and without the project conditions for 2014. Results of this assessment, shown in Table 5, indicate that carbon monoxide conditions would remain below ambient air quality standards. Assumptions used for the prediction of project-related carbon monoxide concentrations are provided in the Attachment.

Table 5. Predicted 8-Hour Worst Case Carbon Monoxide Levels (in PPM)

Description	**2008 Existing**	**2014 No Project**	**2014 with Project (Ph. I & II)**
Mark West Springs Road and Old Redwood Highway	4.4 ppm	4.4 ppm*	4.4 ppm*
Significance Thresholds (CAAQS)	*9.0 ppm for 8-hour exposure*		

* Emission rates are anticipated to decrease by about 45 percent between 2008 and 2014, resulting in much lower CO levels.

Air Quality. Would the project result in:	**Potential Significant Impact**	**Less Than Significant Impact With Mitigation Incorporation**	**Less Than Significant Impact**	**No Impact**
C. Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?	☑	☐	☐	☐

The Bay Area is considered a non-attainment area for ground-level ozone and $PM_{2.5}$ under both the federal Clean Air Act and the California Clean Air Act. The area also considered non-attainment for respirable particulates or particulate matter with a diameter of less than 10 micrometers (PM_{10}) under the California Clean Air Act, but not the federal act. The area has attained both State and federal ambient air quality standards for carbon monoxide. The area is considered to be in attainment for all other regulated air pollutants (i.e., nitrogen dioxide, sulfur dioxide and lead). Attainment means the region normally does not violate air quality standards. In an effort to attain and maintain ambient air quality standards for ozone and PM_{10}, the BAAQMD has established thresholds of significance for evaluating direct and indirect emissions of air pollutants from projects. These thresholds are for ozone precursors (reactive organic gases and nitrogen oxides) and PM_{10}. There are no thresholds for $PM_{2.5}$; however, the PM_{10} thresholds would include $PM_{2.5}$.

The primary sources of air pollutant emissions from the project include indirect emissions from traffic, area-source emissions (e.g., natural gas usage and landscaping), natural gas fired boilers for steam generation, and emissions associated with daily testing of an emergency generator. Emissions associated with helicopter operations were not expected to change with the project.

Project-related emissions of air pollutants from traffic and area sources were predicted using the URBEMIS2007 model (Version 9.3), which is approved for use by the BAAQMD. This model predicts daily emissions associated with land use developments. The model combines predicted daily traffic activity, associated with the different land use types, with emission factors from the State's mobile emission factor model (i.e., EMFAC2007). Dowling and Associates provided trip generation. Assumptions used for predicting project-related emissions of air pollutants that affect the region are provided in the Attachment.

Build out of the project would result in the construction or modification of stationary air pollutant sources that are not properly accounted for in the URBEMIS 2007 modeling. Stationary sources identified at this design phase include natural-gas fired boilers and two 1500-kilowatt Standby Generator Set. The boilers would be fired by natural gas and the generator sets would use diesel fuel. These sources would be subject to BAAQMD permit requirements. Overall, these sources would result in minor emissions, compared to those from traffic generation reported above.

ROG, NOx, and PM_{10} emissions from the boilers are included as part of the natural gas consumption emissions. The applicants Engineer provided estimated annual natural gas consumption rates. Emission factors for natural gas used by the URBEMIS2007 model were applied to these usage rates to develop daily and annual emissions. Separate emissions for the boilers were not computed. The calculations provided in this assessment would over predict the emissions, since emission standards, specified by BAAQMD regulations, would likely apply to these boilers.

Emergency generator emissions, including diesel particulate matter (DPM), were computed for two Caterpillar 1250kw Generator Set. These emissions are based on the manufacturer data at 100% load. A testing schedule of 5 minutes per week, ½ hour each month and annual testing on one day for eight hours (18.3 hours per year operation) was assumed for these calculations.

The BAAQMD CEQA Guidelines do not recommend quantification of construction period emissions because these emissions are temporary and construction equipment is considered to be included in the regional air pollutant emissions inventories that are the basis of regional attainment plans. The BAAQMD does not have thresholds for construction emissions. However, haul trips to import the estimated 100,000 cubic yards of fill are considered to be non-standard construction activities. Emissions from haul trucks trips were calculated using travel estimates and emission factors from the EMFAC2007 model.

Project Phasing

The project would be constructed in several phases over the next 5 years or longer. Each phase is described below.

Phase I

Site grading and preparation would occur under Phase I.

Phase II

Under Phase II, the project would relocate hospital facilities to the project site. This would result in changes in traffic patterns that would affect air pollution emissions. The primary sources of new air pollutant emissions to the region from Phase II of the hospital portion of the project would be increased travel distances to the new hospital facility, emissions from testing of an emergency generator system (required by State law), and areas source emissions such as natural gas emissions from space and water heating. Emissions for Phase II were calculated for 2014, the earliest date of operation.

Phase III

This phase may include future expansion of the Sutter hospital by 29 beds and expansion to the Luther Burbank Memorial Foundation with internal renovation of the Person Theatre.

Project-Related Emissions

Modeled project emission sources include daily haul truck traffic, natural gas combustion on site for space and water heating (including boiler gas consumption), area sources that include landscape equipment, routine testing of emergency generators, and mobile sources. Project direct and indirect emissions were calculated and are included as Attachment 1 to this report.

Phase I - Haul Truck Trips

About 100,000 cubic yards of fill maybe imported to the site. Estimates include about 200 loads of material would be brought to the site per day for a total of about 50 days or 8,695 trips. Each load would include two trips: one in and one out. Sources of fill material have been identified within a 15-mile travel distance of the site. For this analysis, trip lengths of 15 miles at 35 miles per hour were assumed for haul trips. The PM_{10} gram per mile exhaust emission rate was estimated using the EMFAC2007 model for heavy-heavy-duty trucks for the year 2010. Travel activity and emission rates were combines to estimate daily air pollutant emissions during this activity. Truck haul emissions are reported in **Table 6**. Assuming all haul trips are conducted in 2010, annual emissions from this activity would not exceed the annual thresholds established by the BAAQMD. However, daily emissions from this activity would exceed thresholds for NOx and PM_{10}. The NOx emissions would be associated with vehicle exhaust, while most of the PM_{10} emissions would be associated with entrained dust from truck travel. Although temporary (about 50 days), the daily emissions associated with haul truck trips would be considered significant.

Table 6. Project Emissions from Haul Truck Trip Activity

Scenario	**Modeled Emissions in pounds per day and tons per year**		
	Reactive Organic Gases (ROG)	**Nitrogen Oxides (NOx)**	**Respirable Particulates (PM_{10})**
Daily Haul Trips (200)	18 pounds	240 pounds	240 pounds
2010 Annual Haul Trips	0.33 tons	4.27 tons	4.28 tons
BAAQMD Thresholds	*80 pounds per day and 15 tons per year*		

Phase II Build-Out Hospital/Medical Office Building Operation

Operation of the project would include onsite emissions and traffic-related emissions from activity associated with the new hospitals and medical office building. The future uses of the existing hospital facilities, which are being replaced with this project, are unknown at this time. Therefore, this analysis assumed that the hospital related emissions at the project site would be new to the region. The one exception was the emissions associated with helicopter flights, since helicopter operations would be moved from the current facilities to the project site. It is unlikely that future uses of the current hospital facilities would be as intensive, so this analysis represents a credible worst-case scenario.

Area sources from Phase II build out of the proposed project were predicted using the URBEMIS2007 and computing emissions from natural gas consumption. The URBEMIS2007 modeling did not include natural gas consumption. Since only annual natural gas consumption rates were provided, emissions were averaged over the entire year (i.e., daily consumption was the annual consumption divided by 365 days).

Projected trip generation (i.e., 4,584 daily trips) along with the project land use types and sizes were input to the URBEMIS2007 model. Emissions were computed for a summer day and annually. Build out of the project was anticipated to occur in 2014 at the earliest. The year of analysis is important to consider when modeling vehicle emissions. The vehicle emission rates for ROG and NOx are currently decreasing with each year and are predicted to decrease substantially between 2010 and 2020. For instance, NOx emission rates will decrease by 56 percent during that period because of improvements in vehicle emissions and retirement of older, more polluting, vehicles from the roadways.

Daily emissions from typical operation of the hospital are reported in **Table 7**. The typical daily operation of the hospital facilities and medical office building built out in Phase II would have daily emissions that are below the BAAQMD significance thresholds. Typical operation of the proposed project would have *less than significant* daily emissions.

Table 7. Phase II Daily Operation Emissions

	Modeled Emissions in pounds per day		
Scenario	**Reactive Organic Gases (ROG)**	**Nitrogen Oxides (NOx)**	**Respirable Particulates (PM_{10})**
Area Sources	**3 pounds**	**10 pounds**	**<1 pounds**
Mobile Sources	**29 pounds**	**31 pounds**	**32 pounds**
Total	32 pounds	41 pounds	32 pounds
BAAQMD Thresholds	*80 pounds per day and 15 tons per year*		

Phase III – Possible Expansion of Sutter Hospital

In Phase III, Sutter could expand the hospital by 29 beds. This would then include a total of 241,000 square feet of hospital space (includes both Sutter and Physicians Medical Center). Emissions with full build out of the project, as defined in Phase III, was also modeled with URBEMIS2007. Full build-out of Phases I through III was anticipated for 2014. Emissions are reported in Table 8.

Table 8. Phase III Daily Operation Emissions

Scenario	Modeled Emissions in pounds per day		
	Reactive Organic Gases (ROG)	**Nitrogen Oxides (NOx)**	**Respirable Particulates (PM_{10})**
Area Sources	**3 pounds**	**10 pounds**	**<1 pounds**
Mobile Sources	**31 pounds**	**34 pounds**	**35 pounds**
Total	34 pounds	44 pounds	35 pounds
BAAQMD Thresholds	*80 pounds per day and 15 tons per year*		

<u>Phase II Build-Out with Generator Testing</u>

The hospital facilities would require diesel-powered generators to provide electrical power to the hospitals during power outages. These generators must be tested routinely. The proposed schedule for testing would be 5 minutes each week, 30 minutes each month, and 8-hours each year. Emissions associated with operation of both generators during each of the three types of testing are reported in Table 8. Since normal hospital and medical office building would occur simultaneously on days with testing, those emissions were added to the generator testing emissions. Annual emissions associated with the project and generator testing are also reported.

Under a worst-case future scenario reported in Table 9, the hospital would be operating under normal weekday conditions and the generators would be tested. Normal project operation with testing of the generators for either 5 minutes or 30 minutes per day would result in emissions that would be below the BAAQMD daily thresholds of 80 pounds per day. When the generators are tested once annually for 8 hours, NOX emissions would exceed the BAAQMD daily thresholds; and therefore, be considered significant. However, annual emissions from the proposed project that include all sources operating in 2014 (including generator testing) would not exceed the BAAQMD annual significance thresholds.

Summary of Emission Affecting Regional Air Quality

Emissions shown above indicate that the project would have a potentially significant impact on regional air quality. This would occur in 2010 during Phase I when haul trucks import material to the site. NOx emissions from this activity would exceed both NOx and PM_{10} emission thresholds. This would result in a temporary significant impact to regional air quality.

Normal project operation beginning in 2014 would have daily and annual emissions that are less than the BAAQMD thresholds. Emissions of NOx would exceed these thresholds on one day per year when generators are tested for 8 hours. NOx is a precursor pollutant that aids the formation of ground-level ozone or smog. Ozone formation is greatest during the late spring, summer and early fall when temperatures are warm and there is abundant sunshine to also aid in smog formation. As a result, the Bay Area experiences unhealthy levels of ozone during the months May through October. During this ~180-day period, there is an exceedance of the State ozone standard somewhere in the Bay Area on about 9 to 22 days. Fortunately, exceedances in the North Bay region have been rare. However, in some wind patterns, emissions from the North Bay Area can be transported to eastern or southern portions of the Bay Area and contribute to those measured exceedances. Testing of the generators for more than one hour per day during the months May through October would be *significant*.

The BAAQMD has not identified emission thresholds for $PM_{2.5}$. Project emissions were calculated and are contained in Attachment 1. It should be noted that BAAQMD's emission threshold for PM_{10} is based on the State PM_{10} standard of 50 µg/m^3. The new federal $PM_{2.5}$ standard is 35 µg/m^3, which is about 70% of the PM_{10} standard. Maximum daily emissions of $PM_{2.5}$ are predicted at 9.7 pounds per day, which is only 12% of the BAAQMD's PM_{10} threshold. While there is no established emission threshold for PM2.5, comparison of project $PM_{2.5}$ to PM_{10} emissions indicate that these emissions would be less-than-significant.

Table 9. Phase III Operational Emissions with Generator Testing

	Modeled Emissions in pounds per day and tons per year		
Scenario	**Reactive Organic Gases (ROG)**	**Nitrogen Oxides (NOx)**	**Respirable Particulates (PM_{10})**
5-minute Generator Test (once per week)	**<1 pounds**	**4 pounds**	**<1 pounds**
Operation Sources	34 pounds	44 pounds	35 pounds
Total	34 pounds	49 pounds	35 pounds
30-minute Generator Test (once per month)	**<1 pounds**	**24 pounds**	**<1 pounds**
Operation Sources	34 pounds	44 pounds	35 pounds
Total	34 pounds	68 pounds	35 pounds
8-hour Generator Test (once annually)	**9 pounds**	**387 pounds**	**2 pounds**
Operation Sources	34 pounds	44 pounds	35 pounds
Total	43 pounds	**431 pounds**	37 pounds
Total Annual Emissions	6.5 tons	9.3 tons	6.4 tons
BAAQMD Thresholds	*80 pounds per day and 15 tons per year*		

Mitigation Measure 1: Measures to reduce haul truck trips

The following measures could reduce emissions associated with haul truck trips to the project site.

a) Preference for material to be imported to the site should be given to sources closest to the project site;

b) Enforce state idling restrictions that apply to large trucks and construction equipment by posting clearly visible signs at the haul truck entrances that clearly stating the restrictions and fines;

c) If possible, avoid haul truck trips on days when Spare the Air Days are forecasted by the BAAQMD.

Because the source of the fill material and schedule for importing fill cannot be determined at this time, the effectiveness is unknown and therefore, the impact would be considered *significant and unavoidable*.

Mitigation Measure 2: Generator Testing Schedule

Testing of the diesel generators for more than one hour per day should not occur during the months may through October, to ensure that these emissions would not contribute to exceedances of State ozone standards in the region.

Mitigation Measure 3: Ensure compliance with BAAQMD Rules and Regulations

Some mechanical equipment used at the proposed hospital would require permits from the BAAQMD. The applicants should be responsible for consulting with the BAAQMD to ensure compliance with appropriate rules and regulations so that emissions are properly controlled and do not exceed levels reported in this analysis.

Mitigation Measure 4: Reduce air pollutant emissions on Spare the Air Days

The Hospital administrators shall sign up with the BAAQMD to receive Spare the Air notifications and make attempts to avoid scheduling generator testing on these days. In addition, Hospital and office building staffs should be informed of the Spare the Air Days so that they may voluntarily reduce emissions through carpooling, using transit or other means.

Air Quality. Would the project result in:	Potential Significant Impact	Less Than Significant Impact With Mitigation Incorporation	Less Than Significant Impact	No Impact
D. Expose sensitive receptors to substantial pollutant concentrations?	☐	☑	☐	☐

Construction Dust

During demolition, grading and construction activities, dust would be generated. Most of the dust would result during grading activities. The amount of dust generated would be highly variable and is dependent on the size of the area disturbed, amount of activity, soil conditions and meteorological conditions. Typical winds during late spring through summer are from the west-southwest. Nearby residences could be adversely affected by dust generated during construction activities.

Although grading and construction activities would be temporary, they would have the potential to cause both nuisance and health air quality impacts. PM_{10} is the pollutant of greatest concern associated with dust. If uncontrolled, PM_{10} levels downwind of actively disturbed areas could possibly exceed State standards. In addition, dust fall on adjacent properties could be a nuisance. If uncontrolled, dust generated by demolition, grading and construction activities represents a potentially *significant* impact.

Mitigation Measure 5: Include measures to control dust emissions.

Implementation of the measures recommended by the BAAQMD and listed below would reduce the air quality impacts associated with grading and new construction to a less than significant level:

1 Water all active construction areas at least twice daily and more often during windy periods. Active areas adjacent to residences should be kept damp at all times.

2 Cover all hauling trucks or maintain at least two feet of freeboard. Dust-proof chutes shall be used as appropriate to load debris onto trucks during demolition.

3 Pave, apply water at least twice daily, or apply (non-toxic) soil stabilizers on all unpaved access roads, parking areas, and staging areas.

4 Sweep daily (with water sweepers) all paved access roads, parking areas, and staging areas and sweep streets daily (with water sweepers) if visible soil material is deposited onto the adjacent roads.

5 Hydroseed or apply (non-toxic) soil stabilizers to inactive construction areas (i.e., previously-graded areas that are inactive for 10 days or more).

6 Enclose, cover, water twice daily, or apply (non-toxic) soil binders to exposed stockpiles.

7 Limit traffic speeds on any unpaved roads to 15 mph.

8 Replant vegetation in disturbed areas as quickly as possible.

9 Suspend construction activities that cause visible dust plumes to extend beyond the construction site.

10 Limit the area subject to excavation, grading and other construction activity at any one time

Construction Equipment Exhaust

Construction equipment and associated heavy-duty truck traffic generates diesel exhaust, which is a known Toxic Air Contaminant. The BAAQMD has not developed any procedures or guidelines for identifying these impacts from temporary construction activities where emissions are transient. They are typically evaluated for stationary sources (e.g., large compression ignition engines such as generators) in health risk assessments over the course of lifetime exposures (i.e., 24 hours per day over 70 years). Diesel exhaust poses both a health and nuisance impact to nearby receptors. These construction activities are expected to occur during a relatively short time, and therefore, the impacts are considered to be l*ess than significant* if reasonable available control measures are applied.

Mitigation Measure 6: Include measures to reduce diesel particulate matter exhaust from construction equipment.

1. Prohibit equipment with dirty emissions. The project shall ensure that emissions from all off-road diesel powered equipment used on the project site do not exceed 40 percent opacity for more than three minutes in any one hour. Any equipment found to exceed 40 percent opacity (or Ringelmann 2.0) shall be repaired immediately. This measure means that equipment with continuous dark emissions is in violation of the requirement.
2. The contractor shall install temporary electrical service whenever possible to avoid the need for independently powered equipment (e.g. compressors).
3. Signs shall be posted that indicate diesel-powered equipment standing idle for more than five minutes shall be turned off or operators would be subject to fines. This would include trucks waiting to deliver or receive soil, aggregate, or other bulk materials. Rotating drum concrete trucks could keep their engines running continuously as long as they were onsite.
4. Properly tune and maintain equipment for low emissions.
5. The County shall designate a Disturbance Coordinator responsible for ensuring that mitigation measures to reduce air quality impacts to nearby residences from construction are properly implemented. The Disturbance Coordinator shall be responsible for notifying adjacent land uses of construction activities and schedule and shall provide a written list of the aforementioned dust control measures. The list shall identify a contact

person that will respond to any complaints. A log shall be kept of all complaints and the actions taken to remedy any valid complaint as well as the response period.

Toxic Air Contaminant Emissions from Construction and Operation of the Project

Residences near the proposed project could be exposed to emissions of TACs from project construction and operation. The primary sources of TACs would include DPM emitted from construction activities, routine truck deliveries during operation, and testing of the generators. The health risks, in terms of incremental lifetime cancer risk, were assessed for nearby residences. Emissions for each activity or process were computed and used in the ISCST3 dispersion model to predict DPM concentrations. The modeling used screening meteorological conditions that typically result in over predictions of the concentrations. Modeling assumptions are described in the Attachment.

Construction Activity

Construction activities included emissions from the campus construction as estimated by the URBEMIS2007 model using default values and the estimated area of disturbance due to construction. URBEMIS2007 provides exhaust PM_{10} emissions, which were assumed to be DPM. There would also be emissions from roadway construction adjacent to the project site. These emissions were estimated using the Roadway Construction Emission Model (Version 6.3.1) with default assumptions. Roadway construction was assumed to cover about 5 acres and occur over 6 months. The PM_{10} exhaust emissions from this model were assumed to be PM_{10}. The roadway and construction emissions were combined and then modeled as two separate area sources across the site.

About 100,000 cubic yards of fill maybe imported to the site. Estimates include about 200 loads of material would be brought to the site per day for a total of about 50 days or 8,695 trips. Each load would include two trips: one in and one out. The PM_{10} gram per mile exhaust emission rate was estimated using the EMFAC2007 model for heavy-heavy-duty trucks for the year 2010. Predicted PM_{10} truck exhaust emissions were assumed to be DPM. Each truck was assumed to travel along Mark West Springs Road for the entire frontage of the project. Travel to the center of the site was also assumed in the truck modeling.

Routine Operation of the Project Site

The primary source of TACs from routine operation of the project would be DPM emitted from truck deliveries. On average, there would be almost 6 large truck and 5 medium truck trip deliveries anticipated per day. These deliveries would have two trips associated with them: one in and one out. The PM_{10} gram per mile exhaust emission rate was estimated using the EMFAC2007 model for heavy-heavy and medium-duty trucks for the year 2014. Predicted PM_{10} truck exhaust emissions were assumed to be DPM. These emissions were assumed to occur 7 days per week over 70 years of project operation. While emissions of DPM from trucks are anticipated to decrease substantially, the higher 2014 emission factor was assumed for this assessment. Use of this factor would overstate the heath risk associated with this activity. Similar to haul truck trips, these trucks were assumed to travel the entire frontage of Mark West Springs Road and travel on site to the loading areas.

Emergency Generator Testing

The project would include the installation and weekly testing of an emergency generator. This generator would be powered by diesel fuel. While operation under emergency conditions is anticipated to be minimal, State law and the manufacturer would require testing. Diesel particulate matter from the exhaust could pose a health risk to nearby sensitive receptors. The nearest residences are estimated to be over 700 feet from the proposed central plant location where the generators would be located. Emissions of DPM from the routine testing of the generators were included in the screening airway health risk assessment.

As currently proposed, two Caterpillar 1500 KW Generator Sets would be used for emergency power needs. The generator emissions information is provided in the Attachment. As mentioned above, testing of the generator set would occur on a weekly basis for 5 minutes, on a monthly basis for 30 minutes, and annually for 8 hours. During testing, the generators are assumed to operate at full load or over 2,200 horsepower.

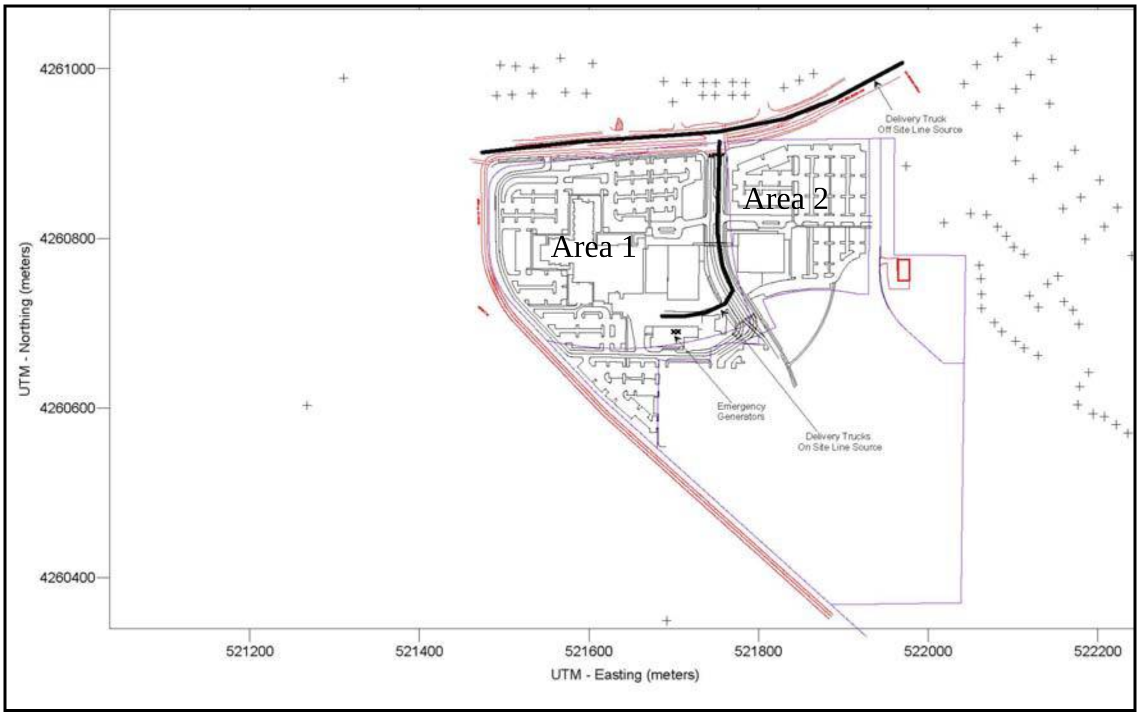
Predicted Incremental Cancer Risk

The ISCST3 model provided 1-hour concentrations at nearby receptor locations from each source. **Figure 1** shows the locations of the receptors, project and DPM sources. The 1-hour diesel particulate matter concentrations predicted by the model were adjusted to annual concentrations using a factor of 0.10. The maximum-modeled annual concentrations resulting from construction activity would range from 0.14 to 0.17 $\mu g/m^3$ of DPM. The lifetime incremental cancer risk associated with this exposure would be 1.38 excess cancer cases per million people. The highest annual DPM concentration for exposure to project operation would be 0.0018 $\mu g/m^3$. Assuming emissions remained similar through a 70-year lifetime exposure period, the incremental cancer risk would be 0.58 excess cancer cases per million people. Note that heavy-duty truck DPM emissions are anticipated to decrease in the future, so the cancer risk would also decrease. The maximum DPM concentrations from construction and operational activities occur at different locations. However, the maximum risk from construction was added to the maximum risk from operation for this screening assessment (even though maximum concentrations occurred at two different receptors). This resulted in a predicted lifetime incremental cancer risk of 1.97 excess cancer cases per million people for a 70-year lifetime exposure.

The acceptable health risk is an increased cancer risk of one in one million (1×10^{-6}) for individual sources (i.e., generator engines), unless the engine used Best Available Control Technology for Toxics (TBACT), in which case the acceptable risk is 10 in one million (10×10^{-6}). The BAAQMD uses a lifetime cancer risk of 10 in one million to evaluate the significance of health risks from projects. The risk of 2 excess cancer cased per million caused by the project would result in a *less-than-significant* impact.

It should be noted that the risk presented in this assessment are overstated and would be less. Key factors contributing to this overestimate are: (1) use of a lifetime exposure that assumes nearly continuous exposure to these sources over a 70-year lifetime, (2) use of 2014 truck emission factors to assess DPM exposure from almost 70 years of project operation, (3) use of screening meteorology in the dispersion modeling assessment, and (4) addition of maximum construction risks to maximum operation risks that occur at two different locations.

Figure 1. Project Sources and Nearby Receptors



Exposure of Hospital Patients and Workers to Toxic Air Contaminants from US 101 Traffic

The proposed project would place a hospital within 500 feet of the travel lanes of U.S. 101. In 2005, CARB issued guidance to local governments that recommended buffers between sources of air pollution and sensitive receptors. CARB identified medical facilities, such as a hospital, as sensitive land uses. For freeways, CARB recommended that sensitive land uses be avoided within 500 feet of a freeway, urban roads with 100,000 vehicles per day, or rural roads with 50,000 vehicles per day. Caltrans reports that U.S. 101 currently has about 91,000 vehicle trips per day just south of the Mark West/River Road interchange (Caltrans 2008). The CARB recommendations are advisory in nature and do not reflect local conditions. In their guidance, CARB notes that land use agencies have to balance other considerations including housing and transportation needs, economic development priorities, and other quality of life issues.

A review of air pollution studies by CARB indicates that residing close to freeways or busy roadways may result in adverse health effects beyond those typically found in urban areas. Several studies found an association between adverse non-cancer health effects (e.g., asthma) and living or attending school near heavily traveled urban roadways. Many of these studies focused on children and developed causal links such as links between proximity of the freeway and hospital or medical visits. However, these proximity studies (and others) found that the roadway and truck traffic densities were key factors affecting the strength of association with adverse health impacts. For urban roadways, the association of traffic-related emissions with adverse health impacts was generally strongest within 300 feet.

Proximity to freeways increases exposure to particulate matter and cancer risk. Diesel particulate matter, or DPM, poses the greatest cancer risk from roadways. On average, CARB reports that DPM represents about 70 percent of the potential cancer risk from vehicle travel. The number and type of diesel-fueled vehicles on any roadway is key in understanding the potential cancer risks. There are other contaminants emitted from motor vehicles (e.g., benzene and 1,3 butadiene), but their potential risks are much smaller compared to DPM.

CARB reviewed studies that found measured air pollution concentrations from motor vehicles drop off dramatically between the source and 500 feet. These studies were consistent with CARB air quality modeling and risk analyses performed for freeways. The estimated risk from DPM exposure was found to vary substantially due to meteorology, where typical downwind areas had much higher risk than upwind areas. Freeways with low truck volumes had lower risks. CARB based their 500-foot buffer recommendation on review of the studies and air dispersion modeling. CARB's modeling was based on 2000 information that included higher DPM emissions rates. CARB's EMFAC2007 model shows that new vehicle standards, diesel fuel reformulation, and CARB adopted Diesel Risk Reduction Measures has resulted in lower vehicle emissions. CARB's published health risk maps show that potential cancer risks near freeways will be substantially reduced in 2010 from 2000 levels. In addition, CARB recently adopted new rules requiring retrofit of large diesel-fueled vehicles that will further reduce DPM emissions by over 50 percent in 2014.

U.S. 101 near the project site currently has relatively low truck traffic volumes, when compared to urban freeways. This portion of U.S. 101 through Santa Rosa carries about 91,000 average daily trips (Caltrans 2008). Of these trips, 5% are trucks (3% are considered large trucks that are almost all diesel-fueled). This is a relatively low fraction of diesel vehicles, when compared to urban freeways that can have up to 20% diesel powered vehicles. In the Air Quality and Landuse Handbook, CARB identified a typical freeway as having truck traffic of 10,000 to 20,000 trucks per day. U.S. 101 near the project has about 3,000 daily large truck trips, about 1/3rd to 1/6th the volumes of the roadways considered by CARB. Based on site-specific traffic levels alone, the siting of sensitive receptors near US 101 could be 1/3rd less than the CARB recommended criteria of 500 feet. In this case, it would be less than 335 feet.

In response to CARB's recommendation, Sonoma County's recent General Plan update requires analysis of health risks for projects near the U.S. 101 corridor:

Policy OSRC-16k: Require that discretionary projects involving sensitive receptors (facilities or land uses that include members of the population sensitive to the effects of air pollutants such as children, the elderly, and people with illnesses) proposed near the Highway 101 corridor include an analysis of mobile source toxic air contaminant health risks. Project review should, if necessary, identify design mitigation measures to reduce health risks to acceptable levels.

In response to CARB guidance and the Sonoma County General Plan policy, a health risk assessment was performed to evaluate the cancer risks at the project site. The health risk involved prediction of vehicle emission rates, prediction of traffic levels, and dispersion modeling of emissions associated with US 101 traffic.

Emissions

Lower future vehicle emission rates that have been established by regulations through 2006 were taken into account in the analysis. Note that DPM emissions are anticipated to decrease in the future. CARB has been developing new regulations and emission standards since identifying DPM as a carcinogenic. Some of these requirements take time to provide substantial emission reductions. For example, new trucks would have considerably lower emission rates than older trucks, but older trucks will only slowly leave the vehicle fleet. Since this analysis assessed the risk of proposed hospital uses to future exposures, the lower future emissions were taken into account. The EMFAC2007 results were then adjusted to the traffic mix on US 101 reported by Caltrans. Emission factors were developed for 2014, 2020 and 2030, using the calculated mix of diesel-fueled vehicles.

CARB's diesel reduction plan includes proposed regulatory actions developed in 2000 that are intended to substantially decrease emissions of DPM. CARB has implemented many of the control measures outlined in the plan and many of those actions are reflected in the EMFAC2007 model runs. Future regulatory actions and additional measures not yet adopted that would lower emissions rates were not included. Such measures include a recent regulation to reduce DPM emissions from in-use on-road diesel-fueled vehicles, which requires truck fleet owners to either retrofit or phase out older engines over time. CARB predicts substantial short-term reductions in DPM as a result of this action.

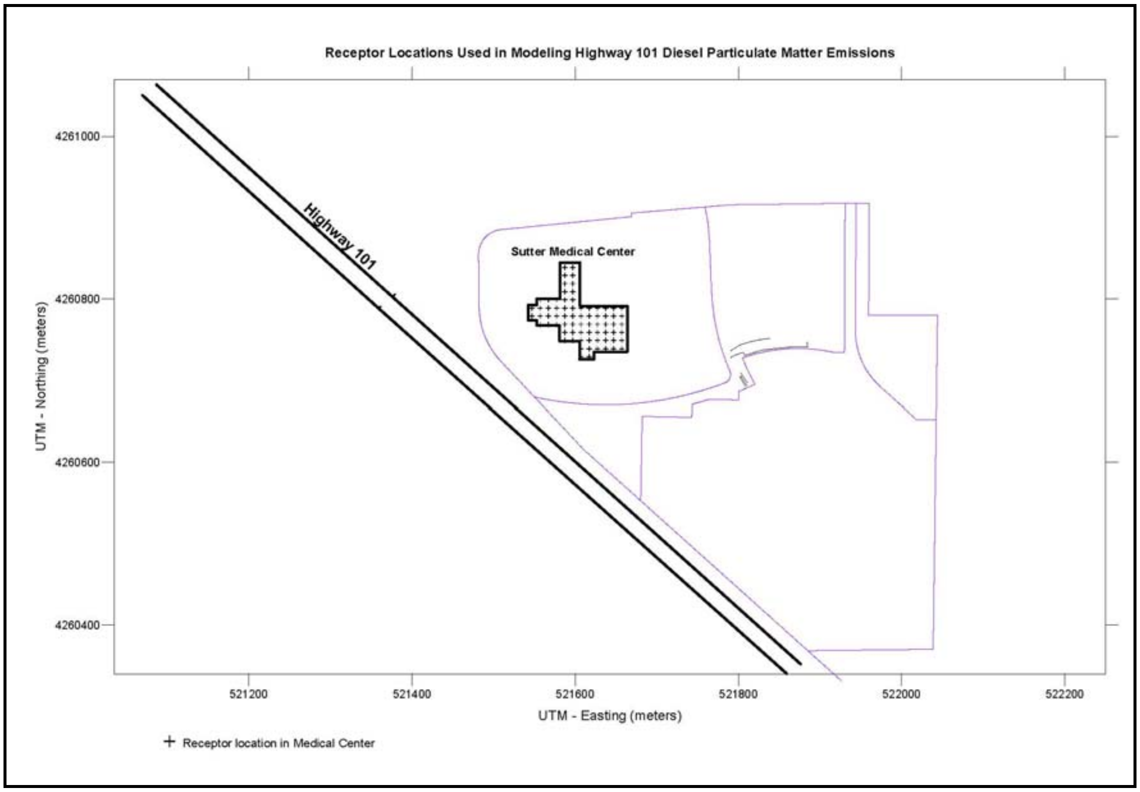
Traffic Levels

Future DPM emissions for traffic on US 101 were developed using the latest version of the CARB EMFAC2007 emission factor model with defaults for Sonoma County. Future traffic increases projected on US 101 were provided by Dowling and Associates.

Dispersion Model

Dispersion modeling was conducted using the Cal3qhcr model, which is acceptable to the BAAQMD for this type of analysis. A 4-year set of hourly meteorological data for the Sonoma County Airport was obtained from the BAAQMD's website and used in the modeling. The station, located one mile south-southwest of the project site, is considered to have metrological conditions that are reasonably representative of the project site. Figure 2 shows US 101 and the modeled hospital receptors. Other inputs to the model included geometry (based on site plans), current traffic conditions reported by Caltrans for US 101, and the DPM emission factors obtained from the EMFAC 2007 model. Inputs along with computed results at receptors are contained in Attachment 1.

Figure 2. US 101 and Project Hospital Receptors



Cancer Risk

The maximum-modeled annual concentrations at the hospital resulting from US 101 traffic would be 0.12 µg/m^3 of DPM, annualized for 2014. This concentration would decrease to 0.08 µg/m^3 in 2020 and 0.06 µg/m^3 in 2030 as emission rates from traffic decrease. The California Office Of Environmental Health Hazard Assessment (OEHHA) does not have recommendations for determining hospital patient cancer risks. Hospital patients tend to spend relatively short periods at the hospital and their time is spent mostly indoors. Therefore, this assessment considered two different exposures: a continuous exposure of a hospital patient for one year (using 2014 emission rates and traffic) and a worker exposure for workers who would work at the hospital and live off-site for 40 years (beginning with 2014 emission rates and traffic).

The highest modeled DPM concentrations and associated health risk were considered for this impact evaluation. Over the course of a 1-year continuous exposure during the first year of hospital operation, the incremental risk is calculated at 0.6 excess cancer cases per for a hospital patient. This is based on highway traffic DPM emissions during 2014. Because highway DPM emissions are anticipated by the EMFAC2007 model to decrease, cancer risk for future years would be less. A worker continuously exposed at this location would have a cancer risk of 4.5 excess cancer cases. The DPM concentrations decrease at positions further from the freeway. It should be clearly noted that these risks are based on outdoor exposures. The indoor risks, especially those inside a hospital, would be less.

On-Site Sources

The project would include DPM emissions from routine testing of emergency power generators and truck deliveries. Emissions and dispersion modeling of these sources were conducted to predict the impact to the project (i.e., hospital). This assessment was similar to that conducted for off-site residential uses. The difference for this impact is that the 4-year meteorological data set obtained from the BAAQMD was used. Results of this assessment show that on-site sources would have a negligible effect on the overall cancer risk predicted for the hospital uses. The cancer risks reported above include the contribution of these sources.

Other Factors Not Considered

The predicted cancer risk is based on outdoor exposures. Patients and workers at the hospital would spend most of their time indoors. While building codes for hospitals require operable windows, most indoor air would be provided through air handling systems. Natural ventilation through windows or other openings such as louvers is considered as supplemental to the required mechanical ventilation systems. Filtration is required in hospital mechanical ventilation systems. CARB estimates a $1/3^{rd}$ reduction in cancer risk between outdoor and indoor air in a residence. This reduction would be greater in a hospital, since most indoor air is mechanically supplied and conditioned with filtration. Also, air intakes are usually located on the rooftops, which have lower exposure than near the ground. Predicted DPM concentrations for this assessment were predicted near ground level, since details of the proposed project mechanical ventilation system were not available.

These results show that a hospital patient exposed continuously for one year or a worker exposed continuously while working at the hospital for 40 years would have incremental cancer risks from US 101 traffic that would be less than ten in one million. This would be below the BAAQMD cancer risk criteria contained in their CEQA Guidelines. The BAAQMD considers an incremental cancer risk of 10 in one million or greater as a significant impact. As a result, this impact would be *less than significant*.

Air Quality. Would the project result in:	**Potential Significant Impact**	**Less Than Significant Impact With Mitigation Incorporation**	**Less Than Significant Impact**	**No Impact**
E. Create objectionable odors affecting number of people?	☐	☐	☐	☑

The project is not expected to be a source of objectionable odors that would affect the general public. Existing sources of odors that could affect the proposed project were not identified.

Cumulative Impacts

Construction of the proposed project would have a temporary significant impact to regional air quality in 2010 when haul trucks import material to the site. Mitigation measures to effectively reduce these emissions to less than significant levels cannot be identified. Typical daily operation of the project would have less than significant long-term impacts to air quality. The project would be required to test two generators for 8 hours in one day once per year. Testing on this one day a year would have NOx emissions that would be considered significant. However, if testing occurs outside of the ozone season (i.e., testing in the months November –April), then the emissions would not contribute to unhealthy air pollutant levels. As a result, those emissions could be mitigated. A project that would individually have a significant air quality impact would also be considered to have a significant cumulative air quality impact. As a result, the project would have a temporary significant cumulative impact to air quality when haul truck trips occur in 2010. Mitigation Measure 1 would reduce this impact, but not to a level of insignificance.

Maximum (kilograms/day)	2.2	9.1	17.0	3.1	0.9	2.3	1.3	0.8	0.5	1,649.2
Total (megagrams/construction project)	0.3	1.0	1.9	0.4	0.1	0.3	0.1	0.1	0.1	182.5

Notes:

Project Start Year -> 2011
Project Length (months) -> 6
Total Project Area (hectares) -> 2
Maximum Area Disturbed/Day (hectares) -> 0
Total Soil Imported/Exported ($meters^3$/day)-> 0

PM10 and PM2.5 estimates assume 50% control of fugitive dust from watering and associated dust control measures if a minimum number of water trucks are specified.

Total PM10 emissions shown in column F are the sum of exhaust and fugitive dust emissions shown in columns H and I. Total PM2.5 emissions shown in Column J are the sume of exhaust and fugitive dust emissions shown in columns K and L.

SUTTER HOSPITAL EMERGENCY GENERATOR
ESTIMATED EMISSIONS FROM 1500 KILOWATT EMERGENCY DIESEL-FUELED GENERATOR

Caterpillar 3512C Tier 2 Diesel Engine

Number of Engines	1						
Engine Horsepower (hp)	2206	standby					
Generator output (kW)	1500	standby

10/23/2009 5:49:39 PM

Phase Assumptions

Phase: Mass Grading 4/30/2012 - 6/15/2012 - Default Fine Site Grading Description

Total Acres Disturbed: 55

Maximum Daily Acreage Disturbed: 5

Fugitive Dust Level of Detail: Default

20 lbs per acre-day

On Road Truck Travel (VMT): 0

Off-Road Equipment:

1 Graders (174 hp) operating at a 0.61 load factor for 8 hours per day

2 Rubber Tired Dozers (357 hp) operating at a 0.59 load factor for 8 hours per day

1 Rubber Tired Loaders (164 hp) operating at a 0.54 load factor for 8 hours per day

2 Scrapers (313 hp) operating at a 0.72 load factor for 8 hours per day

1 Sweepers/Scrubbers (91 hp) operating at a 0.68 load factor for 8 hours per day

1 Tractors/Loaders/Backhoes (108 hp) operating at a 0.55 load factor for 8 hours per day

1 Water Trucks (189 hp) operating at a 0.5 load factor for 8 hours per day

Phase: Trenching 7/21/2012 - 8/21/2012 - Defaul trenching

Off-Road Equipment:

2 Excavators (168 hp) operating at a 0.57 load factor for 8 hours per day

1 Other General Industrial Equipment (238 hp) operating at a 0.51 load factor for 8 hours per day

1 Tractors/Loaders/Backhoes (108 hp) operating at a 0.55 load factor for 0 hours per day

Phase: Paving 6/30/2012 - 7/30/2012 - Default Paving Description

Acres to be Paved: 3.92

Off-Road Equipment:

4 Cement and Mortar Mixers (10 hp) operating at a 0.56 load factor for 6 hours per day

1 Pavers (100 hp) operating at a 0.62 load factor for 7 hours per day

2 Paving Equipment (104 hp) operating at a 0.53 load factor for 6 hours per day

1 Rollers (95 hp) operating at a 0.56 load factor for 7 hours per day

1 Tractors/Loaders/Backhoes (108 hp) operating at a 0.55 load factor for 7 hours per day

Phase: Building Construction 1/11/2013 - 8/22/2013 - Default Building Construction Description

Off-Road Equipment:

2 Cement and Mortar Mixers (10 hp) operating at a 0.56 load factor for 8 hours per day

1 Cranes (399 hp) operating at a 0.43 load factor for 6 hours per day

2 Forklifts (145 hp) operating at a 0.3 load factor for 6 hours per day

1 Generator Sets (49 hp) operating at a 0.74 load factor for 8 hours per day

1 Tractors/Loaders/Backhoes (108 hp) operating at a 0.55 load factor for 8 hours per day

3 Welders (45 hp) operating at a 0.45 load factor for 8 hours per day

Phase: Architectural Coating 8/8/2013 - 12/31/2013 - Default Architectural Coating Description

Rule: Residential Interior Coatings begins 1/1/2005 ends 12/31/2040 specifies a VOC of 250

Rule: Residential Exterior Coatings begins 1/1/2005 ends 12/31/2040 specifies a VOC of 250

Rule: Nonresidential Interior Coatings begins 1/1/2005 ends 12/31/2040 specifies a VOC of 250

Rule: Nonresidential Exterior Coatings begins 1/1/2005 ends 12/31/2040 specifies a VOC of 250

Phase Assumptions

Phase: Mass Grading 4/30/2012 - 6/15/2012 - Default Fine Site Grading Description

Total Acres Disturbed: 55

Maximum Daily Acreage Disturbed: 5

Fugitive Dust Level of Detail: Default

20 lbs per acre-day

On Road Truck Travel (VMT): 0

Off-Road Equipment:

1 Graders (174 hp) operating at a 0.61 load factor for 8 hours per day

2 Rubber Tired Dozers (357 hp) operating at a 0.59 load factor for 8 hours per day

1 Rubber Tired Loaders (164 hp) operating at a 0.54 load factor for 8 hours per day

2 Scrapers (313 hp) operating at a 0.72 load factor for 8 hours per day

1 Sweepers/Scrubbers (91 hp) operating at a 0.68 load factor for 8 hours per day

1 Tractors/Loaders/Backhoes (108 hp) operating at a 0.55 load factor for 8 hours per day

1 Water Trucks (189 hp) operating at a 0.5 load factor for 8 hours per day

Phase: Trenching 7/21/2012 - 8/21/2012 - Defaul trenching

Off-Road Equipment:

2 Excavators (168 hp) operating at a 0.57 load factor for 8 hours per day

1 Other General Industrial Equipment (238 hp) operating at a 0.51 load factor for 8 hours per day

1 Tractors/Loaders/Backhoes (108 hp) operating at a 0.55 load factor for 0 hours per day

Phase: Paving 6/30/2012 - 7/30/2012 - Default Paving Description

Acres to be Paved: 3.92

Off-Road Equipment:

4 Cement and Mortar Mixers (10 hp) operating at a 0.56 load factor for 6 hours per day

1 Pavers (100 hp) operating at a 0.62 load factor for 7 hours per day

2 Paving Equipment (104 hp) operating at a 0.53 load factor for 6 hours per day

1 Rollers (95 hp) operating at a 0.56 load factor for 7 hours per day

1 Tractors/Loaders/Backhoes (108 hp) operating at a 0.55 load factor for 7 hours per day

Phase: Building Construction 1/11/2013 - 8/22/2013 - Default Building Construction Description

Off-Road Equipment:

2 Cement and Mortar Mixers (10 hp) operating at a 0.56 load factor for 8 hours per day

1 Cranes (399 hp) operating at a 0.43 load factor for 6 hours per day

2 Forklifts (145 hp) operating at a 0.3 load factor for 6 hours per day

1 Generator Sets (49 hp) operating at a 0.74 load factor for 8 hours per day

1 Tractors/Loaders/Backhoes (108 hp) operating at a 0.55 load factor for 8 hours per day

3 Welders (45 hp) operating at a 0.45 load factor for 8 hours per day

Phase: Architectural Coating 8/8/2013 - 12/31/2013 - Default Architectural Coating Description

Rule: Residential Interior Coatings begins 1/1/2005 ends 12/31/2040 specifies a VOC of 250

Rule: Residential Exterior Coatings begins 1/1/2005 ends 12/31/2040 specifies a VOC of 250

Rule: Nonresidential Interior Coatings begins 1/1/2005 ends 12/31/2040 specifies a VOC of 250

Sutter Hospital Air Pollution Emissions for Helicopter Operation

ILLINGWORTH & RODKIN, INC.
Acoustics • Air Quality

Memo

To: **Nadin Sponamore**

Cc: Cheri Velzy, URS

Date: **August 28, 2009**

From: **James A. Reyff**

Subject: **Sutter Hospital Air Pollutant Emissions for Helicopter Operations**

As requested, we calculated air pollutant (ROG, NOx and PM) and greenhouse gas (GHG) emissions associated with Sutter Hospital helicopter operations. The attached worksheet includes these emissions.

Helicopter emissions were calculated using published emissions factors for landing/takeoff operations (LTO) for a Bell 222 or similar helicopter[1]. The hospital was assumed to currently generate 200 annual helicopter trips. The number of helicopter trips is expected to increase to 240 trips per year. This increase would equate to about one additional trip per day. Helicopter trips are anticipated to be in the County and most new trips would come from outside of the County, Mendocino or Lake Counties. The project site lies relatively close to the boundaries of the San Francisco Bay Area air basin. As a result, average trip length for air pollutant emissions was assumed to be 15 miles for a one-way trip and 30 miles for a two-way trip (to and from the hospital). Travel speed was assumed to be 80 miles per hour. As a result, average daily emissions associated with helicopter operations are less than 1 pound of NOx or PM and about 1.6 pounds of ROG. These emissions are negligible when considering the overall burden to the air basin and were not added to the project-related emissions reported in the air quality analysis prepared to support the DEIR. In addition, most of these emissions are and will continue to occur on the air basin.

GHG emissions were computed for existing and future helicopter operations, for operations within and outside of the air basin. Currently, annual helicopter operations are estimated to emit 516 tons of CO_2 per year. Future operations would emit 619 tons of CO_2 per year, a 103 ton per year increase.

[1] Guidance on Determination of Helicopter Emissions. Swiss Confederation, Federal Department of the Environment, Transport, Energy and Conservation. March 2009.

Appendix C5

Global Climate Change

GLOBAL CLIMATE CHANGE

I. INTRODUCTION

This section discusses the existing global, national, and statewide conditions for greenhouse gases (GHG) and global climate change and evaluates the potential impacts on global climate from the implementation of the Proposed Project. The section also provides a discussion of the applicable federal, state, regional, and local agencies that regulate, monitor, and control GHG emissions. Copies of the modeling runs to estimate GHG emissions associated with the Proposed Project and supporting technical data are found in Appendix A.

The following sources were used to prepare this section:

- County of Sonoma General Plan 2020 and Final Environmental Impact Report (Sponamore Associates)
- California Air Pollution Control Officers Association's California Environmental Quality Act (CEQA) & Climate Change: Evaluating and Addressing Greenhouse Gas Emissions from Projects Subject to the CEQA
- California Climate Action Registry's General Reporting Protocol: Reporting Entity-Wide Greenhouse Gas
- Governor's Office of Planning and Research (OPR) Preliminary Draft CEQA Guideline Amendments for Greenhouse Gas Emissions

II. EXISTING ENVIRONMENT

1. Description of the Greenhouse Effect

Heat retention within the atmosphere is an essential process to sustain life on Earth. The natural process through which heat is retained in the troposphere[1] is called the "greenhouse effect." The greenhouse effect traps heat in the troposphere through a three-fold process as follows: Short-wave radiation emitted by the Sun is absorbed by the Earth; the Earth emits a portion of this energy in the form of long-wave radiation; and GHGs in the upper atmosphere absorb this long-wave radiation and emit this long-wave radiation into space and toward the Earth. This "trapping" of the long-wave (thermal) radiation emitted back toward the Earth is the underlying process of the greenhouse effect. Without the greenhouse effect, the Earth's average temperature would be approximately -18 degrees Celsius (°C) (0° Fahrenheit [°F]) instead of its present 14 °C (57 °F) (National Climatic Data Center 2008). The most abundant GHGs are water vapor and carbon dioxide. Many other trace gases have greater ability to absorb and re-radiate long-wave radiation; however, these gases are not as plentiful. For this reason, and to gauge the potency of GHGs, scientists have established a Global Warming Potential (GWP) for each

[1] *The troposphere is the bottom layer of the atmosphere, which varies in height from the Earth's surface to 10 to 12 kilometers).*

GHG based on its ability to absorb and re-radiate long-wave radiation. The GWP of a gas is determined using carbon dioxide as the reference gas with a GWP of 1.

2. Greenhouse Gases

A. Primary Greenhouse Gases

Greenhouse gases include, but are not limited to, the following:[2]

1) Carbon dioxide (CO2). Carbon dioxide is primarily generated by fossil fuel combustion in stationary and mobile sources. Due to the emergence of industrial facilities and mobile sources in the past 250 years, the concentration of carbon dioxide in the atmosphere has increased 35 percent (US Environmental Protection Agency [US EPA] 2008b). Carbon dioxide is the most widely emitted GHG and is the reference gas (GWP of 1) for determining GWPs for other GHGs. In 2004, 83.8 percent of California's GHG emissions were carbon dioxide (California Energy Commission [CEC] 2006a).
2) Methane (CH4). Methane is emitted from biogenic sources, incomplete combustion in forest fires, landfills, manure management, and leaks in natural gas pipelines. In the United States, the top three sources of methane come from landfills, natural gas systems, and enteric fermentation (US EPA 2006b). Methane is the primary component of natural gas, which is used for space and water heating, steam production, and power generation. The GWP of methane is 21.
3) Nitrous oxide (N2O). Nitrous oxide is produced by both natural and human-related sources. Primary human-related sources include agricultural soil management, animal manure management, sewage treatment, mobile and stationary combustion of fossil fuel, adipic acid production, and nitric acid production. The GWP of nitrous oxide is 310.
4) Hydrofluorocarbons (HFCs). HFCs are typically used as refrigerants for both stationary refrigeration and mobile air conditioning. The use of HFCs for cooling and foam blowing is growing as the continued phase-out of chlorofluorocarbons (CFCs) and hydrochlorofluorocarbons (HCFCs) gains momentum. The GWP of HFCs range from 140 for HFC-152a to 6,300 for HFC-236fa.
5) Perfluorocarbons (PFCs). Perfluorocarbons are compounds consisting of carbon and fluorine. They are primarily created as a byproduct of aluminum production and semiconductor manufacturing. Perfluorocarbons are potent GHGs with a GWP several thousand times that of carbon dioxide, depending on the specific PFC. Another area of concern regarding PFCs is their long atmospheric lifetime (up to 50,000 years) (Energy Information Administration n.d.). The GWPs of PFCs range from 5,700 to 11,900.

---

[2] *All GWPs are given as 100-year GWP. Unless noted otherwise, all GWPs were obtained from IPCC 1996.*

6) Sulfur hexafluoride. Sulfur hexafluoride is a colorless, odorless, nontoxic, nonflammable gas. It is most commonly used as an electrical insulator in high voltage equipment that transmits and distributes electricity. Sulfur hexafluoride is the most potent GHG that has been evaluated by the Intergovernmental Panel on Climate Change (IPCC) with a GWP of 23,900. However, its global warming contribution is not as high as the GWP would indicate due to its low mixing ratio compared to carbon dioxide (4 parts per trillion [ppt] in 1990 versus 365 parts per million [ppm]) (US EPA n.d.).

7) Water vapor (H2O). Although water vapor has not received the scrutiny of other GHGs, it is the primary contributor to the greenhouse effect. Water vapor and clouds contribute 66 to 85 percent of the greenhouse effect (water vapor alone contributes 36 to 66 percent) (Schmidt 2005). Natural processes such as evaporation from oceans and rivers and transpiration from plants contribute 90 percent and 10 percent of the water vapor in our atmosphere, respectively (US Geological Survey 2007). The primary human-related source of water vapor comes from fuel combustion in motor vehicles; however, this is not believed to contribute a substantial amount (less than 1 percent) to atmospheric concentrations of water vapor (Energy Information Administration 2008). Therefore, the control and reduction of water vapor emissions is not within reach of human actions. The IPCC has not determined a GWP for water vapor.

B. Other Greenhouse Gases

In addition to the six major GHGs discussed above (excluding water vapor), many other compounds have the potential to contribute to the greenhouse effect. Some of these substances were previously identified as stratospheric ozone depletors; therefore, their gradual phaseout is currently in effect. A few of these compounds are discussed below:

1) Hydrochlorofluorocarbons (HCFCs). HCFCs are solvents, similar in use and chemical composition to CFCs. The main uses of HCFCs are for refrigerant products and air conditioning systems. As part of the Montreal Protocol, all developed countries that adhere to the protocol are subject to a consumption cap and gradual phase-out of HCFCs. The United States is scheduled to achieve a 100 percent reduction to the cap by 2030. The GWPs of HCFCs range from 93 for HCFC-123 to 2,000 for HCFC-142b (US EPA 1996).

2) 1,1,1-trichloroethane. 1,1,1-trichloroethane or methyl chloroform is a solvent and degreasing agent commonly used by manufacturers. In 1992, the US EPA issued Final Rule 57 FR 33754 scheduling the phaseout of methyl chloroform by 2002 (US EPA 2007). Therefore, the threat posed by methyl chloroform as a GHG will diminish. Nevertheless, the GWP of methyl chloroform is 110 times that of carbon dioxide (US EPA 1996).

3) Chlorofluorocarbons (CFCs). CFCs are used as refrigerants, cleaning solvents, and aerosol spray propellants. CFCs were also part of the US EPA's Final Rule 57 FR 3374 for the phaseout of ozone depleting substances. Currently, CFCs have been replaced by HFCs in cooling

systems and a variety of alternatives for cleaning solvents. Nevertheless, CFCs remain suspended in the atmosphere, contributing to the greenhouse effect. CFCs are potent GHGs with GWPs ranging from 4,600 for CFC-11 to 14,000 for CFC-13 (US EPA 2006a).

4) Ozone. Ozone occurs naturally in the stratosphere where it is largely responsible for filtering harmful ultraviolet (UV) radiation. In the troposphere, ozone acts as a GHG by absorbing and re-radiating the infrared energy emitted by the Earth. As a result of the industrial revolution and rising emissions of oxides of nitrogen (NOX) and volatile organic compounds (VOCs) (ozone precursors), the concentrations of ozone in the troposphere have increased (IPCC 2008). Due to the short life span of ozone in the troposphere, its concentration and contribution as a GHG is not well established. However, the greenhouse effect of tropospheric ozone is considered small, as the radiative forcing[3] of ozone is 25 percent of that of carbon dioxide (IPCC 2007).

3. Contributions to Greenhouse Gas Emissions

A. Global

Anthropogenic GHG emissions worldwide as of 2005 (the latest year for which data are available for Annex 1 countries[4]) totaled approximately 30,800 CO2 equivalent million metric tons (MMTCO2E).[5] It should be noted that global emissions inventory data are not all from the same year and may vary depending on the source of the emissions inventory data (UNFCCC n.d.[a] and UNFCCC n.d.[b]).[6] Six countries and the European Community accounted for approximately 70 percent of the total global emissions (See Table 1, Six Top GHG Producer Countries and the European Community). The GHG emissions in more recent years may be substantially different than those shown in Table 1.

1) United States

As noted in Table 1, the United States was the top producer of greenhouse gas emissions as of 2005. Based on GHG emissions in 2004, six of the states—Texas, California, Pennsylvania, Ohio, Illinois, and Florida, in ranked order—would each rank among the top 30 GHG emitters internationally

---

[3] *Radiative forcing, measured in Watts/m2, is an externally imposed perturbation (e.g., stimulated by greenhouse gases) in the radiative energy budget of the Earth's climate system (i.e., energy and heat retained in the troposphere minus energy passed to the stratosphere).*

[4] *Annex 1 countries are developed countries which have adopted greenhouse gas emission reduction obligations under the Kyoto Protocol.*

[5] *The CO2 equivalent emissions are commonly expressed as "million metric tons of carbon dioxide equivalent (MMTCO2E)" The carbon dioxide equivalent for a gas is derived by multiplying the tons of the gas by the associated GWP, such that MMTCO2E = (million metric tons of a GHG) x (GWP of the GHG). For example, the GWP for methane is 21. This means that emissions of one million metric tons of methane are equivalent to emissions of 21 million metric tons of CO2.*

[6] *The global emissions are the sum of Annex I and non-Annex I countries without counting Land-Use, Land-Use Change and Forestry (LULUCF). For countries that 2004 data were unavailable, the UNFCCC data for the most recent year were used.*

(World Resources Institute 2006). The primary greenhouse gas emitted by human activities in the United States was CO2, representing approximately 84 percent of total greenhouse gas emissions (US EPA 2008b). Carbon dioxide from fossil fuel combustion, the largest source of US greenhouse gas emissions, accounted for approximately 80 percent of US GHG emissions (US EPA 2008b).

Table 1
Six Top GHG Producer Countries and the European Community

Emitting Countries	GHG Emissions ($MMTCO_2E$)*
United States	7,241.5
China	4,882.7
European Community	4,192.6
Russian Federation	2,132.5
India	1,606.5
Japan	1,359.9
Germany	1,001.5
Total	21,415.7

2) State of California

Based upon the 2004 GHG inventory data (the latest year available) compiled by the California Air Resources Board (CARB) for the California 1990 greenhouse gas emissions inventory, California emitted emissions of 484 MMTCO2E, including emissions resulting from out-of-state electrical generation (CARB 2007). Based on the CARB inventory and GHG inventories for countries contributing to the worldwide GHG emissions inventory compiled by the United Nations Framework Convention on Climate Change (UNFCCC) for 2005, California's GHG emissions rank second in the United States (Texas is number one) with emissions of 423 MMTCO2E (excluding emissions related to imported power) and internationally between Ukraine (418.9 MMTCO2E) and Spain (440.6 MMTCO2E) (UNFCCC n.d.[a]).

A California Energy Commission (CEC) emissions inventory report placed CO2 produced by fossil fuel combustion in California as the largest source of GHG emissions in 2004, accounting for 81 percent of the total GHG emissions (CEC 2006a). CO2 emissions from other sources contributed 2.8 percent of the total GHG emissions, methane emissions 5.7 percent, nitrous oxide emissions 6.8 percent, and the remaining 2.9 percent was composed of emissions of high-GWP gases (CEC 2006a). These high-GWP gases are largely composed of refrigerants and a small contribution of sulfur hexafluoride (SF6) used as insulating materials in electricity transmission and distribution.

The primary contributors to GHG emissions in California are transportation, electric power production from both in state and out-of-state sources, industry, agriculture and forestry, and other sources, which include commercial and residential activities. These primary contributors to California's GHG emissions and their relative contributions are presented in Table 2, GHG Sources in California.

Table 2
GHG Sources in California

Source Category	Annual GHG Emissions ($MMTCO_2E$)	Percent of Total	Annual GHG Emissions ($MMTCO_2E$)	Percent of Total
Agriculture	27.9	5.8%	27.9	6.6%
Commerical Uses	12.8	2.6%	12.8	3.0%
Electricity Generation	119.8	24.7%	58.5	13.8%
Forestry (excluding sinks)	0.2	0.0%	0.2	0.0%
Industrial Uses	96.2	19.9%	96.2	22.7%
Residential Uses	29.1	6.0%	29.1	6.9%
Transportation	182.4	37.7%	182.4	43.1%
Other	16.0	3.3%	16.0	3.8%
Totals	484.4	100.0%	423.1	100.0%

It should be noted that emissions from each of these economic sectors are not confined to emissions from a single process, since there is crossover with other sectors. For example, the GHG emissions from cement production places clinker manufacturing in its own category and the fuel used to heat the cement production process within the industrial fuel category. In the case of landfills, methane emissions and CO2 emissions and sinks are reported in their respective portions of the inventory. Taken together, the CO2 sinks approximately offset the landfill methane emissions. Additionally, fuel-related GHG emissions from transporting wastes to landfills are included in transportation fuels.

4. Global Climate Change

Climate change refers to any substantial change in measures of climate (such as temperature, precipitation, or wind) lasting for an extended period (decades or longer) (US EPA 2008a). Climate change may result from

- natural factors, such as changes in the sun's intensity or slow changes in the Earth's orbit around the sun;
- natural processes within the climate system (e.g., changes in ocean circulation, reduction in sunlight from the addition of GHG and other gases to the atmosphere from volcanic eruptions); and

- human activities that change the atmosphere's composition (e.g., through burning fossil fuels) and the land surface (e.g., deforestation, reforestation, urbanization, desertification).

A. Indications of Anthropogenic Influences

The impact of anthropogenic activities on global climate change is readily apparent in the observational record. For example, surface temperature data shows that 11 of the 12 years from 1995 to 2006 rank among the 12 warmest since 1850, the beginning of the instrumental record for global surface temperature (IPCC 2007). In addition, the atmospheric water vapor content has increased since at least the 1980s over land, sea, and in the upper atmosphere, consistent with the capacity of warmer air to hold more water vapor; ocean temperatures are warmer to depths of 3,000 feet; and a marked decline has occurred in mountain glaciers and snowpack in both hemispheres, and in polar ice and ice sheets in both the arctic and Antarctic regions (IPCC 2007).

B. Influence of Industrialization

Air trapped by ice has been extracted from core samples taken from polar ice sheets to determine the global atmospheric variation of carbon dioxide, methane, and nitrous oxide from before the start of the industrialization, around 1750, to over 650,000 years ago. For that period, it was found that carbon dioxide concentrations ranged from 180 ppm to 300 ppm. For the period from around 1750 to the present, global carbon dioxide concentrations increased from a pre-industrialization period concentration of 280 ppm to 379 ppm in 2005, with the 2005 value far exceeding the upper end of the pre-industrial period range (IPCC 2007). Global methane and nitrous oxide concentrations show similar increases for the same period (see **Table 3, Comparison of Global Pre-Industrial and Current GHG Concentrations**).

Table 3
Comparison of Global Pre-Industrial and Current GHG Concentrations

Greenhouse Gas	Early Industrial Period Concentrations (ppm)	Natural Range for Last 650,000 Years (ppm)	2005 Concentrations (ppm)
Carbon Monoxide	280	180 to 300	379
Methane	715	320 to 790	1774
Nitrous Oxide	270	NA	319

C. Secondary Effects of Global Climate Change

The primary effect of global climate change has been a rise in average global tropospheric temperature of 0.2° Celsius per decade, determined from meteorological measurements worldwide between 1990 and 2005 (IPCC 2007). Climate change modeling using 2000 emission rates shows that further warming would occur, which would induce further changes in the global climate system during the current century (IPCC 2007). Changes to the global climate system and ecosystems and to California would include, but would not be limited to:

1) The loss of sea ice and mountain snowpack resulting in higher sea levels and higher sea surface evaporation rates with a corresponding increase in tropospheric water vapor due to the atmosphere's ability to hold more water vapor at higher temperatures; (IPCC 2007)
2) A rise in global average sea level primarily due to thermal expansion and melting of glaciers and ice caps, the Greenland and Antarctic ice sheets (IPCC 2007)
3) Changes in weather that include widespread changes in precipitation, ocean salinity, and wind patterns, and more energetic aspects of extreme weather including droughts, heavy precipitation, heat waves, extreme cold, and the intensity of tropical cyclones; (IPCC 2007)
4) The decline of Sierra snowpack, which accounts for approximately half of the surface water storage in California, by 70 percent to as much as 90 percent over the next 100 years; (California EPA [Cal/EPA] Climate Action Team 2006)
5) An increase in the number of days conducive to ozone formation by 25 to 85 percent (depending on the future temperature scenario) in high ozone areas of Los Angeles and the San Joaquin Valley by the end of the 21st century (California EPA Climate Action Team 2006); and
6) High potential for erosion of California's coastlines and sea water intrusion into the Delta and associated levee systems due to the rise in sea level (California EPA Climate Action Team 2006).

D. Secondary Effects of Global Climate Change on Groundwater Supply

Global changes in temperature and precipitation patterns, including changes in arctic temperatures and ice, widespread changes in precipitation amounts, ocean salinity, wind patterns, and aspects of extreme weather including droughts, heavy precipitation, and heat waves all have the potential to significantly affect the nation's water resources and water demands. It is projected that climate change will cause more precipitation in the form of rain rather than snow, resulting in less water storage in the annual snowpack and earlier snowmelt. The hydrology in California is controlled by the timing and intensity of the spring snowmelt, and is facilitated primarily by the degree of warming during this time period. It is expected that surface water yields in California will increase in late winter/early spring because of increased runoff due to the seasonality of the precipitation changes and to an earlier spring snowmelt caused by the projected warming under climate change. Conversely, decreases in surface water are expected through summer and fall (DWR 2006).

The vast majority of California's groundwater that is accessible in significant amounts is stored in alluvial groundwater basins, which cover nearly 40 percent of the geographic area of the state (DWR 2003). Groundwater supplies contribute water used for beneficial purposes and has historically been depended upon during droughts. In many areas of California, current levels of groundwater use are already unsustainable, with pumping rates exceeding natural recharge (DWR 2005). During drier years, groundwater pumping is often relied upon to balance the increased demands caused by heat and drought (DWR 2006). It is anticipated that groundwater would be used in this capacity to increase water supply reliability through period of climate fluctuations associated with global climate change.

The global climate change would directly impact groundwater supplies through changes in recharge of surface water resulting from changes in effective rainfall as well as a change in the timing of the recharge season. In general, a large portion of recharge during the winter comes from deep percolation of precipitation below the rooting zone, whether of native vegetation or farmland. The increased winter rainfall and higher temperatures could increase the groundwater recharge during the period of infiltration where soils freeze. Higher evaporation or shorter rainfall seasons, on the other hand, could mean that the moisture deficits in the soil persist for longer periods of time, shortening recharge seasons. Therefore, a greater amount of rain in subsequent storms would then be required to wet the root zone and provide water for deep percolation (DWR 2005). The generally warmer and wetter winters would increase the amount of runoff available for groundwater recharge. However, this additional runoff in the winter would be occurring at a time when some basins are either being recharged at their maximum capacity or are already full. Conversely, reductions in spring runoff and higher evapotranspiration because of higher temperatures could reduce the amount of water available for recharge (DWR 2005).

III. APPLICABLE LAWS, REGULATIONS, PLANS, AND POLICIES

1. International Activities

A. Kyoto Protocol

The original Kyoto Protocol was negotiated in December 1997 and came into force on February 16, 2005. As of May 2008, 181 countries and the European Economic Community have ratified the agreement (UNFCCC n.d.[c]). Notably, however, the US has not ratified the protocol. Participating nations are separated into Annex 1 (i.e., industrialized countries) and Non-Annex 1 (i.e., developing countries) countries that have differing requirements for GHG reductions. The goal of the protocol is to achieve overall emissions reduction targets for six GHGs by the period 2008 to 2012. The six GHGs regulated under the protocol are carbon dioxide, methane, nitrous oxide, sulfur hexafluoride, HFCs, and PFCs. Each nation has an emissions reduction target under which they must reduce GHG emissions a certain percentage below 1990 levels (e.g., 8 percent reduction for the European Union, 6 percent reduction for Japan). The average reduction target for nations participating in the Kyoto Protocol is approximately five percent below 1990 levels (Pew Center on Global Climate Change n.d.). Although the United States has
not ratified the protocol, it has established a target of 18 percent reduction in GHG emissions intensity by 2012 (White House n.d.). Greenhouse gas intensity is the ratio of GHG emissions to economic output (i.e., gross domestic product).

B. Intergovernmental Panel on Climate Change

The World Meteorological Organization (WMO) and United Nations Environmental Program (UNEP) established the IPCC in 1988. The goal of the IPCC is to evaluate the risk of climate change caused by human activities. Rather than performing research or monitoring climate, the IPCC relies on peer-reviewed and published scientific literature to make its assessment. The IPCC assesses information (i.e., scientific literature) regarding human-induced climate change, impacts of human-induced climate change, and options for adaptation and mitigation of climate change. The IPCC reports its evaluation through special reports called "assessment reports." The latest assessment report (i.e., Fourth Assessment Report, consisting of three working group reports and a synthesis report based on the first three reports) was published in 2007.[7]

2. Federal Activities

In *Massachusetts vs. EPA,* the Supreme Court held that US EPA has the statutory authority under Section 202 of the federal Clean Air Act (CAA) to regulate GHGs from new motor vehicles. The court did not hold that the US EPA was required to regulate GHG emissions; however, it indicated that the agency must decide whether GHGs from motor vehicles cause or contribute to air pollution that is reasonably anticipated to endanger public health or welfare. Upon the final decision, President Bush signed Executive Order 13432 on May 14, 2007, directing the US EPA, along with the Departments of Transportation, Energy, and Agriculture, to initiate a regulatory process that responds to the Supreme Court's decision. The order requires the US EPA to coordinate closely with other federal agencies and to consider the president's Twenty-in-Ten plan in this process. The Twenty-in-Ten plan would establish a new alternative fuel standard that would require the use of 35 billion gallons of alternative and renewable fuels by 2017. The US EPA will be working closely with the Department of Transportation in developing new automotive efficiency standards.

3. California Activities

California has enacted several legislative bills and executive orders aimed at reducing the state's greenhouse gas inventory and its impact on global climate change. These are discussed in chronological order below.

A. Assembly Bill 1493

In a response to the transportation sector accounting for more than half of California's CO2 emissions, Assembly Bill 1493 (AB 1493, Pavley) was enacted on July 22, 2002. AB 1493 required CARB to set GHG emission standards for passenger vehicles, light-duty trucks, and other vehicles determined by the state board to be vehicles whose primary use is noncommercial personal transportation in the state. The bill required that CARB set the GHG emission standards for motor vehicles manufactured in 2009 and all subsequent model years. In setting these standards, CARB must consider cost-effectiveness, technological feasibility, economic impacts, and provide maximum flexibility to

[7] *The IPCC's Fourth Assessment Report is available online at http://www.ipcc.ch/.*

manufacturers. CARB adopted the GHG emissions standards in September 2004. These standards are intended to reduce emissions of carbon dioxide and other greenhouse gases (e.g., nitrous oxide, methane). The new standards would phase in during the 2009 through 2016 model years. When fully phased in, the near-term (2009–2012) standards will result in a reduction of about 22 percent in greenhouse gas emissions compared to the emissions from the 2002 fleet, while the mid-term (2013-2016) standards will result in a reduction of about 30 percent. Some currently used technologies that achieve GHG reductions include small engines with superchargers, continuously variable transmissions, and hybrid electric drive.

In December 2004, these regulations were challenged in federal court by the Alliance of Automobile Manufacturers, who claimed that the law regulated vehicle fuel economy, a duty assigned to the federal government. The case had been put on hold by a federal judge in Fresno pending the US Supreme Court's decision in *Massachusetts vs. EPA*. The US Supreme Court's ruling in favor of the state of Massachusetts has been discussed as a likely vindication of state efforts to control GHG emissions. In December 2007, Judge Ishii of the US District Court for the Eastern District dismissed the case by the Alliance of Automobile Manufacturers. However, before these regulations may go into effect, the US EPA must grant California a waiver under the federal CAA, which ordinarily preempts state regulation of motor vehicle emission standards. Following the issuance of the *Massachusetts vs. EPA* decision, the USEPA announced that it would decide whether to grant California a waiver by December 2007. On December 19, 2007, Stephen Johnson, the US EPA Administrator, denied the waiver citing the need for a national approach to reducing greenhouse gas emissions, the lack of a "need to meet compelling and extraordinary conditions," and the benefits to be achieved through the Energy Independence and Security Act of 2007 (Johnson 2007). The California Attorney General subsequently filed suit in January 2008 to overturn the administrator's decision.

On January 27, 2009, President Obama signed an executive order requiring the EPA to review its previous decision denying the waiver. It is expected that the EPA will act in the Spring of 2009 to grant the waiver, allowing CARB to implement its 2004 GHG emissions standards for motor vehicles.

B. Executive Order S-3-05

In June 2005, Governor Schwarzenegger established California's GHG emissions reduction targets in Executive Order S-3-05. The Executive Order established the following goals: GHG emissions should be reduced to 2000 levels by 2010; GHG emissions should be reduced to 1990 levels by 2020; and GHG emissions should be reduced to 80 percent below 1990 levels by 2050. The secretary of Cal/EPA is required to coordinate efforts of various agencies in order to collectively and efficiently reduce GHGs. Some of the agency representatives involved in the GHG reduction plan include the secretary of the Business, Transportation and Housing Agency; the secretary of the Department of Food and Agriculture, the secretary of the Resources Agency, the Chairperson of CARB; the chairperson of the CEC; and the president of the Public Utilities Commission. Representatives from each of the aforementioned agencies comprise the Climate Action Team. The Climate Action Team is responsible for implementing global warming emissions reduction programs. In order to achieve these goals, the Climate Action Team is organized into two subgroups: the market-based options subgroup and the scenario analysis subgroup. The Cal/EPA secretary is required to submit a biannual progress report from the Climate Action Team to the governor and state legislature disclosing the progress made toward GHG emission reduction targets. In addition, another biannual report must be submitted illustrating the impacts of global warming on California's water supply, public health, agriculture, the coastline, and forestry, and reporting possible mitigation and adaptation plans to combat these impacts. The Climate Action Team has fulfilled both of these report requirements through its March 2006 Climate Action Team Report to Governor Schwarzenegger and the legislature (California EPA Climate Action Team 2006). Some strategies currently being implemented by state agencies include CARB introducing vehicle climate change standards and diesel anti-idling measures, the Energy Commission implementing building and appliance efficiency standards, and the Cal/EPA implementing their green building initiative. The Climate Action Team also recommends future emission reduction strategies, such as using only low-GWP refrigerants in new vehicles, developing ethanol as an alternative fuel, reforestation, solar power initiatives for homes and businesses, and investor-owned utility energy efficiency programs. According to the report, implementation of current and future emission reduction strategies have the potential to achieve the goals set forth in Executive Order S-3-05.

C. Assembly Bill 32

In furtherance of the goals established in Executive Order S-3-05, the Legislature enacted Assembly Bill 32 (AB 32, Nuñez and Pavley), the California Global Warming Solutions Act of 2006, which Governor Schwarzenegger signed on September 27, 2006. AB 32 represents the first enforceable statewide program to limit GHG emissions from all major industries with penalties for noncompliance. CARB has been assigned to carry out and develop the programs and requirements necessary to achieve the goals of AB 32. The foremost objective of CARB is to adopt regulations that require the reporting and verification of statewide GHG emissions. This program will be used to monitor and enforce compliance with the established standards. The first GHG emissions limit is equivalent to the 1990 levels, which are to be achieved by 2020. CARB is also required to adopt rules and regulations to achieve the maximum technologically feasible and cost-effective GHG emission reductions. AB 32 allows CARB to adopt market-based compliance mechanisms to meet the specified requirements. Finally, CARB is ultimately
responsible for monitoring compliance and enforcing any rule, regulation, order, emission limitation, emission reduction measure, or market-based compliance mechanism adopted. In order to advise CARB, it must convene an Environmental Justice Advisory Committee and an Economic and Technology Advancement Advisory Committee. By January 2008, the first deadline for AB 32, a statewide cap for 2020 emissions based on 1990 levels and mandatory reporting rules for significant sources of GHGs must be adopted. The following year (January 2009), CARB must adopt a scoping plan indicating how reductions in significant GHG sources will be achieved through regulations, market mechanisms, and other actions. The first action under AB 32 resulted in the adoption of a report listing early action greenhouse gas emission reduction measures on June 21,

2007. The early actions include three specific GHG control rules. On October 25, 2007, CARB approved an additional six early action GHG reduction measures under AB 32. These early action GHG reduction measures are to be adopted and enforced before January 1, 2010, along with 32 other climate-protecting measures CARB is developing between now and 2011. The report divides early actions into three categories:

1) Group 1 - GHG rules for immediate adoption and implementation;
2) Group 2 - Several additional GHG measures under development;
3) Group 3 - Air pollution controls with potential climate co-benefits.

The original three adopted early action regulations meeting the narrow legal definition of “discrete early action GHG reduction measures” include:

1) A low-carbon fuel standard to reduce the “carbon intensity” of California fuels;
2) Reduction of refrigerant losses from motor vehicle air conditioning system maintenance to restrict the sale of ”do-it-yourself” automotive refrigerants; and
3) Increased methane capture from landfills to require broader use of state-of-the-art methane capture technologies.

The additional six early action regulations adopted on October 25, 2007, also meeting the narrow legal definition of “discrete early action GHG reduction measures,” include:

1) Reduction of aerodynamic drag, and thereby fuel consumption, from existing trucks and trailers through retrofit technology;
2) Reduction of auxiliary engine emissions of docked ships by requiring port electrification;
3) Reduction of perfluorocarbons from the semiconductor industry;
4) Reduction of propellants in consumer products (e.g., aerosols, tire inflators, and dust removal products);
5) Require that all tune-up, smog check and oil change mechanics ensure proper tire inflation as part of overall service in order to maintain fuel efficiency; and
6) Restriction on the use of sulfur hexafluoride (SF6) from non-electricity sectors if viable alternatives are available.

As required under AB 32, on December 6, 2007, CARB approved the 1990 greenhouse gas emissions inventory, thereby establishing the emissions limit for 2020. The 2020 emissions limit was set at 427 MMT CO2E. The inventory revealed that in 1990 transportation, with 35 percent of the state's total emissions, was the largest single sector, followed by industrial emissions, 24 percent; imported electricity, 14 percent; in-state electricity generation, 11 percent; residential use, 7 percent; agriculture, 5 percent; and commercial uses, 3 percent.

In addition to the 1990 emissions inventory, CARB also adopted regulations requiring mandatory reporting of greenhouse gases for large facilities on December 6, 2007. The mandatory reporting regulations require annual reporting from the largest facilities in the state, which account for 94 percent of greenhouse gas emissions from industrial and commercial stationary sources in California. About 800 separate sources that fall under the new reporting rules and include electricity generating facilities, electricity retail providers and power marketers, oil refineries, hydrogen plants, cement plants, cogeneration facilities, and industrial sources that emit over 25,000 tons of carbon dioxide each year from on-site stationary combustion sources. Transportation sources, which account for 38 percent of California's total greenhouse gas emissions, are not covered by these regulations but will continue to be tracked through existing means. Affected facilities will begin tracking their emissions in 2008, to be reported beginning in 2009 with a phase-in process to allow facilities to develop reporting systems and train personnel in data collection. Emissions for 2008 may be based on best available emission data.

Beginning in 2010, however, emissions reports will be more rigorous and will be subject to third-party verification. Verification will take place annually or every three years, depending on the type of facility.

As indicated above, AB 32 requires CARB to adopt a scoping plan by January 2009 indicating how reductions in significant GHG sources will be achieved through regulations, market mechanisms, and other actions. After receiving public input on their discussion draft of the Proposed Scoping Plan released in June 2008, CARB released the Climate Change Proposed Scoping Plan in October 2008 and adopted the Plan in December, 2008. This plan contains an outline of the proposed State strategies to achieve the 2020 greenhouse gas emission limits. Key elements of the Scoping Plan include the following recommendations:

1) Expanding and strengthening existing energy efficiency programs as well as building and appliance standards;
2) Achieving a statewide renewables energy mix of 33 percent;
3) Developing a California cap-and-trade program that links with other Western Climate Initiative partner programs to create a regional market system;
4) Establishing targets for transportation-related greenhouse gas emissions for regions throughout California and pursuing policies and incentives to achieve those targets;
5) Adopting and implementing measures pursuant to existing State laws and policies, including California's clean car standards, goods movement measures, and the Low Carbon Fuel standard;
6) Creating targeted fees, including a public goods charge on water use, fees on high global warming potential gases, and a fee to fund the

administrative costs of the state's long-term commitment to AB 32 implementation.

Under the Scoping Plan, approximately 85 percent of the state's emissions are subject to a cap-and-trade program where covered sectors are placed under a declining emissions cap. The emissions cap incorporates a margin of safety whereas the 2020 emissions limit will still be achieved even in the event that uncapped sectors do not fully meet their anticipated emission reductions. Emissions reductions will be achieved through regulatory requirements and the option to reduce emissions further or purchase allowances to cover compliance obligations. It is expected that emission reduction from this cap-and trade program will account for a large portion of the reductions required by AB 32. Table 4, AB 32 Scoping Plan Measures, lists CARB's recommendations for achieving greenhouse gas reductions under AB 32 along with a brief description of the requirements and applicability.

Table 4
AB 32 Scoping Plan Measures

Scoping Plan Measure	Description
SPM-1: California Cap-and-Trade Program linked to Western Climate Initiative	Implement a broad-based cap-and-trade program that links with other Western Climate Initiative Partner programs to create a regional market system. Ensure California's program meets all applicable AB 32 requirements for market-based mechanisms. Capped sectors include transportation, electricity, natural gas, and industry. Projected 2020 business-as-usual emissions are estimated at 512 MTCO2E; preliminary 202 emissions limit under cap-and-trade program are estimated at 365 MTCO2E (29 percent reduction).
SPM-2: California Light-Duty Vehicle GHG Standards	Implement adopted Pavley standards and planned second phase of the program. AB 32 states that if the Pavley standards (AB 1493) do not remain in effect, CARB shall implement equivalent or greater alternative regulations to control mobile sources.
SPM-3: Energy Efficiency	Maximize energy efficiency building and appliance standards, and pursue additional efficiency efforts. The Proposed Scoping Plan considers green building standards as a framework to achieve reductions in other sectors, such as electricity.
SPM-4: Renewables Portfolio Standard	Achieve 33 percent Renewables Portfolio Standard by both investor-owned and publicly owned utilities.
SPM-5: Low Carbon Fuel Standard	Develop and adopt the Low Carbon Fuel Standard (LCFS). CARB identified the LCFS as a Discrete Early Action item and is developing a regulation for Board consideration in late 2008. In January 2007, Governor Schwarzenegger issued Executive Order S-1-07, which called the reduction of the carbon intensity of California's transportation fuels by at least ten percent by 2020.

SPM-6: Regional Transportation-Related Greenhouse Gas Targets	Develop regional greenhouse gas emissions reduction targets for passenger vehicles. SB 375 requires CARB to develop, in consultation with metropolitan planning organizations (MPOs), passenger vehicle greenhouse gas emissions reduction targets for 2020 and 2035 by September 30, 2010. SB 375 requires MPOs to prepare a sustainable communities strategy to reach the regional target provided by CARB.
SPM-7: Vehicle Efficiency Measures	Implement light-duty vehicle efficiency measures. CARB is pursuing fuel-efficient tire standards and measures to ensure properly inflated tires during vehicle servicing.
SPM-8: Goods Movement	Implement adopted regulations for port drayage trucks and the use of shore power for ships at berth. Improve efficiency in goods movement operations.
SPM-9: Million Solar Roofs Program	Install 3,000 MW of solar-electric capacity under California's existing solar programs.
SPM-10: Heavy/Medium-Duty Vehicles	Adopt heavy- and medium-duty vehicle and engine measures. Measures targeting aerodynamic efficiency, vehicle hybridization, and engine efficiency are recommended.
SPM-11: Industrial Emissions	Require assessment of large industrial sources to determine whether individual sources within a facility can cost-effectively reduce green- house gas emissions and provide other pollution reduction co-benefits. Reduce greenhouse gas emissions from fugitive emissions from oil and gas extraction and gas transmission. Adopt and implement regulations to control fugitive methane emissions and reduce flaring at refineries.
SPM-12: High Speed Rail	Support implementation of a high-speed rail (HSR) system. This measure supports implementation of plans to construct and operate a HSR system between Northern and Southern California serving major metropolitan centers.
SPM-13: Green Building Strategy	Expand the use of green building practices to reduce the carbon footprint of California's new and existing inventory of buildings.
SPM-14: High GWP Gases	Adopt measures to reduce high global warming potential gases. The Proposed Scoping Plan contains 6 measures to reduce high GWP gases from mobile sources, consumer products, stationary sources, and semiconductor manufacturing.
SPM-15: Recycling and Waste	Reduce methane emissions at landfills. Increase waste diversion, composting, and commercial recycling. Move toward zero-waste.
SPM-16: Sustainable Forests	Preserve forest sequestration and encourage the use of forest biomass for sustainable energy generation. The federal government and California's Board of Forestry and Fire Protection has the regulatory authority to implement the Forest Practice Act to provide for sustainable management practices. This measure is expected to play a greater role in the 2050 goals.

SPM-17: Water	Continue efficiency programs and use cleaner energy sources to move water. California will also establish a public goods charge for funding investments in water efficiency that will lead to as yet undetermined reductions in greenhouse gases.
SPM-18: Agriculture	In the near term, encourage investment in manure digesters and at the five-year Scoping Plan update determine if the program should be made mandatory by 2020. Increase efficiency and encourage use of agricultural biomass for sustainable energy production. CARB has begun research on nitrogen fertilizers and will explore opportunities for emission reductions.

Source: California Air Resources Board, Climate Change Scoping Plan (2008).

D. Senate Bill 1368

Governor Schwarzenegger, just two days after signing AB 32, reiterated California's commitment to reducing GHGs by signing Senate Bill 1368 (SB 1368, Perata). SB 1368 requires the CEC to develop and adopt regulations for GHG emissions performance standards for the long-term procurement of electricity by local publicly owned utilities. These standards must be consistent with the standards adopted by the Public Utilities Commission. This effort will help to protect energy customers from financial risks associated with investments in carbon-intensive generation by allowing new capital investments in power plants whose GHG emissions are as low or lower than new combined-cycle natural gas plants, by requiring imported electricity to meet GHG performance standards in California and requiring that the standards be developed and adopted in a public process.

E. Executive Order S-1-07

On January 18, 2007, California further solidified its dedication to reducing GHGs by setting a new Low Carbon Fuel Standard (LCFS) for transportation fuels sold within the state. Executive Order S-1-07 sets a declining standard for GHG emissions measured in CO2-equivalent gram per unit of fuel energy sold in California. The target of the LCFS is to reduce the carbon intensity of California passenger vehicle fuels by at least 10 percent by 2020. The LCFS will apply to refiners, blenders, producers, and importers of transportation fuels and will use market-based mechanisms to allow these providers to choose how they reduce emissions during the "fuel cycle" using the most economically feasible methods. The Executive Order requires the secretary of Cal/EPA to coordinate with actions of the CEC, CARB, the University of California, and other agencies to develop a protocol to measure the "life-cycle carbon intensity" of transportation fuels. CARB is anticipated to complete its review of the LCFS protocols no later than June, 2007 and implement the regulatory process for the new standard by December, 2008.

F. Senate Bill 97

In August, 2007, as part of the legislation accompanying the state budget negotiations, the legislature enacted SB 97 (Dutton), which directs the Governor's Office of Planning and Research (OPR) to develop guidelines under CEQA for the mitigation of greenhouse gas emissions. OPR is to develop proposed guidelines by July 1, 2009, and the Resources Agency is directed to adopt guidelines by January 1, 2010. On June 19, 2008, OPR issued a technical advisory as interim guidance regarding the analysis of GHG emissions in CEQA documents (OPR 2008). The advisory indicated that a project's GHG emissions, including those associated with vehicular traffic, energy consumption, water usage, and construction activities, should be identified and estimated. The advisory further recommended that the lead agency determine significance of the impacts and impose all mitigation measures that are necessary to reduce GHG emissions to a less than significant level. The advisory did not recommend a specific threshold of significance—either quantitative or qualitative—leaving this to the lead agency's judgment and discretion, based upon factual data and guidance from regulatory agencies and other sources where available and applicable.

On January 8, 2009, OPR released its Preliminary Draft CEQA Guideline Amendments for Greenhouse Gas Emissions. Generally, the proposed Guidelines seek to apply CEQA's existing basic rules for impact analysis to the topic of greenhouse gas emissions, specifying in several instances, for example, that determinations on greenhouse gas emissions must be supported by substantial evidence, as with other CEQA determinations. OPR's proposed amendments to the CEQA Guidelines would allow lead agencies to determine whether impacts are significant based on "compliance with plan" findings, to specify that projects may determine that their contribution to the cumulative impact of climate change is reduced to a less than significant level by compliance with climate action plans or statewide greenhouse gas mitigation plans.

On July 3, 2009, the California Natural Resources Agency began the formal rulemaking process for the adoption of CEQA Guideline amendments concerning the evaluation of greenhouse gas emissions, and the proposed guidelines, which remain subject to further comment and revision, are expected to become effective early in 2010. The draft guidelines as currently proposed do not set forth a specific proposed threshold of significance, but indicate that lead agencies assessing the significance of greenhouse has emissions on the environment may consider factors that include whether the project increases or reduces greenhouse gas emissions as compared to the existing environmental setting, whether project emissions exceed a significance threshold that the lead agency determines may apply to the project, and whether the project complies with regulations or requirements adopted to implement a greenhouse gas reduction plan.[8]

[8] Proposed Guideline 15064.4, *Determining the Significance of Impacts from Greenhouse Gas Emissions,* July 3, 2009.

G. Senate Bill 375

The California Legislature passed SB 375 (Steinberg) on September 1, 2008. SB 375 would require CARB to set regional greenhouse gas reduction targets after consultation with local governments. The target must then be incorporated within that region's Regional Transportation Plan (RTP), which is used for long-term transportation planning, in a Sustainable Communities Strategy. SB 375 also requires each region's Regional Housing Needs Assessment (RHNA) to be adjusted based on the Sustainable Communities Strategy in its RTP. Additionally, SB 375 will reform the environmental review process to create incentives to implement the strategy, especially transit priority projects. The governor signed SB 375 into law on September 30, 2008.

4. Other Statewide and Regional Activities

A. California Climate Action Registry

The California Climate Action Registry (CCAR) is a private non-profit organization formed by the State of California and serves as a voluntary GHG registry to protect and promote early actions to reduce GHG emissions by organizations. Senate Bill 1771 (SB 1771, Sher) formally established the CCAR with technical changes made to the statute in SB 527, which finalized the structure for the California Registry. The CCAR began with 23 Charter Members and currently has over 300 corporations, universities, cities and counties, government agencies and environment organizations voluntarily measuring, monitoring, and publicly reporting their GHG emissions using the CCAR protocols. The CCAR has published a General Reporting Protocol, as well as project- and industry-specific protocols for landfill activities, livestock activities, the cement sector, the power/utility sector, and the forest sector. The protocols provide the principles, approach, methodology, and procedures required for participation in the CCAR.

B. CAPCOA CEQA and Climate Change White Paper

The California Air Pollution Control Officers Association (CAPCOA) prepared a white paper on CEQA and climate change in January 2008. The white paper was intended to be used as a resource by lead agencies when considering policy options and not as a guidance document. Specifically, the white paper discusses three possible approaches to evaluating the significance of GHG emissions and possible mitigation measures; however, CAPCOA does not endorse any particular approach. The three alternative significance approaches are: (1) not establishing a significance threshold for GHG emissions; (2) setting the GHG emission threshold at zero; and (3) setting the GHG emission threshold at some non-zero level. The white paper evaluates potential considerations and pitfalls associated with the three approaches. At the end of the white paper, CAPCOA provides a list of potential mitigation measures and discusses each in terms of emissions reduction effectiveness, cost effectiveness, and technical and logistical feasibility. While programs are still being developed by CARB, the white paper provides public agencies with information to ensure that GHG emissions are, according to CAPCOA, "appropriately considered and addressed under CEQA."

C. The BAAQMD released draft thresholds of significance in September 2009 (these were updated in October 2009 and again in November 2009). BAAQMD proposes three different project thresholds of significance for GHG emissions: (1) compliance with a qualified Climate Action Plan, (2) a bright line emissions threshold of 1,100 metric tons of CO2e per year, or (3) emissions of and 4.6 metric tons of CO2e per capita per year for mixed use projects. The emissions based thresholds are for operational impacts. BAAQMD did not identify emission based thresholds for construction activities. Instead, best management practices are suggested for construction projects. These draft thresholds are currently under review and may be further revised, with adoption not expected to occur until December 2009 or early 2010.[9]

D. Sonoma County General Plan 2020

The Sonoma County General Plan 2020 includes a significant and broad based set of policies and programs to reduce GHG emissions. These include limiting new development to urban areas, preserving land uses that can offset and event remove GHG emissions, reducing vehicle miles traveled, promoting alternative transportation, reducing energy use and exploring renewable energy, promoting water conservation and reuse, and directly reducing GHG emissions. These include:

GOAL OSRC-16:	Preserve and maintain good air quality and provide for an air quality standard that will protect human health and preclude crop, plant and property damage in accordance with the requirements of the Federal and State Clean Air Acts.
Objective OSRC-16.1:	Minimize air pollution and greenhouse gas emissions.
Objective OSRC-16.2:	Encourage reduced motor vehicle use as a means of reducing resultant air pollution.

The following policies, in addition to those of the Circulation and Transit Element, such as Policy CT-2s: encourage measures that increase the average occupancy of vehicles, shall be used to achieve these objectives:

Policy OSRC-16a: Require that development projects be designed to minimize air emissions. Reduce direct emissions by utilizing construction techniques that decrease the need for space heating and cooling.

[9] *The BAAQMD proposals and updated versions of t hose proposals can be viewed on the BAAQMD website at http://www.baaqmd.gov/Divisions/Planning-and-Research/Planning-Programs-and-Initiatives/CEQA-GUIDELINES.aspx*

Policy OSRC-16b: Encourage public transit, ridesharing and van pooling, shortened and combined motor vehicle trips to work and services, use of bicycles, and walking. Minimize single passenger motor vehicle use.

Policy OSRC-16c: Refer projects to the local air quality districts for their review.

Policy OSRC-16f: Encourage the adoption of standards, the development of new technology, and retrofitting to reduce air pollution resulting from geothermal development.*

Policy OSRC-16h: Require that development within the Bay Area Air Quality Management District that generates high numbers of vehicle trips, such as shopping centers and business parks, incorporate air quality mitigation measures in their design.

Policy OSRC-16i: Ensure that any proposed new sources of toxic air contaminants or odors provide adequate buffers to protect sensitive receptors and comply with applicable health standards. Promote land use compatibility for new development by using buffering techniques such as landscaping, setbacks, and screening in areas where such land uses abut one another.

Policy OSRC-16k: Require that discretionary projects involving sensitive receptors (facilities or land uses that include members of the population sensitive to the effects of air pollutants such as children, the elderly, and people with illnesses) proposed near the Highway 101 corridor include an analysis of mobile source toxic air contaminant health risks. Project review should, if necessary, identify design mitigation measures to reduce health risks to acceptable levels.*

Policy OSRC-14d: Support project applicants in incorporating cost-effective energy efficiency that may exceed State standards.

Policy LU-11b: Encourage all types of development and land uses to use alternative renewable energy sources and meaningful energy conservation measures.

5. Sutter Health Planning and Development Building Design Policy for Sustainability

Sutter Health desires to reduce adverse impacts upon the environment resulting from the design, construction and operations of our health care facilities and therefore developed a Building Design Policy for Sustainability that outlines their commitment to adopt the accompanying guidelines for Building Design Policy for Sustainability and to conform to Part 11 of Title 24 California Building codes and the Green Guide for Health Care (GGHC), which are currently voluntary. The GGHC is a best practices guide for healthy and sustainable building design, construction, and operations for the healthcare industry. Sutter Health projects are evaluated on an individual basis.

This policy is intended to be used in the identification, evaluation and implementation of sustainable principles, objectives and elements in the planning and design of Sutter Health Facilities. The Leadership in Energy and Environment Design New Construction (LEED-NC) Version 2.2/Green Guide for Health Care (GGHC) Version 2.2 project checklist will be used to track and document the degree of compliance for each project.

Building design and construction practices will be administered in five key areas: Site selection, Water Efficiency and Conservation, Energy Efficiency, Material Conservation and Resource Efficiency, and Environmental Air Quality.

The Proposed Project would result in the development of a medical campus which would be integrated with the existing WFC Wells Fargo Center for the Arts facilities (WFC). The Medical Campus would include approximately 342,000 square feet of building space; a central utility plant, the existing WFCA facilities; 1,914 parking spaces (of which 903 are existing); athletic fields, open space and landscaped area.

IV. SIGNIFICANCE CRITERIA FOR EVALUATING EFFECTS

To date, no local or state air quality agency has adopted significance criteria for GHG emissions. While the Global Warming Solutions Act (AB 32) created a framework for the reduction of GHGs in California, the Act did not address the role of CEQA in achieving the goals of the Act. As noted earlier, in August 2007, the governor signed SB 97 (Dutton) into law, which requires the OPR to prepare *State CEQA Guidelines* for the mitigation of GHG emissions or the effects of greenhouse gas emissions. On January 8, 2009 OPR issued the Preliminary Draft CEQA Guideline Amendments. These Draft Amendments are currently under review, but the County has endeavored to develop the following significance criteria based on the Draft Amendments, and the guidance provided by the CAPCOA CEQA and Climate Change White Paper.

The County will consider whether the Proposed Project may result in a cumulatively considerable impact[10] to the environment that cannot be mitigated to a level of level of less than significant.

In assessing the potential significance of such cumulative impacts from GHG emissions from the Proposed Project, the County will qualitatively consider:

The extent to which the project would help or hinder attainment of the State's goals of reducing greenhouse gas emissions to 1990 levels by the year 2020 as stated in the Global Warming Solutions Act of 2006 (AB 32).

---

[10] *While no guidance exists to indicate what level of GHG emissions would be considered substantial enough to result in a significant adverse impact on global climate, it is generally the case that an individual project of any size is of insufficient magnitude by itself to influence climate change or result in a substantial contribution to the global GHG inventory. Thus, GHG impacts are recognized as exclusively cumulative impacts; there are no non-cumulative GHG emission impacts from a climate change perspective (CAPCOA 2008). Accordingly, discussion of the Proposed Project's GHG emissions and their impact on global climate are addressed in terms of its contribution to a cumulative impact on global climate.*

V. METHODOLOGY FOR EVALUATING EFFECTS

The Proposed Project would result in emissions of GHGs due to fuel combustion in motor vehicles, mobile construction equipment, and building heating and water systems associated with the Medical Campus and would contribute to the global GHG inventory. Building and motor vehicle air conditioning systems may also use HFCs (and HCFCs and CFCs to the extent that they have not been completely phased out at later dates), which may result in emissions through leaks. The other primary GHGs (perfluorocarbons and sulfur hexafluoride) are associated with specific industrial sources and are not expected to be associated with the Proposed Project.

The emissions of CO2, the primary greenhouse gas associated with construction and operation of the Proposed Project were estimated using URBEMIS2007 (see Section Appendix A):

1. Motor vehicles: The CO2 emissions associated with construction and operation of the Campus are analyzed at vehicle miles traveled.

2. Area sources (natural gas combustion): The CO2 emissions from natural gas consumption for the Project were adjusted based on emission factors for CO2, CH4, and N2O for natural gas combustion from the California Climate Action Registry's *General Reporting Protocol* (California Climate Action Registry [CCAR] 2008), the global warming potential for each GHG; and 365 days per year.

3. Construction diesel trucks and equipment: No adjustment was made to the CO2 emissions because the GHGs in the exhaust from diesel engines are almost entirely CO2 (less than one percent CH4 and N2O on a CO2 equivalent basis).

The Proposed Project would also result in indirect GHG emissions due to the gas and electricity demands of the Medical Campus. Emission factors for GHGs due to gas and electrical demand from the Proposed Project were calculated by the mechanical engineers for the Project.

Indirect GHG emissions would also be associated with the electrical demand resulting from the provision of water to the project site, electrical demand and process emissions due to wastewater treatment, and decomposition of solid waste generated by the Proposed Project. The electrical demand associated with supplying water to the project site was calculated based on the estimated water; California Energy Commission estimates of electric use for water conveyance, treatment, and distribution (CEC 2005; CEC 2006b). The wastewater-related GHG emissions were not calculated as the Project will not contribute to wastewater flows as the Project will offset its flows through retrofitting toilets and showers within the County equivalent to its projected flows, resulting in a zero net increase. Lastly, the solid waste-related emissions were estimated based on the solid waste generation of the Proposed Project and US EPA emission factors (US EPA 1998).

On-site vegetation currently reduces GHG emissions by sequestering carbon dioxide. GHG emissions would not increase as on-site vegetation will be replaced with landscaping which would increase the number of trees on the site and therefore in the long run would provide greater carbon sequestration.

To put the proposed project's GHG emissions in context, the applicant has also provided an estimate of the GHG construction-related and operational emissions that would be expected with the construction and operation of a "standard" hospital and medical office project of the scale and location of the proposed project, and then compared that estimate with an estimate of the construction and operational emissions of the project as proposed with design features and emissions reduction measures included to reduce energy usage and greenhouse gas emissions. This approach, and the estimates, are set forth and explained below.

It should be noted that the analysis below likely overstates the project's actual contribution to the cumulative impact of global climate change in several important respects. First, the proposed project consists in substantial part of a new hospital that will be replacing an older existing hospital. In this analysis, the greenhouse gas emissions associated with the proposed project have been treated as new emissions, even though there are emissions at the existing hospital and there are substantial emissions associated with mobile emissions to and from the existing hospital. Thus, many of the emissions set forth below are already occurring, and some of those emissions may be reduced by the new project in comparison to the operation of the existing hospital. Also, as noted below, the analysis does not account for the substantial reductions in future emissions that will occur as more efficient fuels and engines are introduced, because the currently available emissions estimates do not yet account for these future emissions reductions.

"Standard" estimate of emissions. The "standard" construction-related GHG emissions estimates were calculated using the URBEMIS2007 model with model default assumptions for Sonoma County. The project size and construction schedule were used to develop an annual estimate of CO2 emissions. Emissions from the import and export of fill material were calculated separately using estimates of truck travel and CO2 emission factors developed with the EMFAC2007 on-road motor vehicle emissions factor model. In addition, emissions from road construction were computed using the Roadway Construction Emission Model (Version 6.3.1) with default assumptions for the estimated size of the roadway construction. These emissions are only those associated with usage of construction equipment, truck traffic and worker traffic. These emissions do not include the indirect emissions of manufacturing materials that comprise the project, as there are no reliable methods for calculating these emissions.

The California Air Pollution Control Officers Association (CAPCOA) has provided guidance for calculating project emissions.[11] Emissions from area, mobile and electricity usage are recommended by CAPCOA. Area and mobile source emissions were calculated using the URBEMIS2007 model with the same inputs used to calculate emissions of air pollutants.

The URBEMIS2007 model was used to predict the emissions from mobile sources associated with the project and minor area sources such as landscape equipment usage (note that natural gas combustion emissions for cooking and heating were calculated separately). Trip generation estimates for the project were used in the URBEMIS2007 model to predict operational (or mobile source) emissions of CO2.

---

[11] *California Air Pollution Control Officers Association, 2008, CEQA & Climate Change, January.*

The "standard" operational GHG emissions estimates for energy usage (i.e., natural gas and electricity consumption) were calculated using data compiled as part of the U.S. Department of Energy's Commercial Building Energy Consumption Survey (CBECS). The CBECS is national sample survey that collects information on the stock of commercial buildings, their energy-related building characteristics, and their energy consumption and expenditures. The survey includes hospitals and medical office buildings. The most recent survey for which results are available on the CBECS website as of October 2009 is the 2003 survey.

The term "standard" is used because it is the terminology employed by PG&E in evaluating energy conservation measures, and it can also be considered a measure of the recent "business as usual" emissions for hospitals and medical centers (shown as inpatient health care on the CBECS charts) and medical office buildings (shown as outpatient health care on the CBECS charts).

V. IMPACTS AND MITIGATION MEASURES

The estimated annual consumption of natural gas and electricity were used to calculate CO2 emissions. For natural gas, the annual consumption rate was applied to the emission rate recommended by the California Climate Action Registry Reporting Protocol.[12] The annual electricity consumption rate was applied to the CO2 emission rate reported by PG&E, which is 524 pounds of CO2 per 1,000 kilo watt hours (see http://www.pge.com/myhome/environment/calculator/assumptions.shtml). It should be noted that PG&E's rate is about 40-percent lower than the statewide average emission rate for electricity production and about half of the national average.[13]

Table 5
Standard Estimated Construction GHG Emissions

Annual Total Emissions	CO2 (tons/year)
2011	729
2012	186
2013	522

[12] *Ref: California Climate Action Registry (CCAR), 2008, California Climate Action Registry General Reporting Protocol – Reporting Entity-Wide Greenhouse Gas Emissions, Version 3.0, April.*

[13] *Emissions from electricity usage were computed using the CO2 rate that PG&E provides to their customers on their website to calculate emissions from household energy consumption. However, PG&E is listed by the Local Government Operations Protocol for quantification of GHG inventories (see ref below) as having a 2006 certified rate of 455.81 pounds of CO2 per megawatt of electricity produced. A 2006 certified rate for California as a whole was not available. However, in 2004 when PG&E's rate was 566.20 pounds of CO2 per megawatt, California's overall rate was 958.49 pounds per megawatt. Hence, PG&E's rate is about 40% lower than the California Grid Average. Local Government Operations Protocol For the quantification and reporting of greenhouse gas emissions inventories, Version 1.0. September 25, 2008. Developed in partnership by: California Air Resources Board, California Climate Action Registry, ICLEI - Local Governments for Sustainability, and The Climate Registry. – Appendix G, Table G.5 "Utility-Specific Verified Electricity CO2 Emission Factors (2000-2006)."*

Table 6
Standard Estimated Operational GHG Emissions

Emission Source	CO2 (tons/year)
Operational (Mobile) Sources	6494
Electricity (including water)	2047
Emergency Generator Testing	41
Natural Gas	1044
Total	9626

"Proposed project" estimate of emissions. To provide a comparison to the "business as usual" scenario, the applicant has also an estimate of the GHG construction-related and operational emissions that would be expected with the construction and operation of the proposed project – the "proposed project" GHG emissions. These estimates reflect all of the measures incorporated into the design and planned operations of the proposed project which will reduce its construction-related and operational GHG emissions.

The "proposed project" construction-related GHG emissions estimates are assumed to be the same as the "standard" construction emissions. It is anticipated that best management practices for construction emissions will reduce GHG emission to some extent. However, there is not yet a basis for reliably calculating the savings in construction emissions that can be achieved through application of the generic types of best management practices such as those that are recommended by BAAQMD for reducing construction emissions of GHG.

The "proposed project" operational GHG emissions estimates were calculated by applying anticipated reductions in vehicle trips, and anticipated energy savings calculated by PG&E.

Mobile source emissions from a project of this type are difficult to reduce. Patients or customers would make up most of the trips, and they are likely to make these trips by car. The project would include many incentives for workers or regular users of the hospital or offices to use alternative means to travel to the project site. These measures would include on-site facilities to accommodate bikers and pedestrians. Such facilities would include secure bike storage, lockers and shower/dressing room facilities. In addition, the project would provide direct linkages of pedestrian paths to different project components and bike paths that connect to the roadways. A reduction in mobile source emissions of 5 percent is anticipated based on these features. In addition, transit access is better the proposed project site than at Sutter's existing Chanate campus, and this should further reduce mobile source emissions.

Energy savings features that would be included in the project to reduce electricity and natural gas consumption would also reduce GHG emissions. Consistent with Title 24 building standards, a number of energy reduction and efficiency measures are being incorporated into the project to reduce energy consumption, many of which are beyond what would normally be included in a hospital. In addition, all facilities are proposed to be LEED certified and as a result would use many of the best energy reduction and efficiency measures available. Energy savings were calculated using Energy Soft modeling as part of the energy savings by design modeling. These reductions were applied to the project to calculate proposed project operational GHG emissions. (It should be noted that the new hospital building and Physicians Medical Center will replace the existing, less energy-efficient medical facilities on Chanate Road. While the buildings on Chanate will likely be occupied by other uses, the new uses are unlikely to involve 24-hour-a-day operations like the existing hospital use, and therefore would likely consume less energy.)

Table 7
Proposed Project Estimated Construction GHG Emissions

Annual Total Emissions	CO2 (tons/year)
2011	729
2012	186
2013	522

There will be some nominal amount of constructions emissions in late 2010 as site grading and soil surcharging begins. The annual construction emissions figures set forth above vary based on the anticipated activity during each year. In 2011, the first year of substantial construction, it is anticipated there will be numerous truck trips for fill import. Roadway improvements are assumed to occur simultaneously. Most building and infrastructure construction is anticipated to take place in 2012 and 2013. In 2013, there would also be truck trips to export fill from the site [x-reference to construction truck trips discussion in Traffic section].

Table 8
Proposed Project Estimated Operational GHG Emissions

Emission Source	CO2 (tons/year)
Operational (Mobile) Sources	6169
Electricity (including water)	1709
Emergency Generator Testing	41
Natural Gas	640
Total	8559

Accordingly, the applicant has estimated that the project as proposed would result in 1067 fewer tons of operational GHG emissions per year, a reduction of just over eleven percent (11%), comparing “proposed project” operational emissions to “standard” operational emissions. The project’s actual reduction in emissions should be greater.

First, there will be some reduction from construction best management practices, but as previously noted it is not yet possible to calculate the amount of such reductions. Second, there will be substantial reductions in the largest category of emissions, operational mobile sources, as more efficient fuels and vehicle engines are introduced. Transportation emission rates would likely decrease due to increased fuel efficiency and lower carbon content in fuels. The URBEMIS2007 model does not reflect current future fuel efficiency projections. Efficiency is regulated by the U.S. Department of Transportation and current CARB regulations that address climate change. Newer fuel standards would increase light-duty automobile and light-duty truck fuel efficiency by 10 miles per gallon (to 35 miles per gallon for cars sold in 2020). In addition, California will require lower carbon content fuels. In the CARB scoping plan, these steps are anticipated to provide some of the most substantial GHG emissions reductions.[14] While PG&E has emission rates for electricity usage that are much lower than State or national averages, these rates are expected to be reduced in the future as power producers develop cleaner sources of energy.

These reductions in estimated GHG emissions reflect the proposed project's inclusion of design features and emission reduction measures that relate to operational emissions reductions, as set forth in Table 8.

Based on the proposed project's incorporation of these GHG reduction measures, which will result in a substantial decrease in the proposed project's GHG emissions as compared to a standard hospital and medical office project of this scale and location, the project would not impede or conflict with the emissions reduction targets and strategies prescribed in or developed to implement AB 32, and will help to achieve AB 32 goals. For the same reason, the project will not impede or conflict with the attainment of the County's greenhouse gas reduction goal as expressed in General Plan Objective OSRC 14.4. Accordingly, the project would not result a contribution to global climate change that would be considered cumulatively considerable, and the impact from the development of the Project on greenhouse gas emissions and global climate change would be considered less than significant. It is important to note that the project's reduction will be in addition to the emissions reductions that are anticipated based on implementation of the AB 32 scoping plan. BAAQMD staff estimate that the combination of key scoping plan measures (such as the renewable portfolio standard, improvements to Title 24, AB 1493 vehicle standards, and low carbon fuel standards) will reduce future emissions by almost 24 per cent. The project's reduction will largely be in addition to these other reductions.

As a further level of analysis, Sutter has provided to the County a qualitative evaluation of the project relative to pertinent measures included in ARB's Scoping Plan for the state's compliance with AB 32. Table 8, Consistency of Campus Project Features with AB 32 Scoping Plan Measures, lists all pertinent measures included in CARB's Scoping Plan for the state's compliance with AB 32, and presents Sutter's sustainability policies, programs, project design features that comply with the Scoping Plan measures.

Based on the analysis in Table 8, the project would reduce its contribution to GHG emissions and global climate change due to its consistency with these strategies and measures. In addition, the project would incorporate other project features, such as proximity to commercial centers and public services that would result in lower fuel

[14] *California Air Resources Board, Climate Change Scoping Plan (December 2008) at 17.*

combustion emissions, reduced energy usage, water conservation, and other collateral benefits with respect to GHG emissions.[15,16] Also, also there are several basic characteristics of the proposed project that reduce its contribution to GHG emissions and global climate change. These include the project's proximity to Highway 101, the improved transit access to the hospital compared to Sutter's current site, and the co-location of various medical facilities on the same campus, avoiding the need for vehicle trips between those facilities.

BAAQMD proposed significance thresholds: One criteria, proposed as the sole recommendation by BAAQMD staff in September 2009 and then proposed as one of several possible options in October 2009, is a threshold of 1,100 metric tons of CO2 equivalent per year in operational emissions associated with the project. The project's estimated operational greenhouse gas emissions of 8559 tons per year would exceed this threshold, were it to be adopted.

Another criteria proposed by BAAQMD staff is 4.6 metric tons per year of CO2 equivalent operational emissions per service population associated with the project, with "service population" being defined as the sum of the number of jobs and the number of residents provided by a project. If this threshold were adopted and if it applied to this project, based on the projected employment at the project, it is anticipated that the project would exceed this threshold.

Consideration of Off-Site Mitigation: In addition to the project design features and mitigation measures on the project site, the County has also considered the feasibility of off-site mitigation, namely the purchase of carbon offsets. There are several issues relating to the feasibility and enforceability of offsets at this time. First, the threshold used in this analysis is the extent to which the project will help or hinder the attainment of state and local greenhouse gas reduction goals, and the offset programs which are available generally do not offset emissions in California or specifically in Sonoma County. There are also a number of uncertainties associated with purchasing offsets, including the permanence of the offsets, price fluctuations, ownership, verification of emissions reductions, and additionality.[17] The Air Resources Board has not adopted an offsets program under AB 32, and has been holding meetings this year to evaluate the

[15] *Project design features and emission reduction measures that are intended to reduce criteria pollutant emissions associated with fuel combustion (e.g., motor vehicle emissions) or energy conservation would also serve to reduce GHG emissions.*

[16] *The proposed project would result, through Phase III, in GHG emissions of approximately 8559 tons per year. Accordingly, the County notes that, compared to the estimated GHGs from all sources in California, and without considering any deduction for the loss of emissions as the Chanate campus closes, the Project's contribution to global climate would add approximately 0.0017 percent to California's GHG emissions inventory (484 million metric tons, including out-of-state electrical generation). The County is not using this figure to determine the significance of the emissions, but is setting it forth for disclosure purposes.*

[17] *Additionality refers to whether emissions reductions are additional steps beyond business as usual. All of these limitations on offsets as potential mitigation are discussed in detail in a certified EIR prepared for a corporate park project in Southern California. Michael Brandman & Associates, Environmental Impact Report P07-157, Highland Fairview Corporate Park, City of Moreno Valley, California. Some of these issues are also addressed in the August 2008 Report by the U.S. General Accounting Office, Carbon Offsets: The U.S. Voluntary Market is Growing but Quality Assurance Poses Challenges for Market Participants.*

role of offsets in a cap-and-trade program.[18] There is not currently an offset program that is designed to meet AB 32 emissions reduction goals or assist in achieving compliance with the greenhouse gas reduction goals in the Sonoma County General Plan. In summary, purchasing offsets to reduce the project's contribution to greenhouse gas emissions is not feasible at this time.]

As noted above, Sutter intends to incorporate Leadership in Energy and Environmental Design (LEED) standards and principles in the design and construction of the campus. The Project will pursue LEED certification for new construction in furtherance of incorporating energy conservation and sustainability measures into the project. The following will be studied for incorporation into the design:

- Building designs to maximize passive approaches to energy usage and reduce reliance on mechanical systems that involve significant energy demands;
- Buildings that incorporate green roof designs to insulate rooftops from heat island effects, slow and filter rain runoff from rooftops, extend the life of the roof, and reduce energy use for cooling and heating;
- Buildings to use waterless urinals, low flow toilets and low flow baths and showers;
- Open space such as passive open space, active and recreational open space, and interstitial open spaces between buildings;
- The open space system resulting in less building coverage and emphasizes the regional landscape of Sonoma County;
- The campus to implement a variety of low impact development practices to minimize adverse impacts related to storm water runoff.

Table 9, Consistency of Campus Project Features with AB 32 Scoping Plan Measures, lists all pertinent measures included in CARB's Scoping Plan for the state's compliance with AB 32, and presents Sutter's sustainability policies, programs, project design features that comply with the Scoping Plan measures.

Table 9
Consistency of the Sutter Project Features with AB 32 Scoping Plan Measures

Scoping Plan Measure	Sutter Policy/Project Feature
SPM-1: California Cap-and-Trade Program linked to Western Climate Initiative	Not applicable.
SPM-2: California Light-Duty Vehicle GHG Standards	Not applicable.

[18] *Information on the ARB's consideration of offsets is available on the ARB website. http://www.arb.ca.gov/cc/capandtrade/capandtrade.htm*

Scoping Plan Measure	Sutter Policy/Project Feature
SPM-3: Energy Efficiency	Aggressive conservation efforts and development of renewable power will be fundamental to project design. Buildings will be designed to consume reduced levels of energy and demand over the current hospital. LEED: The project has been registered for LEED certification.
SPM-4: Renewables Portfolio Standard	Not applicable
SPM-5: Low Carbon Fuel Standard	Not applicable
SPM-6: Regional Transportation-Related Greenhouse Gas Targets	Develop a coordinated master plan to guide design and implementation of the principal circulation infrastructure, including plans that address streets, bikeways, pedestrian ways, transit and parking; created a comprehensive, interconnected bicycle and pedestrian circulation system that provides access to major buildings. Work with local and regional transit providers to coordinate transit service, and establish convenient transfers between transit and other modes of travel. Provide priority parking for vanpools, carpools, and energy efficient and low-pollution vehicles, with recharge stations for electric vehicles and provide a natural gas vehicle charging stations. Provide leadership by using alternative fuel or other low-emission vehicles in the campus service fleet.
SPM-7: Vehicle Efficiency Measures	Not applicable.
SPM-8: Goods Movement	Not applicable.
SPM-9: Million Solar Roofs Program	Sutter is working with PG&E in its Energy By Design Program to optimize solar and thereby minimizing grid connected peak electricity loads by shifting electricity used for cooling away from peak electricity demand periods through chilled water thermal storage, gas or cogeneration-driven cooling, and/or solar power.
SPM-10: Heavy/Medium-Duty Vehicles	Minimize construction emissions.
SPM-11: Industrial Emissions	Not applicable.
SPM-12: High Speed Rail	Not applicable.
SPM-13: Green Building Strategy	Buildings will be designed to consume less energy and demand than the existing hospital and surpass Title 24 minimum efficiency standards, and achieve LEED certification. There is a relationship between indoor environmental quality and materials, lighting, thermal comfort, human health & productivity. Accordingly, Sutter Health as a community role model has a vested interest in delivering environments that optimize patient outcomes and provide a "best place to work and practice"

Scoping Plan Measure	Sutter Policy/Project Feature
	environment for its employees. Minimizing and controlling sources of allergens, mutagens, carcinogens and endocrine disruptors, while providing access to daylight and comfortable indoor climate in an accessible setting are fundamental building design goals. Exposure conditions that adversely affect health can only be evaluated in the light of the benefits received and the alternatives available. **Environmental Air Quality Guidelines** • Establish minimum indoor air quality (IAQ) performance to enhance indoor air quality in buildings, thus contributing to the comfort and well-being of the occupants • Minimize production, distribution and exposure to pollutants-provide risk group specific protection where elimination is impossible • Provide occupants with access to natural daylight and healing views • Provide energy efficient thermal comfort within acceptable ranges • Provide occupant controlled zoned environmental controls (light, view, thermal, ventilation) • Manage pathogens and infection transmission with appropriate barriers, air flow, discharge and refresh rates **Environmental Air Quality Strategies** • Ensure high quality indoor air and thermal comfort by meeting or exceeding ASHRAE 62-1999 and ASHRAE 55-1992 as the minimum basis of design • Baseline design with minimum impact methods and materials including low VOC / low toxic finishes and materials i.e. Green Seal-certified paints; composite wood and agrifiber products without urea-formaldehyde resins; carpet systems certified by Carpet & Rug Institute Green Label Program; adhesives meeting local Air Quality Management District guidelines. • Design and specify systems that prevent trapping of water and microbial growth • Define and implement ICRA Infection control plan for all construction and renovation projects • Install entryway systems (e.g., grates) to trap dirt and particulates • Position building air intakes to prevent contamination from vehicle exhaust and other sources • Assure easy access to inspect and clean filters and ductwork in Air handling systems • Ventilate enclosed parking areas and other source areas (smoking areas, housekeeping, copying rooms, hazardous waste) • For buildings not 100% non smoking, provide total environmental separation for non smokers and assure no feed in to ventilation system • Include automated HVAC carbon dioxide monitoring system to provide feedback on space ventilation performance

Scoping Plan Measure	Sutter Policy/Project Feature
	• Design environments including materials, products, mechanical systems and design features to attenuate sound and vibration within tolerances outlined in Hospital guidelines in ASHRAE Application Handbook.
SPM-14: High GWP Gases	Not applicable.
SPM-15: Recycling and Waste	**Materials Conservation and Resource Efficiency** The healthcare delivery environment is first and foremost concerned with the health and welfare of the patients and staff. Although use of sustainable materials can significantly enhance a building's environmental impacts, there is no room in a critical care setting to compromise the health of our patients. Products and materials used in the healthcare delivery setting must be the best available that is appropriate for the use intended. Total Life Cycle costs associated with operating and maintaining the products and materials proposed must be balanced with the first cost and life cycle environmental impacts of the products considered. Hospital designs must seek to include sustainable harvest material, minimize production of persistent and bioaccumulative toxics (PBTs) and reduce waste. **Materials Conservation and Resource Efficiency Guidelines** • Balance resource depletion reduction objectives with service specific requirements • Reduce embodied energy (use lowest energy density product available) • Reduce toxics generated throughout the life cycle of materials • Reduce waste by including waste evaluations in design choices • Reduce impact of reuse or disposal of building **Materials Conservation and Resource Efficiency Strategies** • Reuse existing structures with minimum demolition practical • Specify materials and methods with reduced (or free from) ozone depleting substances and/or equipment using CFCs, HCFCs, and halons, balancing ozone depletion potential (ODP) with global warming potential (GWP) • Review design alternatives that consider materials that; ❖are free from toxic chemicals ❖do not release toxic byproducts throughout their life cycle ❖do not include toxins that are carcinogenic, persistent or bioaccumulative. (e.g. mercury, arsenic, urea formaldehyde, plasticizers in PVC and asbestos) ❖are recycled, reused/salvaged, remanufactured or from sustainable sources ❖are sustainably harvested

<table>
<tr><th>Scoping Plan Measure</th><th>Sutter Policy/Project Feature</th></tr>
<tr><td></td><td>❖are from local sources when available
❖are easily reusable, recyclable, or biodegradable on disposal
❖are design for efficient material use (less material use and less waste)
❖are design for adaptability of building design as needs change (reusable movable)
❖are designed for disassembly and recycle or reuse at end of building life.</td></tr>
<tr><td>SPM-16: Sustainable Forests</td><td>Not applicable</td></tr>
<tr><td>SPM-17: Water</td><td>Water Efficiency and Conservation
Water efficient design balances water quality and quantity availability and demand, both inside and outside of the building/campus. Water efficient design incorporates available resources and is responsive to the watershed and utility systems capacity as both source and sink. Limitation in utility system capacity and effectiveness demand that water be treated as a constrained and precious resource. Storm and Sanitary Sewer effluent flows can be dramatically impacted by environmentally sound planning and design.

Water Efficiency and Conservation Guidelines
• Optimize the use of potable water resources to conserve community water quality and availability
• Minimize operational impacts to off site treatment of wastewater by avoiding harshest and most problematical chemicals and processes
• Minimize storm water peak releases from the site, (capture and stage/ meter/ re-use)
• Maximize use of on-site water resources, (e.g., rainwater, gray water) where appropriate
• Match source water quality with end use requirements

Water Efficiency and Conservation Strategies
• Use high performance fixtures and equipment: e.g., low flow and pressure assist toilets and urinals; low-flow showerheads and faucets; automatic use activation on sinks, toilets and urinals; Water saving “Energy Star” labeled dietary, housekeeping laundry and mechanical systems equipment.
• Minimize boiler, mechanical and cooling tower water blow down chemical loading on sanitary sewer by eliminating water treatment chemicals. When possible evaluate use of non-evaporative condenser heat rejection equipment (air cooled, or ground source)
• Specify native plants that are tolerant of local climate, soils and water</td></tr>
</table>

Scoping Plan Measure	Sutter Policy/Project Feature
	• Install drip irrigation and high efficiency irrigation control with moisture sensors, weather based controllers. • Implement appropriate, safe strategies to recycle site waste water (e.g. gray water or condensate) and/or municipal secondary treated water for irrigation, sewage conveyance, and toilet flushing • Collect and store storm water runoff from roofs and site and use for irrigation, sewage conveyance, toilet flushing and/or HVAC/process makeup water or aquifer recharge • Minimize hardscapes and install site water runoff control and metering systems including permeable peak storage, specialty paving and other pervious surface materials • Create managed wetlands systems to locally recharge underground water flows.
SPM-18: Agriculture	Not applicable.

The following Table 10, Office of Planning and Research Suggested Mitigation Measures, present mitigation measures recommended by the Attorney General's office and OPR for lead agencies to consider in the development and approval of projects. Many of these measures are already covered by the policies contained in the Project application as well as by design features.

Table 10
Office of Planning and Research Suggested Mitigation Measures

Suggested Mitigation Measures	Project Compliance
Land Use and Transportation	
1. Implement land use strategies to encourage jobs/housing proximity, promote transit-oriented development, and encourage high-density development along transit corridors. Encourage compact, mixed-use projects, forming urban villages designed to maximize affordable housing and encourage walking, bicycling and the use of public transit systems.	The Project is adjacent to transit and will improve and enhance all bus stops along its frontage. The integration before WFCA and Sutter will promote shared uses and will be tied by bike paths and walkways.
2. Encourage infill, redevelopment, and higher density development, whether in incorporated or unincorporated settings.	The Project is compactly designed and is infill development as it is surrounded by development on 3 sides and the freeway.
3. Encourage new developments to integrate housing, civic and retail amenities (jobs, schools, parks, shopping opportunities) to help reduce VMT	The Project is located next to WFCA and within walking distance to the Larkfield community.

Suggested Mitigation Measures	Project Compliance
resulting from discretionary automobile trips.	
4. Apply advanced technology systems and management strategies to improve operational efficiency of transportation systems and movement of people, goods and services.	The hospital Project will incorporate the latest in technology.
5. Incorporate features into project design that would accommodate the supply of frequent, reliable and convenient public transit.	The Project is adjacent to transit and will improve and enhance all bus stops along its frontage. WFCA and Sutter will promote shared uses and will be tied by bike paths and walkways.
6. Implement street improvements that are designed to relieve pressure on a region's most congested roadways and intersections.	The Project will improve and signalize the adjacent local roadways and provide off-ramp improvements.
7. Limit idling time for commercial vehicles, including delivery and construction vehicles.	Condition of approval shall require limits on construction traffic idling times and improved circulation will enhance operational deliveries.
Urban Forestry	
8. Plant trees and vegetation near structures to shade buildings and reduce energy requirements for heating/cooling.	The landscape plan has been designed to maximize aspect and reduce albedo.
9. Preserve or replace on-site trees (that are removed due to development) as a means of providing carbon storage.	Project vegetation, especially trees, will be significantly increased over existing condition. Landscaping will be water efficient and utilize water conservancy technology.
Green Buildings	
10. Encourage public and private construction of LEED Leadership in Energy and Environmental Design certified (or equivalent) buildings.	The Project has registered as a certified project.
Energy Conservation Policies and Actions	
11. Recognize and promote energy saving measures beyond Title 24 requirements for residential and commercial projects.	The Project is committed to working with PG&E to participate in their Savings By Design program which exceeds the 24 standards.
12. Where feasible, include in new buildings facilities to support the use of low/zero carbon-fueled vehicles, such as the charging of electric vehicles from green electricity sources.	Hospital vehicles are low carbon fueled vehicles. The Project will provide charging stations for visitors/employees.
13. Educate the public, schools, other jurisdictions, professional associations, business and industry about reducing GHG emissions.	N/A
14. Replace traffic lights, streetlights, and other electrical uses to energy efficient bulbs and appliances.	The Project will upgrade old signals and underground lights and replace these with modern fixtures thereby reducing energy demand.
15. Purchase Energy Star equipment and appliances for public agency use.	All new appliances will be as efficient as feasible given hospital requirements.
16. Incorporate on-site renewable energy production, including installation of photovoltaic cells or other solar options.	The Project is designing into its buildings solar and other energy producing features.
17. Execute an Energy Savings Performance Contract with a private entity to retrofit public buildings. This	N/A

Suggested Mitigation Measures	Project Compliance
type of contract allows the private entity to fund all energy improvements in exchange for a share of the energy savings over a period of time.	
18. Design, build, and operate schools that meet the Collaborative for High Performance Schools (CHPS) best practices.	N/A
19. Retrofit municipal water and wastewater systems with energy efficient motors, pumps and other equipment, and recover wastewater treatment methane for energy production.	N/A
20. Convert landfill gas into energy sources for use in fueling vehicles, operating equipment, and heating buildings	N/A
21. Purchase government vehicles and buses that use alternatives fuels or technology, such as electric hybrids, biodiesel, and ethanol. Where feasible, require fleet vehicles to be low emission vehicles. Promote the use of these vehicles in the general community.	N/A
22. Offer government incentives to private businesses for developing buildings with energy and water efficient features and recycled materials. The incentives can include expedited plan checks and reduced permit fees.	N/A
23. Offer rebates and low-interest loans to residents that make energy saving improvements on their homes.	N/A
24. Create bicycle lanes and walking paths directed to the location of schools, parks and other destination points.	The Project will install bike paths along its frontage and within the site.
Programs to Reduce Vehicle Miles Traveled	
25. Offer government employees financial incentives to carpool, use public transportation, or use other modes of travel for daily commutes.	N/A
26. Encourage large businesses to develop commute trip reduction plans that encourage employees who commute alone to consider alternative transportation modes.	The Project will provide transit opportunities by: • Providing local and regional transit services through its Volunteer Wheels • Constructing at least two sheltered bus stops in convenient locations • Providing shuttle services The Project will encourage carpooling by: • Develop a carpool/vanpool program by providing preferential parking • Coordinate with regional rideshare programs • Notification to future employees of carpool/vanpool opportunities

Suggested Mitigation Measures	Project Compliance
27. Develop shuttle systems around business district parking garages to reduce congestion and create shorter commutes.	N/A
28. Create an online ridesharing program that matches potential Carpoolers immediately through email.	The Project will provide transit opportunities by: • Providing local and regional transit services through its Volunteer Wheels • Constructing at least two sheltered bus stops in convenient locations • Providing shuttle services The Project will encourage carpooling by: • Develop a carpool/vanpool program by providing preferential parking • Coordinate with regional rideshare programs • Notification to future employees of carpool/vanpool opportunities
29. Develop a Safe Routes to School program that allows and promotes bicycling and walking to school.	N/A
Programs to Reduce Solid Waste	
30. Create incentives to increase recycling and reduce generation of solid waste by residential users.	N/A
31. Implement a Construction and Demolition Waste Recycling Ordinance to reduce the solid waste created by new development.	The Project shall prepare and implement a construction recycling program with a 75% diversion goal.
32. Encourage public and private construction of LEED Leadership in Energy and Environmental Design) certified (or equivalent) buildings.	The Project has registered as a certified project.

Source: Office of Planning and Research, CEQA and Climate Change: Addressing Climate Change Through CEQA Review, http://opr.ca.gov/download.php?dl=ceqa/pdfs/june08-ceqa.pdf. 2008.

As Table 9 shows, Sutter's Sustainability goals and policies, which are being implemented in the Project, are consistent with all applicable measures in the AB 32 Scoping Plan. Accordingly, Project is consistent with applicable AB 32 Scoping Plan measures. Further, as Table 10 shows, many of these measures in the Office of Planning and Research's Suggested Mitigation Measures are also incorporated as part of the Project.

1. INTRODUCTION

Monk & Associates, Inc. (M&A) has prepared this biological resource analysis for the proposed Sutter Medical Center project site located at 50 Mark West Springs Road in Santa Rosa, Sonoma County, California (Figures 1, 2 and 3) (referred to herein as the project site). The proposed Sutter Medical Center will be a Master Planned Project titled the Sutter Medical Center Santa Rosa/Luther Burbank Memorial Foundation Master Plan Project (referred to herein as the project). The purpose of our analysis is to provide a description of existing biological resources on the project site and to identify potentially significant impacts that could occur to sensitive biological resources from the construction of a new hospital. A complete project description is provided below.

Biological resources include common plant and animal species, and special-status plants and animals as designated by the U.S. Fish and Wildlife Service (USFWS), California Department of Fish and Game (CDFG), National Marine Fisheries Service (NMFS), and other resource organizations including the California Native Plant Society. Biological resources also include waters of the United States and State, as regulated by the U.S. Army Corps of Engineers (Corps), California Regional Water Quality Control Board (RWQCB), and CDFG. It is important to note that our analysis includes an assessment of the potential for impacts to regulated waters, but does not provide the level of detail required for a formal delineation of waters suitable for submittal to the Corps.

This biological resources analysis also provides mitigation measures for “potentially significant” and “significant” impacts that could occur to biological resources. When implemented, the mitigation measures would reduce impacts to levels considered less than significant pursuant to the California Environmental Quality Act (CEQA). Accordingly, this report is suitable for review and inclusion in any review being conducted by Sonoma County for the proposed project pursuant to CEQA.

2. PROPERTY LOCATION AND SETTING

The project site is approximately 53± acres in size. It is located in the southeast quadrant of the U.S. Highway 101/Mark West Springs Road interchange. It is currently under two ownerships: Luther Burbank Memorial Foundation (“LBMF”), and Sutter Medical Center of Santa Rosa or affiliate (“Sutter”) and is comprised of four legal parcels as follows:

Parcel	Assessor’s Parcel No.	Owner	General Plan Land Use	Zoning	Area
1	58-040-058	Sutter	PQP	PF SD; SR	15.0± ac.
2	58-040-059	Sutter	PQP	PF/PF SD; SR	10.0± ac.
3	58-040-060	LBMF	PQP	PF/PF SD; SR	25.01± ac.
4	58-040-061	LBMF	PQP	PF	3.01± ac.
	Total				**53.02± ac.**

As outlined in the table above, LBMF owns 28± acres, while Sutter owns 25± acres. These four parcels are shown on Figure 3, an aerial photograph of the project site, which is located at the back of this report.

The project site is located on and adjacent to the Luther Burbank Center. Figure 3 at the back of this report shows the various land uses within the project site boundary. The largest use of the property is paved parking, paved roads, buildings, and manicured landscaping, totaling approximately 25 acres. Soccer/lacrosse fields and other non-irrigated turf areas that include a tot-lot cover another approximately 10 acres. A large, approximately 15-acre parcel occurs on the west edge of the project site; this parcel has been used in the recent past as a horse pasture. No horses were present at the time of M&A's December 2008 site surveys. This parcel is comprised largely of non-native annual grassland species. On the east side of this parcel there is a single family home and large utility barn. A smaller livestock building also occurs on this parcel (see Figure 3 for parcel locations). Also within the 15-acre parcel and immediately south of the residence and barns, there are two sewage treatment ponds that currently service the Luther Burbank Center. The aforementioned areas will be developed into the Sutter Medical Facility.

3. PROJECT DESCRIPTION

Sutter Medical currently operates one acute care hospital in Santa Rosa, located on Chanate Road. Sutter Medical has determined that replacement of the existing hospital on Chanate Road is needed to achieve long-range compliance with the Hospital Seismic Safety Acts (SB 1953 and 1661). Accordingly, Sutter Medical is proposing to build a new hospital to replace the hospital on Chanate Road. Sutter and LBMF have reached an agreement to prepare a joint Master Plan for the jointly owned properties.

The Sutter facilities would exclusively occupy Parcel #1, the LBMF facilities would exclusively occupy approximately 28 acres (Parcels #3 & 4), and 10 acres± (Parcel #2) would be devoted to shared vehicular parking facilities and a medical office building.

Construction of the various buildings and facilities would occur over time, by phases, generally as outlined below:

PHASE I (2010 - 2012) - Entitlement, Relocation, Replacement of Utilities and Existing Facilities

PHASE II (2010-2013) - Medical Center Construction

PHASE III - Possible Future Expansion

PHASE III(a) (2010 or later): Sutter could expand the hospital by up to 29 beds.

PHASE III(b) (2016 or later): Expansion of LBMF (fly loft) with internal renovation of the Person Theater to include a fly loft that is approximately 60 feet tall.

4. ANALYSIS METHODS

Prior to preparing this biological resource constraints analysis, M&A researched the most recent version of the California Department of Fish and Game's (CDFG) Natural Diversity Database, RareFind 3.2 application (CNDDB) for historic and recent records of special-status plant and animal species (that is, threatened, endangered, rare) known to occur in the region of the project site. In addition, M&A researched CNPS' electronic *Inventory* for records of special-status plants within five miles of the project site. All special-status species records were compiled in tables that are presented in this report. M&A examined all known record locations for special-status species to determine if special-status species could occur on the project site or within an area of affect.

M&A has been involved with this project and project site for a number of years. M&A's initial involvement with the project/project site began in 2004 when M&A conducted a site assessment for California tiger salamander on the project site and followed up this site assessment with a one year California tiger salamander trapping (i.e., drift fence/pitfall study) survey and two years of California tiger salamander larval surveys. Subsequent to the California tiger salamander surveys, on October 17, 2008, M&A's principal biologist Mr. Geoff Monk conducted a site evaluation to determine if there could be areas within the project site that would be regulated as waters of the United States and/or State. Potential wetland areas were mapped with a Trimble Pro GPS. Then, on December 23, 2008, Ms. Isabelle de Geofroy conducted a site evaluation to characterize plant communities and wildlife habitats onsite. Finally, on December 31, 2009 Mr. Geoff Monk and Ms. Sarah Lynch conducted a three parameter wetland delineation on the project site, taking the mapped data Mr. Monk previously collected and combining it with vegetation, soils, and hydrology data, making the delineation suitable for submittal to the resource agencies (that is, the Corps and the RWQCB). The results of our literature research, California tiger salamander surveys, wetland delineation, and general site assessments are provided in the sections below.

5. RESULTS OF RESEARCH AND PROJECT SITE ANALYSES

5.1 Soils

There are three soil types on the project site. These soils are discussed below.

5.1.1 CORTINA VERY GRAVELLY LOAM, 0 TO 2 PERCENT SLOPES

The Cortina series consists of excessively drained, very gravelly and sandy loams formed in recently deposited alluvium from mixed sedimentary and basic rock. Cortina very gravelly loam, 0 to 2 percent slopes (CsA), is derived from nearly level soils close to major stream channels on flood plains. Nearly all places are subject to inundation by runoff from winter rains. This results in minor deposition and removal of various soil material. The A horizon ranges from grayish brown to pale brown in color. The material is gravelly or very gravelly in texture ranges from loamy sand or sandy loam to loam. The lower C horizon ranges from 50 to about 90 percent gravel with little or no soil material other than coarse sandy loam and sand. Stratification is common in many areas. Permeability is very rapid in this Cortina soil, runoff is slow, and the hazard of erosion is slight. Fertility is low, and the available water capacity is 2 to 4 inches.

5.1.2 YOLO CLAY LOAM, 0 TO 2 PERCENT

The Yolo series consists of well drained loams underlain by recent alluvium from sandstone and shale. These soils are on alluvial fans and flood plains. The Yolo clay loam, 0 to 2 percent (YtA), is similar to Yolo loam, 0 to 2 percent slopes, but the surface layer is dark grayish-brown and very dark grayish-brown clay loam. Permeability is moderate, run-off is slow, and the hazard of erosion is slight. The available water capacity is 10 to 12 inches.

5.1.3 YOLO SILT LOAM, 0 TO 2 PERCENT

The Yolo series consists of well drained loams underlain by recent alluvium from sandstone and shale. The Yolo silt loam, 0 to 2 percent (YsA), is generally more stratified than Yolo loam. The silt loam surface layer is a result of the deposition from infrequent overflow and sloughing of finer- textured soil material from areas bordering this soil. Permeability is moderate, run-off is slow, and the hazard of erosion is slight. The available water capacity is 10 to 12 inches.

5.2 Hydrology and Topography

The project site consists of nearly level ground. It contains no natural watercourses or creeks. An old soil borrow pit occurs between the soccer field and the tot-lot immediately north of the existing Luther Burbank Center structures. This borrow pit is approximately 15,000 sq. ft. in size and collects surface water (both storm water and irrigation runoff) collected from the soccer field area of the project site. The “pond” attains a maximum depth of approximately 3 feet and is surrounded by and covered over by Fremont cottonwoods (*Populus fremontii* ssp. *fremontii*) and red willows (*Salix laevigata*). The pond dries sometime in mid-summer.

There are two small ephemeral drainage ways on the project site. Both of these are relatively small, man-made drainage features that were constructed with the Luther Burbank Center to facilitate onsite runoff and drainage. The largest drainage way begins east of the pond and adjacent to a driveway that accesses the Luther Burbank Center’s southeastern parking lot. Its source is a small, concrete lined water collection basin that receives storm event sheet flows that are directed into the basin through man-made upland swales off various parking areas and open fields associated with parking areas. This basin is hydrologically connected via culverts under the access driveway to a concrete lined v-ditch (approximately 2 foot across the top of the “V”) that delivers storm water southwestward before entering a long culvert under the main parking area north of the Luther Burbank Center. On the southern edge of this parking area, the culvert jettisons water into a man-made drainage swale that drains southwest into a culvert under Highway 101 on the western edge of the Luther Burbank Center. This swale is dominated by Himalayan blackberry (*Rubus discolor*) and pampas grass (*Cortaderia jubata*).

A second drainage feature that also is man-made occurs on the south end of the Luther Burbank Center. A culvert from the southern parking lot area provides water to this man-made drainage. The drainage starts at the southern end of the paved parking area and leaves the project site via a culvert that is routed westward under Highway 101. This drainage is also dominated by pampas grass and Himalayan blackberry.

The project site has no significant offsite watershed. Virtually the entire project site drains during storm events via percolation into the soil, into limited onsite collection at the pond, and into the two small drainage ways described above.

5.3 Plant Communities and Associated Wildlife Habitats

The project site's vegetation has been altered through historic and ongoing agricultural and other land use activities. Based on aerial photographs from the 1960s, at one time virtually the entire project site supported orchards. Since then the trees have been removed and the main parcel has been completely altered by the construction and operation of the existing Luther Burbank Center facilities. The main project site parcel contains the Center's buildings and parking lots, and extensive planted (and irrigated) turf areas for picnicking, occasional overflow parking, and special events (including the erection and use of large outdoor tents). In the few undeveloped portions of this parcel ruderal (weedy) vegetation grows. An open, non-native annual grassland field is also present along the western edge of the project site between Highway 101 and the sewage treatment ponds. This plant community and other remnant or existing plant communities present on the project site are described in the paragraphs below.

A complete list of plant species observed on the project site is presented in Table 1. Nomenclature used for plant names follows *The Jepson Manual* (Hickman 1993) and changes made to this manual as published on the Jepson Interchange Project website (http://ucjeps.berkeley.edu/interchange/index.html). Table 2 is a list of wildlife species observed on the project site. Nomenclature for wildlife follows CDFG's *Complete list of amphibian, reptile, bird, and mammal species in California* (2006) and any changes made to species nomenclature as published in scientific journals since the publication of CDFG's list.

5.3.1 Non-Native Annual Grassland

Non-native annual grassland occurs in the field on the west side of the project site. This plant community is dominated by introduced grasses and forbs, including Italian rye grass (*Lolium multiflorum*), soft chess brome (*Bromus hordeaceus*), rip-gut brome (*Bromus diandrus*), medusa head (*Taeniatherum caput-medusae*), spring vetch (*Vicia sativa*), prickly lettuce (*Lactuca serriola*), bindweed (*Convolvulus arvensis*), filarees (*Erodium botrys, E. cicutarium, E. moschatum*) and cut leaf geranium (*Geranium dissectum*). A large patch of Fuller's teasel (*Dipsacus sativus*) grows in the approximate center of this field. Coyote brush (*Baccharis pilularis*) are scattered throughout the field. Along the fenceline of this field are valley oak (*Quercus lobata*) and coast live oak (*Quercus agrifolia)* trees, and Himalayan blackberry bushes.

The project site's grassland habitat provides food and cover for a variety of wildlife species, including amphibians such as western toad (*Bufo boreas*) who will seek seasonal refuge in the grassland and forage there; reptiles such as western fence lizard (*Sceloporus occidentalis*) who will forage in the grassland; and mammals such as red fox (*Vulpes vulpes*), Botta's pocket gopher (*Thomomys bottae*), striped skunk (*Mephitis mephitis*), Virginia opossum (*Didelphis virginiana*), deer mouse (*Peromyscus maniculatus*), western harvest mouse (*Reithrodontomys megalotis*), and ornate shrew (*Sorex ornatus*). The grasses and forbs provide seeds for passerine birds (perching birds) such as white-crowned sparrow (*Zonotrichia leucophrys*) and lesser goldfinch (*Carduelis* *psaltria*). All these species were detected on the project site during M&A's 2004 and 2008 site visits.

5.3.2 Ornamental Landscaping

The Luther Burbank Center and the grounds surrounding the single family home have been planted with ornamental trees and shrubs, including redwood (*Sequoia sempervirens*), deodar cedar (*Cedrus deodara*), Monterey pine (*Pinus radiata*), liquidambar (*Liquidambar styraciflua*), camphor (*Cinnamomum camphora*), olive (*Olea europaea*), persimmon (*Diospyros kaki*), strawberry tree (*Arbutus unedo*), rose (*Rosa* sp.) and juniper (*Juniperus* sp.). Large lawns are located north and southwest of the Luther Burbank Center. A few mature valley oaks, including a 48-inch diameter oak, are found within the parcel that now supports the single family home.

Ornamental landscape plants provide urban adapted species with a food source and nesting opportunities. Birds observed in the residential areas of the project site include American robin (*Turdus migratorius*), European starling (*Sturnus vulgaris*), brown-headed cowbird (*Molothrus ater*), California towhee (*Sitta carolinensis*), cedar waxwing (*Bombycilla cedrorum*), house finch (*Carpodacus mexicanus*), yellow-rumped warbler (*Dendroica coronata*), and northern mockingbird (*Mimus polyglottos*). Also detected was western fence lizard.

5.3.3 Pond habitat/borrow pit

The borrow pit/pond on the project site supports an assemblage of riparian tree species commonly associated with ponds and drainages, including valley oak, Fremont cottonwood, red willow, and narrow-leaved willow (*Salix exigua*). Olive trees (*Olea europaea*), likely a remnant of the project site's orchard days, are also growing in this area. This dense growth of vegetation completely encircles the pond, providing wildlife with dense cover. Understory species include coyote brush, cotoneaster (*Cotoneaster pannosa*), and fennel (*Foeniculum vulgare*).

Wildlife species associated with the borrow pit/pond on the project site include bird species who forage insects from the willow leaves and branches, such as ruby-crowned kinglet (*Regulus calendula*), and oak titmouse (*Baeolophus inornatus*), and larger bird species that hunt for insects in the trees bark such as the Nuttall's woodpecker (*Picoides nuttallii*) and northern flicker (*Colaptes auratus*). Black phoebes (*Sayornis nigricans*) were observed sallying for insects near the pond surface. Arboreal salamander (*Aneides lugubris*), California slender salamander (*Batrachoseps attenuatus*), and Pacific tree frog (*Pseudacris regilla*) were all found in the pitfall traps encircling the pond as part of the California tiger salamander drift fence survey.

5.3.4 Ruderal Habitat

Ruderal (weedy) communities are assemblages of plants that thrive in waste areas, roadsides and other sites that have been disturbed by human activity. On the project site, ruderal habitat occurs around the sewage treatment ponds, the single family home, in undeveloped areas south and northeast of the Luther Burbank Center, and along the edges of the project site and the parking lots. Ruderal species detected in these areas include wild oats (*Avena fatua*), soft chess, ripgut brome, common velvet grass (*Holcus lanatus*), Harding grass (*Phalaris aquatica*), English plantain (*Plantago lanceolata*), sharp-point fluellin (*Kickxia elatine*), and short-podded mustard

(*Hirschfeldia incana*). Monterey pines have been planted around the perimeter of sewage treatment pond area, with coyote brush and Himalayan blackberry scattered throughout the area.

Typically, ruderal communities provide habitat for those animal species adapted to man. Examples of animals associated with these communities include house finch (*Carpodacus mexicanus*), killdeer (*Charadrius vociferus*), white-crowned sparrow, California towhee, American robin, American crow (*Corvus brachyrhynchos*), raccoon, and opossum, all of which have been observed (either by sight or sign) on the project site.

6. SPECIAL-STATUS SPECIES DEFINITION

6.1 Definitions

For purposes of this analysis, special-status species are plants and animals that are legally protected under the California and Federal Endangered Species Acts (CESA and FESA, respectively) or other regulations, and species that are considered rare by the scientific community (for example, the CNPS). Special-status species are defined as:

- plants and animals that are listed or proposed for listing as threatened or endangered under the CESA (Fish and Game Code §2050 *et seq*.; 14 CCR §670.1 *et seq.*) or the FESA (50 CFR 17.12 for plants; 50 CFR 17.11 for animals; various notices in the Federal Register [FR] for proposed species);

- plants and animals that are candidates for possible future listing as threatened or endangered under the FESA (50 CFR 17; FR Vol. 64, No. 205, pages 57533-57547, October 25, 1999); and under the CESA (California Fish and Game Code §2068);

- plants and animals that meet the definition of endangered, rare, or threatened under the California Environmental Quality Act (CEQA) (14 CCR §15380) that may include species not found on either State or Federal Endangered Species lists;

- Plants occurring on Lists 1A, 1B, 2, 3, and 4 of CNPS' *Electronic Inventory* (CNPS 2001). The California Department of Fish and Game (CDFG) recognizes that Lists 1A, 1B, and 2 of the CNPS inventory contain plants that, in the majority of cases, would qualify for State listing, and CDFG requests their inclusion in EIRs. Plants occurring on CNPS Lists 3 and 4 are "plants about which more information is necessary," and "plants of limited distribution," respectively (CNPS 2001). Such plants may be included as special-status species on a case by case basis due to local significance or recent biological information;

- migratory nongame birds of management concern listed by U.S. Fish and Wildlife Service (Migratory Nongame Birds of Management Concern in the United States: The list 1995; Office of Migratory Bird Management; Washington D.C.; Sept. 1995);

- animals that are designated as "species of special concern" by CDFG (2008);

- Animal species that are "fully protected" in California (Fish and Game Codes 3511, 4700, 5050, and 5515).

In the paragraphs below we provide further definitions of legal status as they pertain to the special-status species discussed in this report or in the attached tables.

Federal Endangered or Threatened Species. A species listed as Endangered or Threatened under the FESA is protected from unauthorized "take" (that is, harass, harm, pursue, hunt, shoot, trap) of that species. If it is necessary to take a Federal listed Endangered or Threatened species as part of an otherwise lawful activity, it would be necessary to receive permission from the USFWS prior to initiating the take.

State Threatened Species. A species listed as Threatened under the state Endangered Species Act (§2050 of California Fish and Game Code) is protected from unauthorized "take" (that is, harass, pursue, hunt, shoot, trap) of that species. If it is necessary to "take" a state listed Threatened species as part of an otherwise lawful activity, it would be necessary to receive permission from CDFG prior to initiating the "take."

California Species of Special Concern. These are species in which their California breeding populations are seriously declining and extirpation from all or a portion of their range is possible. This designation affords no legally mandated protection; however, pursuant to the CEQA Guidelines (14 CCR §15380), some species of special concern could be considered "rare." Pursuant to its rarity status, any unmitigated impacts to rare species could be considered a "significant effect on the environment" (§15382). Thus, species of special concern must be considered in any project that will, or is currently, undergoing CEQA review, and/or that must obtain an environmental permit(s) from a public agency.

CNPS List Species. The California Native Plant Society (CNPS) maintains an inventory of special status plant species. This inventory has four lists of plants with varying rarity. These lists are: List 1, List 2, List 3, and List 4. Although plants on these lists have no formal legal protection (unless they are also state or federal listed species), the California Department of Fish and Game requests the inclusion of List 1 species in environmental documents. In addition, other state and local agencies may request the inclusion of species on other lists as well. List 1 species have the highest priority: List 1A species are thought to be extinct, and List 1B species are known to still exist but are considered "rare, threatened, and endangered in California and elsewhere." All of the plants constituting List 1B meet the definitions of Section 1901, Chapter 10 (Native Plant Protection Act) or Sections 2062 and 2067 (California Endangered Species Act) of the CDFG Code, and are eligible for state listing (CNPS 2001). List 2 species are rare in California, but more common elsewhere. Lists 3 and 4 contain species about which there is some concern, and are review and watch lists, respectively. Additionally, in 2006 CNPS updated their lists to include "threat code extensions" for each list. For example, List 1B species would now be categorized as List 1B.1, List 1B.2, or List 1B.3. These threat codes are defined as follows: .1 is considered "seriously endangered in California (over 80% of occurrences threatened/high degree and immediacy of threat)"; .2 is "fairly endangered in California (20-80% of occurrences threatened)"; .3 is "not very endangered in California (less than 20% of occurrences threatened or no current threats known)."

Under the CEQA review process only CNPS List 1 and 2 species are considered since these are the only CNPS species that meet CEQA's definition of "rare" or "endangered." Impacts to List 3 and 4 species are not regarded as significant pursuant to CEQA.

Fully Protected Birds. Fully protected birds, such as the white-tailed kite and golden eagle, are protected under California Fish and Game Code (§3511). Fully protected birds may not be "taken" or possessed (i.e., kept in captivity) at any time.

Protected Amphibians. Under Title 14 of the California Code of Regulations (14 CCR 41), protected amphibians, such as the California tiger salamander, may only be taken under special permit from California Department of Fish and Game issued pursuant to Sections 650 and 670.7 of these regulations.

6.2 Potential Special-Status Plants on the Project Site

Figure 5 provides a graphical illustration of the closest known records for special-status species within 5 miles of the project site and helps readers visually understand the number of sensitive species that occur in the vicinity of the project site. Table 3, at the back of this report, lists the special-status plants of concern for the proposed project site. No special-status plants have been mapped on or adjacent the project site.

Surveys for special-status plants were conducted on the project site over four years: 1993, 1998, 1999, and 2004 by plant ecologist, Mr. Charlie Patterson (Patterson 2004). The 1993 surveys focused on the approximately 15-acre, undeveloped, grassland parcel (APN 058-040-058) located in the northern portion of the project site. The other three survey years focused on the entire project site. Surveys for special-status plants were appropriately timed during the known blooming periods of the four federally listed plant species known from the Santa Rosa Plain: Burke's goldfields (*Lasthenia burkei*), Sebastopol meadowfoam (*Limnanthes vinculans*), Baker's blennosperma (*Blennosperma bakeri*), and many-flowered navarretia (*Navarretia plieantha*). To coincide with these species' blooming periods, Mr. Patterson conducted his field surveys on March 16, April 14, May 10, and June 15, 1993, May 6 and June 9, 1998 (a very wet and late spring), and again in 1999 and 2004 on March 29, April 27, May 15 and 30. These survey dates were also appropriate for identifying other special-status plant species known from the region (see Table 3).

Based on the focused surveys conducted over multiple years, the marginal native plant habitat present on the site, the lack of any nearby historic rare plant locations, and Mr. Patterson's experience conducting special-status plant surveys in the Santa Rosa Plain, it was Mr. Patterson's conclusion that the surveys for the project site were adequate to reliably determine the absence of the potential plant species of concern. Based on M&A biologists' experience conducting surveys for special-status plants on the Santa Rosa Plain, we concur with Mr. Patterson's findings.

6.3 Potential Special-Status Animals on the Project Site

Figure 5 provides a graphical illustration of the closest known records for special-status species within 5 miles of the project site and helps readers visually understand the number of sensitive species that occur in the vicinity of the project site. No special-status animals have been mapped on or adjacent to the project site (CNDDB records). However, a total of 10 special-status animal species are known to occur in the region of the project site (CNDDB records and M&A's experience; see Table 4). Based on an absence of suitable habitat onsite, focused studies onsite, and M&A biologists' knowledge of special-status species issues in the Santa Rosa area, we determined that the project site does not provide suitable habitat for any federal or state listed animal species, or state species of special concern. However, the trees on the project site may provide suitable nesting habitat for raptors (birds of prey) and passerine birds (perching birds). Raptors that could nest on the project site are discussed below. Also, because of the sensitivity of one of the listed special-status animal species known to occur in the area, but not on the project site, the California tiger salamander (*Ambystoma californiense*), is discussed in the section below. All other special-status animals known from the region are summarily dismissed for the reasons presented in Table 4 and are not discussed further in this report.

6.3.1 California Tiger Salamander

6.3.1.1 CTS Legal Status

The California tiger salamander (CTS) has different state and federal legal protections. All distinct populations of the CTS are federally listed as endangered (that is, the Sonoma County *Distinct Population Segment* (DPS), the Santa Barbara DPS, and the Central California DPS). The USFWS designated Critical Habitat for the Central California DPS; however, chose not to designate Critical Habitat for the Sonoma County DPS since the USFWS concluded that the designation of critical habitat for the Sonoma County DPS would have negative impacts on the finalization and implementation of the Santa Rosa Plain Conservation Strategy (Federal Register Notice 70: 74137).

To cushion ranchers from any impacts of the salamander protective listing, the USFWS has launched a special rule, authorized under the Endangered Species Act, to work cooperatively with ranchers to save the species. The rule strives to conserve salamander habitat while helping keep ranching viable. The rule allows some traditional ranching activities to continue without additional regulation, such as stock pond construction and maintenance.

The CTS is also a California "species of special concern." This title affords the CTS no legally mandated protection; however, pursuant to CEQA (14 CCR §15380), this species must be considered in any project that will undergo, or is currently undergoing CEQA review, and/or any project that must obtain an environmental permit(s) from a public agency (e.g., the U.S. Army Corps of Engineers). In addition, in December 2008, a Court of Appeal, Third Appellate District struck down a decision by the California Fish and Game Commission ("Commission") to deny listing the California tiger salamander as a candidate species for listing under the California Endangered Species Act ("CESA"). In *Center for Biological Diversity v. California Fish and Game Commission* (2008) 166 Cal. App. 4th 597, the court ruled that the Commission must accept a listing petition of a candidate species if the information would "lead a reasonable person to conclude there is a substantial possibility" that the species could be listed. Placing a species on the candidate list triggers a review by the Department of Fish and Game to determine whether permanent listing under the CESA is required. Prior to impacting designated candidate species a State Endangered Species Act permit is required or a consistency determination with a federal incidental take permit must be made by CDFG pursuant to Section 2080.1 of the CESA. While the Court of Appeal overturned the Commission's decision not to list the CTS, at this date (December 30, 2008), the CTS has not yet been reclassified as a Candidate for Listing by the CDFG although this decision is surely to come in the next month or two.

Finally, under Title 14, CCR 41 (1996), CTS is a protected amphibian that may only be taken or possessed under a special permit issued by the California Department of Fish and Game (CDFG) pursuant to sections 650 and 670.7 of these regulations, or Section 2081 of the Fish and Game Code.

6.3.2 PROJECT SITE SURVEYS

M&A received an amendment to its federal 10(A)(1)(a) permit TE-776608 authorizing M&A to conduct drift fence surveys for the Sonoma County "distinct population segment" of the CTS. Authorization to conduct drift fence surveys was confirmed by Mr. Vincent Griego in a September 7, 2005 email. Field surveys were conducted by M&A 10(A)(1)(a) authorized biologists according to permit conditions.

The field surveys were conducted following guidelines prescribed in the USFWS' October 2003 *Interim Guidance on Site Assessment and Field Surveys for Determining Presence or a Negative Finding of the California Tiger Salamander*. The guidelines required the use of drift fencing in combination with pitfall traps as a means of determining the presence of CTS at sites where they may be affected by development projects.

In the 2005/2006 trapping season drift fences were installed by October 15, 2005 prior to the onset of heavy seasonal rains. Trapping was completed on March 15, 2006, and trap line removal began immediately thereafter with full removal accomplished by April 1, 2006. The drift fence was approximately 6,550 feet in length and contained a total of 218 pitfall traps.

Authorization to conduct spring larval surveys at the project site was granted by Mr. Vincent Griego of the USFWS in a March 22, 2005 email correspondence. The project site contains one man-made pond that could provide CTS breeding habitat. The first dip net larval survey was conducted on March 29, 2005; at that time we determined that it was necessary to also funnel trap the detention basin. Larval surveys were conducted using wire funnel traps in accordance with the survey protocol. Funnel traps were approved for use by Mr. Griego and installed for 2, 3-day trapping periods in 2005, and 3, 3-day periods in 2006. Traps were set and monitored April 12-15 and May 26-29, 2005. During spring 2006, funnel traps were set and monitored March 5-8, April 1-4, May 11-14. Additionally, all aquatic habitats were dip-netted according to survey protocols for a total of 6 dip net surveys at the project site. With the exception of the man-made pond, standing water on the site lasted only during heavy storm events and receded within a few day of dry, warm weather.

No CTS were captured in pitfall traps on the project site during the 2005/2006 survey period. During the 2005/2006 season pitfall traps were opened/checked a total of 58 times. The total number of days traps were set during the months of October, November, December, January, February and March was 3, 8, 13, 14, 9 and 11, respectively. A complete report showing weather data and animal captures was provided to the USFWS (Monk & Associates 2006).

A total of twelve vertebrate species (6 mammals, 2 reptiles, and 4 amphibians) were captured in pitfall traps set at the project site. Animals captured included: California meadow voles (*Microtus californicus*), Botta's pocket gopher (*Thomomys bottae*), Western harvest mouse (*Reithrodontomys megalotis*), deer mouse, black rat (*Rattus rattus*), ornate shrew (*Sorex ornata*), western fence lizard, alligator lizard (*Elgaria coerulea),* Northern Pacific tree frog, arboreal salamander, western toad and California slender salamander. A total of 729 animals were captured during the 2005/2006 trapping season.

No CTS adult, larvae, or eggs were observed during aquatic trap check visual surveys or protocol level dip net surveys. The only amphibian found in the pond was the Northern Pacific tree frog. Larvae, eggs, and metamorphs of this frog were found in all survey years. All other captures were limited to Notonectids, Corixids, dragonfly larvae, snails, Dytiscids, and scuds.

Based on the results of M&A's protocol level pitfall trapping and aquatic surveys (dip-netting and minnow trapping), the USFWS, Sacramento Field Office, concurred with M&A's survey findings that the CTS does not occur on the project site and development of the project site would not result in "take" of this federal listed species. *A letter of "no effect" for this project and project site was written by USFWS and submitted to M&A (email correspondence between Mr. V. Griego of USFWS with Mr. G. Thomas and Mr. G. Monk of M&A, December 20, 2006).* Pursuant to CEQA, the project would have no significant adverse impacts to CTS.

6.3.3 RED SHOULDERED HAWK

Red shouldered hawk (*Buteo lineatus*) is protected under the Migratory Bird Treaty Act (50 CFR 10.13) and under California Fish and Game Code Sections 3503, 3503.5, 3800, and 3513 which protect nesting raptors and their eggs/young. This medium-sized raptor prefers the largest trees in a particular area for nest construction. Blue gum eucalyptus (*Eucalyptus globulus*) trees have become favorite nesting trees for this species in California. A stick nest is constructed and usually two to four eggs are laid in the spring. Incubation lasts about 27 days. Usually two or three nests are built over a several year period by a nesting pair and then are reused year after year. Prey consists of reptiles and small rodents.

The project site provides suitable nesting and foraging habitat for red shouldered hawk. Monterey pines, coast live oaks, and valley oaks are suitable nesting habitat for this species. Hence, until nesting surveys are conducted that confirms or negates this species' presence on the project site impacts to nesting red shouldered hawks from the proposed project are considered potentially significant pursuant to CEQA.

Surveys should be conducted in the late winter and early spring the year project construction is scheduled to commence. If the construction would start later in the spring, t*he optimal time to survey for nesting red shouldered hawks in the San Francisco Bay Area is between April 15 and*

May 15. If red shouldered hawks are identified nesting on the project site a nesting buffer would have to be established. The nesting buffer could be as large as small as 75 feet or as large as 300-feet around the nest tree until the hawks are finished nesting. It is imperative to have a qualified biologist determine the size of the buffer. In this fashion the minimal area necessary to protect the nest site can be identified. This will allow the project to proceed with the minimum avoidance requirements while otherwise ensuring that direct take of the nesting birds is minimized and that the project otherwise remains in compliance with the federal Migratory Bird Treaty Act and California Fish and Game Code. Nesting is finished when the young have left the nest, typically in August. However, completion of the nesting cycle should be determined by a qualified raptor biologist. It is unlikely that mitigation would be required by the resource agencies for impacts to red-shouldered hawk nesting territory after or prior to actual nesting.

6.3.4 RED-TAILED HAWK

The red-tailed hawk (*Buteo jamaicensis*) is protected under the Migratory Bird Treaty Act (50 CFR 10.13) and under California Fish and Game Code §3503.5, 3800, and 3513 which protect nesting raptors and their eggs/young. This raptor species has an extremely wide tolerance for habitat variation, which can be attributed to its very broad spectrum of prey (Johnsgard 1990). Some clear habitat preferences do exist, however, and have been analyzed by a variety of studies. Habitat preferences in the winter for both sexes are oriented toward upland pasture, grassland, and hardwood habitats, with females also using lowland hardwoods and males using marsh–shrub communities. In the spring, females continue to use mainly upland and lowland hardwoods, probably as a reflection of their orientation toward a nest site. M&A has observed red-tailed hawks nesting in a variety of tree species including eucalyptus, coast live oak, and valley oak trees.

The project site's Monterey pines, coast live oaks, and valley oak trees provide suitable nesting habitat for red-tailed hawks. The ruderal field provides suitable foraging habitat. Hence, until nesting surveys are conducted that confirms or negates this species' presence on the project site impacts to nesting red-tailed hawks from the proposed project are considered potentially significant pursuant to CEQA.

Preconstruction nesting surveys should be conducted prior to grading the project site to ensure that direct take of this species would not occur. *Surveys should be conducted in the late winter and early spring the year project construction is scheduled to commence. If the construction would start later in the spring, the optimal time to survey for nesting red-tailed hawks is between April 15 and May 15.* If red-tailed hawks are identified nesting on the project site, a construction buffer would have to be temporarily established until the hawks are finished nesting. The nesting buffer could be as small as 100 feet or as large as 300 feet around the nest tree. It is imperative to have a qualified biologist determine the size of the buffer. In this fashion the minimal area necessary to protect the nest site can be identified. This will allow the project to proceed with the minimum avoidance requirements while otherwise ensuring that direct take of the nesting birds is minimized and that the project otherwise remains in compliance with the federal Migratory Bird Treaty Act and California Fish and Game Code. After the nesting cycle ends, and the young have fledged, typically in late-July or early August, there would be no further requirements for avoidance of the nesting tree.

6.3.5 WHITE-TAILED KITE

The white-tailed kite (*Elanus caeruleus*) is fully protected under the California Fish and Game Code. Fully protected birds may not be "taken" or possessed (i.e., kept in captivity) at any time (§3511). It is also protected under the Federal Migratory Bird Treaty Act (50 CFR 10.13). The white-tailed kite is typically found foraging in grassland, marsh, or cultivated fields where there are dense-topped trees or shrubs for nesting and perching. They nest in a wide variety of trees of moderate height and sometimes in tall bushes, such as coyote bush (*Baccharis pilularis*). Native trees used are live and deciduous oaks (*Quercus* spp.), willows (*Salix* spp.), cottonwoods (*Populus* spp.), sycamores (*Platanus* spp.), maples (*Acer* spp.), toyon (*Heteromeles arbutifolia*), and Monterey cypress (*Cupressus macrocarpa*). Although the surrounding terrain may be semiarid, kites often reside near water sources, where prey is more abundant. The particular characteristics of the nesting site do not appear to be as important as its proximity to a suitable food source (Shuford 1993). Kites primarily hunt small mammals, with California meadow voles (*Microtus californicus*) accounting from between 50-100% of their diet (Shuford 1993).

The Monterey pines, coast live oaks, and valley oaks on the project site provide suitable nesting habitat for white-tailed kites. The ruderal field provides suitable foraging habitat. Preconstruction nesting surveys should be conducted prior to grading the project site to ensure that direct take of this species would not occur. Hence, until nesting surveys are conducted that confirms or negates this species' presence on the project site impacts to nesting white-tailed kites from the proposed project are considered potentially significant pursuant to the CEQA.

Surveys should be conducted in the late winter and early spring the year project construction is scheduled to commence. If the construction would start later in the spring, the optimal time to survey for nesting whit-tailed kites in the San Francisco Bay Area is between April 15 and May 15. If white-tailed kites are identified nesting on the project site, a construction buffer would have to be temporarily established until the kites are finished nesting. The nesting buffer could be as large as a 300-foot radius around the nest tree. It is imperative to have a qualified biologist determine the size of the buffer. In this fashion the minimal area necessary to protect the nest site can be identified. This will allow the project to proceed with the minimum avoidance requirements while otherwise ensuring that direct take of the nesting birds is minimized and that the project otherwise remains in compliance with the federal Migratory Bird Treaty Act and California Fish and Game Code. After the nesting cycle ends, and the young have fledged, typically in late-July or early August, there would likely be no further requirements for avoidance of the nesting tree.

7. REGULATORY FRAMEWORK FOR NATIVE WILDLIFE, FISH, AND PLANTS

This section provides a discussion of those laws and regulations that are in place to protect native wildlife, fish, and plants. Under each law we discuss their pertinence to the proposed development.

7.1 Federal Endangered Species Act

The primary focus of the FESA of 1973 is that all federal agencies must seek to conserve threatened and endangered species through their actions. FESA has been amended several times in the past to correct perceived and real shortcomings. FESA contains three key sections. Section

4 (16 USCA §1533) outlines the procedure for listing endangered plants and wildlife. Section 7 (§1536) imposes limits on the actions of federal agencies that might impact listed species. Section 9 (§1538) prohibits the "taking" of a listed species by anyone, including private individuals, and State and local agencies. In the case of salt water fish and other marine organisms, the requirements of FESA are enforced by the National Marine Fisheries Service (NMFS). The USFWS enforces all other cases. Below, Sections 7, 9, and 10 of FESA are discussed since they are the two sections most relevant to the proposed project.

Section 9 of FESA as amended, prohibits the "take" of any fish or wildlife species listed under FESA as endangered. Under Federal regulation, "take" of fish or wildlife species listed as threatened is also prohibited unless otherwise specifically authorized by regulation. "Take," as defined by FESA, means "to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct." "Harm" includes not only the direct taking of a species itself, but the destruction or modification of the species' habitat resulting in the potential injury of the species. As such, "harm" is further defined to mean "an act which actually kills or injures wildlife; such an act may include significant habitat modification or degradation where it actually kills or injures wildlife by significantly impairing essential behavioral patterns, including breeding, feeding or sheltering" (50 CFR 17.3). A recent (December 2001) decision by the 9th Circuit Court of Appeals (*Arizona Cattle Growers' Association, Jeff Menges, vs. the U.S. Fish and Wildlife Service and Bureau of Land Management, and the Southwest Center for Biological Diversity*) ruled that the USFWS must show that a threatened or endangered species is present on a project site and that it would be taken by the project activities. According to this ruling, the USFWS can no longer require mitigation based on the probability that the species could use the site. Rather they must show that it is actually present.

The project site is located in an area that is regulated by the USFWS' Sacramento Endangered Species Office. This office believes the above case was narrowly focused on federal grazing leases and the affects of these leases on federal listed species. Due to this narrow focus, the Sacramento office believes that this case has little bearing in northern California. This office claims that probable use of habitat by a federal listed species would still be subject to the provisions of FESA.

Section 9 applies not only to federal agencies but also to any local or State agency, and to any individual. If "take" of a listed species is necessary to complete an otherwise lawful activity, this triggers the need for consultation under Section 7 of FESA (for Federal agencies and projects with a federal "nexus" (that is, an authorized, funded or carried out by a federal agency)), or requires preparation of a Habitat Conservation Plan (HCP) pursuant to Section 10 of FESA (for state and local agencies, or individuals, and projects without a federal "nexus").

Section 7(a)(2) of the Act requires that each Federal agency shall, in consultation with and with the assistance of the USFWS, insure that any action authorized, funded or carried out by such agency is not likely to jeopardize the continued existence of an endangered or threatened species or result in the destruction or adverse modification of critical habitat. Critical habitat identifies specific areas, both occupied and unoccupied, that are essential to the conservation of a listed species and that may require special management considerations or protection. Section 4 of the

Act requires USFWS to consider economic and other relevant impacts of specifying any particular area as critical habitat.

Federal actions include permitting, funding, and entitlements for both federal projects, as well as private projects facilitated by federal actions (for example, a private landowner applying to the Corps for a permit). As an example, if a federally listed endangered species is present in "waters of the United States" on a project site, prior to authorizing impacts to “waters of the United States,” the U.S. Army Corps of Engineers (who administers the Clean Water Act) would be required to initiate “formal consultation” with USFWS pursuant to Section 7 of FESA. As part of the formal consultation, the USFWS would then be required to prepare a Biological Opinion based on a review and analysis of the project applicant’s avoidance and mitigation plan. The Biological Opinion will either state that the project will or will not result in “take” or threaten the continued existence of the species (not just that population). If an endangered species could be harmed by a proposed project, USFWS has to be in complete concurrence with the proposed avoidance and mitigation plan. If USFWS is not in complete concurrence with the mitigation plan, they will submit a Biological Opinion to the Corps containing a “jeopardy decision” and state that a Corps’ permit should not be issued for the pending project. The applicant would then have an opportunity to submit a revised mitigation plan that provides greater protection for the species.

In the 1982 amendments to FESA, Congress established a provision in Section 10 that allows for the "incidental take" of endangered and threatened species of wildlife by non-federal entities (for example, project applicants, state and local agencies). "Incidental take" is defined by FESA as take that is "incidental to, and not the purpose of, the carrying out of an otherwise lawful activity." Under Section 10 of FESA, the applicant for an "incidental take permit" is required to submit a "conservation plan" to USFWS or NMFS that specifies, among other things, the impacts that are likely to result from the taking, and the measures the permit applicant will undertake to minimize and mitigate such impacts, and the funding that will be available to implement those steps. Conservation plans under FESA have come to be known as "habitat conservation plans" or "HCPs" for short. The terms incidental take permit, Section 10 permit, and Section 10(a)(1)(B) permit are used interchangeably by USFWS. Section 10(a)(2)(B) of FESA provides statutory criteria that must be satisfied before an incidental take permit can be issued.

7.1.1 Responsible Agency

FESA gives regulatory authority over terrestrial species and non-anadromous fish to the USFWS. The NMFS has authority over marine mammals and anadromous fish.

7.1.2 Applicability to the Proposed Project

The California tiger salamander is the only federal listed animal species with a probability of occurring on the project site. After receiving written authorization from the USFWS to proceed, M&A conducted two years of protocol surveys for the California tiger salamander on the project site and did not identify this species onsite. Based on the results of M&A’s protocol level pitfall trapping surveys and aquatic surveys (dip-netting and minnow trapping), the USFWS, Sacramento Field Office, concurred with M&A’s survey findings that the CTS does not occur on the project site and that development of the project site would not result in “take” of this federal listed species. A letter of “no effect” for this project and project site was written by USFWS and submitted to M&A (email correspondence between Mr. V. Griego of USFWS with Mr. G. Thomas and Mr. G. Monk of M&A, December 20, 2006).

Four federally listed plant species are known to occur within the Santa Rosa Plain (Burke’s goldfields, Baker’s blennosperma, many-flowered navarretia, and Sebastopol meadowfoam). The project site lies within the Santa Rosa Plain. Plant ecologist, Mr. Charlie Patterson, conducted four years of appropriately timed surveys for federally listed plants, and other plant species of special concern, on the project site. These surveys were conducted in the spring and summer of 1993, 1998, 1999, and 2004. No federally listed plants or other special-status plant species were identified on the project site during the course of these surveys. Please see the discussion on special-status plants in the sections above.

Based on M&A’s background research, knowledge of biological resource issues in Sonoma County, field studies conducted on the project site to date, and the presence of only marginal habitat for native plants and wildlife onsite, it is safe to conclude that a project on this project site would not result in take of any federal listed species. Similarly, pursuant to CEQA, there would be no significant adverse impacts to federally listed animal or plant species.

7.2 Federal Migratory Bird Treaty Act

The Migratory Bird Treaty Act of 1918 (16 U.S.C. §§ 703-712, July 3, 1918, as amended 1936, 1960, 1968, 1969, 1974, 1978, 1986 and 1989) makes it unlawful to “take” (kill, harm, harass, shoot, etc.) any migratory bird listed in Title 50 of the Code of Federal Regulations, Section 10.13, including their nests, eggs, or young. Migratory birds include geese, ducks, shorebirds, raptors, songbirds, wading birds, seabirds, and passerine birds (such as warblers, flycatchers, swallows, etc.).

Executive Order 13186 for conservation of migratory birds (January 11, 2001) requires that any project with federal involvement address impacts of federal actions on migratory birds. The order is designed to assist federal agencies in their efforts to comply with the MBTA and does not constitute any legal authorization to take migratory birds. The order also requires federal agencies to work with the USFWS to develop a memorandum of understanding (MOU). Protocols developed under the MOU must promote the conservation of migratory bird populations through the following means:

- avoid and minimize, to the extent practicable, adverse impacts on migratory bird resources when conducting agency actions;
- restore and enhance habitat of migratory birds, as practicable; and prevent or abate the pollution or detrimental alteration of the environment for the benefit of migratory birds, as practicable.

7.2.1 Applicability to Proposed Project

The project site provides suitable nesting habitat for the white-tailed kite, red-tailed hawk, and red shouldered hawk. These raptors (birds of prey) would be protected by the Migratory Bird Treaty Act. Also, the common songbirds that could occur on the site would be protected pursuant to this Act. As long as there is no direct mortality of species protected pursuant to this Act caused by development of the site, there would be no constraints to development of the site. To comply with the Migratory Bird Treaty Act, all active nest sites would have to be avoided while such birds were nesting. Upon completion of nesting, the project could commence as otherwise planned. Preconstruction nesting surveys for nesting birds should be conducted prior to breaking ground for the project if it would occur between February 1st and September 31st.

7.3 State Endangered Species Act

7.3.1 Section 2081 of the State Endangered Species Act

In 1984, the state legislated the California Endangered Species Act (CESA) (Fish and Game Code §2050). The basic policy of CESA is to conserve and enhance endangered species and their habitats. State agencies will not approve private or public projects under their jurisdiction that would jeopardize threatened or endangered species if reasonable and prudent alternatives are available.

CESA requires that all state lead agencies (as defined under CEQA) conduct an endangered species consultation with CDFG if their actions could affect a state listed species. The state lead agency and/or project applicants must provide information to CDFG on the project and its likely impacts. CDFG must then prepare written findings on whether the proposed action would jeopardize a listed species, or would result in the direct take of a listed species. Because CESA does not have a provision for "harm" (see discussion of FESA, above), CDFG considerations pursuant to CESA are limited to those actions that would result in the direct take of a listed species.

If CDFG determines that a proposed project could impact a State listed threatened or endangered species, CDFG will provide recommendations for "reasonable and prudent" project alternatives. The CEQA lead agency can only approve a project if these alternatives are implemented, unless it finds that the project's benefits clearly outweigh the costs, reasonable mitigation measures are adopted, there has been no "irreversible or irretrievable" commitment of resources made in the interim, and the resulting project would not result in the extinction of the species. In addition, if there would be impacts to threatened or endangered species, the lead agency typically requires project applicants to demonstrate that they have acquired "incidental take" permits from CDFG and/or USFWS (if it is a Federal listed species) prior to allowing/permitting impacts to such species.

If proposed projects would result in impacts to a State listed species, an "incidental take" permit pursuant to §2081 of the Fish and Game Code would be necessary (versus a Federal incidental take permit for Federal listed species). CDFG will issue an incidental take permit only if:

1) The authorized take is incidental to an otherwise lawful activity;
2) the impacts of the authorized take are minimized and fully mitigated;
3) measures required to minimize and fully mitigate the impacts of the authorized take:
    a) are roughly proportional in extent to the impact of the taking on the species;
    b) maintain the project applicant’s objectives to the greatest extent possible; and,
    c) capable of successful implementation; and,

4) adequate funding is provided to implement the required minimization and mitigation measures and to monitor compliance with, and the effectiveness of, the measures.

If an applicant is preparing a habitat conservation plan (HCP) as part of the federal 10(a) permit process, the HCP might be incorporated into the §2081 permit if it meets the substantive criteria of §2081(b). To ensure that an HCP meets the mitigation and monitoring standards in Section 2081(b), an applicant should involve CDFG staff in development of the HCP. If a final Biological Opinion (federal action) has been issued for the project pursuant to Section 7 of the federal Endangered Species Act, it might also be incorporated into the §2081 permit if it meets the standards of §2081(b).

No §2081 permit may authorize the take of a species for which the Legislature has imposed strict prohibitions on all forms of "take." These species are listed in several statutes that identify "fully protected" species and "specified birds." *See* Fish and Game Code §§ 3505, 3511, 4700, 5050, 5515, and 5517. If a project is planned in an area where a "fully protected" species or a "specified bird" occurs, an applicant must design the project to avoid all take.

In September 1997, Assembly Bill 21 (Fish and Game Code §2080.1) was passed. This bill allows an applicant who has obtained a "non-jeopardy" federal Biological Opinion pursuant to Section 7, or who has received a federal 10(a) permit (federal incidental take permit), to submit the federal opinion or permit to CDFG for a determination as to whether the federal document is "consistent" with CESA. If after 30 days CDFG determines that the federal incidental take permit is consistent with state law, and that all state listed species under consideration have been considered in the federal Biological Opinion, then no further permit or consultation is required under CESA for the project. However, if CDFG determines that the federal opinion or permit is not consistent with CESA, or that there are state listed species that were not considered in the federal Biological Opinion, then the applicant must apply for a state permit under Section 2081(b). The process provided in Fish and Game Code §2080.1 (Assembly Bill 21) may be of use when the incidental take would occur to species that are listed under both the federal and state endangered species acts. Assembly Bill 21 is of no use if an affected species is state-listed, but not federally listed.

State and federal incidental take permits are issued on a discretionary basis, and are typically only authorized if applicants are able to demonstrate that impacts to the listed species in question are unavoidable, and can be mitigated to an extent that the reviewing agency can conclude that the proposed impacts would not jeopardize the continued existence of the listed species under review. Typically, if there would be impacts to a listed species, mitigation that includes habitat avoidance, preservation, and creation of endangered species habitat is necessary to demonstrate that projects would not threaten the continued existence of a species. In addition, management endowment fees are usually collected as part of the agreement for the incidental take permit(s). The endowment is used to manage any lands set-aside to protect listed species, and for biological mitigation monitoring of these lands over (typically) a five-year period.

7.3.2 Applicability to Proposed Project

No State listed animal species or plant species are known to occur or are expected to occur onsite. Focused surveys for special-status plant species were conducted over a four year period and none were identified onsite. The project site does not provide habitat for state listed animal species. As such, no significant adverse impacts to State listed animal or plant species, or candidates for listing, are expected from project implementation.

7.4 Applicable CEQA Regulations

Section 15380 of CEQA defines "endangered" species as those whose survival and reproduction in the wild are in immediate jeopardy from one or more causes, including loss of habitat, change in habitat, overexploitation, predation, competition, disease, or other factors. "Rare" species are defined by CEQA as those who are in such low numbers that they could become endangered if their environment worsens; or the species is likely to become endangered within the foreseeable future throughout all or a significant portion of its range and may be considered "threatened" as that term is used in the FESA. The CEQA Guidelines also state that a project will normally have a significant effect on the environment if it will "substantially affect a rare or endangered species of animal or plant or the habitat of the species." The significance of impacts to a species under CEQA, therefore, must be based on analyzing actual rarity and threat to that species despite its legal status or lack thereof.

7.4.1 Applicability to Proposed Project

This document addresses impacts to species that would be defined as endangered or rare pursuant to Section 15380 of the CEQA. This document is suitable for use by the CEQA lead agency (in this case the County of Sonoma) for preparation of any CEQA review document prepared for the proposed project. This report has been prepared as a Biology Section that is suitable for incorporation into an initial study or the biology section of an Environmental Impact Report.

7.5 California Fish and Game Code § 3503, 3503.5, 3511, and 3513

California Fish and Game Code §3503, 3503.5, 3511, and 3513 prohibit the "take, possession, or destruction of birds, their nests or eggs." Disturbance that causes nest abandonment and/or loss of reproductive effort (killing or abandonment of eggs or young) is considered "take." Such a take would also violate federal law protecting migratory birds (Migratory Bird Treaty Act).

All raptors (that is, hawks, eagles, owls) their nests, eggs, and young are protected under California Fish and Game Code (§3503.5). Additionally, "fully protected" birds, such as the white-tailed kite (*Elanus leucurus*) and golden eagle (*Aquila chrysaetos*), are protected under California Fish and Game Code (§3511). "Fully protected" birds may not be taken or possessed (that is, kept in captivity) at any time.

7.5.1 Applicability to the Project

Raptors that could be impacted by the project include white-tailed kite, red-tailed hawk, and red-shouldered hawk. Preconstruction surveys would have to be conducted for these species to ensure that there is no direct take of these birds including their eggs, or young. Any active nests that were found during preconstruction surveys would have to be avoided by the project. Suitable non-disturbance buffers would have to be established around nest sites until the nesting cycle is complete. More specifics on the size of buffers are provided in the special-status species section above by each species that could be affected by the project.

7.6 Protected Amphibians

Under Title 14 of the California Code of Regulations (CCR 14, Division 1, Subdivision 1, Chapter 5, §41. Protected Amphibians), protected amphibians, such as the California tiger salamander may only be taken under special permit from California Department of Fish and Game issued pursuant to Sections 650 and 670.7 of these regulations.

7.6.1 Applicability to the Project

Protocol level surveys for the California tiger salamander have been conducted on the project site and none were found. The U.S. Fish and Wildlife Service concurred with Monk & Associates' negative survey findings (see discussion on the California tiger salamander in the special-status species section above). No special-status amphibians would be found on or adjacent to the project site. As such, no significant adverse impacts are expected to occur to special-status amphibians from implementation of the proposed project.

7.7 Sonoma County Tree Ordinance

The Sonoma County Zoning Regulations, Chapter 26, has two articles that pertain to the protection of native trees. These two articles, Article 88 and Article 67, and their applicability to the project site are provided below.

7.7.1.1 Article 88 – General Use and Bulk Exceptions – Building Lines.

Article 88 has provisions that protect native trees. At the project site, native trees that are protected in accordance with Chapter 26, Article 2, Section 26-02-140 "Definitions" of the Sonoma County Zoning regulations are valley oak trees and coast live oak trees. Below we provide the section of Article 88 that discusses protection of native trees.

Section 26-88-010. General Use Provisions and Exceptions:

(m) Tree Protection Ordinance.

General Provisions. Projects shall be designed to minimize the destruction of protected trees. With development permits, a site plan shall be submitted that depicts the location of all protected trees greater than nine inches (9") in diameter at breast height and that depicts their protected perimeters in areas that will be impacted by the proposed development, such as the building envelopes, access roads, leachfields, etc. Lot line adjustments, zoning permits and agricultural uses are exempt from this requirement. The provisions of this section shall not apply to trees which are the subject of a valid timber harvesting permit approved by the state of California. This section shall not be applied in a manner that would reduce allowable density lower than that permitted as a result of CEQA or by other county ordinances or render a property undevelopable. To achieve this end, adjustments may be made.

Agricultural uses exempt from the tree protection ordinance are as follows: the raising, feeding, maintaining and breeding of confined and unconfined farm animals, commercial aquaculture,

commercial mushroom farming, wholesale nurseries, greenhouses, wineries and agricultural cultivation.
Construction Standards. Applicants are encouraged to use a qualified specialist to establish tree protection methods.

(1) Protected trees, their protected perimeters and whether they are to be retained or removed are to be clearly shown on all improvement plans. A note shall be placed on the improvement plans that "Construction is subject to requirements established by Sonoma County to protect certain trees."

(2) Before the start of any clearing, excavation, construction or other work on the site, every tree designated for protection on the approved site plan shall be clearly delineated with a substantial barrier (steel posts and barbed wire or chain link fencing) at the protected perimeter, or limits established during the permit process. The delineation markers shall remain in place for the duration of all work. All trees to be removed shall be clearly marked. A scheme shall be established for the removal and disposal of brush, earth and other debris as to avoid injury to any protected tree.

(3) Where proposed development or other site work must encroach upon the protected perimeter of a protected tree, special measures shall be incorporated to allow the roots to obtain oxygen, water and nutrients. Tree wells or other techniques may be used where advisable. No changes in existing ground level shall occur within the protected perimeter unless a drainage and aeration scheme approved by a certified arborist is utilized. No burning or use of equipment with an open flame shall occur near or within the protected perimeter (except for authorized controlled burns).

(4) No storage or dumping of oil, gasoline, chemicals or other substances that may be harmful to trees shall occur within the drip line of any tree, or any other location on the site from which such substances might enter the drip line.

(5) If any damage to a protected tree should occur during or as a result of work on the site, the county shall be promptly notified of such damage. If a protected tree is damaged so that it cannot be preserved in a healthy state, the planning director shall require replacement in accordance with the *arboreal value chart*. If on-site replacement is not feasible, the applicant shall pay the in-lieu fee to the tree replacement fund.

(6) The following design standards for protected trees shall be adhered to:

(i) Underground trenching for utilities should avoid tree roots within the protected perimeter. If avoidance is impractical, tunnels should be made below major roots. If tunnels are impractical and cutting roots is required, it shall be done by hand-sawn cuts after hand digging trenches. Trenches should be consolidated to serve as many units as possible.

(ii) Compaction within the drip line or protected perimeter shall be avoided.

(iii) Paving with either concrete or asphalt over the protected perimeter should be avoided. If paving over the protected perimeter cannot be avoided, affected trees shall be treated as removed for purposes of calculating arboreal values.

(iv) Wherever possible, septic systems and/or leach lines shall not be located on the uphill side of a protected tree.

(7) Security posted for the purpose of insuring the proper construction of public or private improvements shall also include an amount sufficient to secure any requirements imposed pursuant to this section. In addition, security for potential tree damage shall be twenty-five percent (25%) of the amount posted for planned tree replacement. In lieu fees shall be paid prior to recording any maps. Such security shall not be released until protection requirements, including planting replacement trees, and any long term maintenance requirements have been satisfactorily discharged. The initial bond amount may be reduced to cover only the maintenance and replacement of trees after construction is completed.

(8) The Valley Oak (*Quercus lobata*) shall receive special consideration in the design review process to the extent that mature specimens shall be retained to the fullest extent feasible. Valley Oaks contribute greatly to Sonoma County's visual character, landscape and they provide important visual relief in urban settings. On existing parcels created without the benefit of an accompanying EIR, design review shall focus on the preservation of valley oaks to the fullest extent feasible. Where such preservation would render a lot unbuildable, partial protection with accompanying appropriate mitigations developed by a certified arborist shall be incorporated into the project design. In such cases where only partial protection can be achieved, full replacement in accordance with the arboreal value chart shall be required.

Arboreal Value Charts. One of the following charts is to be used for determining arboreal values. The applicant shall indicate at time of application which chart is to be used. Chart No. 1 requires analysis to be done only in the development areas (building envelopes, access roads, etc.) and requires one hundred percent (100%) replacement or in-lieu fees. Chart No. 2 requires analysis of the entire site but allows for removal of up to fifty percent (50%) of the arboreal value. Compensation for the loss of greater than fifty percent (50%) arboreal value will require replacement by using the chart.

7.7.1.2 Article 67 - Valley Oak Habitat Combining District

The purpose of this Article is to protect and enhance valley oaks and valley oak woodlands and to implement the provisions of Section 5.1 of the general plan resource conservation element (Ord. No. 4991 § 1(h), 1996.). Under this Article it is necessary to mitigate for impacts to protected valley oaks. According to Section 26-67-030: Mitigation required-Exceptions: (a) Except as provided in subsection (b), when any person cuts down or removes any large valley oak, or any small valley oaks having a cumulative diameter at breast height greater than sixty inches (60"), on any property within the *VOH district*, such person shall mitigate the resulting valley oak loss by one of the following measures: (1) retaining other valley oaks on the subject property, (2) planting replacement valley oaks on the subject property or on another site in the county having the geographic, soil, and other conditions necessary to sustain a viable population of valley oaks, (3) a combination of measures (1) and (2), or (4) paying an in-lieu fee, which shall be used exclusively for valley oak planting programs in the county. Such person shall have the sole discretion to determine which mitigation measure to use to mitigate the valley oak loss. The requirements for each mitigation measure are specified in Table 26-67-030. The selected mitigation measure shall be undertaken and completed within one (1) year after the valley oak or valley oaks are cut down or removed in accordance with guidelines established by resolution or ordinance of the board of supervisors.

(b) This section shall not apply to the cutting down or removal of any valley oak within the VOH district that is (1) determined necessary by emergency personnel engaged in emergency procedures, (2) dead or irretrievably damaged or destroyed by causes beyond the property owner's control, including, without limitation, fire, flood, wind, lightning, or earth movement, or (3) part of a development project subject to the provisions of Section 26-67-040.

7.7.2 Applicability to the Proposed Project

According to the arborist contracted for the project, Mr. John Meserve, the project site supports 143 native trees, and approximately 340 ornamental (non-protected trees). Since coast redwoods were planted on the site as part of the landscaping they are categorized as ornamental trees even though they are a native species in other parts of Sonoma County (Meserve 2006). The Site Plan dated January 18, 2009 shows a 48-inch valley oak[1] in the northern portion of the project site and the trees adjacent to this valley oak being preserved onsite, as well as some trees around the existing Luther Burbank Center. However, the Site Plan also shows that many of the trees will be removed to allow room for the proposed project facilities. In accordance with Articles 88 and 67, valley oaks and coast live oaks on the project site are protected trees. In accordance with Article 88, mitigation compensation for protected trees is pursuant to the arboreal value chart. Chart No. 2 requires analysis of the entire site but allows for removal of up to fifty percent (50%) of the arboreal value. In accordance with Article 67, loss of valley oaks can be mitigated by one of the following measures: (1) retaining other valley oaks on the subject property, (2) planting replacement valley oaks on the subject property or on another site in the county having the geographic, soil, and other conditions necessary to sustain a viable population of valley oaks, (3) a combination of measures (1) and (2), or (4) paying an in-lieu fee, which shall be used exclusively for valley oak planting programs in the county. As such, mitigation would be required for the project's proposed impact to protected trees. See the Impacts and Mitigations section for details.

7.8 Sonoma County General Plan

Under the policies pertaining to "Biotic Habitat Areas" in the Open Space and Resource Conservation Element of the Sonoma County General Plan 2020 (approved September 23, 2008), the following policies apply:

Policy OSRC-7f: Support acquisition of conservation easements or fee title by the Sonoma County Agricultural Preservation and Open Space District (SCAPOSD) of designated Biotic Habitat Areas.

[1] This 48-inch diameter valley oak tree does not meet the County's definition of a "heritage tree." A heritage tree is defined as: a tree or grove of trees so designated by the Sonoma County board of supervisors because of historical interest or significance. The 48-inch valley oak tree onsite has not been officially designated by the Board of Supervisors as a heritage tree.

Policy OSRC-7k: Require the identification, preservation and protection of native trees and woodlands in the design of discretionary projects, and, to the maximum extent practicable, minimize the removal of native trees and fragmentation of woodlands, require any trees removed to be replaced, preferably on the site, and provide permanent protection of other existing woodlands where replacement planting does not provide adequate mitigation.

Policy OSRC-7o: Encourage the use of native plant species in landscaping. For discretionary projects, require the use of native or compatible non-native species for landscaping where consistent with fire safety. Prohibit the use of invasive exotic species.

7.8.1 APPLICABILITY TO THE PROPOSED PROJECT

Applicability of Policy OSRC-7k: While the project site does not provide any native woodland habitat (the site currently is mostly developed and was a planted orchard in the past), it does support many native trees, including two large (greater than 30 inches dbh) valley oak trees. Under the current project design, the 48-inch valley oak tree will be avoided by the project. Removal of native trees for the proposed project would be mitigated for by replanting of the same species or another appropriate tree species native to the Santa Rosa area somewhere on the project site or, in accordance with Article 67, Valley Oak Habitat Combining District, by paying an in-lieu fee, or a combination of planting and paying a fee. See the Impacts and Mitigations section of this report for details.

Applicability of Policy OSRC-7o: Native plant species for landscaping will be recommended to the project applicant at the time landscaping plans are designed.

8. REGULATORY REQUIREMENTS PERTAINING TO WATERS OF THE UNITED STATES AND STATE

This section presents an overview of the criteria used by the U.S. Army Corps of Engineers, the California Regional Water Quality Control Board, the State Water Resources Control Board, and CDFG to determine those areas within a project area that would be subject to their regulation.

8.1 U.S. Army Corps of Engineers Jurisdiction and General Permitting

8.1.1 SECTION 404 OF THE CLEAN WATER ACT

Pursuant to Section 404 of the Clean Water Act (33 U.S.C. 1344), the U.S. Army Corps of Engineers (Corps) regulates the discharge of dredged or fill material into "waters of the United States" (33 CFR Parts 328 through 330). This requires project applicants to obtain authorization from the Corps prior to discharging dredged or fill material into any water of the United States. In the Federal Register "waters of the United States" are defined as, “...all interstate waters including interstate wetlands...intrastate lakes, rivers, streams (including intermittent streams), wetlands, [and] natural ponds, the use, degradation or destruction of which could affect interstate or foreign commerce...” (33 CFR Section 328.3).

Limits of Corps’ jurisdiction.

(a) Territorial Seas. The limit of jurisdiction in the territorial seas is measured from the baseline in a seaward direction a distance of three nautical miles. (See 33 CFR 329.12)

(b) Tidal Waters of the United States. The landward limits of jurisdiction in tidal waters:
(1) Extends to the high tide line, or
(2) When adjacent non-tidal waters of the United States are present, the jurisdiction extends to the limits identified in paragraph (c) of this section.

(c) Non-Tidal Waters of the United States. The limits of jurisdiction in non-tidal waters:
(1) In the absence of adjacent wetlands, the jurisdiction extends to the ordinary high water mark, or
(2) When adjacent wetlands are present, the jurisdiction extends beyond the ordinary high water mark to the limit of the adjacent wetlands.
(3) When the water of the United States consists only of wetlands the jurisdiction extends to the limit of the wetland.

Section 404 jurisdiction in "other waters" such as lakes, ponds, and streams, extends to the upward limit of the ordinary high water mark (OHWM) or the upward extent of any adjacent wetland. The OHWM on a non-tidal water is the "line on shore established by the fluctuations of water and indicated by physical characteristics such as a clear natural line impressed on the bank; shelving; changes in the character of soil; destruction of terrestrial vegetation; the presence of litter or debris; or other appropriate means that consider the characteristics of the surrounding areas" (33 CFR Section 328.3[e]). Wetlands are defined as "...those areas that are inundated or saturated by surface or ground water at a frequency and duration to support a prevalence of vegetation adapted for life in saturated soil conditions" (33 CFR Section 328.8 [b]). Wetlands usually must possess hydrophytic vegetation (i.e., plants adapted to inundated or saturated conditions), wetland hydrology (e.g., topographic low areas, exposed water tables, stream channels), and hydric soils (i.e., soils that are periodically or permanently saturated, inundated or flooded) to be regulated by the Corps pursuant to Section 404 of the Clean Water Act.

It should be noted that the extent of the Corps jurisdiction pursuant to Section 404 of the Clean Water Act was recently modified. In Solid Waste Agency of Northern Cook County v. U.S. Army Corps of Engineers, the U.S. Supreme Court [148 L. Ed. 2d 576 (2001) (SWANCC)] ruled that the Corps exceeded its authority under the Clean Water Act when it regulated discharges of fill material into "isolated" waters used as habitat by migratory birds. Accordingly, waters (including wetlands) that are not connected hydrologically to navigable waters are not subject to regulation by the Corps.

Another recent Supreme Court decision also significantly changes how the Corps defines waters of the United States. On June 19, 2006 the United States Supreme Court, in a "four-one-four" decision, addressed the extent of Clean Water Act jurisdiction over wetlands adjacent to tributaries of navigable waters. In two consolidated cases, *Rapanos v. United States* and *Carabell v. U.S. Army Corps of Engineers*, a five-Justice majority of the Court remanded the case to the Sixth circuit for further consideration. The Court was unable to produce a majority vote in favor of any one jurisdictional standard for the Sixth Circuit to apply (or for the regulated community to follow). Instead, Justice Scalia authored a plurality opinion that would significantly narrow the reach of federal wetlands jurisdiction, while Justice Kennedy, concurring in the judgment only, concluded that the appropriate test for jurisdiction over wetlands was the presence of a "significant nexus" between wetlands and "navigable waters" in the traditional sense. The remaining four Justices, in a dissenting opinion by Justice Stevens, would have upheld the Corps of Engineers' assertion of jurisdiction and would have affirmed the Sixth Circuit's decision. When no opinion garners at least five votes, lower courts follow the concurrence that reached the result on the narrowest grounds. Here, that is Justice Kennedy's opinion. Unfortunately, Justice Kennedy did not provide specific guidance about the extent of federal jurisdiction over wetlands that are adjacent to tributaries of navigable waters.

Justice Kennedy concluded that the Clean Water Act applies only to those wetlands with a "significant nexus" to "navigable waters in the traditional sense." A significant nexus exists when a wetland, "either alone or in combination with similarly situated lands in the region, significantly affect[s] the chemical, physical, and biological integrity" of factually navigable waters. Under Supreme Court precedent, wetlands adjacent to navigable waters meet this test. For wetlands located near tributaries of navigable waters, however, each wetland demands a case-by-case jurisdictional inquiry. We know that a "mere hydrological connection" is not enough in all cases, and that "speculative or insubstantial" effects on water quality will not suffice to satisfy the test. [Preceding text excerpted from a news letter prepared by Briscoe, Ivester, and Bazel LLP].

To remain in compliance with Section 404 of the Clean Water Act, project proponents and property owners (applicants) are required to acquire authorization from the Corps prior to discharging or otherwise impacting “waters of the United States”. In many cases, the Corps must visit a proposed project area to confirm the extent of area falling under their jurisdiction (to conduct a “jurisdictional determination”) prior to authorizing any permit for that project. Typically, at the time the jurisdictional determination is conducted, applicants (or their representative) will discuss the appropriate permit application that would be filed with the Corps for permitting the proposed impact(s) to “waters of the United States.”

Pursuant to Section 404 of the Clean Water Act, the Corps normally provides two alternatives for permitting impacts to “waters of the United States.” The first alternative would be to use Nationwide Permit(s). The second alternative is to apply to the Corps for an Individual Permit (33 CFR Section 235.5(2)(b)). The application process for Individual Permits is extensive and includes a public review (i.e., public notice and receipt of public comments) and must contain an “alternatives analysis” that is prepared pursuant to Section 404(b) of the Clean Water Act (33 U.S.C. 1344(b)). The alternatives analysis is also typically reviewed by the federal Environmental Protect Agency (EPA), and thus brings another resource agency into the permitting framework. Both the Corps and EPA take the initial viewpoint that there are practical alternatives to any proposed project there would not result in impacts to waters of the U.S., if the proposed permitted action is not a water dependent project (e.g. a pier or a dredging project). Alternative analyses therefore must provide convincing reasons that the proposed impacts are unavoidable.

Nationwide Permit(s) (NWP) are a type of general permit administered by the Corps and issued on a nationwide basis that authorize <u>minor</u> activities that affect Corps regulated waters. Under the NWP program, if certain conditions are met, the specified activities can take place without the need for an individual or regional permit from the Corps (33 CFR, Section 235.5[c][2]). In order to use NWP(s), a project must meet 27 general nationwide permit conditions, and all specific conditions pertaining to the NWP being used (as presented at 33 CFR Section 330). It is also important to note that pursuant to 33 CFR Section 330.4(e), there may be special regional conditions or modifications to NWPs that could have relevance to individual proposed projects. Finally, pursuant to 33 CFR Section 330.6(a), Nationwide permittees may, and in some cases, request from the Corps confirmation that an activity complies with the terms and conditions of the NWP intended for use (*i.e.,* must receive "verification" from the Corps).

Prior to finalizing design plans, the applicant needs to be aware that the Corps maintains a policy of "no net loss" of wetlands (waters of the United States). Therefore, it is incumbent upon applicants that propose to impact Corps regulated areas to submit a mitigation plan that demonstrates that impacted regulated areas would be recreated (*i.e.*, impacts would be mitigated). Typically, the Corps requires mitigation to be "in-kind" (i.e., if a stream channel would be filled, mitigation would include replacing it with a new stream channel), and at a minimum of a 1:1 replacement ratio (i.e., one acre or fraction thereof recreated for each acre or fraction thereof lost). Often a 2:1 replacement ratio is required. Usually the 2:1 ratio is met by recreation or enhancement of an equivalent amount of wetland that is impacted, in addition to preserving an equivalent amount of wetland. In some cases, the Corps allows "out-of-kind" mitigation if the compensation/mitigation has greater value than the impacted area. Finally, there are many Corps approved wetland mitigation banks where wetland mitigation credits can be purchased by applicants to meet their mitigation requirements. Mitigation banks have limited distribution and the Corps typically only allows their use when projects have limited impacts. If a project meets conditions of Nationwide Permits, and an Individual Permit is not required by the Corps, then typically the Corps allows use of wetland mitigation banks (if available) to meet its no net loss requirement and to otherwise mitigate the impacts to waters of the United States resulting from the proposed project.

8.1.2 APPLICABILITY TO THE PROPOSED PROJECT

In 2005, Mr. Charlie Patterson conducted a wetland delineation on the project site. This delineation was verified in the field by the Corps on October 7, 2005. On October 24, 2005, the Corps submitted to Mr. Patterson an official map of their jurisdiction over waters of the U.S. on the project site. This jurisdictional determination expired three years after the date of the October 24, 2005 letter (that is, it expired on October 24, 2008). Hence, in late-2008 and early 2009, M&A biologists conducted a new wetland delineation for the project site so that this map could be submitted to the Corps for this agency's confirmation. With a Corps confirmed map the applicant would have a valid map of waters of the U.S. on the project site that could be relied upon for project planning purposes.

In total, M&A delineated 0.46-acre of potential waters of the United States on the project site. Please note that this acreage figure has not been confirmed by the Corps and could change (be greater or less than this amount). The project will avoid all waters of the U.S. and State on the project site except the 0.36-acre man-made borrow pit "pond" and a small, isolated wetland (0.0057-acre) along the project site's western edge. Hence, all impacts to waters of the U.S. will be less than 0.5-acre. Prior to impacting the man-made pond and the isolated wetland it will be necessary to obtain confirmed map and a Nationwide Permit authorization from the Corps.

8.2 State Water Resources Control Board (SWRCB) / California Regional Water Quality Control Board (RWQCB)

8.2.1 Section 401 of the Clean Water Act

The SWRCB and RWQCB regulate activities in "waters of the State" (which includes wetlands) through Section 401 of the Clean Water Act. While the Corps administers a permitting program that authorizes impacts to waters of the United States, including wetlands and other waters, any Corps permit authorized for a proposed project would be invalid unless it is a NWP that has been certified for use in California by the SWRCB, or if the RWQCB has issued a project specific certification or waiver of water quality. Certification of NWPs requires a finding by the SWRCB that the activities permitted by the NWP will not violate water quality standards individually or cumulatively over the term of the permit (the term is typically for five years). Certification must be consistent with the requirements of the federal Clean Water Act, the California Environmental Quality Act, the California Endangered Species Act, and the SWRCB's mandate to protect beneficial uses of waters of the State. Any denied (i.e., not certified) NWPs, and all Individual Corps permits, would require a project specific RWQCB certification of water quality.

Additionally, if a proposed project would impact waters of the State, including wetlands, the project applicant must demonstrate that the project is unable to avoid these adverse impacts, or water quality certification will most likely be denied. Section 401 Certification may also be denied based on significant adverse impacts to waters of the United States/State, including wetlands. The RWQCB has also adopted the Corps' policy that there shall be "no net loss" of wetlands. Thus, prior to certifying water quality, the RWQCB will impose avoidance mitigation requirements on project proponents that impact waters of the State.

8.2.2 Applicability to the Proposed Project

In 2005, Mr. Charlie Patterson conducted a wetland delineation on the project site. This delineation was verified in the field by the Corps on October 7, 2005. On October 24, 2005, the Corps submitted to Mr. Patterson an official map of their jurisdiction over waters of the U.S. on the project site. This jurisdictional determination expired three years after the date of the October 24, 2005 letter (that is, it expired on October 24, 2008). Hence, in late-2008 and early 2009, M&A biologists conducted a new wetland delineation for the project site so that this map could be submitted to the Corps for this agency's confirmation. With a Corps confirmed map the applicant would have a valid map of waters of the U.S. on the project site that could be relied upon for project planning purposes.

In total, M&A delineated 0.46-acre of potential waters of the United States on the project site. Please note that this acreage figure has not been confirmed by the Corps and could change (be greater or less than this amount). Any Section 404 permit authorized by the Corps for the project would be inoperative without also obtaining authorization from the RWQCB pursuant to Section 401 of the Clean Water Act (i.e., without obtaining a certification of water quality). Since the RWQCB does not have a formal method for technically defining what constitutes waters of the state, M&A expect that the RWQCB should remain consistent with the Corps' determination. Therefore, if the Corps determines there are a specified number of acres of wetland or other waters within the project site boundaries, the RWQCB will likely concur.

Any impacts to waters of the State would have to be mitigated to the satisfaction of the RWQCB prior to the time this resource agency would issue a permit for impacts to such features. The RWQCB requirements for issuance of a "401 Permit" typically parallel the Corps requirements for permitting impacts to Corps regulated areas pursuant to Section 404 of the Clean Water Act. Please refer to the Corps Applicability Section above for likely mitigation requirements for impacts to RWQCB regulated wetlands. Also, please refer to the applicability section of the Porter-Cologne Water Quality Control Act below for other applicable actions that may be imposed on the project by the RWQCB prior to the time any certification of water quality is authorized for the project. Please note that any isolated wetlands or other waters that are determined to be on the project site that are not regulated by the Corps pursuant to the SWANCC decision, would still be regulated by the RWQCB pursuant to the Porter-Cologne Water Quality Control Act (see below).

8.2.3 PORTER-COLOGNE WATER QUALITY CONTROL ACT

The Porter-Cologne Water Quality Control Act, Water Code § 13260, requires that "any person discharging waste, or proposing to discharge waste, that could affect the waters of the State to file a report of discharge" with the RWQCB through an application for waste discharge (Water Code Section 13260(a)(1). The term "waters of the State" is defined as any surface water or groundwater, including saline waters, within the boundaries of the State (Water Code § 13050(e)). It should be noted that pursuant to the Porter-Cologne Water Quality Control Act, the RWQCB also regulates "isolated wetlands," or those wetlands considered to be outside of the Corps' jurisdiction pursuant to the SWANCC decision (see Corps Section above).

The RWQCB generally considers filling in waters of the State to constitute "pollution." Pollution is defined as an alteration of the quality of the waters of the state by waste that unreasonably affects its beneficial uses (Water Code §13050(1)). The RWQCB litmus test for determining if a project should be regulated pursuant to the Porter-Cologne Water Quality Control Act is if the action could result in any "threat" to water quality.

The RWQCB requires complete pre- and post-development Best Management Practices Plan (BMPs) of any portion of the project site that is developed. This means that a water quality treatment plan for the pre- and post-developed project site must be prepared and implemented. Preconstruction requirements must be consistent with the requirements of the National Pollutant Discharge Elimination System (NPDES). That is, a *Stormwater Pollution Prevention Plan* (SWPPP) must be developed prior to the time that a site is graded (see NPDES section below). In addition, a post construction BMPs plan, or a Stormwater Management Plan (SWMP) must be developed and incorporated into any site development plan.

While SWMPs are complex, some of the basics include that 85 percent or greater of all stormwater falling on impervious surfaces must be treated prior to being discharged into features that will carry the stormwater off site. Also, beginning in 2005, the RWQCB changed their policies to include a requirement that the first 2/10ths of an inch of any storm event be treated prior to the time it is discharged from a project site. Flows above those generated on a project site during the first 2/10ths-inch of rainfall may be discharged from the project site without water quality treatment, although the project must still demonstrate that peak storm event discharges from the project site are ameliorated, or do not exceed pre-project levels. Above ground pretreatment water quality basins can be designed into the site development plan to accommodate this requirement. Peak flow amelioration can be achieved any number of other ways such as over sized piping with metered release points. Again though, water should be treated prior to entering any peak flow amelioration feature. Treatment can occur by having stormwater flow into and through “bioswales” or similar treatment facilities. The current standard the RWQCB is looking for is not necessarily flow-through swales as much as features that provide vertical percolation. The RWQCB has expressed a desire to see two feet of vertical percolation capacity in any created water treatment swale. If soils are not suitable, the RWQCB suggests the swale feature be over-excavated and the base soils in the first two feet of the soil profile be replaced below the swale with well-drained soils. Swale-like features can also be constructed in a sense similar to linear detention basins. These basins should be landscaped or otherwise vegetated. Irrigation systems, necessary to sustain vegetation in the dry periods of the year, are often a component of linear bioswale basins. Finally, typically roof leaders would be diverted into splash blocks that then drain through grassy swales in side and front yards. These measures are now standard policies that the RWQCB looks for prior to issuing any discretionary permit(s) for a development project.

Please note that post construction BMPs is a relatively new science, and the RWQCB continually updates its requirements to remain consistent with evolving technologies. Hence, it will be important that applicants contract with an engineering firm that has direct experience working with the RWQCB and its recent BMP requirements.

8.2.4 APPLICABILITY TO PROPOSED PROJECT

In 2005, Mr. Charlie Patterson conducted a wetland delineation on the project site. This delineation was verified in the field by the Corps on October 7, 2005. On October 24, 2005, the Corps submitted to Mr. Patterson an official map of their jurisdiction over waters of the U.S. on the project site. This jurisdictional determination expired three years after the date of the October 24, 2005 letter (that is, it expired on October 24, 2008). Hence, in late-2008 and early 2009, M&A biologists conducted a new wetland delineation for the project site so that this map could be submitted to the Corps for this agency’s confirmation. With a Corps confirmed map the applicant would have a valid map of waters of the U.S. on the project site that could be relied upon for project planning purposes.

In total, M&A delineated 0.46-acre of <u>potential</u> waters of the United States on the project site. Please note that this acreage figure has not been confirmed by the Corps and could change (be greater or less than this amount). The Corps would need to verify M&A’s wetland map to confirm the extent of this agency’s jurisdiction onsite and to confirm the acreage of jurisdictional waters onsite. These areas would also be regulated by the RWQCB pursuant to the Porter-Cologne Water Quality Control Act. Since any “threat” to water quality could conceivably be regulated pursuant to the Porter-Cologne Water Quality Control Act, care will be required when constructing the proposed project to be sure that adequate pre and post construction Best Management Practices Plan (BMPs) are incorporated into the project implementation plans.

Please note that any isolated wetlands defined by the Corps on the project site, that are not regulated by the Corps pursuant to the SWANCC decision, would still be regulated by the RWQCB pursuant to the Porter-Cologne Water Quality Control Act.

It should also be noted that prior to issuance of any permit from the RWQCB this agency will require submittal of a Notice of Determination from the County of Sonoma, indicating that the proposed project has completed a review conducted pursuant to CEQA. The pertinent sections of the CEQA document (typically the biology section) are often submitted to the RWQCB for review prior to the time this agency will issue a permit for a proposed project.

Finally, it should be noted that any SWMP prepared to meet Sonoma County's Standard Urban Storm Water Mitigation Plan (SUSMP) guidelines, would also meet the RWQCB's SWMP requirements. For greater detail please review the SUSMP requirements presented below.

8.2.5 National Pollutant Discharge Elimination System (NPDES)

In 1972 the Clean Water Act was amended to state that the discharge of pollutants to waters of the United States from any point source is unlawful unless the discharge is in compliance with an NPDES permit. The 1987 amendments to the Clean Water Act added Section 402(p) which establishes a framework for regulating municipal and industrial stormwater discharges under the NPDES Program. On November 16, 1990, the U.S. Environmental Protection Agency (EPA) published final regulations that establish stormwater permit application requirements for specified categories of industries. The regulations provide that discharges of stormwater to waters of the United States from construction projects that encompass five (5) or more acres of soil disturbance are effectively prohibited unless the discharge is in compliance with an NPDES Permit. EPA regulations that became final on December 8, 1999 (known as Phase II) expand the existing NPDES program to address stormwater discharges from small MS4s and from construction sites disturbing between 1 and 5 acres of land.

While federal regulations allow two permitting options for stormwater discharges (individual permits and General Permits), the SWRCB has elected to adopt only one statewide General Permit at this time that will apply to all stormwater discharges associated with construction activity, except from those on Tribal Lands, in the Lake Tahoe Hydrologic Unit, and those performed by the California Department of Transportation (CalTrans). The General Permit requires all dischargers where construction activity disturbs greater than one acre of land to:

1. Develop and implement a Storm Water Pollution Prevention Plan (SWPPP) which specifies Best Management Practices (BMPs) that will prevent all construction pollutants from contacting stormwater with the intent of keeping all products of erosion from moving off site into receiving waters.

2. Eliminate or reduce non-stormwater discharges to storm sewer systems and other waters of the nation.

3. Perform inspections of all BMPs.

This General Permit is implemented and enforced by the nine California Regional Water Quality Control Boards (RWQCBs).

Types of Construction Activity Covered by the General Permit

Construction activity subject to this General Permit includes clearing, grading, and disturbances to the ground such as stockpiling, or excavation that results in soil disturbances of at least one acre or more of total land area. Construction activity that results in soil disturbances to a smaller area would still be subject to this General Permit if the construction activity is part of a larger common plan of development that encompasses greater than one acre of soil disturbance, or if there is significant water quality impairment resulting from the activity. Construction activity does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of the facility, nor does it include emergency construction activities required to protect public health and safety. Project proponents (landowners) should confirm with the local RWQCB whether or not a particular routine maintenance activity is subject to this General Permit.

8.2.6 APPLICABILITY TO PROPOSED PROJECT

Surface grading and excavation of the project site will exceed one acre and thus would be regulated pursuant to the NPDES program. It is the responsibility of the applicant to obtain coverage under the General Permit prior to commencement of construction activities that disturb greater than one acre of area. To obtain coverage, the project proponent (landowner) must file an NOI with a vicinity map and the appropriate fee with the SWRCB. In addition, coverage under this permit shall not occur until the applicant develops an adequate SWPPP for the project. Section A of the General Permit outlines the required contents of a SWPPP. For proposed construction activity on easements or on nearby property by agreement or permission, the entity responsible for the construction activity shall file an NOI and filing fee and shall be responsible for development of the SWPPP, all of which must occur prior to commencement of construction activities. The NOI must be sent to the following address:

State Water Resources Control Board
Division of Water Quality
Storm Water Permit Unit
1001 I Street, 15th floor
Sacramento, CA 95814
(916) 341-5455

8.3 RWQCB Municipal Storm Water Permitting Program

The Municipal Storm Water Permitting Program regulates storm water discharges from municipal separate storm sewer systems (MS4s). MS4 permits were issued in two phases. Under Phase I, which started in 1990, the RWQCBs have adopted NPDES storm water permits for medium (serving between 100,000 and 250,000 people) and large (serving 250,000 people) municipalities. Most of these permits are issued to a group of co-permittees encompassing an entire metropolitan area. These permits are reissued as the permits expire.

The City of Santa Rosa, Sonoma Water Agency and County of Sonoma entered into an interagency agreement for a Phase I MS4 Permit for municipalities serving more than 100,000 people and is administered by the North Coast RWQCB coverage under an NPDES permit for storm water discharges. The County of Sonoma is a co-permittee with the City of Santa Rosa and the Sonoma County Water Agency for the Phase I boundary which includes the City of Santa Rosa and unincorporated areas near the cities of Healdsburg, Windsor, Santa Rosa, Rohnert Park, Cotati, and Sebastopol. The California Regional Water Quality Control Board, North Coast Region, issued Waster Discharge Requirements, Order No. 97-3 NPDES Permit No. CA0025038; WDID No. 1B96074SSON for the City of Santa Rosa, Sonoma Water Agency and County of Sonoma in 1997. In June 2003, these Waste Discharge Requirements were revised and updated.

The MS4 permits require the discharger to develop and implement a Storm Water Management Plan/Program (SWMP) with the goal of reducing the discharge of pollutants to the maximum extent practicable (MEP). MEP is the performance standard specified in Section 402(p) of the Clean Water Act. The management programs specify what best management practices (BMPs) will be used to address certain program areas. The program areas include public education and outreach; illicit discharge detection and elimination; construction and post-construction; and good housekeeping for municipal operations. In general, medium and large municipalities are required to conduct chemical monitoring, though small municipalities are not.

Permittees, including the City of Santa Rosa, that operate an MS4 that serves 50,000 people or more, or that serve an area of high growth (which is defined as more than 25% over 10 years), must comply with the Supplemental Provisions contained in Attachment 4 of the Small MS4 General Permit. Regulated Small MS4s subject to this requirement must adopt an ordinance or other document to ensure implementation of Design Standards for certain new development/re-development projects as specified in Attachment 4 to the permit.

9. STANDARD URBAN STORM WATER MITIGATION PLAN (SUSMP),

To comply with their MS4 permit, the City of Santa Rosa, Sonoma Water Agency and County prepared *Guidelines for the Standard Urban Storm Water Mitigation Plan (SUSMP), Storm Water Best Management Practices for New Development and Redevelopment for the Santa Rosa Area and Unincorporated Areas around Petaluma and Sonoma were released by Sonoma County* on June 3, 2005. The SUSMP guidelines were developed to assist project sponsors and municipal staff to implement the Santa Rosa Area requirements that were adopted by the North Coast Regional Water Quality Control Board in June 2003. Since the SUSMP requirements apply to both privately sponsored projects and public capital improvement projects, these Guidelines are required to be used by development project applicants, municipal development project review staff, and municipal staff responsible for capital improvement projects. The SUSMP requirements are part of the Storm Water Management Plan that has become an enforceable part of the reissued municipal storm water National Pollutant Discharge Elimination System (NPDES) permit for the City of Santa Rosa, the County of Sonoma, and the Sonoma County Water Agency. The SUSMP guidelines also have been created to comply with the municipal storm water NPDES permit requirement for the City of Santa Rosa and County of Sonoma to develop a SUSMP Guidance Document.

The SUSMP goals for new and redevelopment projects are to manage, as close to the point of origin as possible, 1) storm water quality, 2) storm water quantity, and 3) to conserve natural areas of the development site. These three goals are described further below. It should be noted that the concept of "maximum extent practical" (MEP) applies to each of the goals. The MEP requirement is a technology based standard established by Congress in the Clean Water Act U.S.C. S 1342 (p)(3)(B)(iii) that municipal dischargers of storm water must meet. To achieve the maximum extent practicable standard, municipalities must employ whatever Best Management Practices (BMPs) are technically feasible (i.e., are likely to be effective) and are not cost prohibitive. The major emphasis is on technical feasibility. Reducing pollutants to the maximum extent practicable means choosing effective BMPs, and rejecting applicable BMPs only where other effective BMPs will serve the same purpose, or the BMPs would not be technically feasible, or the cost would be prohibitive.

The SUSMP goals for new and redevelopment projects are as follows:

Storm Water Quality. The first goal is to prevent pollutants generated at development and redevelopment projects from reaching storm drains. Projects covered by the SUSMP must be designed to minimize the introduction of pollutants.

Storm Water Quantity. The second goal is to prevent increases in storm water runoff from the two-year 24 hour storm event for Sonoma County. SUSMP projects should incorporate best management practices to limit the post-development runoff to pre-development conditions to the MEP. Best management practices are methods used to minimize pollutants in storm water and the quantity of runoff. One of the objectives of these guidelines is to provide more specific information about how MEP will be achieved.

Conserve Natural Areas. The third goal is to conserve natural areas of a development site. This goal supports the other two goals by preserving areas where storm water runoff can be purified naturally by infiltration into the soil and flow over vegetated areas. SUSMP projects should strive to maximize the amount of land left in a natural, undisturbed condition, preserve riparian areas and wetlands, limit clearing of native vegetation, and maximize trees and vegetation.

This SUSMP applies to applicable projects that require a discretionary permit, including any ministerial permits that are based on the discretionary permit. Source controls will be recommended for all discretionary projects.

Projects that must comply with the SUSMP include:

a) Development projects that create one acre (43,560 square feet) or more of new impervious surface. This category includes development of any type on public or private land, which falls under the planning and building authority of Sonoma County or City of Santa Rosa, where one acre or more of new impervious surface, collectively over the entire project site, will be created.
b) Streets, roads, highways and freeways that create one acre (43,560 square feet) or more of new impervious surface. This category includes any newly constructed impervious surface used for the transportation of pedestrians, bicycles, and motorized vehicles.

c) Redevelopment projects that are located on an already developed site and result in the addition of and/or reconstruction of one acre (43,560 square feet) or more of new impervious surface. Only the additional and/or reconstructed portion(s) of the site must be included in treatment design. Excluded from this category are interior remodels and routine maintenance or repair, including roof or exterior surface replacement and resurfacing.
d) Development and redevelopment projects located directly adjacent to a natural waterway, modified natural waterway, or constructed channel or that require a new storm drain outfall to such waterway, regardless of project size or impervious surface. This requirement is intended to protect environmentally sensitive areas. For redevelopment projects, excluded from this category are interior remodels and routine maintenance or repair, including roof or exterior surface replacement and resurfacing.

Regarding phased projects, new development or redevelopment activity that is part of a larger common plan of development that results in less than one acre of impervious surface must comply with SUSMP requirements. (For example, if 50% of a subdivision is constructed and results in 0.9 acre of impervious surface and the remaining 50% of the subdivision is to be developed at a future date, the property owner must comply with SUSMP requirements.

9.1 Source and Treatment Control Requirements

Source control and treatment control BMPs are intended to reduce runoff and keep pollutants out of storm water throughout the life of the project. They may be described as post-construction BMPs or “post-development” control measures. Post-construction BMPs differ from construction BMPs, which are used during the construction phase to prevent erosion and keep construction-related pollutants from reaching storm water.

The SUSMP recognizes two types of post-development BMPs for storm water pollution control – source controls and treatment controls. Source controls include BMPs that are designed to prevent pollutants from reaching storm water runoff and minimize site runoff. Source controls include a large variety of BMPs that range from minimizing the amount of impervious surface used at a project site to specific pollution prevention BMPs such as providing a roof over waste storage areas. The municipal storm water NPDES permit characterizes source control as the first line of defense at a project site and storm water treatment as a backup or additional line of defense. Source controls will be recommended for all discretionary projects.

Storm water treatment controls are engineered systems that are designed to remove pollutants from storm water. The SUSMP and NPDES permit have specific hydraulic design criteria for sizing storm water treatment controls to assure that an optimum amount of storm water receives treatment. Examples of storm water treatment controls include vegetated swales, extended detention basins, and bioretention areas. These are described in more detail in Chapter 4.

Source and treatment controls require long-term maintenance to continue to function effectively and avoid the creation of nuisance conditions. The SUSMP requires the project applicant to provide to the City or County a signed statement accepting responsibility for maintenance until the responsibility is legally transferred. The SUSMP further requires property owners to conduct maintenance inspection of all source and treatment control BMPs at least once a year or as specified by the designer or manufacturer.

9.2 Post-Construction Sediment and Erosion Control

Sediment is an important pollutant of concern in the North Coast Region. During construction sediment and erosion control BMPs must be implemented in accordance with the Statewide Construction Activity NPDES General Permit and the City of Santa Rosa or County of Sonoma grading permit programs. The design of projects must also consider potential sedimentation and erosion issues during long-term project operations and incorporate appropriate sediment and erosion controls in the project design.

Source Controls includes the need to select and maintain vegetation in landscaped pervious areas to prevent runoff from contacting bare earth and conveying sediment into the storm drain system. Similarly, pervious paving materials must also be selected, designed and maintained to avoid sedimentation and erosion.

9.3 Enforceability

The Santa Rosa Area municipal storm water NPDES permit requires the City of Santa Rosa, County of Sonoma and Sonoma County Water Agency to implement legal authority to control pollutant discharges to their respective storm drain systems. At a minimum, this legal authority empowers the agencies to use enforcement mechanisms, including monetary fines, to require compliance by private entities within their jurisdictions. In the event that a project applicant fails to comply with the SUSMP requirements, the City or County may determine that it is necessary to undertake enforcement actions, which may include a monetary fine.

9.4 Applicability to the Proposed Project

The project would create greater than one acre (43,560 square feet) of new impervious surface. The project could be considered in part a redevelopment project since it is partially located on an already developed site. Regardless it would result in the addition of and/or reconstruction of one acre (43,560 square feet) or more of new impervious surface. Thus the project must comply with the SUSMP and a complete SWMP would have to be provided to the County of Sonoma prior to the time a grading permit would be authorized for the project.

10. CALIFORNIA DEPARTMENT OF FISH AND GAME PROTECTIONS

10.1 Section 1602 of California Fish and Game Code

Pursuant to Section 1602 of the California Fish and Game Code, California Department of Fish and Game (CDFG) regulates activities that divert, obstruct, or alter stream flow, or substantially modify the bed, channel, or bank of a stream which CDFG typically considers to include its riparian vegetation. Any proposed activity in a natural stream channel that would substantially adversely affect an existing fish and/or wildlife resource, would require entering into a Streambed Alteration Agreement (SBAA) with CDFG prior to commencing with work in the stream. However, prior to authorizing such permits, CDFG typically reviews an analysis of the expected biological impacts, any proposed mitigation plans that would be implemented to offset biological impacts and engineering and erosion control plans.

10.1.1 Applicability to Proposed Project

Two man-made drainages were excavated on the project site when the Luther Burbank Center was originally constructed. These drainages drain parking areas and other ancillary landscaped and non-landscaped areas. Neither of these drainages would be impacted by the proposed project. A third drainage, a man-made roadside ditch that runs along Mark West Springs Road just north of the property line, would be effected by this project. Because technically it could be reasoned there is a bed and bank along this ditch, CDFG may want to regulate impacts to this ditch, and the other drainages if any impacts were proposed. CDFG should confirm or deny their intent to regulate impacts to the roadside ditch prior to the time that it would be impacted by the project. If CDFG chooses to regulate impacts to this ditch, a SBAA application would have to be submitted to the CDFG for this project.

11. CALIFORNIA ENVIRONMENTAL QUALITY ACT (CEQA) REGULATIONS

A CEQA lead agency must determine if a proposed activity constitutes a project requiring further review pursuant to the CEQA. Pursuant to CEQA, a lead agency would have to determine if there could be significant adverse impacts to the environment from a proposed project. Typically, if within the city limits, the city would be the CEQA lead agency. If a discretionary permit (i.e., conditional use permit) would be required for a project (e.g. an occupancy permit must be issued), the lead agency typically must determine if there could be significant environmental impacts. This is usually accomplished by an “initial study.” If there could be significant environmental impacts, the lead agency must determine an appropriate level of environmental review prior to approving and/or otherwise permitting the impacts. In some cases, there are “Categorical Exemptions” that apply to the proposed activity; thus the activity is exempt from CEQA. The Categorical Exemptions are provided in CEQA. There are also Statutory Exemptions in CEQA that must be investigated for any proposed project. If the project is not exempt from CEQA, the lowest level of review typically reserved for projects with no significant affects on the environment would be for the lead agency to prepare a “Negative Declaration.” If a proposed project would have only minimal impacts that can be mitigated to a level of no significance pursuant to the CEQA, then a “Mitigated Negative Declaration” is typically prepared by the lead agency. Finally those projects that may have significant affects on the environment, or that have impacts that can’t be mitigated to a level considered less than significant pursuant to the CEQA, typically must be reviewed via an Environmental Impact Report (EIR). All CEQA review documents are subject to public circulation, and comment periods.

Section 15380 of CEQA defines “endangered” species as those whose survival and reproduction in the wild are in immediate jeopardy from one or more causes, including loss of habitat, change in habitat, overexploitation, predation, competition, disease, or other factors. “Rare” species are defined by CEQA as those who are in such low numbers that they could become endangered if their environment worsens; or the species is likely to become endangered within the foreseeable future throughout all or a significant portion of its range and may be considered “threatened” as that term is used in FESA. The CEQA Guidelines also state that a project will normally have a significant effect on the environment if it will "substantially affect a rare or endangered species of animal or plant or the habitat of the species." The significance of impacts to a species under CEQA, therefore, must be based on analyzing actual rarity and threat of extinction to that species despite its legal status or lack thereof.

11.1.1 Applicability to the Proposed Project

This report has been prepared to assist the EIR consultant with preparation of a Biological Resources section of a CEQA document. This report addresses the proposed project's impacts to significant biological resources and provides mitigation measures that, when implemented, would reduce those impacts to a less than significant level.

12. IMPACT ANALYSIS

In this section we discuss potential impacts to sensitive biological resources including special-status animal species and waters of the United States and/or State. We follow each impact with a mitigation prescription that when implemented would reduce impacts to the greatest extent possible. This impact analysis is based on a Site Plan prepared on December 10, 2008 by Quadriga Landscape Architecture and Planning, Inc.

12.1 Significance Criteria

A significant impact is determined using CEQA and CEQA Guidelines. Pursuant to CEQA §21068, a significant effect on the environment means a substantial, or potentially substantial, adverse change in the environment. Pursuant to CEQA Guideline §15382, a significant effect on the environment is further defined as a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project including land, air, water, minerals, flora, fauna, ambient noise, and objects of historical or aesthetic significance. Other Federal, State, and local agencies' considerations and regulations are also used in the evaluation of significance of proposed actions.

Direct and indirect adverse impacts to biological resources are classified as "significant," "potentially significant," or "less than significant." Biological resources are broken down into four categories: vegetation, wildlife, threatened and endangered species, and regulated "waters of the United States" and/or stream channels. "Significant" impacts as they pertain to these four categories are discussed under the appropriate heading below.

A "potentially significant" designation is used under circumstances where the presence of a special-status species or resource is uncertain and project construction could result in its loss. This designation is also used if it is unclear if the proposed project would result in a significant adverse impact, but the likelihood is great. "Less than significant" impacts are those impacts not put into either significant or potentially significant categories. Impacts would be generally considered less than significant if the habitats and species affected were common and widespread in the region and in the State.

12.1.1 Thresholds of Significance

12.1.1.1 Plants, Wildlife, Waters

In accordance with Appendix G (Environmental Checklist Form) of the CEQA Guidelines, implementing the project would have a significant biological impact if it would:

- Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service.

- Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service.

- Have a substantial adverse effect on federally protected "wetlands" as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.

- Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.

- Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.

- Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.

12.1.1.2 Waters of the United States and State.

Pursuant to Section 404 of the Clean Water Act (33 U.S.C. 1344), the U.S. Army Corps of Engineers (Corps) regulates the discharge of dredged or fill material into waters of the United States, which includes wetlands, as discussed in the bulleted item above, and also includes "other waters" (stream channels, rivers) (33 CFR Parts 328 through 330). Substantial impacts to Corps regulated areas on a project site would be considered a significant adverse impact. Similarly, pursuant to Section 401 of the Clean Water Act, and to the Porter-Cologne Water Quality Control Act, the RWQCB regulates impacts to waters of the state. Thus, substantial impacts to RWQCB regulated areas on a project site would also be considered a significant adverse impact.

12.1.1.3 Stream Channels

Pursuant to Section 1602 of the California Fish and Game Code, CDFG regulates activities that divert, obstruct, or alter stream flow, or substantially modify the bed, channel, or bank of a stream which CDFG typically considers to include riparian vegetation. Any proposed activity that would result in substantial modifications to a natural stream channel would be considered a significant adverse impact.

13. IMPACT ASSESSMENT AND PROPOSED MITIGATION

13.1 Impact 1. Trees

The project site supports 143 native trees, many of which are valley oaks and coast live oaks. Both valley oak and coast live oak trees are "protected trees" under Sonoma County's Zoning Regulations. It is estimated that approximately 60 coast live oak and valley oak trees could be removed for the proposed project (J. Meserve, Arborist, pers. comm. with S. Lynch of M&A). In accordance with Sonoma County's Zoning Regulations, Chapter 26, Article 88, mitigation compensation is required for impacts to protected trees. Mitigation is based on one of the County's Arboreal Value Charts (Chart No. 1 or Chart No. 2). Another mitigation option available for impacts to valley oak trees, in accordance with Article 67, loss of valley oaks can be mitigated by one of the following measures: (1) retaining other valley oaks on the subject property, (2) planting replacement valley oaks on the subject property or on another site in the county having the geographic, soil, and other conditions necessary to sustain a viable population of valley oaks, (3) a combination of measures (1) and (2), or (4) paying an in-lieu fee, which shall be used exclusively for valley oak planting programs in the county.

Under the Sonoma County General Plan 2020, Policy OSRC-7k requires the identification, preservation and protection of native trees in the design of discretionary projects, and, to the maximum extent practicable, minimize the removal of native trees, require any trees removed to be replaced, preferably on the site. Additionally, Chapter 26 of the Sonoma County Zoning Regulations requires mitigation for the removal of protected trees. Hence, based on all of the above zoning regulations, removal of native, protected trees onsite without compensatory mitigation would be a s**ignificant, adverse impact pursuant to CEQA**. This impact could be mitigated to a level considered less than significant.

13.2 Mitigation Measure 1 - Trees

In order to offset the impact of removing native, protected valley oak and coast live oak trees onsite, the applicant shall mitigate by planting replacement trees or paying an in-lieu fee. If replacement planting is the mitigation option chosen, replacement trees shall be the same species as the trees removed.

To determine mitigation for coast live oaks and valley oaks removed, it shall be necessary for the applicant to implement Sonoma County's "arboreal value" method, which is a mathematical evaluation of the arboreal component of a site for the purposes of establishing a plan for tree preservation. Under this method one of two available methods can be used for determining arboreal values, based on Chart #1 or Chart #2 contained in the Sonoma County Tree Ordinance. Chart #1 requires analysis be done only in the development areas and requires 100% replacement or in-lieu fees. Chart #2 requires analysis of the whole site but allows for removal up to 50% of the arboreal value. Compensation for the loss of greater than 50% arboreal value will require replacement by using the chart. Replacement shall include the replanting of coast live oaks and valley oaks on the project site in accordance with the arboreal value and Chart 2 or by paying in in-lieu fee.

The applicant's arborist calculated the number of protected trees to be removed on the entire property, breaking the trees down by size class (diameter at breast height) consistent with the Arboreal Value Charts. Using Chart No. 2, it has been determined that greater than 50% of the arboreal value onsite will be removed. (That is, the existing arboreal value is 103, and the removed arboreal value is 95). Hence, mitigation by replacement planting or in-lieu fee payment using the County's arboreal valuations shall be required for the project.

This mitigation measure when implemented would reduce the project's impact to native oak trees to a level considered less than significant pursuant to CEQA.

13.3 Impact 2. Nesting Raptors

No large stick nests or tree cavities were found on the project site suggesting that raptors have nested on the project site in the recent past. However, red-tailed hawks, red shouldered hawks, and white-tailed kites are all known from the area, and conceivably they could nest on the project site in future years. All of these raptors (that is, birds of prey) are protected under the Migratory Bird Treaty Act (50 CFR 10.13) and their eggs and young are protected under California Fish and Game Codes Sections 3503, 3503.5. Any project-related impacts to these species would be considered a significant adverse impact. Potential impacts to these species from the proposed project include disturbance to nesting birds, and possibly death of adults and/or young. No nesting raptors (birds of prey) have been identified on the proposed project site; however, no specific surveys for nesting raptors have been conducted. As such, in the absence of survey results, it must be concluded that impacts to nesting raptors from the proposed project would be **potentially significant pursuant to CEQA.** This impact could be mitigated to a level considered less than significant.

13.4 Mitigation Measure 2. Nesting Raptors

In order to avoid impacts to nesting raptors, a nesting surveys shall be conducted prior to commencing with grading or construction work if this work would commence between February 1st and August 31st. The raptor nesting surveys shall include examination of all trees within 500 feet of the entire project site, not just trees slated for removal.

If nesting raptors are identified during the surveys, the dripline of the nest tree must be fenced with orange construction fencing (provided the tree is on the project site), and a 300-foot radius around the nest tree must be staked with bright orange lath or other suitable staking. If the tree is located off the project site, then the buffer shall be demarcated per above where the buffer occurs on the project site. *The size of the buffer may be altered if a qualified raptor biologist conducts behavioral observations and determines the nesting raptors are well acclimated to disturbance.* If this occurs, the raptor biologist shall prescribe a modified buffer that allows sufficient room to prevent undue disturbance/harassment to the nesting raptors. No construction or earth-moving activity shall occur within the established buffer until it is determined by a qualified raptor biologist that the young have fledged (that is, left the nest) and have attained sufficient flight skills to avoid project construction zones. This typically occurs by July 15th. This date may be earlier or later, and would have to be determined by a qualified raptor biologist. If a qualified biologist is not hired to watch the nesting raptors then the buffers shall be maintained in place through the month of August and work within the buffer can commence September 1st.

Implementation of this mitigation measure would reduce impacts to nesting raptors to a level considered less than significant.

13.5 Impact 3. Impacts to Waters of the United States and/or State

The proposed project may result in impacts to areas that are likely within the Corps' and RWQCB jurisdiction pursuant to Sections 404 and 401 of the Clean Water Act, respectively. Areas subject to potential jurisdiction by these two agencies include the seasonal pond/borrow pit wetland adjacent to the soccer field on the project site, and possibly to an isolated wetland on the western edge of the site. Impacts to less than 0.5-acre of "waters of the United States/State" would occur from implementation of the proposed project. This impact would be regarded as a **significant adverse impact.** Such an impact could be mitigated to a level considered less than significant.

13.6 Mitigation Measure 3. Impacts to Waters of the United States and/or State

Impacts to potential waters of the United States and/or State can be reduced to less-than-significant levels through various means, including avoidance, minimization of impacts, and mitigation compensation. Because only the Corps can determine the extent of its jurisdiction on any site, and because the existing delineation is now expired, a current wetland delineation is currently in preparation using the 1987 Corps' Wetland Delineation Manual (U.S. Army Corps of Engineers 1987) and the Interim Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region (U.S. Army Corps of Engineers 2006). A preliminary wetland delineation map shall be prepared and submitted to the Corps for confirmation. *A currently valid delineation map shall be provided to the County of Sonoma.* Since the RWQCB does not have a formal method for technically defining what constitutes waters of the state, M&A expects that the RWQCB should remain consistent with the Corps' determination.

Waters of the U.S. and State will be avoided by the project where possible. Because full avoidance of waters of the United States and State is not possible, impacts will be minimized to the extent practicable. In addition, use of Best Management Practices to protect preserved wetlands and ensure water quality in wetlands and other waters within the watershed will be employed. These practices can include installing orange construction fencing, hay or gravel waddles, and other protective measures to protect preserved jurisdictional waters of the U.S. and State.

Since the man-made pond cannot be avoided by the project as it play a pivotal role in providing adequate parking spaces for hospital patrons and personnel, it shall be compensated for at a 2:1 ratio. That is the 15,857 square feet (0.36-acre) of man-made seasonal pond shall be compensated for via purchase of approximately 0.72-acre of mitigation credits from a Corps and RWQCB approved Wetland Conservation Bank. For example, the Hale Mitigation Bank in Santa Rosa (at Arlington Avenue, south of Todd Road) was fully approved as a wetland mitigation bank in 2006. This mitigation bank is available to mitigate impacts to waters of the U.S./State associated with this project site (H. Rich, pers. comm. with S. Lynch of M&A). Purchase of mitigation credits is deemed acceptable since the onsite pond is a man-made pond that does not support high quality seasonal wetland herbaceous vegetation owing to a dense overstory of red willows and Fremont cottonwoods. The functions and values of the pond in its setting between a soccer field and the Luther Burbank Center are low and accordingly purchase of mitigation credits is deemed appropriate. Purchase of such credits shall be made a condition of project approval; however, this condition may be altered in the future to otherwise comply with and be consistent with any Corps or RWQCB permit authorized for the proposed project. If mitigation compensation is not required by the Corps and/or RWQCB for the project, then this condition of project approval shall be deemed unnecessary.

Implementation of the measures just described above would reduce potentially significant impacts to waters of the United States/State to a level considered less-than-significant pursuant to the CEQA. Any other conditions that are stipulated for wetland impacts by the Corps and/or RWQCB shall also become conditions of project approval.

Table 1

Plants Observed on the Sutter Medical Center Project Site

Gymnosperms

Cupressaceae

Juniperus sp.	Juniper
Sequoia sempervirens	Redwood

Pinaceae

**Cedrus deodara*	Deodar cedar
Pinus radiata	Monterey pine

Angiosperms - Dicots

Araliaceae

**Hedera helix*	English ivy

Asteraceae

Baccharis pilularis	Coyote brush
**Carduus pycnocephalus*	Italian thistle
**Cirsium vulgare*	Bull thistle
Conyza canadensis	Horseweed
**Helminthotheca echioides*	Bristly ox-tongue
**Lactuca serriola*	Prickly lettuce
Taraxacum californicum	California dandelion

Brassicaceae

**Hirschfeldia incana*	Short-podded mustard
**Raphanus sativus*	Wild radish

Convolvulaceae

**Convolvulus arvensis*	Bindweed

Dipsacaceae

**Dipsacus sativus*	Fuller's teasel

Ebenaceae

**Diospyros kaki*	Persimmon

Ericaceae

**Arbutus unedo*	Strawberry tree

Fabaceae

**Trifolium sp.*	Clover
**Vicia sativa*	Common vetch

Fagaceae

Quercus agrifolia var. agrifolia	Coast live oak
Quercus lobata	Valley oak

Geraniaceae

**Erodium botrys*	Broad-leaf filaree
**Erodium cicutarium*	Red-stem filaree
**Erodium moschatum*	White-stem filaree
**Geranium dissectum*	Cut-leaf geranium

* Indicates a non-native species

Hamamelidaceae

Liquidambar styraciflua	Liquidambar

Lauraceae

**Cinnamomum camphora*	Camphor tree

Oleaceae

**Olea europaea*	Olive

Onagraceae

Epilobium ciliatum	Hairy willow-herb

Oxalidaceae

**Oxalis pes-caprae*	Bermuda buttercup

Papaveraceae

Eschscholzia californica	California poppy

Plantaginaceae

**Kickxia elatine*	Sharppoint fluvellin
**Plantago lanceolata*	English plantain

Polygonaceae

**Rumex crispus*	Curly dock

Rosaceae

**Cotoneaster pannosa*	Cotoneaster
**Rosa sp.*	Wild rose
**Rubus discolor*	Himalayan blackberry

Salicaceae

Populus fremontii ssp. fremontii	Fremont cottonwood
Salix exigua	Narrow-leaved willow
Salix laevigata	Red willow

Sapindaceae

**Acer sp.*	Maple

Angiosperms -Monocots

Arecaceae

Washingtonia filifera	California fan palm

Cyperaceae

Cyperus eragrostis	Tall flatsedge

Liliaceae

**Yucca sp.*	Yucca

Poaceae

**Avena fatua*	Wild oat
**Bromus hordeaceus*	Soft chess
**Cortaderia jubata*	Pampas grass
**Holcus lanatus*	Common velvet grass
**Hordeum marinum ssp. gussoneanum*	Mediterranean barley
**Lolium multiflorum*	Italian ryegrass
Paspalum distichum	Joint paspalum
**Phalaris aquatica*	Harding grass
**Poa annua*	Annual bluegrass
**Taeniatherum caput-medusae*	Medusahead

* Indicates a non-native species

Table 2
Wildlife Observed on the Sutter Medical Center Project Site

Amphibians

Arboreal salamander	*Aneides lugubris*
California slender salamander	*Batrachoseps attenuatus*
Western toad	*Bufo boreas*
Pacific tree frog	*Hyla regilla*

Reptiles

Western fence lizard	*Sceloporus occidentalis*
Northern alligator lizard	*Elgaria coerulea*

Birds

Great egret	*Ardea alba*
Turkey vulture	*Cathartes aura*
Mallard	*Anas platyrhynchos*
Red-shouldered hawk	*Buteo lineatus*
Red-tailed hawk	*Buteo jamaicensis*
Killdeer	*Charadrius vociferus*
Anna's hummingbird	*Calypte anna*
Nuttall's woodpecker	*Picoides nuttallii*
Northern flicker	*Colaptes auratus*
Black phoebe	*Sayornis nigricans*
Western scrub jay	*Aphelocoma californica*
American crow	*Corvus brachyrhynchos*
Oak titmouse	*Baeolophus inornatus*
Bushtit	*Psaltriparus minimus*
Bewick's wren	*Thryomanes bewickii*
Marsh wren	*Cistothorus palustris*
Ruby-crowned kinglet	*Regulus calendula*
American robin	*Turdus migratorius*
Northern mockingbird	*Mimus polyglottos*
European starling	*Sturnus vulgaris*
Cedar waxwing	*Bombycilla cedrorum*
Yellow-rumped warbler	*Dendroica coronata*
California towhee	*Pipilo crissalis*
Song sparrow	*Melospiza melodia*
White-crowned sparrow	*Zonotrichia leucophrys*
Brown-headed cowbird	*Molothrus ater*
House finch	*Carpodacus mexicanus*
Lesser goldfinch	*Carduelis psaltria*

Mammals

Virginia opossum	*Didelphis virginiana*
Ornate shrew	*Sorex ornatus*
Botta's pocket gopher	*Thomomys bottae*
Western harvest mouse	*Reithrodontomys megalotis*
Deer mouse	*Peromyscus maniculatus*
Norway rat	*Rattus norvegicus*

Table 2

Wildlife Observed on the Sutter Medical Center Project Site

California meadow vole	*Microtus californicus*
Red fox	*Vulpes vulpes*
Raccoon	*Procyon lotor*
Striped skunk	*Mephitis mephitis*

Table 3

Special-Status Plant Species Known to Occur in the Vicinity of the Sutter Medical Center Project Site

Family Taxon Common Name	Status*	Flowering Period	Habitat	Area Locations	Probability on Project Site
Apiaceae					
Eryngium constancei Loch Lomand button-celery	Fed: FE State: CE CNPS: List 1B.1	April-June	Vernal pools. Elevation 460-855.	On CNPS 9-quad list.	None. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Asteraceae					
Balsamorhiza macrolepis macrolepis Big-scale balsam-root	Fed: - State: - CNPS: List 1B.2	March-June	Chaparral; cismontane woodland; valley and foothill grassland; [sometimes serpentinite]. Elevation 90-1400 meters.	On CNPS 9-quad list.	None. This species was not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Blennosperma bakeri Sonoma sunshine	Fed: FE State: CE CNPS: List 1B.1	March-May	Valley and foothill grassland (mesic); vernal pools. Elevation 10-110 m.	Record for this species located 0.7 miles southwest of the project site (Occurrence No. 25).	None. This species was not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Centromadia parryi parryi Pappose tarplant	Fed: - State: - CNPS: List 1B.2	May-November	Chaparral; coastal prairie; meadows and seeps; marshes and swamps; valley and foothill grassland (vernally mesic/often alkaline). Elevation 2-420 m.	On CNPS 9-quad list.	None. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Erigeron biolettii Streamside daisy	Fed: - State: - CNPS: List 3	June-October	Broad-leaved upland forest; cismontane woodland; northern coniferous forest [rocky, mesic]. Elevation 30-1100 m.	On CNPS 9-quad list.	None. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Erigeron serpentinus Serpentine daisy	Fed: - State: - CNPS: List 1B.3	May-August	Chaparral (serpentinite). Elevation 60-670 meters	On CNPS 9-quad list.	None. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.

Table 3

Special-Status Plant Species Known to Occur in the Vicinity of the Sutter Medical Center Project Site

Family Taxon Common Name	Status*	Flowering Period	Habitat	Area Locations	Probability on Project Site
Hemizonia congesta congesta Hayfield tarweed	Fed: State: CNPS: List 1B.2	April-November	Valley and foothill grassland (VFGrs)/sometimes roadsides. Elevation 20-560 meters.	Record for this species located approximately 1.1 mile east of the project site (Occurrence No. 22).	None. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Lasthenia burkei Burke's goldfields	Fed: FE State: CE CNPS: List 1B.1	April-June	Meadows (mesic); vernal pools. Elevation 15 to 600 meters.	Record for this species located 0.9-mile southwest of the project site (CNDDB Occurrence No. 19).	None. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Lasthenia californica bakeri Baker's goldfields	Fed: State: CNPS: List 1B.2	April-October	Closed-cone coniferous forest, coastal scrub, meadows and seeps, marshes and swamps. Elevation 60-520 meters.	On CNPS 9-quad list.	None. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Lasthenia conjugens Contra Costa goldfields	Fed: FE State: - CNPS: List 1B.1	March-June	Valley and foothill grassland (mesic); vernal pools; cismontane woodlands; playas. Elevation 0-470 meters.	On CNPS 9-quad list.	None. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Layia septentrionalis Colusa layia	Fed: - State: - CNPS: List 1B.2	April-May	Chaparral; cismontane woodland, valley and foothill grassland; [sandy, serpentinite]. Elevation 100-1095 meters.	On CNPS 9-quad list.	None. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Lessingia hololeuca Woolly-headed lessingia	Fed: - State: - CNPS: List 3	June-October	Broad-leaved upland forest; coastal scrub; lower montane coniferous forest; valley and foothill grassland; [clay, serpentinite]. Elevation 15-305 m.	On CNPS 9-quad list.	None. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.

Table 3

Special-Status Plant Species Known to Occur in the Vicinity of the Sutter Medical Center Project Site

Family Taxon Common Name	Status*	Flowering Period	Habitat	Area Locations	Probability on Project Site
Microseris paludosa Marsh silverpuffs	Fed: - State: - CNPS: List 1B.2	April-July	Closed-cone coniferous forest; cismontane woodland; coastal scrub; valley and foothill grassland. Elevation 5-300 m.	On CNPS 9-quad list.	None. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Boraginaceae					
Mertensia bella Oregon lungwort	Fed: - State: - CNPS: List 2.2	May-July	Meadows; upper montane coniferous forest; [mesic]. Elevation 1500-2000 meters.	On CNPS 9-quad list.	None. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Campanulaceae					
Downingia pusilla Dwarf downingia	Fed: - State: - CNPS: List 2.2	March-May	Valley and foothill grassland (mesic); vernal pools. Elevation 1-445 meters.	Record for this species located 1.6 miles west of the project site (Occurrence No. 85).	None. Marginally suitable habitat is present on the project site. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Legenere limosa Legenere	Fed: - State: - CNPS: List 1B.1	April-June	Vernal pools. Elevation 1-880 m.	On CNPS 9-quad list.	None. Marginally suitable habitat is present on the project site. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Caprifoliaceae					
Viburnum ellipticum Western viburnum	Fed: - State: - CNPS: List 2.3	May-June	Chaparral; cismontane woodland; lower montane coniferous forest. Elevation 215-1400 meters.	Record for this species located 4.0 miles northeast of the project site (Occurrence No. 11).	None. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.

Table 3

Special-Status Plant Species Known to Occur in the Vicinity of the Sutter Medical Center Project Site

Family Taxon Common Name	Status*	Flowering Period	Habitat	Area Locations	Probability on Project Site
Convolvulaceae					
Calystegia collina oxyphylla Mt. Saint Helena morning-glory	Fed: - State: - CNPS: List 4	May-June	Chaparral (serpentinite).	Record for this species located 4.9 miles northeast of the project site (Occurrence No. 5).	None. No suitable habitat present on the project site. This species was not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Cyperaceae					
Carex albida White sedge	Fed: FE State: CE CNPS: List 1B.1	May-July	Bogs and fens; marshes and swamps (freshwater). Elevation 15-90 meters.	Record for this species located 3.2 miles south of the project site (Occurrence No. 2).	None. Marginally suitable habitat on site. This species was not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Rhynchospora alba White beaked-rush	Fed: - State: - CNPS: List 1B.1	July-August	Bogs and fens; marshes and swamps (freshwater). Elevation 45-1010 meters.	On CNPS 9-quad list.	None. No suitable habitat is present on the project site. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Rhynchospora californica California beaked-rush	Fed: - State: - CNPS: List 1B.1	May-July	Bogs & fens, lower montane coniferous forest; seeps; freshwater marshes and swamps. Elevation 45-1010 m.	On CNPS 9-quad list.	None. No suitable habitat is present on the project site. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Rhynchospora capitellata Brownish beakrush	Fed: - State: - CNPS: List 2.2	July-August	Lower montane coniferous forest, meadows and seeps, marshes/swamps, upper montane conif. forest /mesic; elev. range 455 - 2000 M (1,493 - 6,652 feet).	On CNPS 9-quad list.	None. No suitable habitat is present on the project site. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Rhynchospora globularis globularis Roundheaded beaked-rush	Fed: - State: - CNPS: List 2.1	July-August	Marshes and swamps (freshwater). Elevation 45-60 meters.	On CNPS 9-quad list.	None. No suitable habitat is present on the project site. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.

Table 3

Special-Status Plant Species Known to Occur in the Vicinity of the Sutter Medical Center Project Site

Family Taxon Common Name	Status*	Flowering Period	Habitat	Area Locations	Probability on Project Site
Ericaceae					
Arctostaphylos canescens sonomensis Sonoma manzanita	Fed: - State: - CNPS: List 1B.2	January-June	Chaparral; lower montane coniferous forest (sometimes serpentinite). Elevation 180-1675 m.	Record for this species located 2.5 miles northeast of the project site (Occurrence No. 20).	None. No suitable habitat present on the project site. This species was not observed during surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Arctostaphylos densiflora Vine Hill manzanita	Fed: - State: CE CNPS: List 1B	February-April	Chaparral (acid marine sand). Elevation 50-120 meters.	On CNPS 9-quad list.	None. No suitable habitat present on the project site. This species was not observed during surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Arctostaphylos stanfordiana decumbens Rincon manzanita	Fed: - State: - CNPS: List 1B.1	February-April	Chaparral (rhyolitic), cismontane woodland. Elevation 75 to 370 meters.	Record for this species located 2.3 miles east of the project site (Occurrence No. 5).	None. No suitable habitat present on the project site. This species was not observed during surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Fabaceae					
Amorpha californica napensis Napa false indigo	Fed: - State: - CNPS: List 1B.2	April-July	Broadleaved upland forest (openings); chaparral, cismontane woodland. Elevation 120-2000 m.	Record for this species located 3 miles north of the project site (Occurrence No. 23).	None. No suitable habitat present on the project site. This species was not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Astragalus claranus Clara Hunt's milkvetch	Fed: FE State: CT CNPS: List 1B.1	March-May	Cismontane woodland; valley and foothill grassland; [serpentinite, volcanic clay]. Elevation 75-275 meters.	On CNPS 9-quad list.	None. No suitable habitat present on the project site. This species was not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Lupinus sericatus Cobb Mountain lupine	Fed: - State: - CNPS: List 1B.2	March-June	Broadleaved upland forest; chaparral; cismontane woodland; lower montane coniferous forest. Elevation 275-1525 m.	On CNPS 9-quad list.	None. No suitable habitat on site. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.

Table 3

Special-Status Plant Species Known to Occur in the Vicinity of the Sutter Medical Center Project Site

Family Taxon Common Name	Status*		Flowering Period	Habitat	Area Locations	Probability on Project Site
Trifolium amoenum Showy Indian clover	Fed: State: CNPS:	FE - List 1B.1	April-June	Valley and foothill grassland (sometimes serpentinite) and coastal bluff scrub. Elevation 5 -415 meters.	Record for this species located 2.2 miles southeast of the project site (Occurrence No. 21).	None. Marginally suitable habitat on site. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Trifolium buckwestiorum Santa Cruz clover	Fed: State: CNPS:	 - List 1B.1	May-July	Broadleaf upland forest; coastal prairie; [margins]. Elevation 105-610 meters.	On CNPS 9-quad list.	None. No suitable habitat on site. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Trifolium depauperatum hydrophilum Saline clover	Fed: State: CNPS:	- - List 1B.2	April-June	Marshes and swamps; valley and foothill grassland (mesic, alkaline); vernal pools. Elevation 0-300 m.	Record for this species located 4.2 miles south of the project site (Occurrence No. 16).	None. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Lamiaceae						
Monardella villosa globosa Robust monardella	Fed: State: CNPS:	- - List 1B.2	June-August	Chaparral (openings); cismontane woodland; broadleafed upland forest (openings), coastal scrub, valley and foothill grassland. Elevation 100-915 meters.	On CNPS 9-quad list.	None. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Liliaceae						
Allium peninsulare franciscanum Franciscan onion	Fed: State: CNPS:	- - List 1B.2	May-June	Cismontane woodland; valley and foothill grassland [clay, volcanic, often serpentine]. Elevation 52-300 m.	On CNPS 9-quad list.	None. This species was not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Fritillaria liliacea Fragrant fritillary	Fed: State: CNPS:	- - List 1B.2	February-April	Cismontane woodland, coastal prairie; coastal scrub; valley and foothill grassland; [often serpentinite]. Elevation 3-410 meters.	On CNPS 9-quad list.	None. Marginally suitable habitat on site. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.

Table 3

Special-Status Plant Species Known to Occur in the Vicinity of the Sutter Medical Center Project Site

Family Taxon Common Name	Status*	Flowering Period	Habitat	Area Locations	Probability on Project Site
Lilium pardalinum pitkinense Pitkin Marsh lily	Fed: FE State: CE CNPS: List 1B.1	June-July	Cismontane woodland (mesic); marshes and swamps (freshwater). Elevation 35 to 65 meters.	Known from Pitikin Marsh which is greater than 5 miles west of the project site (this known locality is approximately 1 mile south of Forestville. R. Bittman, CDFG, pers. comm.).	None. No suitable habitat on site. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Limnanthaceae					
Limnanthes vinculans Sebastopol meadowfoam	Fed: FE State: CE CNPS: List 1B.1	April-May	Meadows (mesic); vernal pools. Elevation 15-305 meters.	Record for this species located 1.7 miles west of the project site (Occurrence No. 28).	None. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Malvaceae					
Sidalcea hickmanii viridis Marin checkerbloom	Fed: - State: - CNPS: List 1B.3	May-June	Chaparral (serpentinite). Elevation 50-430 m.	On CNPS 9-quad list.	None. No suitable habitat on site. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Sidalcea oregana valida Kenwood Marsh checkerbloom	Fed: FE State: CE CNPS: List 1B.1	June-September	Marshes and swamps (freshwater). Elevation 115-150 meters.	On CNPS 9-quad list.	None. No suitable habitat on site. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Onagraceae					
Clarkia imbricata Vine Hill clarkia	Fed: FE State: CE CNPS: List 1B	June-August	Chaparral; meadows; cismontane woodland. Elevation 50-75 meters.	On CNPS 9-quad list.	None. Marginally suitable habitat on site. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.

Table 3

Special-Status Plant Species Known to Occur in the Vicinity of the Sutter Medical Center Project Site

Family Taxon Common Name	Status*		Flowering Period	Habitat	Area Locations	Probability on Project Site
Orobanchaceae						
Castilleja uliginosa Pitkin Marsh Indian paintbrush	Fed: State: CNPS:	- CE List 1A	June-July	Marshes and swamps (freshwater).	On CNPS 9-quad list.	None. No suitable habitat on site. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Cordylanthus tenuis capillaris Pennell's bird's-beak	Fed: State: CNPS:	FE CR List 1B.2	June-September	Closed-cone coniferous forest; chaparral; [serpentinite]. Elevation 45-305 meters.	On CNPS 9-quad list.	None. No suitable habitat on site. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Plantaginaceae						
Penstemon newberryi sonomensis Sonoma beardtongue	Fed: State: CNPS:	- - List 1B.3	April-August	Chaparral (rocky).	On CNPS 9-quad list.	None. No suitable habitat on site. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Poaceae						
Alopecurus aequalis sonomensis Sonoma alopecurus	Fed: State: CNPS:	FE - List 1B.1	May-July	Marshes & swamps (freshwater); riparian scrub. Elevation 5-365 m.	On CNPS 9-quad list.	None. No suitable habitat is present on the project site. This species was not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Calamagrostis crassiglumis Thurber's reed grass	Fed: State: CNPS:	- - List 2.1	May-July	Coastal scrub (mesic); marshes and swamps (freshwater). Elevation 10-45 meters.	On CNPS 9-quad list.	None. No suitable habitat present on the project site. This species was not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Pleuropogon hooverianus North coast semaphore grass	Fed: State: CNPS:	- CT List 1B.1	April-August	Broadleaved upland forest; meadows; north coast coniferous forest; vernal pools; [mesic]. Elevation 10-671 m.	On CNPS 9-quad list.	None. Marginally suitable habitat on site. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.

Table 3

Special-Status Plant Species Known to Occur in the Vicinity of the Sutter Medical Center Project Site

Family Taxon Common Name	Status*	Flowering Period	Habitat	Area Locations	Probability on Project Site
Poa napensis Napa bluegrass	Fed: FE State: CE CNPS: List 1B.1	May-August	Meadows (alkaline, near hot springs). Elevation 100-200 meters.	On CNPS 9-quad list.	None. No suitable habitat on site. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Polemoniaceae					
Gilia capitata tomentosa Woolly-headed gilia	Fed: - State: - CNPS: List 1B.1	May-July	Coastal bluff scrub (rocky, outcrops). Elevation 15-155 m.	On CNPS 9-quad list.	None. No suitable habitat on site. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Leptosiphon jepsonii Jepson's linanthus	Fed: - State: - CNPS: List 1B.2	March-May	Chaparral; cismontane woodland (usually volcanic). Elevation 100-500 meters.	Record for this species located 3.0 miles southeast of the project site (Occurrence No. 3).	None. No suitable habitat on site. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Navarretia leucocephala bakeri Baker's navarretia	Fed: - State: - CNPS: List 1B.1	April-July	Cismontane woodland; lower montane coniferous forest; meadows; valley and foothill grassland; vernal pools (mesic). Elevation 5-1740 m.	Record for this species located 1.9 miles south of the project site (Occurrence No. 20).	None. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Navarretia leucocephala plieantha Many-flowered navarretia	Fed: FE State: CE CNPS: List 1B.2	May-June	Vernal pools (can be volcanic ash flow). In the S. R. Plain; it is extant on one remaining site (Occ. 7). This occ. is a claypan v. pool (no volcanic substrate). Elev. 30 to 950 M.	Record for this species located 4.9 miles northwest of the project site (Occurrence No. 9).	None. No suitable habitat on site. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Polygonaceae					
Chorizanthe valida Sonoma spineflower	Fed: FE State: CE CNPS: List 1B.1	June-August	Coastal prairie (sandy). Elevation 10-305 m.	On CNPS 9-quad list.	None. No suitable habitat on site. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.

Table 3

Special-Status Plant Species Known to Occur in the Vicinity of the Sutter Medical Center Project Site

Family / Taxon / Common Name	Status*	Flowering Period	Habitat	Area Locations	Probability on Project Site
Ranunculaceae					
Delphinium luteum Yellow larkspur	Fed: FE State: CR CNPS: List 1B.1	March-May	Chaparral; coastal prairie; coastal scrub (rocky). Elevation 0-100 m.	On CNPS 9-quad list.	None. No suitable habitat on site. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Rhamnaceae					
Ceanothus confusus Rincon Ridge ceanothus	Fed: - State: - CNPS: List 1B.1	February-June	Closed-cone coniferous forest; chaparral; cismontane woodland; [volcanic or serpentinite]. Elevation 75-1065 m.	Record for this species located 2.0 miles east of the project site (Occurrence No. 1).	None. No Ceanothus on site. This species was not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Ceanothus divergens Calistoga ceanothus	Fed: - State: - CNPS: List 1B.2	February-March	Chaparral (serpentinite or volcanic, rocky). Elevation 170 to 950 meters.	Record for this species located 2.7 miles east of the project site (Occurrence No. 4).	None. No Ceanothus on site. This species was not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Ceanothus foliosus vineatus Vine Hill ceanothus	Fed: - State: - CNPS: List 1B.1	March-May	Chaparral. Elevation 45 - 305 meters	Record for this species located 4.6 miles southwest of the project site (Occurrence No. 3).	None. No Ceanothus on site. This species was not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Ceanothus purpureus Holly-leaf ceanothus	Fed: - State: - CNPS: List 1B.2	February-June	Chaparral; cismontane woodland (volcanic, rocky). Elevation 120-640 m.	On CNPS 9-quad list.	None. No Ceanothus on site. This species was not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Ceanothus sonomensis Sonoma ceanothus	Fed: - State: - CNPS: List 1B.2	February-April	Chaparral (sandy, serpentinite, or volcanic). Elevation 215-800 meters.	On CNPS 9-quad list.	None. No Ceanothus on site. This species was not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.

Table 4

Special-Status Animal Species Known to Occur in the Vicinity of the Sutter Medical Center Project Site

Species	*Status	Habitat	Closest Locations	Probability on Project Site
Invertebrates				
California linderiella *Linderiella occidentalis*	Fed: -- State: - Other: -	Seasonal pools in unplowed grasslands with old alluvial soils underlain by hardpan or in sandstone depressions. Water in the pools has very low alkalinity, conductivity, and tds.	Record for this species located 1.2 miles south of the project site (Occurrence No. 133).	None. No vernal pools or seasonal wetlands onsite that provide habitat. No impact expected.
Fish				
Navarro roach *Lavinia symmetricus navarroensis*	Fed: - State: CSC Other: -	California roach generally found in small, warm intermittent streams. This subspecies is reported by CDFG to be extremely numerous in the warmer reaches of the Russian and Navarro Rivers in Sonoma County.	Record for this species located 2.8 miles north of the project site (Occurrence No. 2).	None. No creek channels or streams onsite. No fish habitat. No impact expected.
Amphibians				
California tiger salamander *Ambystoma californiense*	Fed: FT State: CSC Other:	Found in grassland habitats of the valleys and foothills. Requires burrows for aestivation and standing water until late spring (May) for larvae to metamorphose.	Record for this species located 1.8 miles southwest of the project site (Occurrence No. 360).	None. Two years of protocol surveys did not detect CTS. USFWS issued a "no effect" to CTS letter for the project (see text).
Foothill yellow-legged frog *Rana boylii*	Fed: -- State: CSC Other:	Found in partially shaded, shallow streams with rocky substrates. Needs some cobble-sized rocks as a substrate for egg laying. Requires water for 15 weeks for larval transformation.	Record for this species located 5 miles northeast of the project site (Occurrence No. 293).	None. No creeks onsite. No impact expected.
Reptiles				
Pacific pond turtle (=western pond turtle) *Actinemys marmorata (=Clemmys m.)*	Fed: -- State: CSC Other:	Inhabits ponds, marshes, rivers, streams, and irrigation ditches with aquatic vegetation. Needs suitable basking sites and upland habitat for egg laying. Occurs in the Central Valley and Contra Costa County.	Record for this species located 0.8 miles northwest of the project site (Occurrence No. 283).	None. No creeks onsite. Only an isolated man-made pond exists that was surveyed for 3 years. No turtles were found. No impact expected.

Table 4

Special-Status Animal Species Known to Occur in the Vicinity of the Sutter Medical Center Project Site

Species	*Status	Habitat	Closest Locations	Probability on Project Site
Birds				
White-tailed kite *Elanus leucurus*	Fed: State: Other: *	Found in lower foothills and valley margins with scattered oaks and along river bottomlands or marshes adjacent to oak woodlands. Nests in trees with dense tops.	Known from Sonoma County and the Santa Rosa area. Nests locally.	Moderate. Oak trees and redwood trees onsite provide suitable nesting habitat. Nesting surveys necessary. See text.
Red-shouldered hawk *Buteo lineatus*	Fed: - State: - Other: *	Found in a wide variety of habitats. Nest in oaks, eucalyptus, cypress trees, riparian woodland. Forages over grasslands, agricultural fields, woodlands.	Known from Sonoma County and the Santa Rosa area. Nests locally.	Moderate. Oak trees and redwood trees onsite provide suitable nesting habitat. Nesting surveys necessary. See text.
Red-tailed hawk *Buteo jamaicensis*	Fed: - State: - Other: *	Found in a wide variety of habitats. Nests in oaks, eucalyptus, cypress trees, among others. Forages over grasslands, agricultural fields, woodlands, marshes.	Known from Sonoma County and the Santa Rosa area. Nests locally.	Moderate. Oak trees and redwood trees onsite provide suitable nesting habitat. Nesting surveys necessary. See text.
Mammals				
Pallid bat *Antrozous pallidus*	Fed: - State: CSC Other:	Occurs in deserts, grasslands, shrublands, woodlands, and forests. Most common in dry habitats with rocky areas for roosting.	Record for this species located 5 miles west of the project site (Occurrence No. 62).	None. All structures onsite have been recently constructed and are in use. No vacant buildings or structures present. No suitable habitat. No impact expected.
American badger *Taxidea taxus*	Fed: - State: CSC Other:	Most abundant in drier open stages of most shrub, forest, and herbaceous habitats, with friable soils. Need sufficient food, friable soils & open, uncultivated ground. Prey on burrowing rodents. Dig burrows.	Record for this species located 4.3 miles south of the project site (Occurrence No. 28).	None. No suitable habitat. No sign of badger burrows. No impact expected.

Special Status Plant Survey Report, Sutter Medical Center

July 7, 2009

Sponamore Associates
2128 Contra Costa Avenue
Santa Rosa, California 95405

Attention: Ms. Nadin Sponamore

RE: Special-Status Plant Survey Report
Sutter Medical Center
Santa Rosa, Sonoma County, California
APNs 58-040-058, -059, 060, 061

Dear Ms. Sponamore:

1. INTRODUCTION

In the spring of 2009, Monk & Associates, Inc. (M&A) completed focused surveys for special-status (that is, rare, threatened, or endangered) plants for the proposed Sutter Medical Center project site located at 50 Mark West Springs Road in the City of Santa Rosa, Sonoma County, California (herein referred to as the project site) (Figures 1 and 2). These focused surveys supplement rare plant surveys conducted by Mr. Charlie Patterson in 1993, 1998, 1999, and 2004. No special-status plants were identified during either M&A's surveys or Mr. Patterson's surveys conducted on this project site. Below we provide our survey methods, a description of the project site's plant communities, and the results of our surveys.

2. PROJECT SITE LOCATION AND DESCRIPTION

The 53-acre project site consists of 4 parcels located in the southeast quadrant of the U.S. Highway 101/Mark West Springs Road interchange in the City of Santa Rosa (Figure 2). Figure 3 shows the various land uses within the project site boundary. The project site consists of nearly level ground. The largest use of the property is paved parking, paved roads, buildings, and manicured landscaping, totaling approximately 25 acres. Soccer/lacrosse fields and other non-irrigated turf areas that include a tot-lot cover another approximately 10 acres. The remaining land is comprised largely of non-native annual grassland. The project site contains no natural watercourses or creeks. Two small, man-made drainage features have been constructed to facilitate onsite runoff and drainage. Two sewage treatment ponds currently service the Luther Burbank Center. An old soil borrow pit collects surface water runoff from the soccer field area of the project site during the winter months. A single family home, large utility barn, and a livestock building are also on the project site.

3. PRIOR RARE PLANT SURVEYS

Surveys for special-status plants were conducted on the project site in 1993, 1998, 1999, and 2004 by plant ecologist, Mr. Charlie Patterson. A copy of his report is attached to this document as Appendix A. The 1993 surveys focused on the approximately 15-acre, undeveloped, grassland parcel (APN 058-040-058) located in the northern portion of the project site. The other three survey years focused on the entire project site. Surveys for special-status plants were appropriately timed during the known blooming periods of the four federally listed plant species known from the Santa Rosa Plain: Burke's goldfields (*Lasthenia burkei*), Sebastopol meadowfoam (*Limnanthes vinculans*), Baker's blennosperma (*Blennosperma bakeri*), and many-flowered navarretia (*Navarretia plieantha*). To coincide with these species' blooming periods, Mr. Patterson conducted his field surveys on March 16, April 14, May 10, and June 15, 1993, May 6 and June 9, 1998 (a very wet and late spring), and again in 1999 and 2004 on March 29, April 27, May 15 and 30. These survey dates were also appropriate for identifying other special-status plant species known from the region. No special-status plant species were identified on the project during Mr. Patterson's surveys.

4. SURVEY METHODOLOGY

Prior to conducting the 2009 surveys on the project site, M&A searched California Department of Fish and Game's (CDFG) Natural Diversity Database[1] for occurrences of special-status plants within five miles of the project site. M&A also reviewed the most current electronic version of the California Native Plant Society's (CNPS) *Inventory of Rare and Endangered Vascular Plants of California* (CNPS 2001)[2] for special-status plants in the Santa Rosa quadrangle plus the surrounding eight quadrangles (CNPS Nine Quad Search). Drawings, photographs and written descriptions of all special-status plants were reviewed prior to or during the survey period. Table 1, attached, lists the target special-status plant species M&A looked for during the 2009 surveys.

Special-status plant surveys were conducted on the project site by Ms. Sarah Lynch and Mr. Jessie Fujikawa on March 23, 2009, by Ms. Stephanie Tornberg and Mr. Fujikawa on April 23, 2009, and by Ms. Isabelle de Geofroy and Mr. Fujikawa on May 22, 2009. The surveys followed USFWS[3], CDFG[4] and CNPS[5] published survey guidelines. These guidelines state that special-status plant surveys should be conducted at the proper time of year when special-status and locally significant plants are both evident and identifiable. These guidelines also state that the surveys be floristic in nature with every plant observed identified to species, subspecies, or variety as necessary to determine their rarity status. Finally, these surveys must be conducted in a manner that is consistent with conservation ethics and accepted plant collection and

documentation techniques. Following these guidelines, surveys were conducted during the months when special-status plant species from the region are known to be evident and flowering.

A reference rare plant population was monitored to ensure that potentially-occurring federally listed plant species such as Sonoma sunshine (*Blennosperma bakeri*), Burke's goldfields (*Lasthenia burkei*), and Sebastopol meadowfoam (*Limnanthes vinculans*) were visible during survey periods. The local reference site used was the Alton Lane Mitigation Bank. Visits to the reference site were made prior to project site surveys to determine if the federally listed plants were flowering and otherwise visible at the time of the surveys. Figure 4, attached, illustrates the proximity of the reference site to the Sutter Hospital project site.

During surveys, all areas of the project site were examined by walking systematic transects through potential habitat, and by closely examining any existing microhabitats that could support special-status plants. Nearly all plant species found on the project site were identified to species. All plants were identified to the level required to determine rarity status. A list of all vascular plant taxa encountered within the project site was recorded in the field. Plants that needed further evaluation were collected and keyed in the lab. Final determinations for collected plants were made by keying specimens using standard references such as *The Jepson Manual*[6] and *A Flora of Sonoma County*[7].

5. PLANT COMMUNITIES

The project site's vegetation has been altered through historic and ongoing agricultural and other land use activities. Based on aerial photographs from the 1960s, at one time virtually the entire project site supported orchards. Since then the trees have been removed and the main parcel has been completely altered by the construction and operation of the existing Luther Burbank Center facilities.

Four plant communities occur within the project site. Non-native annual grassland is present in a field on the west side of the project site. Ornamental landscaping and an extensive planted (and irrigated) turf area are located in and around the Center's buildings and parking lots. In the few undeveloped portions of this parcel, ruderal (weedy) vegetation grows. A borrow pit/man-made pond on the project site supports an assemblage of riparian species. These four plant communities are discussed below. Plants listed in the community descriptions below were observed onsite during M&A's 2009 spring surveys.

5.1.1 NON-NATIVE ANNUAL GRASSLAND

Non-native annual grassland occurs in the field on the west side of the project site. This plant community is dominated by introduced grasses and forbs, including Italian rye grass (*Lolium multiflorum*), soft chess brome (*Bromus hordeaceus*), rip-gut brome (*Bromus diandrus*), medusa head (*Taeniatherum caput-medusae*), spring vetch (*Vicia sativa*), prickly lettuce (*Lactuca serriola*), bindweed (*Convolvulus arvensis*), filarees (*Erodium botrys, E. cicutarium, E.*

moschatum) and cut leaf geranium (*Geranium dissectum*). A large patch of Fuller's teasel (*Dipsacus sativus*) grows in the approximate center of this field. Coyote brush (*Baccharis pilularis*) are scattered throughout the field. Along the fenceline of this field are valley oak (*Quercus lobata*) and coast live oak (*Quercus agrifolia)* trees, and Himalayan blackberry bushes.

5.1.2 ORNAMENTAL LANDSCAPING

The Luther Burbank Center and the grounds surrounding the single family home/barn located on the project site have been planted with ornamental trees and shrubs, including redwood (*Sequoia sempervirens*), deodar cedar (*Cedrus deodara*), Monterey pine (*Pinus radiata*), liquidambar (*Liquidambar styraciflua*), camphor (*Cinnamomum camphora*), olive (*Olea europaea*), persimmon (*Diospyros kaki*), strawberry tree (*Arbutus unedo*), rose (*Rosa* sp.) and juniper (*Juniperus* sp.). Large lawns are located north and southwest of the Luther Burbank Center. A few mature valley oaks are found within the parcel that supports the single family home. Recently, one large, mature valley oak was removed from this parcel because two large branches tore off, destabilizing the tree and rendering it a potential hazard to the public.

5.1.3 POND HABITAT/BORROW PIT

The borrow pit/pond on the project site supports an assemblage of riparian tree species commonly associated with ponds and drainages, including valley oak, Fremont cottonwood, red willow, and narrow-leaved willow (*Salix exigua*). Olive trees (*Olea europaea*), likely a remnant of the project site's orchard days, are also growing in this area. This dense growth of vegetation completely encircles the pond. Understory species include coyote brush, cotoneaster (*Cotoneaster pannosa*), and fennel (*Foeniculum vulgare*).

5.1.4 RUDERAL HABITAT

Ruderal (weedy) communities are assemblages of plants that thrive in waste areas, roadsides and other sites that have been disturbed by human activity. On the project site, ruderal habitat occurs around the sewage treatment ponds, the single family home, in undeveloped areas south and northeast of the Luther Burbank Center, and along the edges of the project site and the parking lots. Ruderal species detected in these areas include wild oats (*Avena fatua*), soft chess, ripgut brome, common velvet grass (*Holcus lanatus*), Harding grass (*Phalaris aquatica*), English plantain (*Plantago lanceolata*), sharp-point fluellin (*Kickxia elatine*), and short-podded mustard (*Hirschfeldia incana*). Monterey pines have been planted around the perimeter of sewage treatment pond area, with coyote brush and Himalayan blackberry (*Rubus discolor*) scattered throughout the area.

SURVEY RESULTS AND CONCLUSION

All plants observed on the project site during the 2009 surveys are listed in Table 2, attached. No special-status plant species were observed on the project site during the appropriately-timed field surveys. M&A's survey results corroborate Mr. Patterson's negative findings based on four years of surveys he conducted in 1993, 1998, 1999, and 2004. Due to the project site's history as an orchard, and years of disturbance to the vegetation (disking, mowing, etc.), a large number of non-native species were observed during our surveys. Native species also occur; however, their total percent cover and frequency is much lower than the non-native species present. Overall, a total of 136 plant species were observed on the project site. Of these 136 species, 39 plants (or 29%) were native, and 97 plants (or 71%) were non-native.

Based upon the prior surveys conducted in 1993, 1998, 1999, and 2004, and M&A’s 2009 survey results, it is M&A’s conclusion that development of the Sutter Medical Center project site will not impact any special-status plant species. If you have any questions regarding M&A’s special-status plant surveys or this survey report please do not hesitate to contact me at (925) 947-4867 extension 211, or Ms. Sarah Lynch at extension 203.

Sincerely,

Isabelle de Geofroy
Project Biologist

Table 2

Plants Observed on the Sutter Hospital Project Site

Gymnosperms

Cupressaceae

**Juniperus sp.*	Juniper
Sequoia sempervirens	Redwood

Pinaceae

**Cedrus deodara*	Deodar cedar
Pinus radiata	Monterey pine

Angiosperms - Dicots

Anacardiaceae

Toxicodendron diversilobum	Western poison-oak

Apiaceae

**Foeniculum vulgare*	Sweet fennel
**Torilis arvensis*	Field hedge-parsley

Apocynaceae

Apocynum androsaemifolium	Bitter dogbane

Araliaceae

**Hedera helix*	English ivy

Asteraceae

**Anthemis cotula*	Mayweed
Baccharis pilularis	Coyote brush
**Carduus pycnocephalus*	Italian thistle
**Cirsium vulgare*	Bull thistle
Conyza canadensis	Horseweed
**Helminthotheca echioides*	Bristly ox-tongue
**Hypochaeris radicata*	Rough cat's-ear
**Lactuca saligna*	Willow lettuce
**Lactuca serriola*	Prickly lettuce
**Matricaria discoidea*	Pineapple-weed
**Pseudognaphalium luteoalbum*	Everlasting cudweed
Psilocarphus tenellus var. tenellus	Slender woolly-marbles
**Senecio vulgaris*	Common groundsel
**Sonchus asper*	Prickly sow-thistle
**Sonchus oleraceus*	Common sow-thistle
Taraxacum californicum	California dandelion
**Tragopogon porrifolius*	Salsify
Xanthium strumarium	Cocklebur

Betulaceae

Alnus rhombifolia	White alder
**Betula sp.*	Birch

Boraginaceae

**Echium plantagineum*	Echium

* Indicates a non-native species

Brassicaceae

**Brassica rapa*	Field mustard
**Capsella bursa-pastoris*	Shepherd's purse
Cardamine oligosperma	Few-seed bitter cress
**Hirschfeldia incana*	Short-podded mustard
Lepidium strictum	Peppergrass
**Raphanus raphanistrum*	Jointed charlock
**Raphanus sativus*	Wild radish

Caprifoliaceae

**Viburnum sp.*	Cultivated viburnum

Caryophyllaceae

Cerastium arvense	Meadow chickweed
**Cerastium glomeratum*	Mouse-ear chickweed
**Spergularia rubra*	Ruby sand-spurrey

Convolvulaceae

**Convolvulus arvensis*	Bindweed

Dipsacaceae

**Dipsacus sativus*	Fuller's teasel

Ebenaceae

**Diospyros kaki*	Persimmon

Ericaceae

**Arbutus unedo*	Strawberry tree

Euphorbiaceae

**Euphorbia esula*	Leafy spurge
**Euphorbia peplus*	Petty spurge

Fabaceae

**Lotus corniculatus*	Birdfoot trefoil
Lotus purshianus var. purshianus	Spanish-clover
Lupinus bicolor	Miniature lupine
Lupinus nanus	Sky lupine
**Medicago polymorpha*	California burclover
Trifolium ciliolatum	Ciliate clover
**Trifolium dubium*	Little hop clover
**Trifolium incarnatum*	Crimson clover
**Trifolium repens*	White clover
**Trifolium subterraneum*	Subterranean clover
**Vicia sativa*	Common vetch

Fagaceae

Quercus agrifolia var. agrifolia	Coast live oak
Quercus kelloggii	California black oak
Quercus lobata	Valley oak

Geraniaceae

**Erodium botrys*	Broad-leaf filaree
**Erodium cicutarium*	Red-stem filaree
**Erodium moschatum*	White-stem filaree
**Geranium dissectum*	Cut-leaf geranium

Hamamelidaceae

**Liquidambar styraciflua*	Liquidambar

Lamiaceae

**Prunella vulgaris var. vulgaris*	Self-heal
Stachys ajugoides var. ajugoides	Bugle hedge-nettle

Lauraceae

**Cinnamomum camphora*	Camphor tree

Linaceae

**Linum bienne*	Flax

Malvaceae

**Malva sp.*	Cheeseweed
**Modiola caroliniana*	Carolina bristle-mallow

Myrsinaceae

**Anagallis arvensis*	Scarlet pimpernel

Oleaceae

**Ligustrum sp.*	Privet
**Olea europaea*	Olive

Onagraceae

Epilobium brachycarpum	Summer cottonweed
Epilobium ciliatum	Hairy willow-herb

Orobanchaceae

**Parentucellia viscosa*	Yellow glandweed

Oxalidaceae

Oxalis laxa	Oxalis
**Oxalis pes-caprae*	Bermuda buttercup

Papaveraceae

Eschscholzia californica	California poppy

Plantaginaceae

**Kickxia elatine*	Sharppoint fluvellin
**Plantago lanceolata*	English plantain
**Veronica filiformis*	Speedwell
**Veronica persica*	Persian speedwell

Polygonaceae

Persicaria punctata	Dotted smartweed
**Polygonum aviculare*	Common knotweed
**Rumex acetosella*	Sheep sorrel
**Rumex conglomeratus*	Green dock
**Rumex crispus*	Curly dock
Rumex salicifolius	Willow dock

Ranunculaceae

**Ranunculus muricatus*	Spiny-fruit buttercup

Rosaceae

**Cotoneaster pannosa*	Cotoneaster
**Prunus sp.*	Prunus
**Pyracantha sp.*	Pyracantha
**Rosa sp.*	Rose
**Rubus discolor*	Himalayan blackberry

Rubiaceae

**Galium aparine*	Goose grass

* Indicates a non-native species

Salicaceae

Populus fremontii ssp. fremontii	Fremont cottonwood
Salix exigua	Narrow-leaved willow
Salix laevigata	Red willow

Sapindaceae

**Acer sp.*	Maple

Viscaceae

Phoradendron serotinum ssp. tomentosum	Oak mistletoe

Vitaceae

Vitis californica	California wild grape

Angiosperms -Monocots

Alismataceae

Alisma plantago-aquatica	Water plantain

Arecaceae

**Washingtonia filifera*	California fan palm

Cyperaceae

Cyperus eragrostis	Tall flatsedge
Eleocharis macrostachya	Creeping spikerush

Juncaceae

Juncus bufonius	Toad rush
Juncus patens	Common rush

Liliaceae

**Agapanthus orientalis*	Lily-of-the-Nile
**Yucca sp.*	Yucca

Poaceae

**Aira caryophyllea*	Silver European hairgrass
**Avena barbata*	Slender wild oat
**Avena fatua*	Wild oat
**Bromus diandrus*	Ripgut grass
**Bromus hordeaceus*	Soft chess
**Bromus madritensis ssp. rubens*	Red brome
**Bromus stamineus*	Brome
**Cortaderia jubata*	Pampas grass
**Cynodon dactylon*	Bermuda grass
Festuca idahoensis	Idaho fescue
**Holcus lanatus*	Common velvet grass
**Hordeum marinum ssp. gussoneanum*	Mediterranean barley
**Hordeum murinum ssp. leporinum*	Foxtail barley
**Lolium multiflorum*	Italian ryegrass
**Lolium perenne*	Perennial ryegrass
Paspalum distichum	Joint paspalum
**Phalaris aquatica*	Harding grass
**Poa annua*	Annual bluegrass
**Poa pratensis ssp. pratensis*	Kentucky bluegrass
**Taeniatherum caput-medusae*	Medusahead
**Triticum aestivum*	Wheat
**Vulpia bromoides*	Brome fescue
**Vulpia myuros*	Rattail fescue

Typhaceae

Typha angustifolia	Narrow-leaved cattail

Table 1

Special Status Plant Species with the Potential to Occur on the Sutter Medical Center Project Site

Family Taxon Common Name	Status*	Flowering Period	Habitat	Area Locations	Probability on Project Site
Apiaceae					
Eryngium constancei Loch Lomand button-celery	Fed: FE State: CE CNPS: List 1B.1	April-June	Vernal pools. Elevation 460-855.	On CNPS 9-quad list.	None. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, 2004 and 2009.
Asteraceae					
Balsamorhiza macrolepis macrolepis Big-scale balsam-root	Fed: - State: - CNPS: List 1B.2	March-June	Chaparral; cismontane woodland; valley and foothill grassland; [sometimes serpentinite]. Elevation 90-1400 meters.	On CNPS 9-quad list.	None. This species was not observed during appropriately timed surveys conducted in 1993, 1998, 1999, and 2004. No impact expected.
Blennosperma bakeri Sonoma sunshine	Fed: FE State: CE CNPS: List 1B.1	March-May	Valley and foothill grassland (mesic); vernal pools. Elevation 10-110 m.	Record for this species located 0.7 miles southwest of the project site (Occurrence No. 25).	None. This species was not observed during appropriately timed surveys conducted in 1993, 1998, 1999, 2004 and 2009.
Centromadia parryi parryi Pappose tarplant	Fed: - State: - CNPS: List 1B.2	May-November	Chaparral; coastal prairie; meadows and seeps; marshes and swamps; valley and foothill grassland (vernally mesic/often alkaline). Elevation 2-420 m.	On CNPS 9-quad list.	None. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, 2004 and 2009.
Erigeron biolettii Streamside daisy	Fed: - State: - CNPS: List 3	June-October	Broad-leaved upland forest; cismontane woodland; northern coniferous forest [rocky, mesic]. Elevation 30-1100 m.	On CNPS 9-quad list.	None. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, 2004 and 2009.
Erigeron serpentinus Serpentine daisy	Fed: - State: - CNPS: List 1B.3	May-August	Chaparral (serpentinite). Elevation 60-670 meters	On CNPS 9-quad list.	None. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, 2004 and 2009.

Table 1

Special Status Plant Species with the Potential to Occur on the Sutter Medical Center Project Site

Family Taxon Common Name	Status*	Flowering Period	Habitat	Area Locations	Probability on Project Site
Hemizonia congesta congesta Hayfield tarweed	Fed: State: CNPS: List 1B.2	April-November	Valley and foothill grassland (VFGrs)/sometimes roadsides. Elevation 20-560 meters.	Record for this species located approximately 1.1 mile east of the project site (Occurrence No. 22).	None. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, 2004 and 2009.
Lasthenia burkei Burke's goldfields	Fed: FE State: CE CNPS: List 1B.1	April-June	Meadows (mesic); vernal pools. Elevation 15 to 600 meters.	Record for this species located 0.9-mile southwest of the project site (CNDDB Occurrence No. 19).	None. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, 2004 and 2009.
Lasthenia californica bakeri Baker's goldfields	Fed: State: CNPS: List 1B.2	April-October	Closed-cone coniferous forest, coastal scrub, meadows and seeps, marshes and swamps. Elevation 60-520 meters.	On CNPS 9-quad list.	None. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, 2004 and 2009.
Lasthenia conjugens Contra Costa goldfields	Fed: FE State: - CNPS: List 1B.1	March-June	Valley and foothill grassland (mesic); vernal pools; cismontane woodlands; playas. Elevation 0-470 meters.	On CNPS 9-quad list.	None. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, 2004 and 2009.
Layia septentrionalis Colusa layia	Fed: - State: - CNPS: List 1B.2	April-May	Chaparral; cismontane woodland, valley and foothill grassland; [sandy, serpentinite]. Elevation 100-1095 meters.	On CNPS 9-quad list.	None. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, 2004 and 2009.
Lessingia hololeuca Woolly-headed lessingia	Fed: - State: - CNPS: List 3	June-October	Broad-leaved upland forest; coastal scrub; lower montane coniferous forest; valley and foothill grassland; [clay, serpentinite]. Elevation 15-305 meters.	On CNPS 9-quad list.	None. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, 2004 and 2009.

Table 1

Special Status Plant Species with the Potential to Occur on the Sutter Medical Center Project Site

Family Taxon Common Name	Status*	Flowering Period	Habitat	Area Locations	Probability on Project Site
Microseris paludosa Marsh silverpuffs	Fed: - State: - CNPS: List 1B.2	April-July	Closed-cone coniferous forest; cismontane woodland; coastal scrub; valley and foothill grassland. Elevation 5-300 meters.	On CNPS 9-quad list.	None. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, 2004 and 2009.
Boraginaceae					
Mertensia bella Oregon lungwort	Fed: - State: - CNPS: List 2.2	May-July	Meadows; upper montane coniferous forest; [mesic]. Elevation 1500-2000 meters.	On CNPS 9-quad list.	None. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, 2004 and 2009.
Campanulaceae					
Downingia pusilla Dwarf downingia	Fed: - State: - CNPS: List 2.2	March-May	Valley and foothill grassland (mesic); vernal pools. Elevation 1-445 meters.	Record for this species located 1.6 miles west of the project site (Occurrence No. 85).	None. Marginally suitable habitat is present on the project site. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, 2004 and 2009.
Legenere limosa Legenere	Fed: - State: - CNPS: List 1B.1	April-June	Vernal pools. Elevation 1-880 m.	On CNPS 9-quad list.	None. Marginally suitable habitat is present on the project site. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, 2004 and 2009.
Caprifoliaceae					
Viburnum ellipticum Western viburnum	Fed: - State: - CNPS: List 2.3	May-June	Chaparral; cismontane woodland; lower montane coniferous forest. Elevation 215-1400 meters.	Record for this species located 4.0 miles northeast of the project site (Occurrence No. 11).	None. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, 2004 and 2009.

Table 1

Special Status Plant Species with the Potential to Occur on the Sutter Medical Center Project Site

Family Taxon Common Name	Status*	Flowering Period	Habitat	Area Locations	Probability on Project Site
Convolvulaceae					
Calystegia collina oxyphylla Mt. Saint Helena morning-glory	Fed: - State: - CNPS: List 4	May-June	Chaparral (serpentinite).	Record for this species located 4.9 miles northeast of the project site (Occurrence No. 5).	None. No suitable habitat present on the project site. This species was not observed during appropriately timed surveys conducted in 1993, 1998, 1999, 2004 and 2009.
Cyperaceae					
Carex albida White sedge	Fed: FE State: CE CNPS: List 1B.1	May-July	Bogs and fens; marshes and swamps (freshwater). Elevation 15-90 meters.	Record for this species located 3.2 miles south of the project site (Occurrence No. 2).	None. Marginally suitable habitat on site. This species was not observed during appropriately timed surveys conducted in 1993, 1998, 1999, 2004 and 2009.
Rhynchospora alba White beaked-rush	Fed: - State: - CNPS: List 1B.1	July-August	Bogs and fens; marshes and swamps (freshwater). Elevation 45-1010 meters.	On CNPS 9-quad list.	None. No suitable habitat is present on the project site. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, 2004 and 2009.
Rhynchospora californica California beaked-rush	Fed: - State: - CNPS: List 1B.1	May-July	Bogs & fens, lower montane coniferous forest; seeps; freshwater marshes and swamps. Elevation 45-1010 meters.	On CNPS 9-quad list.	None. No suitable habitat is present on the project site. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, 2004 and 2009.
Rhynchospora capitellata Brownish beakrush	Fed: - State: - CNPS: List 2.2	July-August	Lower montane coniferous forest, meadows and seeps, marshes/swamps, upper montane conif. forest /mesic; elev. range 455 - 2000 M (1,493 - 6,652 feet).	On CNPS 9-quad list.	None. No suitable habitat is present on the project site. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, 2004 and 2009.
Rhynchospora globularis globularis Roundheaded beaked-rush	Fed: - State: - CNPS: List 2.1	July-August	Marshes and swamps (freshwater). Elevation 45-60 meters.	On CNPS 9-quad list.	None. No suitable habitat is present on the project site. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, 2004 and 2009.

Table 1

Special Status Plant Species with the Potential to Occur on the Sutter Medical Center Project Site

Family Taxon Common Name	Status*	Flowering Period	Habitat	Area Locations	Probability on Project Site
Ericaceae					
Arctostaphylos canescens sonomensis Sonoma manzanita	Fed: - State: - CNPS: List 1B.2	January-June	Chaparral; lower montane coniferous forest (sometimes serpentinite). Elevation 180-1675 m.	Record for this species located 2.5 miles northeast of the project site (Occurrence No. 20).	None. No suitable habitat present on the project site. This species was not observed during surveys conducted in 1993, 1998, 1999, 2004 and 2009.
Arctostaphylos densiflora Vine Hill manzanita	Fed: - State: CE CNPS: List 1B	February-April	Chaparral (acid marine sand). Elevation 50-120 meters.	On CNPS 9-quad list.	None. No suitable habitat present on the project site. This species was not observed during surveys conducted in 1993, 1998, 1999, 2004 and 2009.
Arctostaphylos stanfordiana decumbens Rincon manzanita	Fed: - State: - CNPS: List 1B.1	February-April	Chaparral (rhyolitic), cismontane woodland. Elevation 75 to 370 meters.	Record for this species located 2.3 miles east of the project site (Occurrence No. 5).	None. No suitable habitat present on the project site. This species was not observed during surveys conducted in 1993, 1998, 1999, 2004 and 2009.
Fabaceae					
Amorpha californica napensis Napa false indigo	Fed: - State: - CNPS: List 1B.2	April-July	Broadleaved upland forest (openings); chaparral, cismontane woodland. Elevation 120-2000 m.	Record for this species located 3 miles north of the project site (Occurrence No. 23).	None. No suitable habitat present on the project site. This species was not observed during appropriately timed surveys conducted in 1993, 1998, 1999, 2004 and 2009.
Astragalus claranus Clara Hunt's milkvetch	Fed: FE State: CT CNPS: List 1B.1	March-May	Cismontane woodland; valley and foothill grassland; [serpentinite, volcanic clay]. Elevation 75-275 meters.	On CNPS 9-quad list.	None. No suitable habitat present on the project site. This species was not observed during appropriately timed surveys conducted in 1993, 1998, 1999, 2004 and 2009.
Lupinus sericatus Cobb Mountain lupine	Fed: - State: - CNPS: List 1B.2	March-June	Broadleaved upland forest; chaparral; cismontane woodland; lower montane coniferous forest. Elevation 275-1525 m.	On CNPS 9-quad list.	None. No suitable habitat on site. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, 2004 and 2009.

Table 1

Special Status Plant Species with the Potential to Occur on the Sutter Medical Center Project Site

Family Taxon Common Name	Status*	Flowering Period	Habitat	Area Locations	Probability on Project Site
Trifolium amoenum Showy Indian clover	Fed: FE State: - CNPS: List 1B.1	April-June	Valley and foothill grassland (sometimes serpentinite) and coastal bluff scrub. Elevation 5 -415 meters.	Record for this species located 2.2 miles southeast of the project site (Occurrence No. 21).	None. Marginally suitable habitat on site. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, 2004 and 2009.
Trifolium buckwestiorum Santa Cruz clover	Fed: State: - CNPS: List 1B.1	April-October	Broadleaf upland forest; coastal prairie; [margins]. Elevation 105-610 meters.	On CNPS 9-quad list.	None. No suitable habitat on site. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, 2004 and 2009.
Trifolium depauperatum hydrophilum Saline clover	Fed: - State: - CNPS: List 1B.2	April-June	Marshes and swamps; valley and foothill grassland (mesic, alkaline); vernal pools. Elevation 0-300 meters.	Record for this species located 4.2 miles south of the project site (Occurrence No. 16).	None. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, 2004 and 2009.
Lamiaceae					
Monardella villosa globosa Robust monardella	Fed: - State: - CNPS: List 1B.2	June-August	Chaparral (openings); cismontane woodland; broadleafed upland forest (openings); coastal scrub; valley and foothill grassland. Elevation 100-915 meters.	On CNPS 9-quad list.	None. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, 2004 and 2009.
Liliaceae					
Allium peninsulare franciscanum Franciscan onion	Fed: - State: - CNPS: List 1B.2	May-June	Cismontane woodland; valley and foothill grassland [clay, volcanic, often serpentine]. Elevation 52-300 meters.	On CNPS 9-quad list.	None. This species was not observed during appropriately timed surveys conducted in 1993, 1998, 1999, 2004 and 2009. No impact expected.
Fritillaria liliacea Fragrant fritillary	Fed: - State: - CNPS: List 1B.2	February-April	Cismontane woodland, coastal prairie; coastal scrub; valley and foothill grassland; [often serpentinite]. Elevation 3-410 meters.	On CNPS 9-quad list.	None. Marginally suitable habitat on site. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, 2004 and 2009.

Table 1

Special Status Plant Species with the Potential to Occur on the Sutter Medical Center Project Site

Family Taxon Common Name	Status*	Flowering Period	Habitat	Area Locations	Probability on Project Site
Lilium pardalinum pitkinense Pitkin Marsh lily	Fed: FE State: CE CNPS: List 1B.1	June-July	Cismontane woodland (mesic); marshes and swamps (freshwater). Elevation 35 to 65 meters.	Known from Pitikin Marsh which is greater than 5 miles west of the project site (this known locality is approximately 1 mile south of Forestville. R. Bittman, CDFG, pers. comm.).	None. No suitable habitat on site. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, 2004 and 2009.
Limnanthaceae					
Limnanthes vinculans Sebastopol meadowfoam	Fed: FE State: CE CNPS: List 1B.1	April-May	Meadows (mesic); valley and foothill grassland; vernal pools. Elevation 15-305 meters.	Record for this species located 1.7 miles west of the project site (Occurrence No. 28).	None. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, 2004 and 2009.
Malvaceae					
Sidalcea hickmanii viridis Marin checkerbloom	Fed: - State: - CNPS: List 1B.3	May-June	Chaparral (serpentinite). Elevation 50-430 meters.	On CNPS 9-quad list.	None. No suitable habitat on site. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, 2004 and 2009.
Sidalcea oregana valida Kenwood Marsh checkerbloom	Fed: FE State: CE CNPS: List 1B.1	June-September	Marshes and swamps (freshwater). Elevation 115-150 meters.	On CNPS 9-quad list.	None. No suitable habitat on site. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, 2004 and 2009.
Onagraceae					
Clarkia imbricata Vine Hill clarkia	Fed: FE State: CE CNPS: List 1B	June-August	Chaparral; meadows; cismontane woodland. Elevation 50-75 meters.	On CNPS 9-quad list.	None. Marginally suitable habitat on site. Not observed during appropriately timed surveys conducted in 1993, 1998, 1999, 2004 and 2009.

Biological Resources Report
For The
Sutter Medical Center and Luther Burbank Center for the Arts

Charles A. Patterson, Plant Ecologist - 12/8/04

1.0 Introduction

1.1 Background and Setting

The study area for the Sutter Medical Center and Luther Burbank Center for the Arts (LBC) is approximately 60 acres in size total, including the 40± acre existing (developed) LBC and an undeveloped II.8 acre northern parcel. The site is bounded to the west by the Interstate Highway 101, to the east by Old Redwood Highway, and to the north by Mark West Springs Road. To the south is land which is a combination of vineyard, residential development and open undeveloped land.

The two main parts of the study area include (1) the developed southern area which contains the extensive pavement and buildings of the LBC, plus its peripheral turf and dirt parking areas, and (2) the undeveloped pasture area to the north. The entire vicinity has been historically used for agricultural and rural residential uses (and more recently commercial uses), resulting over the long term in the displacement of most of the original landscape's natural plant communities and habitats. Historic land uses have involved widespread soil disturbance and topographic alterations from discing, ripping, amendments, and/or irrigation, plus localized ditching and filling, and relatively extensive grading and leveling. The main LBC site has been almost completely graded and covered with pavement and/or large structures, with planted turf around the outer portions. The smaller (11.8 acre) parcel has not been developed, but rather, has been used as livestock pasture for many years. Both parcels were cultivated as orchard in the early 1960's and before.

1.2 Methods

Biological surveys have been conducted for the entire study area by this investigator (C. Patterson) in 1998, 1999, and 2004. While the emphasis was on the smaller undeveloped parcel, the overall study area was surveyed to document existing conditions and to determine whether any sensitive biological resources (e.g., wetlands, rare plants, etc.) might be present. The smaller undeveloped site was also surveyed for potential wetlands and rare plants in 1993.

1.2.1 Rare Plants

Portions of the study area have been walked in detail on several occasions in four separate years and have been examined for general conditions, potential wetlands, and possible occurrences of (or suitable habitats for) sensitive plant and/or animal species. Each site visit involved carefully walking across the open or undeveloped portions of each parcel and visually examining the vegetation cover, looking specifically for any unusual habitats and/or species. The vegetation types and species observed were noted, and several small potential wetland areas in particular were closely examined for possible sensitive species. Close inspection (essentially 100 percent visual examination) was made of all open ground in the study area. Field surveys were specifically timed to coincide with the known blooming periods of the region's most significant rare plants, these being Burke' goldfields *(Lasthenia burkei)*, Sebastopol meadowfoam *(Limnanthes vinculans)*, Baker's blennosperma *(Blennosperma bakeri)*, and

many-flowered navarretia *(Navarretiaplieanthd).* Held surveys were originally conducted for the 11.8 acre parcel in 1993, including site visits on March 16, April 14, May 10, and June 15. Held surveys were made on May 6 and June 9, 1998 (a very wet and late spring), and again in 1999, including March 29, April 27, May 15 and 30. Burke' goldfields in particular is known from several sites around the general Windsor and northwestern Santa Rosa areas, including the area near Highway 101 at Shiloh Road, at the Sonoma County Airport, and west of the freeway near Starr Road. Many years of surveys in and around this area by this investigator have indicated that most local rare plant locations now occur west of the freeway. Other site surveys conducted in 1993 by this investigator (to be used as reference sites) included the Alton Lane mitigation site and the old Naval Air Center. Reference sites for surveys in 1998 and 1999 include the Sonoma County Airport (goldfields), Alton Lane (goldfields and blennosperma), and the Wright Mitigation Bank (Hall Road or 'Cramer') site for Sebastopol meadowfoam.

Field dates in April are generally the most optimum to catch any of these four sensitive species at their peak phenology, although surveys as early as late March and as late as mid-May are generally also adequate to still identify these species. Surveys of the smaller site include four separate years (1993, 1998, 1999, 2004) and cover the appropriate spring flowering windows. This site has two or three small areas of seasonal wetland habitat that could conceivably support any of the sensitive species. The main LBC site, however, because of its thorough alteration and development, does not contain wetland habitats suitable for these species. One other sensitive species, many-flowered navarretia, typically blooms concurrently with Burke's goldfields, but it is only known from one or two sites on the Santa Rosa Plain (off Sanders Road in southwest Windsor) and has not been seen regularly in this part of its range in recent years. Its primary range is well to the north, closer to Clear Lake.

Several wetland plant species of lesser concern (e.g., *Downingia humilis, Navarretia bakeri,* and others; see Table 1) are also generally in bloom during this same period (primarily April and May) and were sought during all years of surveys. Still others, such as showy Indian clover *(Trifolium amoenum),* hayfield tarplant *(Hemizonia congesta),* and Gairdner's yampah *(Perideridia gairdneri)* bloom later (late May, June, and even July), but are also generally recognizable in late April and early May, prior to absolute peak maturation. Based on the following:

(1) full detailed surveys in the wet year of 1998,
(2) supplemental spring surveys in 1999 and 2004,
(3) the previous partial surveys (11.8 acres only) in 1993,
(4) the marginal character of the habitats present,
(5) the lack of suitable habitats on the 40 acre site,
(6) the lack of any immediately nearby historic rare plant locations, and
(7) extensive local experience.

It is this investigator's conclusion that the surveys for this study have been adequate to reliably determine the absence of the potential species of concern.

Table 1 is a list of rare plants known and/or potentially to be expected in the greater Santa Rosa region (excluding species of chaparral, forest, and strictly coastal habitats, since these habitats are not present here) and which were sought during the field surveys. This list includes all sensitive plants known or expected to occur in the greater Santa Rosa region, including all such species currently designated as being "of concern" to the California Department of Fish and Game (CDFG), California Native Plant Society (CNPS), and the U.S. Fish and Wildlife Service (FWS). Table 1 lists virtually all of the known or expected rare plants from the greater Santa Rosa Plain area, as well as a number of species historically reported from nearby areas around

Sebastopol, Petaluma, and even the more mountainous areas to the east. A few are not known from this 'region' at all (e.g., Clara Hunt's milk-vetch), but are included in the table since they have been mentioned in various project review letters by the FWS as being of some concern for a somewhat larger region (i.e., Sonoma and Napa counties). The surveys for this project were floristic in that all plants encountered were identified at least to the level necessary to determine commonness or rarity, and were conducted according to published CDFG and FWS guidelines. Table 2 is a plant species list compiled for the site.

Records from the California Natural Diversity Data Base (CNDDB, 1991) indicate no known occurrences of any rare plants on the actual project site or on any immediately adjoining property, although there are known records for several rare plants within about two miles of the site (all to the west). The nearest known rare plant occurrences are for Burke' goldfields about two miles to the south near San Miguel Avenue, about one mile to the north near Shiloh Road, and also farther west near the Sonoma County Airport. No other sensitive plants are positively known from this immediate area, although any of the species of secondary concern could also be present here or nearby.

1.2.2 Sensitive Wildlife Species

Sensitive wildlife species known, expected, or with some potential to occur in this region include the California tiger salamander (CTS), the Pacific freshwater shrimp, the California red-legged frog, steelhead trout, Coho salmon, and several species of fairy shrimp. In addition, there are a number of (protected) migratory birds that could potentially occur in this area on occasion. The habitats preferred by these species were researched as well as the current status of each and their known ranges of occurrence. Mr. Geoff Monk of Monk & Associates was contacted for information regarding these and any other potential sensitive species in the region, and field biologists at CDFG (Bill Cox, Allan Buckmann) have been contacted regarding the various wildlife species of concern for the greater Santa Rosa region.
Habitats in the study area were examined and evaluated with regard to the various wildlife species of concern. The results and conclusions reached during discussions with CDFG biologists completed recently for other regional projects regarding these species have also been incorporated into this report.

1.2.3 Wetlands

Wetlands on the site were sought and mapped according to standard 1987 Corps wetland delineation procedures, including a detailed onsite investigation of the Corps' three parameter wetland delineation approach. This involved documenting evidence of hydric soils, hydrophytic vegetation, and/or actual wetland hydrology. Early field inspections regarding potential wetlands were conducted under relatively wet conditions in March and April, *1998,* at a point with roughly 150 percent of average rainfall. These preliminary findings were corroborated in the spring of 2004.

The vegetation was examined and evaluated for the presence of plant species categorized as either Facultative or Facultative-Wet according to the U.S. Fish and Wildlife Service's (FWS) wetland plant classification for California, and direct hydrological observations were made during the 1998 site visits. Since the site was in fact 'overly' wet (for purposes of determining wetland conditions) during much of the 1998 winter and spring, it was determined during that year's site visits that any areas not exhibiting surface hydrology (shallow inundation or fully saturated soil) at that time were not considered "wetland". Clearly, areas not exhibiting qualifying hydrology under 'wet' conditions would not qualify as "wetlands".
Field mapping was initially difficult (and approximate) since there was no topographic base map

available. The study area was walked and all areas encountered in the field as having qualifying wetland characteristics (i.e., wetland hydrology, hydric soil, and wetland or hydrophytic vegetation) were identified as to their approximate shapes, sizes, and locations. Field measurements of the qualifying wetland features' dimensions were made to quantify these areas even if they could not be mapped with great precision. At the end of the 1998 study season, a blueline air photo was obtained that allowed for more detailed mapping (Figure 4 portrays the site's existing conditions).

During the data collection process, soils were examined (moist, to about 15 inches) for evidence of hydric conditions such as color variations (mottles), iron stains, and/or concretions (iron and/or manganese), plus oxidized root halos, significant organic inclusions, and/or undecomposed surface organic layers. Soil color was determined through the use of a Munsell color chart. In particular, the presence or absence of iron staining near to the soil surface was key in the wetland determination. Clear (i.e., bright: 7.5YR 4/6 etc.) and pervasive iron stains within the near-surface root zone (typically the top ten inches) and/or oxidized rhizospheres (recently oxidized root channels of live roots) were deemed primary indicators of both hydric soil and sufficiently prolonged hydrology. Mottles and dark (low chroma) soil in general were not especially helpful as diagnostic characters over much of the site because of the native soil's inherent darkness throughout.

Vegetation was recorded by noting all plant species observed and their visually estimated percent dominance (cover) in sample 'quadrats' of approximately one square meter at each soil pit. Virtually all plants present were identifiable, at least to the point of knowing genus as well as 'hydrophytic' status (Facultative, Facultative-Wet, Obligate, etc.).

2.0 Existing Conditions

2.1 Climate, Terrain, and Land Use

The study area is located on the Santa Rosa Plain of Sonoma County. This area generally receives approximately 30 inches of rainfall per year, concentrated between November and April. Summers are hot and dry, with winters being wet and relatively mild.

Topography in the study area is almost level, with the natural landscape being relatively flat, but historically with meandering low gradient swales and scattered small ephemeral creeks running from east to west, ultimately draining into the Laguna de Santa Rosa or directly into the Russian River to the west of the plain. Topography in the study area has been thoroughly altered and disturbed (i.e., leveled, ditched) by the construction of the adjacent freeway and other surrounding roadways, plus the buildout of the LBC itself. The undeveloped parcel is not as severely altered, but is also relatively flat and reflects typical agricultural uses (i.e., peripheral ditches, discing, fencing).

Most of the surrounding lands are already developed for urban (residential) and commercial uses, and there are only a few scattered parcels that are still undeveloped. This study area is essentially surrounded by developed land, with paved roads immediately adjacent on three sides. Most of the area is in residential neighborhoods. There is a small area of vineyard and open ground immediately to the south of the LBC.

2.2 Soils and Hydrology

The site's soils (Figure 3) are mapped by the USDA - Soil Conservation Service (Miller, et al,

1972) as "Yolo silt loam, 0 to 2 percent slopes" over most of the primary (40 acre) LBC site, while the northern 11.8 acre area is underlain by "Yolo clay loam, 0 to 2 percent slopes". These soils are generally "well drained" and consist of a surface loam over ancient deposits (buried layers) of sandstone and shale alluvium. These soils are found mainly on floodplains and alluvial fans (i.e., along major drainages) and have been used historically for orchards and hay cultivation. Within the Yolo series, the two phases found in the study area contain the finer components (silt and clay) of the periodic prehistoric drainage overflows, but in general are still relatively well drained because of their overall coarse (alluvial) character and lack of solid buried restrictive layers. In general, these are not considered to be "wetland" soils, although scattered inclusions and/or lenses of clay may occur that foster localized wetland formation.

The site's soils have been at least moderately (or even severely) altered through historic agricultural uses (primarily orchard in this study area) and localized ditching and minor grading throughout the general vicinity. Soils on the LBC site have been thoroughly altered, either by outright paving, or at least by leveling and planting with turf.

Topographically, the study area consists of nearly level ground, and it contains no natural watercourses or creeks. There are two sections of very small ephemeral channel that cross the main (developed) site, although both of these are relatively small man-made drainage features that were constructed to facilitate onsite runoff and drainage when the LBC was built. One is a short section of created channel (draining westward to the freeway just west of the main LBC auditorium) that has been landscaped with ornamental trees and shrubs, while the other feature is a small swale-like ditch that was constructed to aid drainage over the northeastern area of turf, plus the general entry roadway. This latter feature is strictly herbaceous and runs from roughly northeast to southwest through a planted (and irrigated) turf area in the middle of the site. The overall area that it drains is irrigated and mowed. This drainage then crosses beneath pavement (the main entry road) to the section of channel that occurs at the western edge of the main LBC, taking much of the property's onsite runoff toward the freeway. This latter section of drainage channel supports stands of planted (and/or escaped) pampas grass *(Cortaderia sellanoana)* and dense growth of the non-native Himalaya blackberry *(Rubus discolor)*, plus clusters of trees (oaks, acacia, redwoods), and understory shrubs (coyote brush, non-native rose, volunteer fruit trees, etc.). Neither of these features are natural in terms of either their configuration or vegetation.

The site contains relatively simple hydrology, including strict surface runoff (sheet flow) over most of the site, plus the two small ephemeral drainages (man-made channels) and some scattered soil saturation and/or highly intermittent shallow ponding (rainpools) in the lower topographic places. There is no significant offsite watershed that either contributes sheet flow or runoff to the site, nor are there any defined drainages (creeks or channels) that originate offsite that convey flows through the site. Virtually the entire study area drains via slow downward percolation and limited onsite collection into the small channels. While much of the surrounding Santa Rosa Plain involves a seasonally perched (subsurface) water table on top of buried restrictive layers, this study area, with its coarser alluvial soil, does not support any significant perched water table formation and is relatively well drained.

The main LBC parcel in particular is well drained (the Yolo silt loam), and the scattered small depressional areas here fail to hold any appreciable standing water after storms. There is one area, however, that has been created as a larger depression (probably a soil borrow area) where localized runoff from the northern part of the parcel (all planted turf) collects and remains indefinitely through the winter and early spring. This area (see Figure 4) is about 15,000 square feet (034 acre) in size and has obviously been created by human activities. This feature supports a dense stand of willows *(Salix* spp.) and coyote brush, and does not represent habitat suitable for any of the regionally known sensitive wetland species. It is heavily shaded and contains old deposits of trash (wood, concrete, etc.). Of this distinct grove of willows, about 12,000 square feet (0.27 acre) is actual "wetland".

The main LBC parcel also contains a rectangular man-made pond at its western edge, but this is a managed feature (wastewater treatment facility) and is not considered "wetland". This pond is maintained to have clear banks and does not support any significant wetland or riparian vegetation.

The smaller 11.8 acre parcel has a slightly higher clay content and exhibits minor seasonal ponding in about three small areas where depressional topography has been created. These features occur in low microtopography that has been created over the years along the site's fencelines due to cultivation, fence-line accumulation of soil, and localized tractor operations (e.g., turning).These features are all small and total only about 2500 square feet.

2.3 Vegetation and Flora

The study area's vegetation has been altered through historic and ongoing agricultural and other land use activities. Based on air photos from the 1960's, virtually all of the study area (all parcels) supported orchard. Since then, however, the trees have been removed and the main parcel has been completely altered by the construction and operation of the existing LBC facilities. This main parcel contains the Center's buildings and parking lots, and extensive planted (and irrigated) turf areas for picnicking, occasional overflow parking, and special events (including the erection and use of large outdoor tents). In the few undeveloped portions of this parcel (i.e., around the edges and in certain unused comers), the dominant vegetation includes typical weedy non-native annual grassland composed of introduced grasses such as wild oats *(Avena)*, bromes *(Bromus mollis, B. rigidus)*, Italian ryegrass *(Lolium multiflorum)*, and wild barleys *(Hordeum* spp.), plus a high proportion of common field weeds such as mustards *(Brassica, Raphanus)*, vetch *(Vicia* spp.), wild geranium *(Geranium dissectum, G. molle)*, bindweed *(Convolvulus arvensis)*, thistles *(Cirsium, Sonchus, Carduus)*, prickly ox-tongue *(Picris echioides)*, fennel *(Foeniculum)*,and rattlesnake plantain *(Plantago lanceolata)*. There are also planted strips of pampas grass *(Cortaderid)* used as screening and partial windrows and a few clusters of planted Monterey pines, acacia, redwoods, and other ornamental trees and shrubs. A few clumps and scattered individuals of the native shrub coyote brush *(Baccharis pilularis* ssp. *consanguined)* also occur around the site's periphery.

The 11.8 acre parcel is essentially vacant and is used for livestock grazing. This area is composed exclusively of herbaceous annual (non-native) grassland. The dominant species are roughly the same non-native grasses mentioned above (i.e., oats, bromes, barley, vetch, thistles, etc.), plus stands of the non-native herb teasel *(Dipsacus fullonum)*. Non-native grassland forms essentially 100 percent cover here.

This undeveloped parcel also contains, however, several very small, shallow depressional areas that support a slight shift in vegetation toward a weedy seasonal wetland vegetation type. These small areas are not part of any larger drainage (swale/pool) system, nor are they well developed or undisturbed enough to support significant native wetland communities (see additional discussion below under 'wetlands'). This 11.8 acre parcel contains no significant tree or shrub vegetation, although there are about three medium-sized valley oaks *(Quercus lobatd)* situated along the northern and western fencelines, and there is a small cluster of planted redwoods (offsite) along the freeway frontage.

In general, the study area has been thoroughly altered and disturbed such that there are very few native plants left. None of the grassland represents native grassland, and only a very few scattered native oak trees remain (with essentially no significant regeneration). Even the few small wetland features are dominated by non-native species, including Italian ryegrass, Mediterranean barley *(Hordeum hystrix)*, curly dock *(Rumex crispus)*, umbrella sedge *(Cyperus eragrostis)*, velvet grass *(Holcus lanatus)*, loosestrife *(Lythrum hyssopifolid)*, mint or pennyroyal *(Menlhapulegium)*, and rabbit-foot grass *(Polypogon monspeliensis)*. There are only a very few scattered individuals of such native wetland species as flowering quillwort *(Lilaea scilloides)*, meadow barley *(Hordeum brachyantherum)*, toad rush *(Juncus bufonius')*, slender rush *(Juncus temtis)*, popcornflower *(Plagiobothrys bracteatus)*, common semaphore grass *(Pleuropogon californicus)*, western manna grass *(Glyceria occidentalis)*, and water star-wort *(Callitriche marginata)*.

One native plant species of general interest that occurs as scattered individual plants and very small localized clusters in the 11.8 acre site is Indian hemp *(Apocynum cannabinum)*. While this species is in fact relatively common and widely distributed (and as such has no official status), it is of interest because of its historical (and possibly even continued) use by native Americans for various purposes that utilize its notable fiber.

The study area has not been reported as supporting any actual rare, endangered, or otherwise uncommon or sensitive plant species. There are several rare endemic plants known to grow in vernal pools in this region, but none are known from this property or any others immediately nearby. The nearest known locations for such species are for Burke's goldfields which historically have occurred west of the freeway along Airport Boulevard.

2.4 <u>Wildlife</u>

Because of the highly developed lands that surround the study area, plus the long term presence of the adjacent freeway, wildlife use of the site has been severely curtailed over the years. Movements of large mammals such as deer have been drastically reduced because of the freeway and neighboring development, and with minimal actual wetland habitats, even use by transitory birds is not great. The undeveloped parcel and the unpaved portions of the main LBC provide some resource value for songbirds, small mammals, and some reptiles (lizards, snakes), but overall, the long term agricultural use and development in this area has greatly reduced the study area's value for wildlife.

The solitary man-made 'pond' on the LBC may have some minor value for amphibians, but because of its extreme isolation and very limited extent, it is not expected to provide much actual value. Current investigations are being conducted to assess this feature's potential value for supporting the endangered California tiger salamander (CTS). Also, while such a ponded habitat might otherwise provide certain habitat values for wetland-associated birds, this feature's extremely dense cover by tall woody vegetation (to the point of totally obscuring the surface water from essentially all directions), plus its isolation and generally developed surroundings, renders the aquatic potential here to a very low level.

No rare or endangered wildlife species are known or expected to occur in this general area, and given the extremely small and poor quality of the onsite habitats for same, no such species are expected here. Studies regarding CTS (along with associated agency review of the results) will be able to provide more definitive conclusions in this regard by the spring of 2005.

2.5 Wetlands

The overall study area (all parcels combined) contains approximately 0.46 acre (20,100 square feet) of jurisdictional seasonal wetlands and other waters (channels). This includes the borrow pit with the willow grove (12,000 square feet of 'wetland') and two small man-made channels on the main parcel (5600 square feet total), plus three small seasonal wetlands around the periphery of the 11.8 acre parcel (2500 square feet). None of these features, however, represent especially natural habitat, nor do they contain significant direct wetland resource values.

The wetland features on the main 40 acre LBC parcel are without significant direct resource value because of their largely man-made character and isolated occurrence, although they do represent potentially significant generic resources for the region. The willow grove wetland may provide habitat (cover, foraging, possible nesting) for common songbirds and small mammals, but does not constitute suitable habitat for waterfowl, waterbirds, or other truly wetland-dependent wildlife. Further, because of the man-made character and the dense willow growth here, this feature does not have any significant potential to support native (endemic) wetland plants, especially any of the regionally known sensitive species. The small seasonal wetlands on the 11.8 acre parcel are likewise not of high resource value or significance, but they are slightly more 'natural' for the region and also represent generic habitats of at least some regional value (even if only for their restoration potential). While these wetland features are also highly altered and disturbed, they have at least some minor potential as suitable habitat for endemic wetland plants (although none have been reported or found here).

Overall, the site's wetlands and small channels could be considered to be somewhat genetically sensitive habitats or communities, but because of their relatively common and largely non-native vegetation, degraded physical state, and increasingly disturbed setting, are not regarded here as especially sensitive, rare, or ecologically significant in and of themselves. The study area's wetlands are, rather, severely disturbed, reconfigured, and/or heavily impacted remnants of the pre-existing area wide drainage patterns that once (long ago) occurred on this low-gradient terrain. These disturbed habitats are important and somewhat sensitive in the generic sense, but more for their general value (or the potential for restoration), rather than for the current actual direct resource values. The actual onsite habitats and plant assemblages are not of especially high direct ecological value. Their lack of persistent ponding or significant natural vegetation, plus the local setting of increasing human activity nearby render them of relatively low value to wildlife.

2.6 Other Habitats

The study area contains no other significant habitats or natural plant communities, and in particular, there is no native grassland, no significant brush, nor any significant creekbed riparian habitat, although there is a small area along the channel next to the freeway that has at least some pseudo-riparian cover (pines, pampas grass, Himalaya blackberry, and a few willows) and some intermittent flow in the winter. Further, there are no other natural habitats of particular value or significance on any adjacent land.

2.7 Sensitive Plant Species

Based on multiple spring botanical surveys in 1993,1998,1999, and 2004, the study site supports no occurrences of any rare, endangered, or otherwise sensitive plant species. No such plant species have been found on the site, nor have any been reported here (or immediately nearby) by the California Natural Diversity Data Base (CNDDB, 1991) or the California Native Plant Society (CNPS). Table 1 lists the primary target species considered during the investigations, and Table 2 is a plant list compiled for the site.

Aside from the willows in the borrow pit area, the site's wetlands and small channels support very few native wetland species. The channel bed near the freeway is largely bare and eroded, and supports no true wetland vegetation (e.g., cattails, rushes, sedges), and has a canopy of planted pines, a few small oaks, and numerous non-native shrubs and small trees (i.e., ornamental roses, escaped fruit and landscaping trees).

All species observed over the entire site (see Table 2) are relatively common in the greater Sonoma County region. There is very little realistic potential for any of the rare vernal pool species to occur here because of the high degree of local urban encroachment, the severe long term disturbance from agriculture, the meager hydrological development, and very minor physical extent. No such species have been found here during the recent investigations. Even such wetland species as the more aggressive and adaptable coyote thistle *(Eryngium)*, dock *(Rumex)*, cocklebur *(Xanthium)*, and western manna grass *(Glyceria occidentalis)* are largely absent from the study area's wetlands. There is almost no native seasonal pool vegetation, and no evidence of any of the common or rare pool species typically found in this region (e.g., no *Lasthenia, Limnanthes, Plagiobothrys, Downingia, Gratiola, Eryngium,* etc.). Even the widespread and nearly ubiquitous semaphore grass *(Pleuropogon californicus)* has not been observed here.

More specifically, the willow grove wetland supports solely willows and coyote brush, with no herbaceous wetland cover at all because of the dense shading and competition. The small channel and swale nearby (see Figure 4) support only common non-native grasses *(Lolium, Poa annua, Hordeum hystrix, Vulpia,* and lawn grasses) and common weeds *(Plantago, Lythrum, Rumex, Lotus corniculatus).*

Based on these findings, it is my conclusion that this site has essentially no realistic potential to support any rare or endangered plants, and no additional surveys should be needed.

2.8 Sensitive Wildlife Species

In general, the site contains relatively little direct resource value for wildlife, although it does provide some escape cover, resting, and potential nesting opportunities for common urban-tolerant animals. It does not, however, contain any significant natural habitats or areas of high use by any particular species of wildlife, especially species regarded as sensitive. There is only minor native vegetation left in the area and the entire site has been substantially altered, with literally all of the study area having been used historically for orchard. Currently, the undeveloped parts of the LBC parcel contain bare ground, weeds, managed turf, and planted landscaping. The 11.8 acre pasture parcel is dominated almost exclusively by non-native annual grassland. There are no significant natural wetlands or native grassland habitats, and no true aquatic habitat. The site provides some minor escape cover and potential foraging habitat for songbirds and small mammals, with possibly occasional use by other transitory animals such as deer, owls, and hawks. The site is undoubtedly used to some extent by common urban-tolerant species (e.g., opossum, skunk, raccoon, rodents, numerous small birds), but does not provide suitable habitat for the region's known rare or endangered animals.

Specifically, there are no suitable habitats here for the California red-legged frog or the Pacific freshwater shrimp (no significant perennial water). None of the listed species of fairy shrimp are known to occur anywhere in Sonoma County and are not regarded as an issue here, and the red-legged frog is specifically protected as a listed species only within certain drainages (i.e., around the north Bay Area only in the Petaluma River, Napa River, Sonoma Creek watersheds). This project site (and virtually all of the Santa Rosa Plain) occurs well outside the established range of the protected form of red-legged frog.

Significantly ponded habitats present either directly onsite or nearby that could support CTS are relatively minimal, and the project site occurs generally north of the regionally known range of this rare amphibian. The onsite channels are completely man-made and lack any significant pools. Surveys and discussions with the appropriate agencies (U.S. Fish and Wildlife Service) are currently in process to more conclusively document presence or absence of this species. Based on the general lack of suitable habitats here and nearby, the extreme degree of fragmentation and isolation, and barriers posed by the adjacent freeway, it does not appear likely that CTS will be an issue here.

There is insufficient year-round flow in any of the study area's channels for any of the region's other known sensitive aquatic species, including specifically the Pacific freshwater shrimp (or other aquatic species of concern such as the western pond turtle). Further, as highly intermittent sections (fragments) of short man-made drainages, the onsite channels do not support any fish.

3.0 Impacts to Biotic Resources from the Proposed Project

The proposed project would involve significant new building and pavement, essentially eliminating what undeveloped ground remains. Impacts to the previously developed LBC facilities should be relatively minimal, as this entire area has already been almost completely built on, paved, or landscaped. Renovating and/or re-building various components would not eliminate any natural habitats or important biological resources. Minor pockets of volunteer, semi-riparian vegetation will be lost along the small channels and at the old 'borrow pit' feature. Development of the currently vacant 11.8 acre parcel would eliminate open pasture and some minor biotic resource value, although no natural habitats or vegetation would be lost.

3.1 Baseline Condition of Onsite Resources

The existing biological resources within the study area are already in a state of severely diminished value. The LBC area has been thoroughly developed, with little remaining in the way of biotic resources, and even these (i.e., the small sections of ditch, the solitary riparian wetland) are completely man-made and are surrounded by a developed landscape. There are no remaining natural habitats or plant communities here, and impacts from the project would be, in general, minimal.

The undeveloped 11.8 acre parcel would sustain a slightly higher level of resource loss, but this too would be relatively insignificant. This parcel has no existing development and essentially all of it would be used for buildings, pavement, or landscaped facilities. This parcel consists exclusively of open, non-native annual grassland.

In addition to the main parcels planned for development, there is an adjoining undeveloped parcel of approximately 25 acres that currently is restricted to agricultural use under an 'open space' easement with the Sonoma County Agricultural Preservation and Open Space District (SCAPOSD). This parcel contains a protected wetland drainage (broad swale), a set-aside for

Indian hemp, and some area of recently planted vineyard. This parcel is under the same ownership as the project study area and may be used in part for either an onsite detention basin (to serve water quality issues) and/or additional wetland/riparian mitigation.

3.2 Direct Impacts

Direct impacts will occur from the physical development of the study area, primarily on the northern 11.8 acre parcel, where virtually all existing vegetation and ground surface would be affected and replaced with buildings, parking, and landscaping. Drainage will be collected and routed, although the overall existing pattern of simple onsite runoff collection and conveyance westward will not change dramatically.

3.2.1 Soils and Hydrology

No significant impacts will occur to soil or hydrological attributes, at least as they relate to biological resources. A small amount of potential agricultural land (11.8 acres) would be lost to possible future crop or livestock production. This translates into a small future loss of hayfield, pasture, or other potential cropland, but none of these preclusions is deemed significant and no mitigation for same is necessary. Hydrology will be altered as the areas to be developed will have onsite runoff and drainage placed in pipes below ground, but this will not affect any highly significant wetlands or water-related habitats, and no such aquatic features nearby would be adversely affected. There are no significant nearby wetlands or aquatic habitats that would have their hydrological regimes altered by the project. The only nearby wetland of note is the linear wetland swale to the south; however, this area does not currently receive any significant runoff from the project site and the project would not have any deleterious impact on this 'offsite' feature.

3.2.2 Vegetation and Flora

Completion of the project would result in the loss of approximately 11.8 acres of non-native annual grassland, plus roughly another 15-16 acres of planted and irrigated turf (which has some limited foraging value for common wildlife species similar to open grassland) and weedy peripheral grassland. There would, however, be no loss of any significant native grassland, nor of any significant native brush or woodland communities. Vegetation losses would also include the loss of approximately 0.46 acre of minor seasonal wetland, 0.4 acre of semi-riparian woodland (cottonwoods, willows, blackberries; not all of which is actual "wetland"), three mature valley oak trees (along the fencelines next to the Mark West Springs Road off ramp), and a small (but unknown) number (probably less than 100) of scattered Indian hemp plants. Several other clusters of planted ornamental trees would also presumably be lost, but these do not represent significant losses of natural habitats or communities. The loss of the Indian hemp plants may be regarded by some as a potentially significant impact, but this species has no formal status and is actually fairly common and widespread in the region.

3.2.3 Wildlife

Impacts to wildlife will be relatively insignificant in that no natural habitats, nor any others of especially high value will be lost. The main losses in terms of wildlife will be the simple elimination of approximately 15 acres of open grassland and planted turf habitat suitable for common songbirds, small mammals, and selected reptiles. The open grassland that will be lost may have some limited foraging value for raptors (common hawks, owls, etc.), but this is not regarded as a significant impact as the grassland habitat to be lost does not have high value for such species (proportional to its relatively small size, agricultural use, and semi-urban setting).

No significant aquatic habitat would be lost, and the wetlands to be eliminated do not represent important or significant habitats for wetland-dependent species. The wetlands here are of extremely limited extent and meager habitat values, set within a fairly urban landscape. Therefore, the loss of these minor features does not represent a significant impact to wildlife resources.

3.2.4 Wetlands

The project would involve the loss of (in total) approximately 0.46 acre of relatively low quality wetland, including 0.06 acre of seasonally wet, herbaceous swale or shallow rainpool habitat, 0.12 acre (roughly 650 linear feet) of man-made drainage channel (with weedy volunteer and planted shrubs and trees), and 0.27 acre of volunteer semi-riparian (wetland) woodland. None of this loss is considered significant as it is of very limited extent and is set within a generally urban landscape. None of the wetland features to be lost represent natural habitat, and none currently support any rare, endangered, or otherwise sensitive species. None of the wetland areas constitute good suitable habitat for endangered species, plants or animals, and based on the habitats' fragmented situation and meager habitat integrity, no such species are expected here.

The two primary aspects of wetland impacts that are notable are (1) the loss of the isolated semi-riparian grove of trees in the center of the LBC parcel, and (2) the scattered small seasonally wet depressions around the periphery of the undeveloped 11.8 acre site. Loss of the semi-riparian feature could be regarded as potentially of moderate significance because of the woody vegetation and the persistent ponding, but this feature's ruderal character (i.e., the vegetation is not all native, it is set within an old 'borrow' pit fringed with debris) and completely isolated occurrence render it of relatively low actual habitat value. Its loss would not be considered significant, although it will be regarded as "jurisdictional" wetland either by the Army Corps of Engineers and/or the Sate of California and will require some level of permitting. Loss of this feature is not highly significant, will be eligible for a relatively ,ow level permit, and will require some low level of mitigation (replacement).

3.2.5 Rare, Endangered, or Otherwise Sensitive Species

No rare, endangered, or otherwise sensitive plants or animals are likely to be affected by the project. No such species have been found here, and habitats suitable for such species are generally not present. No sensitive plants been found here over several years of detailed spring surveys, and there are no historic records of such species occurring here or immediately nearby.

3.2.6 California Tiger Salamander

It is conceivable that CTS use the small riparian pool onsite, but there is no current evidence of this, and the range limitations of this species seem to indicate it dies not occur here. Full protocol surveys are currently being conducted to definitively ascertain the presence or absence of this species.

3.3 Indirect Impacts

Because almost all of the land immediately next to the study area has been developed, no significant indirect impacts are expected. The properties immediately to the east north, and west are all highly altered man-made landscapes with little or no natural resource values left, and the small area to the southeast is a combination of vineyard, wetland swale, and open weedy grassland, all of which has already been placed under a land preservation easement.

There are no highly significant wetlands adjacent to the study site that could be adversely affected, and the minor swale that occurs just to the southeast is already protected within that area's easement. Drainage patterns will not be drastically altered so as to pose a threat to that swale wetland area. There are no significant natural plant communities or habitats anywhere on adjacent lands that would be jeopardized by this project.

4.0 Permits and Approvals

4.1 CEOA

State environmental concerns and issues are being addressed under CEQA through the preparation of an Environmental Impact Report (EIR), of which this biological report will become a part. Biological resource issues are addressed here and will be reviewed by the appropriate state agencies, most specifically the California department of Rsh and Game (CDFG) as part of the EIR and CEQA review process. The primary issues and topics of concern are related to wetlands, sensitive species, and native habitats and/or plant communities. These issues are all addressed herein. One possible issue that is not likely to be of concern to state or federal agencies, but which may warrant some consideration is the presence (and projected loss of) a small colony of Indian hemp on the 11.8 acre parcel. This species has no specific protection, but represents a species of at least some cultural interest.

4.2 U.S. Army Corps of Engineers

In spite of the low quality and small amount of the study area's wetlands, formal permitting will still be required if any of the wetland features are to be filled' (or otherwise eliminated). Development of the full study area as proposed, and the attendant loss of all wetland features requires notification of the Corps of Engineers requesting authorization to fill, and most likely will qualify for authorization under the Nationwide Permit (NWP) number 39.

RII authorization under the NWP 39 should be obtainable without major problems or delay provided that at least (1) 1:1 habitat replacement is provided (either through independent wetland creation, onsite or off, or through the purchase of credits at an approved mitigation bank), and (2) 1:1 wetland habitat preservation of existing higher quality wetland habitat somewhere in the region is also completed. Based on a regional "Programmatic Consultation" between the Corps of Engineers and the U. S. Fish and Wildlife Service (FWS), impacts to wetlands on the Santa Rosa Plain require both the replacement ("creation") of similar wetland habitat, as well as the preservation of existing high quality habitat. In general, the created wetlands in regional 'banks' are of the herbaceous, seasonal type, somewhat similar to the small shallow depressions on the 11.8 acre site. The loss of these wetlands (0.06 acre) will require either such a bank credit purchase (of at least equal acreage in credits, generally rounded up to the nearest 0.1 acre), or may be accomplished through the independent construction of new similar wetland habitat at an appropriate site.

However, if independent wetland creation is to be pursued, and is to be done concurrently with the project and its impacts to wetlands, the ratio of replacement will most likely be 1.5-to-l. Two factors argue for this higher ratio. The first, based on language in the governing Programmatic Consultation is the stipulation that sites where independent wetland creation is to be done that are ~~not~~ specifically approved as "High Quality" sites by the FWS require the 1.5:1 ratio, and, also dictated by the 'Programmatic', if wetland creation is done in the same season as when the impacts occur, the ratio (to account for the temporal loss) is to be 1.5:1. Wetlands created in advance and that have been in place for at least one full wet season may be allowed back at 1:1. However, if the selected site is not FWS-approved, the other factor arguing for 1.5:1 will still apply. Recent approvals do not indicate that the two 1.5:1 requirements will be multiplied together, but satisfying one of the two dictating factors (but not the other), still results in the requirement of 1.5:1 replacement. Only if the newly created wetlands are to be completed at a FWS-approved site one year in advance of the wetland loss (impacts) would the replacement ratio be allowed to stay at 1:1. Credit purchase of created wetlands can be made at simple 1:1 regardless of these two factors since the bank format establishes that the bank site is FWS-approved and the wetlands have generally been created in advance.

Preservation of wetlands is generally at simple 1:1, but usually must be in-kind, i.e., preserving the same type of wetland as is being impacted, there may be some leeway here, but typically, seasonal wetland loss must be compensated with similar wetland replacement and preservation, while riparian habitat loss should be mitigated with similar habitat. Most mitigation banks on the Santa Rosa Plain cater to vernal pool and herbaceous seasonal wetland impacts, but do not include riparian types. Some may have preservation of riparian habitat, but few (if any) actually provide 'creation' credits for riparian habitat impacts.

Most likely this project will be faced with acquiring 0.1-0.2 acre of seasonal wetland creation credits or replacement acreage, as well as equal acreage in wetland preservation, plus some form of riparian restoration (0.2+. acre). Since the creation of actual new riparian habitat is extremely difficult, many permits for similar impacts (i.e., small semi-riparian vegetation) will allow for the restoration of some previously degraded section of creekbank to compensate for loss of actual riparian growth and/or habitat.

With regard to timing, once an application is accepted as complete by the Corps under NWP 39, a decision as to the project's eligibility (or not) must be rendered within 45 days. For wetland losses less than one-half acre (and no sensitive species issues), the Corps generally processes the application in-house (without consulting with any other agencies), while impacts to more than one-half acre require them to solicit comments from the FWS and CDFG under the Individual Permit (IP) format. There is no fee for the Corps authorization process.

Should it be determined that CTS actually use this site, the permit process will be required to go forth as an IP, and additional "Section 7 Consultation" with the FWS will be required. Additional (as yet undefined) mitigation would be required for any impacts to CTS, including compensation for both wetland (potential breeding habitat) and undeveloped upland (potential summer aestivation habitat) losses. Actual mitigation requirements for CTS issues are as yet undefined by the agencies and would need to be determined through additional discussions with the FWS.

4.3 California Regional Water Quality Control Board

In addition to obtaining fill authorization from the Corps, "401 Certification" from the California Regional Water Quality Control Board (CRWQCB) is also necessary in order to make the Corps permit valid. This requires notification of the CRWQCB of the proposed action, payment of their processing fee (which will be based on the acreage of wetland fill), awaiting their public notice period, and addressing any substantial comments that might be registered on behalf of the public or the RWQCB itself. Obtaining 401 Certification typically takes approximately two months, and can be pursued either concurrently with the Corps process, or any time thereafter as long as no physical wetland impacts are incurred before obtaining the approval. Full documented compliance with CEQA must be provided to the RWQCB before they will complete the 401 Certification.

4.4 California Department of Fish and Game

A "Streambed Alteration Agreement" from CDFG would probably not (although it conceivably could) be necessary here because the site's small 'channels' are not well developed, are not natural features, and do not represent significant drainages. While a Streambed Alteration Agreement may be required, typically the mitigation required under that approval process would be essentially the same as would be required by either the Corps or the RWQCB. As a practical matter, CDFG will be contacted for their comments and possible requirements both under CEQA and during the Corps' permit process.

5.0 Recommended Mitigation Measures

5.1 Wetlands

Based on the proposed project, all of the study area's existing wetlands would be filled or otherwise eliminated. This will require specific authorization from the Corps, as well as related approvals from the RWQCB and CDFG. The first step in this process has been initiated, that being the submittal of a request of the Corps to make a "Jurisdictional Determination". This step will result in a formal map showing the exact extent of Corps jurisdiction and will establish the baseline conditions as a basis for eventual permitting.

Once the Jurisdictional map is confirmed, the applicant will need to apply for an Army Corps (404) permit to fill the onsite wetlands. This application may well fall within the terms and conditions of the NWP program, and as long as adequate replacement and preservation compensation is provided, the Corps should be able to process this permit within about two months. It is recommended here that the applicant procure specific wetland mitigation in the form of the following:

(1) herbaceous seasonal wetland replacement at a ratio of 1:1 if done through credit purchase at an approved mitigation bank, or at 1.5:1 if done independently (such as onsite);

(2) seasonal wetland preservation of at least 0.1 acre at an approved mitigation bank;

(3) approximately 0.3-0.4 acre of riparian restoration opportunity at some regional creek situation where degradation can be reversed to provide good new riparian growth.

The actual exact acreages of the various mitigation components will need to be determined through future discussions with the permitting and advisory agencies, and the exact form of such mitigation offering may be somewhat flexible given the site's already degraded and fragmented character. It is also unclear at this time whether or not preservation will be required for the riparian or channel impacts.

If space allows, onsite mitigation for all wetland impacts could likely be provided in the adjacent 25+. acre open space area. Such an effort here would need to include seasonal wetland creation, riparian planting in an appropriate setting, an adequate amount of surrounding upland watershed and buffer (roughly an area equal to or slightly greater than the wetland area being replaced), and overall legal and physical protection in perpetuity. It is unclear if onsite preservation could be accomplished here as this is not a FWS-approved site, not is there any truly "High Quality" seasonal wetland already present that could be dedicated to preservation.

5.2 Sensitive Species

Since there are no known or suspected occurrences of sensitive species in the study area, no specific mitigation measures are recommended at this time.

PLANT TAXON	COMMON NAME	LIST	R-E-D	FWS	CDFG	HABITAT	Likely In Study Area ?
SPECIES OF PRIMARY CONCERN:							
Castilleja uliginosa	Pitkin Marsh paintbrush	1 A	PE 1987	SC	E	marshes, wet meadow; Pitkin Marsh	No; poor habitat onsite; presumed extinct; none seen
Plagiobothrys mollis var. vestitus	Petaluma popcorn flower	1 A	PE 1888	SC	-	valley flats, vernal pools ?	No; none seen; presumed extinct; out of range?
Alopecurus aequalis var. sonomensis	Sonoma alopecurus	1 B	3 - 3 - 3	E	-	low wet places, marsh, riparian scrub	No; poor habitat onsite; none seen
Astragalus clarianus	Clara Hunt's milkvetch	1 B	3 - 3 - 3	E	T	grassy hillsides, cismontane woodland	No; no good habitat; out of range; none seen
Blennosperma bakeri	Baker's blennosperma or Sonoma sunshine	1 B	2 - 3 - 3	E	E	low wet places; valley grassland, vernal pools	No; poor habitat onsite; none seen
Campanula californica	swamp harebell	1 B	1 - 2 - 3	SC	-	freshwater marshes, bogs, closed cone pine,	No; poor habitat onsite; none seen; out of range?
Carex albida	white sedge	1 B	3 - 3 - 3	E	E	open marshy places; Pitkin Marsh	No; marginal habitat; none seen
Fritillaria liliacea	fragrant fritillary	1 B	1 - 2 - 3	SC	-	heavy adobe soils, coastal grassland and	No; poor habitat quality; none seen
Gratiola heterosepala	Bogg's Lake hedge-hyssop	1 B	1 - 2 - 2		E	vernal pools, shallow marshy ground	No; out of main range; none seen
Lasthenia burkei	Burke's goldfields	1 B	3 - 3 - 3	E	E	vernal pools, wet swales	No; poor habitat: marginal hydrol.; none seen
Legenere limosa	legenere	1 B	2 - 3 - 3	SC	-	vernal pools; valley grassland	No; poor habitat; marginal hydrol.; none seen
Lilium pardalinum ssp. pitkinense	Pitkin Marsh lily	1 B	3 - 3 - 3	E	E	wet marshy ground, Pitkin Marsh	No; poor habitat; marginal hydrol.; none seen
Limnanthes vinculans	Cunningham Marsh or Sebastopol	1 B	2 - 3 - 3	E	E	vernal pools, wet meadows	No; poor habitat; marginal hydrol.; none seen
Navarretia leucocephala ssp. bakeri	Baker's navarretia	1 B	2 - 2 - 3		-	vernal pools, wet swales, mesic grassland?	No; poor habitat; marginal hydrol.; none seen
Navarretia leucocephala ssp. plieantha	many- flowered navarretia	1 B	3 - 2 - 3	E	E	edges of vernal pools, meadows	No; poor habitat; marginal hydrol.; none seen
Pleuropogon hooverianus	Hoover's or North Coast semaphore grass	1 B	3 - 2 - 3	SC	R	meadows, coastal decid. forest, wet places	No; poor habitat quality; none seen
Rhynchospora californica	California beaked rush	1 B	3 - 3 - 3	SC	-	bogs, swamps, freshwater marsh	No; no suitable habitat; none seen

Not including plants of chaparral, forest, or coastal habitats

PLANT TAXON	COMMON NAME	LIST	R-E-D	FWS	CDFG	HABITAT	Likely In Study Area ?
ıalcea oregana ssp. valida	Kenwood Marsh checkerbloom	1B	3 - 3 - 3	E	E	freshwater marsh	No; none seen; out of main range; marginal hydrol.
Trifolium amoenum	showy Indian clover	1B	3 - 3 - 3	E	-	low rich fields, swales; serpentine	No; poor habitat quality; none seen
SPECIES OF SECONDARY CONCERN:							
Downingia pusilla	dwarf downingia	2	1 - 2 - 1		-	vernal pools; valley grassland	No; poor habitat; marginal hydrol.; none seen
Rhynchospora globularis var. globularis	round headed beaked rush	2	3 - 3 - 1		-	bogs, freshwater marsh	No; no suitable habitat; none seen
Hemizonia congesta ssp. leucocephala	hayfield tarplant	3	? - ? - 3		-	coastal scrub, prairie, grassland	Possible, but none seen
Pogogyne douglasii ssp. parviflora	Douglas' pogogyne	3	1 - 2 - 3		-	vernal pools, low seas. wet places	No; poor habitat quality; none seen
Amsinckia lunaris	bent- flowered fiddleneck	4	1 - 1 - 3		-	valley and foothill grassland	No; poor habitat quality; none seen
Astragalus breweri	Brewer's milkvetch	4	1 - 2 - 3		-	chaparral, woodland, grassland	No; no good habitat; none seen
Elymus californicus (Hystrix c.)	California bottlebrush grass	4	1 - 1 - 3		-	coastal, shaded woods and forest	No; no suitable habitat; none seen
Lomatium repostum	Napa lomatium	4	1 - 1 - 3		-	shaded woods, chaparral	No; poor habitat; out of main range; none seen
Perideridia gairdneri ssp. gairdneri	Gairdner's yampah	4	1 - 2 - 3	SC	-	moist places, marshes, woodland	No; too disturbed; none seen
Ranunculus lobbii	Lobb's aquatic buttercup	4	1 - 2 - 3		-	shallow vernal ponds & pools	Possible, but none seen
Rhynchospora alba	white beaked rush	4	1 - 1 - 1		-	bogs, freshwater marsh	No; no suitable habitat; none seen
OTHER SPECIES OF POSSIBLE CONCERN:							
Cuscuta howelliana	Bogg's Lake dodder	-	dropped		-	vernal pools	No longer listed; none seen
Hemizonia multicaulis ssp. vernalis	Tiburon tarplant	-	dropped		-	coastal scrub prairie; serpentine	No longer listed; none seen
Quercus lobata	valley oak	-	dropped		-	foot. & valley woodland, riparian	Several salings present, but no longer listed

Not including plants of chaparral, forest, or coastal habitats

LEGEND FOR TABLE 1

Plant Taxon: as listed by Skinner, M.W., and B. M. Pavlik, ed.s (1994).

List: Refers to the list number on which the plant is included in Skinner and Pavlik, Ed.s (1994): California Native Plant Society's sensitive plant inventory. **1a**: Plants presumed extinct, **1b**: Plants rare or endangered in California and elsewhere, **2**: Plants rare or endangered in California, but more common elsewhere, **3**: Plants about which we need more information, and **4:** Plants of limited distribution [a watch list]. Appendix 1: plants considered, but not included.

R-E-D: rarity (R), endangerment (E), and distribution (D) code from Skinner, M.W., Ed. (1994) :

Rarity :

1 = Rare, but found in sufficient numbers and distributed widely enough that the potential for extinction or extirpation is low at this time.

2 = Occurrence confined to several or one extended population(s).

3 = Occurrence limited to one or a few highly restricted populations, or present in such small numbers that it is seldom seen.

PE = Presumed extinct in California (with date last seen)

Endangerment :

1 = Not endangered.

2 = Endangered in a portion of its range.

3 = Endangered throughout its range.

Distribution :

1 = More or less widespread outside California.

2 = Rare outside California.

3 = Endemic to California.

FWS (1999): C1 = A candidate taxon, Category 1: information sufficient for federal listing by FWS. C2 = Also a candidate, Category 2: information insufficient for formal proposal for listing. C3c = Previously considered, but currently considered to be too common for listing. * = presumed extinct. SC = species of special concern.

CDFG (1998): E = Endangered, R = Rare, T = Threatened; as designated by CDFG (1992).

Habitat, Elevation, Flowering Period: As reported in Munz and Keck (1959), Munz (1968), Skinner and Pavlik, ed.s (1994), Hickman, J.C., Ed. 1993, and/or Abrams and Ferris (1923 - 1951).

Not including plants of chaparral, forest, or coastal habitats

Table 2. Plant Species List, Luther Burbank Center for the Arts, Santa Rosa

FAMILY	Name/Jepson	COMMON NAME
\lismataceae	Alisma plantago-aquatica	water-plantain
Apiaceae	Conium maculatum	poison hemlock
	Daucus carota	Queen Anne's lace
	Daucus pusillus	wild carrot
	Foeniculum vulgare	fennel
	Lepidium nitidum	shining peppergrass
	Torilis nodosa	hedge parsley
Apocynaceae	Apocynum cannabinum	Indian hemp
Asteraceae	Achillea millefolium var. borealis	yarrow
	Achyrachaena mollis	blow-wives
	Anthemis cotula	mayweed
	Artemisia douglasiana	mugwort
	Baccharis pilularis ssp. consanguinea	coyote brush
	Bellis perennis	English daisy
	Carduus pycnocephalus	Italian thistle
	Cichorum intybus	chicory
	Cirsium arvense	Canada thistle
	Conyza canadensis	horseweed
	Filago gallica	filago
	Hemizonia congesta ssp. luzulifolia	hayfield tarweed
	Hemizonia fitchii	Fitch's tarplant
	Hypochaeris glabra	smooth cat's-ear
	Lactuca serriola	prickly lettuce
	Picris echioides	bristly ox-tongue
	Senecio vulgaris	common groundsel
	Silybum marianum	milk thistle
	Sonchus asper	prickly sow thistle
	Taraxacum officinale	dandelion
	Tragopogon dubius	oyster plant
	Xanthium strumarium	cocklebur
Boraginaceae	Amsinckia menziesii var. intermedia	fiddleneck, rancher's fireweed
	Plagiobothrys bracteatus	popcorn flower
Brassicaceae	Brassica nigra	black mustard
	Capsella bursa-pastoris	shepherd's purse
	Cardamine oligosperma	bitter cress
	Hirschfeldia incana	Mediterranean mustard
	Raphanus sativus	wild radish
	Rorippa islandica	yellow cress
Callitrichaceae	Callitriche marginata	water-starwort
Caryophyllaceae	Stellaria nitens	shining chickweed
Chenopodiaceae	Atriplex patula ssp. hastata	fat-hen

FAMILY	Name/Jepson	COMMON NAME
	Chenopodium album	lamb's quarters
Convolvulaceae	Convolvulus arvensis	field morning-glory, bindweed
Cyperaceae	Cyperus eragrostis	umbrella or flat sedge
	Eleocharis macrostachya	pale spikerush
Euphorbiaceae	Eremocarpus setigerus	dove weed
Fabaceae	Lotus corniculatus	common bird'sfoot trefoil
	Lotus purshianus	Spanish clover
	Lupinus bicolor ssp. pipersmithii	Lindley's annual lupine
	Lupinus nanus var. latifolius	sky lupine
	Medicago polymorpha	bur-clover
	Melilotus indica	yellow sweetclover
	Trifolium depauperatum	dwarf-sac clover
	Trifolium fragiferum	strawberry clover
	Trifolium hirtum	rose clover
	Trifolium subterraneum	subterranean clover
	Trifolium wildenovii	tomcat clover
	Vicia sp.	vetch
	Vicia villosa ssp. varia	winter vetch
Fagaceae	Quercus agrifolia	coast live oak
	Quercus lobata	valley oak
Gentianaceae	Centaurium trichanthum	centaury
Geraniaceae	Erodium botrys	long-bearded storksbill
	Erodium cicutarium	cut-leaf filaree
	Geranium dissectum	cut-leaf geranium
	Geranium molle	dove's foot geranium
Juncaceae	Juncus bufonius ssp. bufonius	toad rush
	Juncus patens	spreading rush
	Juncus phaeocephalus var. paniculatus	iris-leaved rush
	Juncus tenuis	slender rush
Juncaginaceae	Lilaea scilloides	flowering quillwort
Lamiaceae	Lamium purpureum	dead nettle
	Marrubium vulgare	horehound
	Mentha pulegium	common mint, pennyroyal
	Stachys sp.	hedge-nettle
Liliaceae	Brodiaea elegans	harvest brodiaea
	Chlorogalum pomeridianum	soap plant
	Triteleia hyacinthina	white brodiaea
Lythraceae	Lythrum hyssopifolia	hyssop-leaved loosestrife
Malvaceae	Malva neglecta	mallow
	Malvella leprosa	alkali mallow
Onagraceae	Camissonia ovata	sun cups

APPENDICES

Appendix A. Daily weather data collected from the official National Weather Service station in Santa Rosa, California.

1. INTRODUCTION

On behalf of Sponamore Associates representing Sutter Medical Center of Santa Rosa, Monk & Associates, Inc. (M&A) has completed field surveys for the Sonoma County "distinct population segment" of the California tiger salamander (*Ambystoma californiense*) (CTS) on the Sutter Medical Center of Santa Rosa/Luther Burbank Center project site located at the junction of Highway 101 (101) and Mark West Springs Road (MWS Road), east of Highway 101 and south of MWS Road in Santa Rosa, Sonoma County, California. This project site is approximately 53 acres and consists of three legal parcels with the following Assessor's Parcel Numbers: 58-040-027, 58-040-026, and 58-040-045.

The project site falls within the U.S. Fish and Wildlife Service (USFWS) mapped range of the CTS in Sonoma County (USFWS 2002b). Accordingly, USFWS determined that the project site provides habitat that potentially could be used by CTS and required the project proponent to conduct focused field surveys pursuant to the USFWS' October 2003 *Interim Guidance on Site Assessment and Field Surveys for Determining Presence or a Negative Finding of the California Tiger Salamander.*

The field survey was conducted using the detection methods required in the joint USFWS and California Department of Fish and Game guidelines for conducting field surveys for the Sonoma County "distinct population segment" of the CTS (USFWS 2003b). Per the guidelines, for project sites that could provide CTS aestivation habitat (i.e., over-summering habitat) and potential breeding habitats, applicants are required to conduct drift fence/pitfall trapping studies over one winter season bracketed by larval surveys during the Spring preceding and following the winter survey. The first Spring larval survey was conducted March-May 2005, the winter pitfall survey began on October 15, 2005 and ended on March 15, 2006, and the final Spring larval survey occurred March-May 2006.

No CTS were observed or captured in pitfall traps on the project site at any time during the 2005/2006 surveys. Additionally, no CTS larvae were observed or captured during the focused larval surveys of the aquatic habitats on the project site.

2. PROPOSED PROJECT

The project site is the proposed relocation site for the Sutter Medical Center of Santa Rosa. Existing single family homes, parking stalls, vineyard, and two water treatment ponds would be redeveloped as part of the project. The proposed Sutter Medical Center would include two independent structures; Sutter Hospital and an adjacent medical office building. The remainder of the parcel would be utilized as parking, landscaping, and mitigation for impacts to wetlands.

3. PROJECT SITE LOCATION/SETTING

The approximately 53-acre project site is located immediately east of Highway 101, south of Mark West Springs Road (Figures 1-3). The northern edge borders Mark West Springs Road and high density residential development. The eastern edge borders high density residential housing and cultivated vineyard. The southwestern edge borders Highway 101 and cultivated vineyard.

4. LEGAL STATUS OF THE CALIFORNIA TIGER SALAMANDER (CTS)

The U.S. Fish and Wildlife Service (USFWS) listed the Sonoma County "distinct population segment" of the CTS as endangered on March 19, 2003 (USFWS 2003a). USFWS determined that this population is significantly and immediately imperiled by a variety of threats including habitat destruction, degradation, and fragmentation due to urban development, road construction, pesticide drift, collection, and inadequate regulatory mechanisms. In addition, it was determined that this population could face extinction as a result of naturally occurring events (e.g., fires, droughts) due to the small and isolated nature of the remaining breeding sites combined with the small number of individuals in the population.

In addition to its legal status as a federal listed endangered species, the CTS is also a California "species of special concern." This title affords the CTS no legally mandated protection; however, pursuant to CEQA (14 CCR §15380), this species must be considered in any project that will undergo, or is currently undergoing, CEQA review, and/or any project that must obtain a discretionary environmental permit(s) from a public agency (e.g., County Planning Department). The CTS is also protected under Title 14 of the California Code of Regulations (CCR). Under Title 14, CCR 41 (1996), CTS is a protected amphibian that may only be taken or possessed under a special permit issued by the California Department of Fish and Game (CDFG) pursuant to sections 650 and 670.7 of these regulations, or Section 2081 of the Fish and Game Code.

5. CTS HABITAT REQUIREMENTS

CTS occur in grasslands and open oak woodlands that provide suitable aestivation and/or breeding habitats. M&A have worked with populations that are almost at sea level (Catellus Site in the City of Fremont) to almost 2,900 feet above sea level (Kammerer Ranch, East Santa Clara County). CTS spend the majority of their lives underground. They typically only emerge from their subterranean refugia for a few nights each year during the rainy season to migrate to breeding ponds. CTS may migrate up to 0.6-mile or further from their underground refugia to breeding ponds (personal data; Monk & Lynch 1997). As such, unobstructed migration corridors are important component of CTS habitat.

In Sonoma County, CTS emerge during the first heavy, warm rains of the year, typically in late November and early December. In most instances, larger movements of CTS do not occur unless it has been raining hard and continuously for several hours. Typically, for larger movements of CTS to occur nighttime temperatures also must be above 48° F (G. Monk and S. Lynch pers. observations). Other factors that encourage larger movements of CTS to their breeding ponds include flooding of refugia (observed by G. Monk in Springtown, east Alameda County in 1997).

During the spring, summer, and fall months, most known populations of the CTS predominately use California ground squirrel (*Spermophilus beechyi*) burrows as aestivation habitat (G. Monk personal observation). Other secondary subterranean refugia, or primary refugia where California ground squirrels are absent, likely include Botta's pocket gopher (*Thomomys bottae*) burrows, deep fissures in desiccated clay soils, and debris piles (e.g. downed wood, rock piles). In Sonoma County within the range of the CTS, California ground squirrel colonies are very repressed or non-existent. CTS refugia are therefore less well understood in Sonoma County, but in general, are believed to be provided by Botta's pocket gopher burrows, deep fissures in desiccated clay soils, and to some extent by debris piles.

Currently the only common truly fossorial (i.e., those animals with a life cycle that is predominately lived underground) rodent in the range of the CTS in Sonoma County is Botta's pocket gopher. These rodents typically only open their burrows to feed, closing their burrows shortly after consuming available suitable forage. In most instances, pocket gophers will feed from below ground, pulling tuberous vegetation down into their burrows for consumption. Sometimes at night they will leave their burrows traveling only a few feet to graze on the above ground forage of non-tuberous plants. The pocket gopher's behavior of meticulously closing burrows, especially in times of inclement weather when storm events potentially can cause in-burrow flooding, do not leave CTS many opportunities to use their burrows. Since most CTS migrate at night during large storm events to and from their breeding ponds, the likelihood of CTS being able to readily exit or re-enter open gopher burrows in storm events is greatly diminished. For this reason, the importance of the relationship between the Sonoma County "distinct population segment" of the CTS and the Botta's pocket gopher is likely to be far less than the relationship of the CTS to the California ground squirrel in other parts of the CTS' range. Since this ground squirrel always maintains its burrows to remain open.

Stock ponds, seasonal wetlands, and deep vernal pools typically provide most of the breeding habitat used by CTS. In such locations, CTS attach their eggs to rooted, emergent vegetation, and other stable filamentous objects in the water column. Eggs are gelatinous and are laid singly or occasionally in small clusters. Eggs range in size from about ¾ the diameter of a dime to the full diameter of a dime.

Occasionally CTS are found breeding in slow moving, streams or ditches. In 1997, Mr. G. Monk observed CTS breeding in large, still ditches in Fremont, California. Similarly, in 2001/2002, Mr. D. Wooten observed CTS breeding in a roadside ditch in Cotati, California (D. Wooten, pers. comm. w/ Mr. G. Monk). Ditches and/or streams that are subject to rapid flows, even if only on occasion, typically will not support or sustain CTS egg attachment through hatching, and thus, are not usually used successfully by CTS for breeding (G. Monk and S. Lynch, pers. observation). Similarly, streams and/or ditches that support predators of CTS or their eggs and larvae such as fish, bullfrogs (*Rana catesbeiana*), red swamp crayfish (*Procambarus clarkii*), or signal crayfish (*Pacifastacus leniusculus*), almost never constitute suitable breeding habitat.

In most of the northern range of the CTS, seasonal wetlands that are used for breeding typically must hold water into the month of May to allow enough time for larvae to fully metamorphose. In dry years, seasonal wetlands may dry too early to allow enough time for CTS larvae to successfully metamorphose. Under such circumstances, desiccated CTS larvae can be found in dried pools. In addition, as pools dry down to very small areas of inundation, CTS larvae become concentrated and are very susceptible to predation. In the past, G. Monk has observed drying pool predation by red-sided garter snakes (*Thamnophis sirtalis infernalis*), ducks (various spp.), wild pigs (*Sus scrofa*), and raccoons (*Procyon lotor*). However, in years exhibiting wet springs, these same dryer pools can remain hydrated long enough through continual rewetting to allow CTS larvae ample time to successfully metamorphose.

6. PROJECT SITE DESCRIPTION

The Sutter Medical Center Relocation project site is located on and adjacent to the Luther Burbank Center for the Performing Arts. Figure 4 at the back of this report shows the various land uses within the project site boundary. The largest use of the property is developed as either paved parking, paved roads, buildings, and/or manicured landscaping totaling approximately 25 acres. Soccer fields and other non-irrigated turf areas cover another 8.1 acres. The remaining 19.9 acres is best classified as undeveloped and ruderal. Of the 19.9 acres, 11.8 acres are an open ruderal field on the west edge of the project area that is currently used as horse pasture. The developed parcel immediately east of the pasture will be redeveloped from a single family house and horse barn, two water treatment ponds, and paved parking into the new Sutter Medical Facility. Immediately east of the entrance road to the LBC is an irrigated turf field used for soccer and lacrosse. A water retention pond is located on the southern edge of soccer fields, north of the LBC. The retention pond is fed by an underground culvert that conveys surface water collected from the northeast area of the project site. The pond attains a maximum depth of approximately 3 feet and is surrounded by willow (*Salix* sp.). East of the pond is a hydrologically connected water collection basin that, based on "bathtub rings" appears to hold approximately 1.5 feet of water. Property at the southern edge of the Luther Burbank Center consists exclusively of vineyard bisected by an intermittent storm water swale.

Vegetation on the project site is dominated by a variety of ornamentals and weedy species such as Monterey pine (*Pinus radiata*), cut-leaf geranium (*Geranium dissectum*), pampas grass (*Cortaderia sp.*), Harding grass (*Phalaris aquatica*) and Himalayan blackberry (*Rubus discolor*). Curley dock (*Rumex crispus*) can be found along fences and scattered throughout the 11.8 acre pasture.

There is a minimal amount of seasonal wetland on the project site. Much of the seasonal wetland along the western border consists of areas where the ground saturates and inundates 3-5 inches during heavy rain events. This was typical of the 2005/2006 season. However, there is rapid drainage off the site and the pools drain in a matter of a few days after rains cease. The wetland areas fluctuated dramatically throughout the 2005/2006 season depending on weather patterns. Due to heavy rains, a few areas were inundated during the March 15, 2006 closing date.

7. CTS SURVEY METHODS

7.1 Trapping

M&A received an amendment to its federal 10(A)(1)(a) permit TE-776608 authorizing M&A to conduct surveys for the Sonoma County "distinct population segment" of the CTS. Authorization to conduct spring larval surveys at the LBC site was granted by Mr. Vincent Griego in a March 22, 2005 email correspondence and approval of the drift fence survey was also confirmed by Mr. Griego in a September 7, 2005 email. Field surveys were conducted by M&A 10(A)(1)(a) authorized biologists Mr. Geoff Monk, Mr. Geoff Thomas, Ms. Sandy Etchell, Mrs. Hope Kingma, Ms. Melisa Scheele, Ms. Stephanie Scolari, Ms. Kimberly Debriansky, and Dr. Monte Kirven according to permit conditions.

The field survey was conducted following guidelines prescribed in the USFWS' October 2003 *Interim Guidance on Site Assessment and Field Surveys for Determining Presence or a Negative*

Finding of the California Tiger Salamander. The guidelines required the use of drift fencing in combination with pitfall traps as a means of determining the presence of CTS at sites where they may be affected by development projects.

In the 2005/2006 trapping season drift fences were installed by October 15, 2005 prior to the onset of heavy seasonal rains. Trapping was completed on March 15, 2006, and trap line removal began immediately thereafter with full removal accomplished by April 1, 2006. The drift fence was approximately 6,550 feet in length and contained a total of 218 pitfall traps. The fencing layout is depicted in Figure 3 (behind tab at back of report).

The drift fence was constructed of UV resistant silt fencing and Vexar® construction material that was buried in a 6-inch trench and raised vertically 24-inches above ground level. Vexar® was used during the 2005/2006 trapping year in areas of expected inundation or flow. The Vexar® drift fence was secured to wooden stakes with one-half inch staples. The stakes were installed at approximately 6-foot intervals. Silt fencing has factory preinstalled stakes every 10 feet. These stakes were supplemented with mid-stakes. Pitfall traps consisted of five-gallon buckets that were buried so that the lip of each bucket was close to flush with the ground. Pea gravel was mounded up to a slightly raised bucket edge to make a smooth transition to the pit, but at the same time would shed sheet water flows away from the pit. Additionally, a 2" x 3" piece of movable flashing was attached to the fencing on either side of pitfall traps. This flashing filled any gap at the bucket/fence interface and also compensated for minor shifting and settling of the buckets and/or fence.

Pit-fall traps were spaced at 30-foot intervals along the length of the drift fence. A trap was placed at the beginning and end of each trapping line, and at corners or junctions. Manufacturer supplied bucket lids were modified so that they could be turned over and fitted into a raised position above the bucket openings. To accomplish this, 2"x 4" fir boards were cut into 18" lengths and then attached to the lids parallel, six inches apart. Wood screws were used to attach the boards to the lids. Finally, a piece of twine was attached to one of the boards so that when the trap was set the string would dangle to the bottom of the open bucket. This string was installed to help inadvertently trapped rodents escape the buckets.

When traps were set, the raised position of the lids over the buckets were designed to allow CTS (and other animals) to enter the buckets, and at the same time shield the bucket from rainfall and trapped animals from predators. The flashing was rotated in and out of position when opening and closing traps. To close the traps, lids were simply turned over and positioned on the buckets as the manufacturer intended.

All pitfall traps were set (i.e. opened) in the late afternoon/early evening (3:30-6:30 p.m.) on appropriate days. The following criteria were used to determine when traps should be opened (USFWS 2003):

1. Beginning on or before October 15, pitfall buckets should be opened before sunset if there was any rain during the day or if at 2 PM rain is forecast for the remainder of the day or subsequent night with 70% or greater probability (based on the nearest National Weather Service forecast.

2. Traps should be open each night and checked each morning until no rain has fallen within the preceding 24 hours. Nights of high relative humidity (greater than 75% relative humidity) should be considered equivalent to rain events once onsite or nearby seasonal wetlands have become inundated with standing water, regardless of its depth, surface area, or duration.

3. The above guidance was to be followed until 20 nights of surveying under the proper conditions has been conducted. After 20 nights of surveying is completed, and until March 15, pitfall buckets are to be opened before sunset if there was any rain during the day, or if at 2 PM rain is forecast for the remainder of the day or subsequent night with 70% or greater probability. Traps are to be checked the next morning, and unless it is still raining or more rain is forecast, the traps are to be closed until the next rain event.

In order to keep the drift fences and pitfall traps in good condition, as required by USFWS, it was necessary to conduct various maintenance tasks over the course of the field survey. This was especially necessary after periods of unusually heavy rains combined with strong winds that characterized December 2005 to early January 2006 and late February 2006. When necessary, drift fences and pitfall traps were always repaired the afternoon before setting traps. Maintenance measures including replacing sections of degraded silt fence and replacing pea gravel that had eroded away from the rims of buckets (i.e. pit fall traps). Finally, as the trapping seasons progressed and as soils swelled or shrank if buckets shifted or floated to ground level they were reinstalled to the original specifications.

7.2 Larval Survey

The LBC project site contains one pond that could be potential habitat to be used for breeding by CTS. Larval surveys were conducted using wire funnel traps in accordance with protocol on three consecutive days in March, April, and May 2005 and 2006 for a total of 15 trapping days. The first dip net larval survey was conducted on March 29, 2005; at that time we determined that it was necessary to also funnel trap the detention basin. Funnel traps were approved for use by Mr. Griego and installed for 2, 3-day trapping periods over the remainder of the 2005 season, and 3, 3-day periods over the 2006 season. Traps were set and monitored April 12-15 and May 26-29, 2005. During Spring 2006 funnel traps were set and monitored March 5-8, April 1-4, May 11-14. Additionally, all aquatic habitats including drainage ditches and swales were dip-netted according to survey protocols for a total of 6 dip net surveys at the project site.

With the exception of the detention pond standing water on the site lasted only during heavy storm events and receded within a few day of dry, warm weather. Standing water was still present at the end of the 2005/2006 survey season due to unusually high rainfall; however, standing water that was present during this period and other periods was regularly visually surveyed as part of the trap checking procedure.

8. SURVEY RESULTS

8.1 Drift Fence Survey Results

No CTS were captured in pitfall traps on the LBC project site during the 2005/2006 survey period. During the 2005/2006 season pitfall traps were opened/checked a total of 58 times. Pitfall traps were partially installed by October 15, 2005 and opened for the first rain event on October 26, 2005, and checked for the last time on March 15, 2006. The total number of days traps were set during the months of October, November, December, January, February and March was 3, 8, 13, 14, 9 and 11, respectively. A summary of daily weather data (rainfall and low/high temperatures) collected at the official National Weather Service station in Santa Rosa, California is provided in Appendix A (behind tabs at back of report).

A total of twelve vertebrate species (6 mammals, 2 reptiles, and 4 amphibians) were captured in pitfall traps set at the project site. Animals captured included: California meadow voles (*Microtus californicus*), Botta's pocket gopher (*Thomomys bottae*), Western harvest mouse (*Reithrodontomys megalotis*), deer mouse (*Peromyscus maniculatus*), house rat (*Rattus rattus*), Ornate shrew (*Sorex ornata*), Western fence lizard (*Sceloporus occidentalis*), alligator lizard (*Elgaria coerulea),* Pacific tree frogs (*Hyla regilla*), arboreal salamander (*Aneides lugubris*), western toad (*Bufo boreas)* and California slender salamander (*Batrachoseps attenuatus*) (Table 1 behind tabs at back of report). A total of 729 animals were captured during the 2005/2006 trapping season. Of these animals, 367 of 729 were captured alive and released.

8.2 Egg and Larval Surveys

No CTS adult, larval, or eggs were observed during trap check visual surveys or protocol level dip net surveys. The only amphibian found in the pond was Pacific tree frog. Larvae, eggs, and metamorphs of this frog were found in all survey years. Surprisingly, there were no western toad (*Bufo boreas*) eggs or larvae in the pond any survey year. All other captures were limited to Notonectids, Corixids, dragonfly larvae, snails, Dytiscids, and scuds.

The table following on the next page summarizes the results of all dip net and funnel surveys conducted in March, April and May 2005 and 2006:

Date	Feature	Survey Methods	Species Observed
29-Mar-05	Pond, swales, ditches	Observation/Dip Net	Notonectids, Corixids, *Hyla* eggs, snails, Dytiscids
4/13-15/2005	Pond, swales, ditches	Dip Net/Funnel Trap	Notonectids, Corixids, dragonfly larvae, *Hyla* larvae, snails
5/27-29/2005	Pond, swales, ditches	Dip Net/Funnel Trap	Notonectids, Corixids, dragonfly larvae, *Hyla* larvae, snails, Dytiscids
3/6-8/2006	Pond, swales, ditches	Dip Net/Funnel Trap	Notonectids, Corixids, dragonfly larvae, snails, Dytiscids, scuds
4/1-3/2006	Pond, swales, ditches	Dip Net/Funnel Trap	Notonectids, Corixids, *Hyla* eggs, snails, Dytiscids, Chironomids, damselfly larvae
5/12-13/2006	Pond, swales, ditches	Dip Net/Funnel Trap	Notonectids, Corixids, dragonfly larvae, *Hyla* larvae, snails, Dytiscids, scuds

9. DISSCUSION AND CONCLUSIONS

M&A found no evidence of CTS during two spring larval surveys and one full season of drift fence pitfall trapping at the project site located at the junction of Highway 101 and Mark West Springs Road in Santa Rosa. Based on these findings it is our conclusion that CTS do not reside within upland habitats on the project site or use the project site's aquatic habitats for breeding. Therefore it is our belief that this project will not affect CTS. This concludes the CTS trapping effort at the Santa Rosa Medical Center project site.

Appendix D5

Preconstruction Nesting Raptor Survey Report, Sutter Medical Center

August 31, 2009

Sponamore Associates
2128 Contra Costa Avenue
Santa Rosa, California 95405

Attention: Ms. Nadin Sponamore

RE: Preconstruction Nesting Raptor Survey Report
Sutter Medical Center
Santa Rosa, Sonoma County, California
APNs 058-040-058, -059, -060, -061

Dear Ms. Sponamore:

INTRODUCTION

On April 29, 2009, Monk & Associates, Inc. (M&A) completed a focused survey for active raptor (birds of prey) nest sites on the proposed Sutter Medical Center project site located at 50 Mark West Springs Road in the City of Santa Rosa, Sonoma County, California (herein referred to as the project site) (Figures 1 and 2). Specifically, this survey focused on nesting raptors such as red-tailed hawk (*Buteo jamaicensis*), red-shouldered hawk (*Buteo lineatus*), and white-tailed kite (*Elanus leucurus*) that could be affected by future project construction activities. Below we provide a discussion of the legal protections provided nesting raptors, a description of the project site, our survey methods and results.

LEGAL PROTECTION FOR RAPTORS AND OTHER NESTING BIRDS

All raptors are protected under the Federal Migratory Bird Treaty Act. Additionally, all nesting birds, including raptors, are protected under Sections 3505, 3503.5, and 3800 of the California Fish and Game Code that protect nesting birds, raptors, their eggs, and young. Finally, the white-tailed kite is “fully protected” under California Fish and Game Code. These laws/regulations protect raptors from “take,” or direct mortality of individuals and/or eggs. Thus, in accordance with these laws and regulations, direct “take” of nesting raptors, their active nests, eggs, and young should be avoided. However, once a raptor has completed its nesting cycle and the nest is empty, that is, the young have fledged (left the nest) or the nesting attempt failed, removal of the inactive nest site or nesting tree is not considered “take” under these regulations. Other regulations may be in affect, however, such as a tree ordinance or CEQA mitigation requirement that states otherwise so it is always necessary to check local ordinance or project specific documents prior to removing nests/nest trees or other nesting locations.

SITE LOCATION AND DESCRIPTION

The project site is approximately 53± acres in size. It is located in the southeast quadrant of the U.S. Highway 101/Mark West Springs Road interchange. It is currently under two ownerships: Luther Burbank Memorial Foundation (“LBMF”), and Sutter Medical Center of Santa Rosa or affiliate (“Sutter”) and is comprised of four legal parcels as follows:

The project site is located on and adjacent to the Luther Burbank Center. Figure 3 at the back of this report shows the various land uses within the project site boundary. The largest use of the property is paved parking, paved roads, buildings, and manicured landscaping, totaling approximately 25 acres. Soccer/lacrosse fields and other non-irrigated turf areas that include a tot-lot cover another approximately 10 acres. A large, approximately 15-acre parcel occurs on the west edge of the project site; this parcel has been used in the recent past as a horse pasture. This parcel is comprised largely of non-native annual grassland species. On the east side of this parcel there is a single family home and large utility barn. A smaller livestock building also occurs on this parcel (see Figure 3 for parcel locations). Also within the 15-acre parcel and immediately south of the residence and barns, there are two sewage treatment ponds that currently service the Luther Burbank Center. The aforementioned areas will be developed into the Sutter Medical Facility.

SURVEY METHODS

A survey of the project site and surrounding trees was conducted on April 29, 2009. M&A biologist Ms. Sarah Lynch conducted a focused survey for nesting raptors known from the region of the project site. Ms. Lynch is a qualified raptor biologist with many years of survey experience. The raptor species surveyed for included white-tailed kite, red-tailed hawk, and red-shouldered hawk, among others. These three species are the three that are most likely to occur in the habitats onsite.

Survey methods included conducting walking surveys to examine all trees and shrubs on the project site and using high-powered (10x42) Leica binoculars to examine trees and suitable shrubs within 500 feet of the project site. If trees offsite were located along public roads they were also checked for nests from an optimal location at or near the base of the tree. All suitable raptor nesting areas were examined for the presence of nests. The surveys also included examinations for indirect evidence of nesting. Such evidence includes the presence of fresh white-wash (i.e., excrement) in a tree or on the ground below a nest. Also, adult molt feathers, and/or down or feathers from young and/or adults located in relatively high concentrations in the vicinity of a nest. Also, evidence of kills (i.e., plucking posts and solitary kills) or pellet piles may indicate use of a tree or locality by nesting raptors. Finally, when raptors were observed, their behavior was interpreted to determine if they might be nesting in the vicinity of the project site. Behaviors that would indicate nesting in the vicinity would include defensive behavior, territorial behavior, or other behavior indicating that a raptor was unusually interested in our presence in the area.

SURVEY RESULTS

During the April 2009 nesting survey, M&A did not identify any active raptor nests on or within 500 feet of the project site. No raptors were observed in the area during the survey. Bird species observed onsite included house finch (*Carpodacus mexicanus*), California towhee (*Pipilo crissalis*), and American crow (*Corvus brachyrhynchos*). An old, crow-sized stick nest was observed onsite in a grove of pine trees. This nest was deemed inactive due to the presence of cobwebs and the absence of white wash below the nest and an absence of green branches on the nest.

CONCLUSIONS

M&A did not identify any raptor nests on site or within 500 feet of the project site during our 2009 survey. Since raptors are highly mobile and could nest on the project site or adjacent to the project site in future years, it is M&A's recommendation that if project site grading or construction activities would take place during the nesting season (February 1 through August 31st) that a preconstruction nesting survey be conducted. This survey should take place no greater than 30 days prior to any earth-moving or construction activity onsite. If a raptor nest was identified onsite or adjacent to the site during the preconstruction survey, appropriate nesting buffers would have to be established until the birds were finished nesting and the young were foraging independently. Once the young were foraging independently then the nesting buffer could be removed.

This concludes M&A's preconstruction nesting survey report. Should you have any questions, or wish to discuss any other aspect of this survey, please do not hesitate to call me at (925) 947-4867 extension 203.

Sincerely,

Sarah Lynch

Sarah Lynch

INTRODUCTION

Purpose

The purpose of this study was to undertake an initial geotechnical exploration program to develop preliminary geotechnical conclusions and recommendations for the proposed development. Additionally, in accordance with the requirements for such studies established by the Hospital Facilities Seismic Safety Act (SB 1953) and the California Building Code (CBC), this report presents an assessment of geologic hazards pertinent to the project site as these relate to the planned uses of the site.

This report provides our preliminary conclusions and recommendations for the conceptual development at the site. This report provides our recommendations for site development including site preparation; grading and treatment of existing fills; treatment of areas underlain by compressible and/or expansive soils; stability of graded slopes; preliminary foundation design considerations, preliminary pavement and retaining wall design criteria, and drainage.

Scope of Services

The scope of our current services included:

1. Review of published maps and previous reports regarding geological and geotechnical characteristics of the subject site.
2. Assessment of geological hazards in the general project area.
3. Drilling 21 exploratory borings.
4. Laboratory testing on selected materials.
5. Preliminary analysis of the geological and geotechnical data.

6. Preparation of this report summarizing our preliminary findings and recommendations.

This report anticipates that additional further design-level geotechnical explorations will be required at the site once development and grading plans have been developed. The future studies should address and characterize settlement conditions and provide recommendations for site-specific foundations based on proposed grading and planned structures.

Once detailed grading and site improvement plans have been prepared, ENGEO should be provided the opportunity to review these for conformance with the intent of our recommendations. During that time, ENGEO may need to perform additional evaluation and/or modify the recommendations contained herein (as deemed appropriate). Also, during our review of the 40-scale plans, additional recommendations for remedial site grading should be provided by ENGEO. This report was prepared for the exclusive use of the Sutter Medical Center and their design team consultants. In the event that any changes are made in the character, design, or layout of the development, the conclusions and recommendations contained in this report should be reviewed by ENGEO to determine whether modifications to the report are necessary. This document may not be reproduced in whole or in part by any means whatsoever, nor may it be quoted or excerpted without the express written consent of ENGEO Incorporated.

<u>Site Location and Description</u>

The subject site is located at 50 Mark West Springs Road in Santa Rosa, California, as shown on the Site Vicinity Map (Figure 1). The site encompasses approximately 78 acres, including the Luther Burbank Center for the Arts (LBC) which is approximately 52 acres in size. In addition to the LBC, a rural residence with barn, out buildings and undeveloped pasture land as well as a single-family home that is currently used as law offices are present within the property boundary.

An existing Luther Burbank Center (LBC) and associated parking areas is currently located at the center of the site. The LBC structure is a cultural and performing arts event center, and a part of the property is leased to the Sonoma Academy, an independent college-preparatory high school. This portion of the Property includes approximately 39 acres that are occupied by asphalt-covered parking areas, an athletic field, and an existing waste water treatment facility. Two ponds associated with the wastewater treatment facility are located along the main access road that connects to Mark West Springs Road. The athletic field is located opposite to the wastewater treatment facility at the north side of the site along Mark West Springs Road. At the south and southeast corner of the site, a vineyard is present. The remainder of the site is currently vacant and covered with seasonal grass. Figure 2 shows the existing site conditions.

<u>Proposed Development</u>

Proposed development at the site includes construction of two Sutter facilities – a medical office building and a main hospital building; three LBC facilities – an amphitheatre, a conference/banquet center and a new hospitality center; and associated parking areas and garages. Furthermore, site improvements such as widening of Marks West Springs Road as well as construction of stormwater retention areas, water tank and wastewater storage are proposed.

A preliminary design concept for the proposed hospital building is to be approximately 6 stories in height, with a building footprint of about 180,000 square feet. A helipad is proposed at the top of the hospital building. The medical office building is planned to be 5 stories in height, and occupy a footprint of approximately 80,000 square feet. Paved parking areas and a parking garage is proposed around the hospital building. The details regarding building loads have not been determined at this time; however, based on similar developments, it is anticipated that the structural loads of the planned multi-level building structures will be low to high.

The proposed LBC facilities are anticipated to consist of single-level structures, and the amphitheater acoustically controlled for year-round use for up to 2,800 attendees.

FIELD EXPLORATION

The field exploration for this study was conducted between October 25 and 28, 2004, and consisted of drilling 20 boreholes and excavating 1 hand auger boring. The approximate locations of the borings as they relate to existing site and planned development are shown in Figures 2 and 3, respectively. The locations of borings were determined by pacing from existing features and should be considered accurate only to the degree implied by the method used.

Twenty test borings were drilled using CME 75 truck-mounted drill rig equipped with hollow stem augers and an automatic-trip hydraulic hammer. The borings ranged in depth between 6½ and 41½ feet below the existing ground surface (bgs). An ENGEO geologist logged the boreholes in the field and collected soil samples using a 3-inch O.D. California-type split-spoon sampler fitted with 6-inch-long brass liners or a 2-inch O.D. Standard Penetration Test (SPT) split-spoon sampler.

The penetration of the split-spoon samplers into the subsurface materials was field recorded as the number of blows needed to drive the sampler 18 inches in 6-inch increments using the 140-pound hammer with a 30-inch drop. The report boring logs represent the actual field blow counts for the last one foot of penetration and have not been subjected to conversion factors to achieve representative SPT results.

One test boring was drilled using hand auger equipment to a depth of 2½ feet. One bulk soil sample is collected from the exploration location using hand sampling techniques.

Three 1-inch-diameter standpipe piezometers were installed within three borings designated as P-3, P-11 and P-22. On October 28, 2004, readings of stabilized free water levels in the piezometers were measured relative to the existing ground surface elevations. The field logs for the borings were used to develop the report borelogs, which are located in Appendix A. The boring logs depict subsurface conditions within the borings for the date of site activities; however, subsurface conditions may vary with time. The boreholes were backfilled on the day of field exploration activities.

Laboratory Testing

Following the exploratory drilling, the collected soil samples were re-examined in our laboratory to confirm field classifications. Representative soil samples recovered during drilling were tested for the following physical characteristics:

Characteristic	Test Method	Location of Results Within this Report
Natural Unit Weight and Moisture Content	ASTM D-2216	Appendix A
Unconfined Compressive Strength	ASTM D-2166	Appendix B
Percent Passing No. 200 Sieve	ASTM D-422	Appendix B
Atterberg Limits	ASTM D-4318	Appendix B
Consolidation Test and Time Rate	ASTM D-4186	Appendix B

The results of moisture and density tests are included on the boring logs in Appendix A. The remaining laboratory test results are presented in Appendix B.

GEOLOGY AND SEISMICITY

Regional Geology

The site is located within the Coast Ranges geologic province of California, a series of northwest-trending ridges and valleys. Bedrock in the province has been folded and faulted during regional uplift beginning in the Pliocene period, about 4 million years before present. Locally, the site is mapped as underlain by Holocene-Pleistocene Alluvium (Wagner and Bortugno, 1982). This alluvium consists of unconsolidated deposits of sand, silt, gravel and clay likely derived from the bedrock uplands and older unconsolidated deposits. The alluvial deposits in this area are greater than 30 feet in thickness.

Faulting and Seismicity

The site is located in a region that contains numerous active[1] and potentially active earthquake faults. The site is not located within the State of California Fault Hazard Zone. The active Rodgers Creek fault is located approximately 0.7 mile to the east of the project area. The Rodgers Creek fault is capable of creating earthquakes with a moment magnitude of M7.0 (Blake, 1996). The Maacama Fault is located 6.3 miles to the east, and the San Andreas Fault is located 19.5 miles to the west of the site. A Regional Faulting and Seismicity Map are shown on Figure 5, which shows regional proximity of major active faults and significant historic earthquakes with respect to the site.

The regional seismicity of the Bay Area was recently evaluated by the Working Group on Northern California Earthquake Probabilities (WGEP 2003). The Working Group periodically attempts to summarize seismic risk in the Bay Area by presenting probabilities of 6.7 Mw or greater earthquakes on active Bay Area faults for a 30-year return interval (2003-2032); the most

[1] An active fault is defined by the State Mining and Geology Board as one that has had surface displacement within Holocene time (about the last 11,000 years) (Hart, 1997).

recent summary gives a 62 percent aggregate probability for the entire Bay Area. The active Rodgers Creek fault system is estimated to have a 30-year probability of 27 percent for a M6.7 or greater earthquake. The San Andreas Fault system was assigned a 30-year probability of 21 percent. It should therefore be expected that the site will experience one or more episodes of strong ground shaking during the design life of the proposed improvements.

Subsurface Conditions

Existing Fills. Existing fills are encountered throughout this site, except in the existing fields used for grazing at the northwestern section of the site. Based on Borings B-5 through B-11, HB15 and B-16 to B-21, existing fills extend to approximately 3 to 5 feet below the current site grades. These fills typically consist of stiff to very stiff sandy clays and silty clays with various amounts of gravel and rock fragments. The existing fills were likely placed at the site in conjunction with previous site grading associated with the existing LBC center development.

Alluvium. Alluvial deposits were encountered in all borings drilled at the site. These deposits generally consist of sands, clayey sand, sandy clay, silty clay and clays. These were encountered extending from the existing ground surface at Borings B-1 to B-4 and B-12 to B-14, as well as immediately beneath existing fill deposits encountered at Borings B-5 to B-11 and B-15 to B-21. Alluvium extended to at least the maximum depth of borings drilled during this study, to depths of at least 41½ feet. Above the groundwater table, these alluvial deposits are generally medium stiff to stiff. Below the free groundwater levels, the alluvial deposits grades to sandy clay to clayey sand and become soft. The soft clayey sand to sandy clay deposits are encountered in all borings except in Boring B-7. The soft deposits are approximately 5 to 15 feet thick and are generally encountered at 10 to 15 feet bgs.

Beneath the soft alluvial deposits layer, medium dense sandy soils with gravels as well as medium stiff to stiff clayey soils are encountered to the termination depths of the deeper borings drilled, B-3, B-4 and B-11.

Groundwater Conditions

Based on the exploration data at this site, groundwater levels ranged from depth of approximately 10½ to 19 feet bgs. Three piezometers were installed at Boring B-3, B-11 and B-16. General construction of the piezometers is depicted on the boring logs in Appendix A. Groundwater in the piezometer was measured after the water level stabilized and is recorded on the well logs. It should be noted that groundwater conditions are expected to vary depending on factors such as weather conditions, time of year, and irrigation practices.

Seismic Hazards

Potential seismic hazards resulting from a nearby moderate to major earthquake may include primary ground rupture, ground shaking, lurching, liquefaction, dynamic densification, lateral spreading, inundation due to embankment failure, and earthquake-induced landsliding. These hazards are discussed below. Risks from seiches, tsunamis, and volcanic eruption are currently considered negligible at the subject project site.

Ground Rupture. No active or inactive faults are known to pass through the proposed site. The closest known active fault to the site is the Rodgers Creek fault located about 0.7 mile to the east. The site is not within an Earthquake Fault Special Study Zone. Based on this information, it is our assessment that the risk of ground rupture is considered low at this site.

Ground Shaking. An earthquake of moderate to high magnitude generated within the San Francisco Bay Region could cause considerable ground shaking at the site. The degree of shaking is dependent on the magnitude of the event, the distance to its zone of rupture, and local geologic conditions. We performed a probabilistic seismic hazard analysis for the site based on current California fault data. In this analysis, a computer program (EZ-FRISK) was used to model the seismic setting of the region and is able to explicitly account for uncertainty relating to the following:

- Earthquake magnitude
- Rupture length
- Location of rupture
- Maximum possible earthquake magnitude
- Recurrence interval of earthquake events

The program calculates, by summation from earthquake sources, the total average annual expected number of occurrences of acceleration greater than each of several specified values. Once the annual probability is obtained, the probability of the level of ground acceleration being exceeded over a specified time period is calculated. Using this method, a horizontal ground surface acceleration of 0.86g is predicted to have a 10 percent probability of being exceeded in a 100-year design life, and a horizontal ground surface acceleration of 0.66g is predicted to have a 10 percent probability of being exceeded in a 50-year design life. The probabilistic ground surface acceleration was derived using attenuation relationships developed by Boore-Joyner-Fumal (1997), Sadigh (1997) and Abrahamson and Silva (1997). Figure 8 shows the normalized spectral acceleration. The EZFRISK Probabilistic Seismic Hazard Analysis is provided in Appendix C.

To mitigate the ground shaking effects, all structures should be designed using sound engineering judgment and the latest Uniform Building Code (UBC) requirements as a minimum, taking into consideration that the proposed medical facilities are considered special occupancy structures. In accordance with the 1997 UBC, the site is located within Seismic Zone 4, with a seismic zone factor Z of 0.4, as given in Figure 16-2 and Table 16-I in the UBC. Based on site conditions, the soil profile at the site can be classified as a S_D profile as defined in Table 16-J. According to Tables 16-S and 16-T, near-source factors, N_a of 1.5 and N_v of 2.0, are based on the

Rodgers Creek fault being a seismic source type A, approximately 0.7 miles (1.1 km) away. The UBC parameters for the site are presented in the following table:

1997 UNIFORM BUILDING CODE - Chapter 16

ITEM	DESIGN VALUE	SOURCE
Seismic Zone	4	Figure 16-2
Seismic Zone Factor	0.40	Table 16-I
Soil Profile Type	S_D	Table 16-J
Seismic Source Type	A	Table 16-U
Near Source Factor, N_a	1.5	Table 16-S
Near Source Factor, N_v	2.0	Table 16-T
Seismic Coefficient, C_a	0.66	Table 16-Q
Seismic Coefficient, C_v	1.28	Table 16-R

Seismic design provisions of current building codes generally prescribe minimum lateral forces, applied statically to the structure, combined with the gravity forces of dead-and-live loads. The prescribed lateral forces are generally considered to be substantially smaller than the actual peak forces that would be associated with a major earthquake. The Structural Engineers Association of California has also developed performance-based engineering guidelines in their report entitled Vision 2000 (SEAOC, 1995). The conceptual framework for performance-based engineering guidelines is defined as a full range of seismic engineering issues to be addressed in designing structures for predictable and definable seismic performance within established levels of risk. The performance levels are defined as follows:

- Fully Operational – Facility continues in operation with negligible damage.
- Operational – Facility continues in operation with minor damage and minor disruption in nonessential services.
- Life Safe – Life safety is substantially protected, damage is moderate to extensive.
- Near Collapse – Life safety is at risk, damage is severe, structural collapse is prevented.

Vision 2000 includes four levels of earthquake risk as shown below.

Vision 2000 Event	Probability of Exceedance (%)	Design Life (years)	Recurrence Interval (years)
Frequent	50	30	43
Occasional	50	50	72
Rare	10	50	475
Very rare	10	100	970

As shown in Figure 9, essential and safety-critical buildings, such as hospitals and nuclear power facilities, would be expected to meet the basic objective to be fully operational in a rare earthquake and satisfy a life-safety performance level for a very rare earthquake.

Liquefaction. Liquefaction is a phenomenon in which saturated cohesionless soils are subject to a temporary, but essentially total, loss of shear strength because of pore pressure build-up under the reversing cyclic shear stresses associated with earthquakes. According to recent liquefaction research performed by Seed et al. (2003), a soil layer is not considered liquefiable if it meets any of the following criteria:

- The factor of safety of liquefaction resistance calculated by the methods of Youd et al. (2001) is greater than 1.0.
- The layer is above the water table.
- The fines content (FC) is greater than 20 percent, Plasticity Index (PI) is greater than 12 percent, and water content (w_c) is less than 80 percent of the liquid limit (LL).
- The FC is greater than 35 percent, PI is less than 12 percent, and w_c is less than 0.85(LL).

As discussed in previous sections, saturated, soft sandy clay and clayey sand deposits were encountered at the site. Laboratory results on two soil samples collected within this layer indicate that the soft soil deposits have an FC greater than 35 percent, PI greater than 12 percent.

Although soil in this layer contains plastic fines, if the water content relative to their liquid limit is 75 percent to 85 percent of LL, this layer has a potential to hold the water and dissipate excess pore pressures slowly due to their low permeability, resulting in a postponed liquefaction condition. Depending on the in-situ water content of the soft soils, some high water content layers might be potentially liquefiable. Although the fines of the potentially liquefiable layers are not classified as sensitive soils and, therefore, are not vulnerable to major loss of strength if sheared or remolded during an earthquake event. Supplemental geotechnical exploration at this site should employ rotary wash methods and/or cone penetration testing (CPT) to define susceptibility of alluvial soils to seismic settlement or potential deformation as these relate to liquefaction.

<u>Surface Deformation</u>. One implication of possible liquefaction is the potential that its occurrence may result in surface expression. A strong seismic event induces cyclic loading of subsurface soils and subsequent liquefaction may occur; the soil layers undergoing liquefaction lose strength due to an increase in pore pressure. The induced pore pressures upset the subsurface equilibrium and relief of the pressure is sought. If the seismic event occurs over an extended duration, the soils subjected to increased pore pressure may migrate toward the surface, resulting in ejection and subsequent sand boiling at the surface. This phenomenon of surface expression can result in substantial ground settlement and heave. Supplemental geotechnical exploration at this site should employ rotary wash methods and/or cone penetration testing (CPT) to define susceptibility of alluvial soils to surface deformation.

<u>Earthquake-Induced Densification</u>. Densification of loose to medium-dense clean sand above and below the groundwater level during earthquake shaking could cause settlement. As previously stated, loose to medium-dense clean sands were not encountered during the subsurface exploration; therefore, densification induced by earthquake shaking is expected to be low.

Lateral Spreading. Lateral spreading is a failure within a nearly horizontal soil zone (possibly due to liquefaction), which causes the overlying soil mass to move toward a free face or down a gentle slope. Supplemental geotechnical exploration at this site should employ rotary wash methods and/or cone penetration testing (CPT) to define susceptibility of alluvial soils to seismic settlement or potential lateral spreading.

Earthquake-Induced Landsliding. No landslides have been mapped within or immediately adjacent to the site; therefore, the potential for earthquake-induced landsliding to occur is considered low.

Inundation Due to 100-Year Flood. As shown on Figure 6, the project site is not located within the 100-year flood inundation area; therefore, risk of flooding is considered low.

Corrosion Potential. An evaluation of possible corrosion impacts to site improvement should be conducted after mass grading of the site. Near-surface soil samples should be collected and tested for sulfate corrosivity. Based on test results, a suitable type of cement can be chosen according to the criteria presented in Table 19-A-4 of the 1997 Uniform Building Code (UBC). In absence of lab testing on near-surface soil, we recommended utilizing the “Very Severe” sulfate exposure criteria of the UBC for concrete strength design; however, structural engineering requirements for strength design may result in more stringent concrete specifications.

Expansive Soils. Another concern within the proposed project is the expansive nature of some of the on-site soils. Based on lab testing results, Plasticity Index (PI) range from 13 to 26 indicating that site soils have low to moderately expansion potential. Expansive soils shrink and swell as a result of moisture changes. This can cause heaving and cracking of slabs-on-grade, pavements, and improvements overlying these soils. Successful development on expansive soils requires special attention during construction. It is imperative that exposed subgrade materials be kept moist at all times prior to construction because it is extremely difficult to re-moisturize the soil without excavating, moisture conditioning, and recompacting. Long-term mitigation measures should also include the prevention of moisture variation.

CONCLUSIONS AND RECOMMENDATIONS

Based on the findings from this subsurface exploration, laboratory test results and analyses, it is our preliminary conclusion that the planned project development is feasible from a geotechnical standpoint, provided that the recommendations contained in this report along with sound engineering practices are incorporated in the future design and construction of the project. This study is preliminary and intended to provide guidelines for planning and conceptual site development. The recommendations should be refined and modified, as deemed appropriate by the Geotechnical Engineer during project development. During that time, ENGEO anticipates a need to perform additional field investigations, settlement analysis, and modify the recommendations contained herein to address the site-specific development plans.

The main consideration for the planned development is the compressibility of soft clayey soils at depths between 10 to 25 feet, and potential total and differential settlement from increased future loads. The alluvial deposits are considered susceptible to compression from loads imposed by future fills and heavy structural loads. Additional geotechnical considerations for the planned development include the presence of existing “uncontrolled” fill materials considered susceptible to excessive total and differential settlements; low to moderately expansive soil which may undergo significant volume changes (swell and compression) when subjected to varying moisture contents; and the potential for liquefaction under strong ground shaking.

Settlement Considerations

Depending on planned structural loads, grading, and allowable settlement of the planned structures, the use of a number of different foundation systems may be appropriate at this site. The near-surface soils are generally stiff in the upper 10 feet of existing grades. From 10 to 25 feet, soft to stiff clayey soils were encountered and groundwater levels were detected from about 10½ to 19 feet bgs. Soft layers may compress or settle when subjected to increased loads from raising future grades and/or from heavily-loaded shallow foundations bearing upon these soils. Excessive settlement could potentially impact future structures, site improvements, grades and drainage. To reduce settlement, it is recommended to minimize raising grades. As a guideline, it is our preliminary recommendations that future site grades should not be raised greater than two feet above existing site grades. If it is necessary to raise future site grades greater than 2 feet, supplemental design-level geotechnical exploration and settlement analyses should be performed to evaluate such conditions. Furthermore, it may be possible to raise grades beyond the 2 feet, if special mitigation measures such as surcharging are undertaken. Surcharging is used to pre-consolidate compressible soils using surplus fill above design grades, and once actual settlements are nearly completed and significantly diminish the excess surcharge fill is removed. If this special mitigation measure is undertaken, a surcharge program will be established based on final design considerations, anticipated loads as well as an appropriate settlement monitoring.

Foundation Considerations

Based on the soil conditions, it is our preliminary assessment that the use of shallow foundation systems would be suitable to support relatively light to moderate load located near the existing site grades (approximately less than 1 to 3 kips per lineal foot for wall loads, and less than 30 to 40 kips per column load). Of the available shallow foundation systems, continuous strip and column footings embedded approximately 18 to 24 inches would be suitable combined with concrete slab-on-grade floors. Allowable bearing pressures considering dead plus live loads may be approximately 1,500 to 2,500 pounds per square foot (psf). A one-third increase in allowable pressure may be considered acceptable for temporary loads. Due to the presence of near-surface expansive soils slab on grade elements should be underlain by a layer of low expansive select materials.

For larger multiple-level buildings and parking structures, it is anticipated that settlement resulting from shallow foundations near existing grade may be considerable and excessive for the planned structures. Therefore, for the large buildings and structures, the use of deep foundation systems, such as driven piles or drilled piers, would be suitable to provide the necessary support and minimize settlement. Another foundation alternative to consider for heavily-loaded structures with depressed lower levels approximately 10 to 20 feet below existing site grades is the use of a rigid structural mat system.

Deep foundations would be intended to support structural loads in the stiff soils at greater depth. Based on our preliminary site exploration, stiff soils were encountered at Boring B-3 at approximately 40 feet bgs. Of the available systems and given groundwater conditions, pre-stressed concrete driven piles foundation would be suitable for support of heavy loaded structures. Pre-stressed concrete piles extending to and deriving support in stiff alluvium as friction piles are anticipated based on the significant depth of alluvium in this area. Although no design loads are available at this time, typical pile capacities of approximately 100 to 300 kips per pile could be achieved depending on specific pile design and capacity. If a pile foundation system is desired, ENGEO should be consulted to work with the Structural Engineer regarding design considerations. Design-level exploration is necessary to determine criteria for deep foundations at this site. Once details regarding the structural designs of the large structures have been determined, ENGEO should review such designs for appropriate changes and/or modifications to these preliminary foundation recommendations as deemed necessary.

Concrete Slabs-on-Grade and Concrete Pavements. It may be desired to have the lower level of the structures resting upon grade. It is our preliminary recommendations that concrete slabs of at least 6 inches thick to be underlain by an 8-inch-thick layer of Class 2 Aggregate Base (AB) material. The AB should be placed at a minimum relative compaction of 95 percent with a moisture content of at least optimum. Concrete floor slab and pavement reinforcing should be designed by the Structural Engineer. As a minimum, the slab reinforcement should consist of No. 4 bars spaced 16 inches on center each way.

If penetration of moisture or water vapor would be objectionable, such as special coverings, a vapor retarder should be used. As a minimum, this should consist of a 20 mils thick membrane. Even with this recommended system, localized wet spots may occur. If this is objectionable, waterproofing and pavement subdrainage, as described below, should be considered. Minor cracking and distress should be anticipated in the structure and the slabs-on-grade as a result of concrete shrinkage. Frequent control joints should be provided to control cracking as recommended by the American Concrete Institute (Publication ACI 302.1R-89).

Subdrainage. Groundwater levels at this site in our borings correlates to an approximate elevation of about 150 feet mean sea level datum (msl). We understand that the elevation of the lowest level of structures has not yet been determined. As such, appropriate subdrainage should be provided in order to minimize the amount of water penetration to the lower levels of the structure. Subsurface drains should be installed around the perimeter and below structures, as deemed appropriate. Alternatively waterproofing needs to be considered where portions of the structure may extend below high-water levels.

Exterior Slab-on-Grade

This section provides guidelines for exterior "secondary" slabs such as exterior walkways and steps. Secondary slabs-on-grade should be constructed as units that are structurally independent of the foundation system. This allows the slabs to move with minimum distress to the foundations. Slabs-on-grade should be designed specifically for their intended use and loading requirements by the Structural Engineer. As mentioned previously, some of the site soils have a low to moderate expansive potential; therefore, cracking of slabs should be expected in the future. To reduce and control cracking, slabs-on-grade should be reinforced with steel rebar and provided with frequent control joints. The actual reinforcement should be designed by the Structural Engineer and should, as a minimum, consist of No. 3 bars spaced 16 inches on center each way. In our experience, welded wire mesh is not sufficient to control slab cracking. Secondary slabs-on-grade should consist of a minimum thickness of 4 inches of concrete placed on a 4-inch-thick layer of clean, crushed rock or gravel (Section 2.04, Part I of Guide Contract Specifications).

Steel should not be used to tie the secondary slabs, walkways, or steps to adjacent foundations. To minimize the swell potential of the subgrade soils under secondary slabs, care must be exercised to attain a near-saturated condition of the subgrade before concrete is placed. Exterior slabs should be constructed with thickened edges extending at least 6 inches into compacted soil to minimize water infiltration. Slabs should slope away from structures at least 2 percent.

Preliminary Grading Considerations

The recommendations for grading contained in this report are of a general nature and may be refined as detailed design and grading plans become available. ENGEO should provide geotechnical input during the design process and be provided with final design drawings for review prior to grading and construction. Our preliminary recommendations for the anticipated earthwork are as follows:

Excavation. Excavations may be necessary for the construction of the proposed basement level of the structures. The size and nature of these excavations have not yet been determined. All excavations should conform to Cal-OSHA requirements.

Fills, Backfills, and Subgrade Preparation. With the exception of any organically contaminated materials (soil which contains more than 3 percent organics), the site soils are suitable for use as engineered fill provided debris and deleterious matter, as determined by an ENGEO representative in the field, has first been removed. All existing structures, buried structures and remnants should be removed prior to construction. Existing uncontrolled fills and any debris-laden fills are considered susceptible to excessive total and differential settlements. Therefore, to reduce settlements resulting from unsuitable fills where these fills will be located below structures or improvements, they should be completely over-excavated and replaced with engineered fill. In general, if existing fills are cleared of unsuitable debris and rubble, oversized-rock fragments, and any hazardous or deleterious materials (if encountered), these materials are anticipated, from a geotechnical standpoint, to be suitable for reuse as engineered fill. Prior to the placement of engineered fill, wet or compressible soil should be removed, and the bottom should be scarified an additional 12 inches. Fill placement should be performed in accordance with the recommendations provided in future anticipated design-level studies. After removal of soft surface soils and any loose fill, and existing fills, the exposed surface should be scarified to a depth of 12 inches, moisture conditioned, and recompacted to provide adequate bonding with the initial lift of fill. All fills should be placed in thin lifts. The lift thickness should not exceed 12 inches or the depth of penetration of the compaction equipment used, whichever is less. General engineered fill material should be moisture conditioned to at least 3 percentage points above optimum moisture content and compacted to not less than 90 percent relative compaction. Relative compaction refers to in-place dry density of the fill material expressed as a percentage of the maximum dry density as determined by ASTM D-1557-91. Optimum moisture is the moisture content corresponding to the maximum dry density. ENGEO must be notified a minimum of 48 hours prior to grading in order to coordinate our schedule with the grading contractor. It is important that all site preparation, including demolition and stripping, should be done under the observation of the Geotechnical Engineer or his/her qualified field representative and should be carried out according to the requirements contained herein and within the Guide Contract Specifications in Appendix D.

Import Fills. The Geotechnical Engineer should be informed when import materials are planned for the site. Import materials should be submitted to the Geotechnical Engineer for testing and approval prior to delivery at the site and should conform to the requirements provided in Section 2.02B of Part I of the Guide Contract Specifications.

Construction Dewatering. The water table for the site is estimated at depths ranging from 10½ to 19 feet bgs. If excavations extend below this elevation, temporary construction dewatering should be anticipated. The selection of dewatering equipment should be left to the discretion of the contractor. We recommend that dewatering be carried out in such a manner as to maintain groundwater a minimum of 2 feet below the bottom of the excavation. Ponding of storm water, except within engineered sediment detention basins, must not be allowed at the site and particularly on the building areas during work stoppage for rainy weather. Before the grading is halted by rain, positive slopes should be provided to carry surface runoff in a controlled manner to a discharge point approved by the Civil Engineer.

Graded Slopes. Cut and fill slopes up to 15 feet in vertical height may be constructed at slope gradients no steeper than 2:1 (horizontal:vertical).

Drainage Requirements. Improper drainage may result in fill saturation with consequent loss of compaction and fill strength. As a minimum requirement, finished grades should provide a slope gradient of at least 3 to 5 percent to drain positively away from the structures. Care should be exercised to ensure that landscape with 5-foot mounds will not interfere with these requirements.

Preliminary Retaining Walls Criteria

Conventional retaining walls (i.e. concrete, masonry, etc.) that are drained and less than 10 feet in vertical height should be designed to resist the following earth pressures. If the retaining walls are free to deflect, then these should be designed for active earth pressures. If the walls are restrained (not free to deflect), then these should be designed for at-rest earth pressures.

DRAINED LATERAL EARTH PRESSURES

Backfill Slope Condition (horizontal:vertical)	Active Pressure (pcf)	At-Rest Pressure (pcf)
Level	50	85
4:1	55	90
3:1	60	100
2:1	70	110

For walls greater than 10 feet, additional support will be needed to minimize the amount of rotational movement. The final plans should be reviewed by ENGEO, and large walls should be evaluated on a case-by-case basis. ENGEO should work together with the Structural Engineer. All walls should contain backdrain facilities placed at the base of the foundation. Backfill of walls should be performed under the observation and testing of ENGEO and according to the recommendations provided in the referenced reports.

Preliminary Pavement Design

The following recommendations for preliminary asphalt pavement sections are intended as a conceptual guide for planning. The preliminary pavement sections are based on an estimated R-Value of 5. Actual R-Value samples should be collected for testing after grading to approximate rough grades and installation of underground utilities. The preliminary pavement sections are based on the estimated R-Value, the Caltrans “Design Method for Flexible Pavements”, and Traffic Indices (T.I.) ranging from 4 to 8. However, T.I. values should be determined by the Civil Engineer or appropriate public agency.

Traffic Index	Asphalt Concrete (in.) (Type B)	Aggregate Base (in.) (Class 2)
4.0	2½	7½
5.0	3	10
6.0	3½	13
7.0	4	16
8.0	4	17½

Pavement materials and construction should comply with the specifications and requirements of the Standard Specifications by the State of California Division of Highways, City of Santa Rosa requirements and the following minimum requirements.

- All pavement subgrades should be scarified to a minimum depth of 12 inches below finished subgrade elevation; moisture conditioned to 3 percent above optimum, and compacted to at least 95 percent relative compaction and in accordance with city requirements.

- Subgrade soils should be in a stable, non-pumping condition at the time aggregate baserock materials are placed and compacted.

- Adequate provisions must be made such that the subgrade soils and aggregate baserock materials are not allowed to become saturated.

- Aggregate baserock materials should meet current Caltrans specifications for Class 2 Aggregate Baserock, and should be compacted to at least 95 percent of maximum dry density.

- Asphalt paving materials should meet current Caltrans specifications for asphalt concrete.

- All concrete curbs separating pavement and irrigated landscaped areas should extend into the subgrade and below the bottom of adjacent aggregate baserock materials.

<u>Utilities</u>

It is recommended that all utility trench backfill be done under the observation of a Geotechnical Engineer, in accordance with both the City of Santa Rosa and utility agency requirements. Pipe zone backfill (i.e. material beneath and immediately surrounding the pipe) may consist of a well-graded import or native material less than ¾ inch in maximum dimension compacted in accordance with the recommendations provided above for engineered fill. Trench zone backfill (i.e. material placed between the pipe zone backfill and the ground surface) may consist of native soil compacted in accordance with recommendations for engineered fill.

LIMITATIONS AND UNIFORMITY OF CONDITIONS

This report is issued with the understanding that it is the responsibility of the owner to transmit the information and recommendations of this report to developers, owners, buyers, architects, engineers, and designers for the project so that the necessary steps can be taken by the contractors and subcontractors to carry out such recommendations in the field. The conclusions and recommendations contained in this report are solely professional opinions.

The professional staff of ENGEO Incorporated strives to perform its services in a proper and professional manner with reasonable care and competence, but is not infallible. There are risks of earth movement and property damages inherent in land development. We are unable to eliminate all risks or provide insurance; therefore, we are unable to guarantee or warrant the results of our work.

This report is based upon field and other conditions discovered at the time of preparation of ENGEO's work. This document must not be subject to unauthorized reuse, which is, reusing without written authorization of ENGEO. Such authorization is essential because it requires ENGEO to evaluate the document's applicability given new circumstances, not the least of which is passage of time. If actual field or other conditions necessitate clarifications, adjustments, modifications or other changes to ENGEO's work, ENGEO must be engaged to prepare the necessary clarifications, adjustments, modifications or other changes before construction activities commence or further activity proceeds. If ENGEO's scope of services does not include on-site construction observation, or if other persons or entities are retained to provide such services, ENGEO cannot be held responsible for any or all claims arising from or resulting from the performance of such services by other persons or entities, and from any or all claims arising from or resulting from clarifications, adjustments, modifications, discrepancies or other changes necessary to reflect changed field or other conditions.

Guide Contract Specifications

GUIDE CONTRACT SPECIFICATIONS

PART I - EARTHWORK

PREFACE

These specifications are intended as a guide for the earthwork performed at the subject development project. If there is a conflict between these specifications (including the recommendations of the geotechnical report) and agency or code requirements, it should be brought to the attention of ENGEO and Owner prior to contract bidding.

PART 1 - GENERAL

1.01 WORK COVERED

A. Grading, excavating, filling and backfilling, including trenching and backfilling for utilities as necessary to complete the Project as indicated on the Drawings.

B. Subsurface drainage as indicated on the Drawings.

1.02 CODES AND STANDARDS

A. Excavating, trenching, filling, backfilling, and grading work shall meet the applicable requirements of the Uniform Building Code and the standards and ordinances of state and local governing authorities.

1.03 SUBSURFACE SOIL CONDITIONS

A. The Owners' Geotechnical Exploration report is available for inspection by bidder or Contractor. The Contractor shall refer to the findings and recommendations of the Geotechnical Exploration report in planning and executing his work.

1.04 DEFINITIONS

A. Fill: All soil, rock, or soil-rock materials placed to raise the grades of the site or to backfill excavations.

B. Backfill: All soil, rock or soil-rock material used to fill excavations and trenches.

C. On-Site Material: Soil and/or rock material which is obtained from the site.

D. Imported Material: Soil and/or rock material which is brought to the site from off-site areas.

E. Select Material: On-site and/or imported material which is approved by ENGEO as a specific-purpose fill.

F. Engineered Fill: Fill upon which ENGEO has made sufficient observations and tests to confirm that the fill has been placed and compacted in accordance with specifications and requirements.

G. Degree of Compaction or Relative Compaction: The ratio, expressed as a percentage, of the in-place dry density of the fill and backfill material as compacted in the field to the maximum dry density of the same material as determined by ASTM D-1557 or California 216 compaction test method.

H. Optimum Moisture: Water content, percentage by dry weight, corresponding to the maximum dry density as determined by ASTM D-1557.

I. ENGEO: The project geotechnical engineering consulting firm, its employees or its designated representatives.

J. Drawings: All documents, approved for construction, which describe the Work.

1.05 OBSERVATION AND TESTING

A. All site preparation, cutting and shaping, excavating, filling, and backfilling shall be carried out under the observation of ENGEO, employed and paid for by the Owners. ENGEO will perform appropriate field and laboratory tests to evaluate the suitability of fill material, the proper moisture content for compaction, and the degree of compaction achieved. Any fill that does not meet the specification requirements shall be removed and/or reworked until the requirements are satisfied.

B. Cutting and shaping, excavating, conditioning, filling, and compacting procedures require approval of ENGEO as they are performed. Any work found unsatisfactory or any work disturbed by subsequent operations before approval is granted shall be corrected in an approved manner as recommended by ENGEO.

C. Tests for compaction will be made in accordance with test procedures outlined in ASTM D-1557, as applicable. Field testing of soils or compacted fill shall conform with the applicable requirements of ASTM D-2922.

D. All authorized observation and testing will be paid for by the Owners.

1.06 SITE CONDITIONS

A. Excavating, filling, backfilling, and grading work shall not be performed during unfavorable weather conditions. When the work is interrupted by rain, excavating, filling, backfilling, and grading work shall not be resumed until the site and soil conditions are suitable.

B. Contractor shall take the necessary measures to prevent erosion of freshly filled, backfilled, and graded areas until such time as permanent drainage and erosion control measures have been installed.

PART 2 - PRODUCTS

2.01 GENERAL

A. Contractor shall furnish all materials, tools, equipment, facilities, and services as required for performing the required excavating, filling, backfilling, and grading work, and trenching and backfilling for utilities.

2.02 SOIL MATERIALS

A. Fill

1. Material to be used for engineered fill and backfill shall be free from organic matter and other deleterious substances, and of such quality that it will compact thoroughly without excessive voids when watered and rolled. Excavated on-site material will be considered suitable for engineered fill and backfill if it contains no more than 3 percent organic matter, is free of debris and other deleterious substances and conforms to the requirements specified above. Rocks of maximum dimension in excess of two-thirds of the lift thickness shall be removed from any fill material to the satisfaction of ENGEO.

2. Excavated earth material which is suitable for engineered fill or backfill, as determined by ENGEO, shall be conditioned for reuse and properly stockpiled as required for later filling and backfilling operations. Conditioning shall consist of spreading material in layers not to exceed 8 inches and raking free of debris and rubble. Rocks and aggregate exceeding the allowed largest dimension, and deleterious material shall be removed from the site and disposed off site in a legal manner.

3. ENGEO shall be immediately notified if potential hazardous materials or suspect soils exhibiting staining or odor are encountered. Work activities shall be discontinued within the area of potentially hazardous materials. ENGEO environmental personnel will conduct an assessment of the suspect hazardous material to determine the appropriate response and mitigation. Regulatory agencies may also be contacted to request concurrence and oversight. *ENGEO will rely on the Owner, or a designated Owner's representative, to make necessary notices to the appropriate regulatory agencies. The Owner may request ENGEO's assistance in notifying regulatory agencies, provided ENGEO receives Owner's written authorization to expand its scope of services.*

4. ENGEO shall be notified at least 48 hours prior to the start of filling and backfilling operations so that it may evaluate samples of the material intended for use as fill and backfill. All materials to be used for filling and backfilling require the approval of ENGEO.

B. Import Material: Where conditions require the importation of fill material, the material shall be an inert, nonexpansive soil or soil-rock material free of organic matter and meeting the following requirements unless otherwise approved by ENGEO.

Gradation (ASTM D-421):	<u>Sieve Size</u>	<u>Percent Passing</u>
	2-inch	100
	#200	15 - 70
Plasticity (ASTM D-4318):	<u>Liquid Limit</u>	<u>Plasticity Index</u>
	< 30	< 12
Swell Potential (ASTM D-4546B): (at optimum moisture)	<u>Percent Heave</u>	<u>Swell Pressure</u>
	< 2 percent	< 300 psf
Resistance Value (ASTM D-2844):	Minimum 25	
Organic Content (ASTM D-2974):	Less than 2 percent	

A sample of the proposed import material should be submitted to ENGEO for evaluation prior to delivery at the site.

2.03 SAND

A. Sand for sand cushion under slabs and for bedding of pipe in utility trenches shall be a clean and graded, washed sand, free from clay or organic material, suitable for the intended purpose with 90 to 100 percent passing a No. 4 U.S. Standard Sieve, not more than 5 percent passing a No. 200 U.S. Standard Sieve, and generally conforming to ASTM C33 for fine aggregate.

2.04 AGGREGATE DRAINAGE FILL

A. Aggregate drainage fill under concrete slabs and paving shall consist of broken stone, crushed or uncrushed gravel, clean quarry waste, or a combination thereof. The aggregate shall be free from fines, vegetable matter, loam, volcanic tuff, and other deleterious substances. It shall be of such quality that the absorption of water in a saturated surface dry condition does not exceed 3 percent of the oven dry weight of the samples.

B. Aggregate drainage fill shall be of such size that the percentage composition by dry weight as determined by laboratory sieves (U. S. Series) will conform to the following grading:

Sieve Size	Percentage Passing Sieve
1½-inches	100
1-inch	90 - 100
#4	0 - 5

2.05 SUBDRAINS

A. Perforated subdrain pipe of the required diameter shall be installed as shown on the drawings. The pipe(s) shall also conform to these specifications unless otherwise specified by ENGEO in the field.

Subdrain pipe shall be manufactured in accordance with one of the following requirements:

Design depths less than 30 feet

- Perforated ABS Solid Wall SDR 35 (ASTM D-2751)
- Perforated PVC Solid Wall SDR 35 (ASTM D-3034)
- Perforated PVC A-2000 (ASTM F949)
- Perforated Corrugated HDPE double-wall (AASHTO M-252 or M-294, Caltrans Type S, 50 psi minimum stiffness)

Design depths less than 50 feet

- Perforated PVC SDR 23.5 Solid Wall (ASTM D-3034)
- Perforated Sch. 40 PVC Solid Wall (ASTM-1785)
- Perforated ABS SDR 23.5 Solid Wall (ASTM D-2751)
- Perforated ABS DWV/Sch. 40 (ASTM D-2661 and D-1527)
- Perforated Corrugated HDPE double-wall (AASHTO M-252 or M-294, Caltrans Type S, 70 psi minimum stiffness)

Design depths less than 70 feet

- Perforated ABS Solid Wall SDR 15.3 (ASTM D-2751)
- Perforated Sch. 80 PVC (ASTM D-1785)
- Perforated Corrugated Aluminum (ASTM B-745)

B. Permeable Material (Class 2): Class 2 permeable material for filling trenches under, around, and over subdrains, behind building and retaining walls, and for pervious blankets shall consist of clean, coarse sand and gravel or crushed stone, conforming to the following grading requirements:

Sieve Size	Percentage Passing Sieve
1-inch	100
¾-inch	90 - 100
3/8-inch	40 - 100
#4	25 - 40
#8	18 - 33
#30	5 - 15
#50	0 - 7
#200	0 - 3

C. Filter Fabric: All filter fabric shall meet the following Minimum Average Roll Values unless otherwise specified by ENGEO.

Grab Strength (ASTM D-4632).. 180 lbs
Mass Per Unit Area (ASTM D-4751).................................... 6 oz/yd^2
Apparent Opening Size (ASTM D-4751) .... 70-100 U.S. Std. Sieve
Flow Rate (ASTM D-4491) .... 80 $gal/min/ft^2$
Puncture Strength (ASTM D-4833)....................................... 80 lbs

D. Vapor Retarder: Vapor Retarders shall consist of PVC, LDPE or HDPE impermeable sheeting at least 10 mils thick.

2.06 PERMEABLE MATERIAL (Class 1; Type A)

A. Class 1 permeable material to be used in conjunction with filter fabric for backfilling of subdrain excavations shall conform to the following grading requirements:

Sieve Size	Percentage Passing Sieve
¾-inch	100
½-inch	95 - 100
$^{3}/8$-inch	70 - 100
#4	0 - 55
#8	0 - 10
#200	0 - 3

PART 3 - EXECUTION

3.01 STAKING AND GRADES

A. Contractor shall lay out all his work, establish all necessary markers, bench marks, grading stakes, and other stakes as required to achieve design grades.

3.02 EXISTING UTILITIES

A. Contractor shall verify the location and depth (elevation) of all existing utilities and services before performing any excavation work.

3.03 EXCAVATION

A. Contractor shall perform excavating as indicated and required for concrete footings, drilled piers, foundations, floor slabs, concrete walks, and site leveling and grading, and provide shoring, bracing, underpinning, cribbing, pumping, and planking as required. The bottoms of excavations shall be firm undisturbed earth, clean and free from loose material, debris, and foreign matter.

B. Excavations shall be kept free from water at all times. Adequate dewatering equipment shall be maintained at the site to handle emergency situations until concrete or backfill is placed.

C. Unauthorized excavations for footings shall be filled with concrete to required elevations, unless other methods of filling are authorized by ENGEO.

D. Excavated earth material which is suitable for engineered fill or backfill, as determined by ENGEO, shall be conditioned for reuse and properly stockpiled for later filling and backfilling operations as specified under Section 2.02, "Soil Materials."

E. Abandoned sewers, piping, and other utilities encountered during excavating shall be removed and the resulting excavations shall be backfilled with engineered fill as required by ENGEO.

F. Any active utility lines encountered shall be reported immediately to the Owner's Representative and authorities involved. The Owner and proper authorities shall be permitted free access to take the measures deemed necessary to repair, relocate, or remove the obstruction as determined by the responsible authority or Owner's Representative.

3.04 SUBGRADE PREPARATION

A. All brush and other rubbish, as well as trees and root systems not marked for saving, shall be removed from the site and legally disposed of.

B. Any existing structures, foundations, underground storage tanks, or debris must be removed from the site prior to any building, grading, or fill operations. Septic tanks, including all drain fields and other lines, if encountered, must be totally removed. The resulting depressions shall be properly prepared and filled to the satisfaction of ENGEO.

C. Vegetation and organic topsoil shall be removed from the surface upon which the fill is to be placed and either removed and legally disposed of or stockpiled for later use in approved landscape areas. The surface shall then be scarified to a depth of at least eight inches until the surface is free from ruts, hummocks, or other uneven features which would tend to prevent uniform compaction by the equipment to be used.

D. After the foundation for the fill has been cleared and scarified, it shall be made uniform and free from large clods. The proper moisture content must be obtained by adding water or aerating. The foundation for the fill shall be compacted at the proper moisture content to a relative compaction as specified herein.

3.05 ENGINEERED FILL

A. Select Material: Fill material shall be "Select" or "Imported Material" as previously specified.

B. Placing and Compacting: Engineered fill shall be constructed by approved and accepted methods. Fill material shall be spread in uniform lifts not exceeding 8 inches in uncompacted thickness. Each layer shall be spread evenly, and thoroughly blade-mixed to obtain uniformity of material. Fill material which does not contain sufficient moisture as specified by ENGEO shall be sprinkled with water; if it contains excess moisture it shall be aerated or blended with drier material to achieve the proper water content. Select material and water shall then be thoroughly mixed before being compacted.

C. Unless otherwise specified in the Geotechnical Exploration report, each layer of spread select material shall be compacted to at least 90 percent relative compaction at a moisture content of at least three percent above the optimum moisture content. Minimum compaction in all keyways shall be a minimum of 95 percent with a minimum moisture content of at least 1 percentage point above optimum.

D. Unless otherwise specified in the Geotechnical Exploration report or otherwise required by the local authorities, the upper 6 inches of engineered fill in areas to receive pavement shall be compacted to at least 95 percent relative compaction with a minimum moisture content of at least 3 percentage points above optimum.

E. Testing and Observation of Fill: The work shall consist of field observation and testing to determine that each layer has been compacted to the required density and that the required moisture is being obtained. Any layer or portion of a layer that does not attain the compaction required shall be reworked until the required density is obtained.

F. Compaction: Compaction shall be by sheepsfoot rollers, multiple-wheel steel or pneumatic-tired rollers or other types of acceptable compaction equipment. Rollers shall be of such design that they will be able to compact the fill to the specified compaction. Rolling shall be accomplished while the fill material is within the specified moisture content range. Rolling of each layer must be continuous so that the required compaction may be obtained uniformly throughout each layer.

G. Fill slopes shall be constructed by overfilling the design slopes and later cutting back the slopes to the design grades. No loose soil will be permitted on the faces of the finished slopes.

H. Strippings and topsoil shall be stockpiled as approved by Owner, then placed in accordance with ENGEO's recommendations to a minimum thickness of 6 inches and a maximum thickness of 12 inches over exposed open space cut slopes which are 3:1 or flatter, and track walked to the satisfaction of ENGEO.

I. Final Prepared Subgrade: Finish blading and smoothing shall be performed as necessary to produce the required density, with a uniform surface, smooth and true to grade.

3.06 BACKFILLING

A. Backfill shall not be placed against footings, building walls, or other structures until approved by ENGEO.

B. Backfill material shall be Select Material as specified for engineered fill.

C. Backfill shall be placed in 6-inch layers, leveled, rammed, and tamped in place. Each layer shall be compacted with suitable compaction equipment to 90 percent relative compaction at a moisture content of at least 3 percent above optimum.

3.07 TRENCHING AND BACKFILLING FOR UTILITIES

A. Trenching:

1. Trenching shall include the removal of material and obstructions, the installation and removal of sheeting and bracing and the control of water as necessary to provide the required utilities and services.

2. Trenches shall be excavated to the lines, grades, and dimensions indicated on the Drawings. Maximum allowable trench width shall be the outside diameter of the pipe plus 24 inches, inclusive of any trench bracing.

3. When the trench bottom is a soft or unstable material as determined by ENGEO, it shall be made firm and solid by removing said unstable material to a sufficient depth and replacing it with on-site material compacted to 90 percent minimum relative compaction.

4. Where water is encountered in the trench, the contractor must provide materials necessary to drain the water and stabilize the bed.

B. Backfilling:

1. Trenches must be backfilled within 2 days of excavation to minimize desiccation.

2. Bedding material shall be sand and shall not extend more than 6 inches above any utility lines.

3. Backfill material shall be select material.

4. Trenches shall be backfilled as indicated or required and compacted with suitable equipment to 90 percent minimum relative compaction at the required moisture content.

3.08 SUBDRAINS

A. Trenches for subdrain pipe shall be excavated to a minimum width equal to the outside diameter of the pipe plus at least 12 inches and to a depth of approximately 2 inches below the grade established for the invert of the pipe, or as indicated on the Drawings.

B. The space below the pipe invert shall be filled with a layer of Class 2 permeable material, upon which the pipe shall be laid with perforations down. Sections shall be joined as recommended by the pipe manufacturer.

C. Rocks, bricks, broken concrete, or other hard material shall not be used to give intermediate support to pipes. Large stones or other hard objects shall not be left in contact with the pipes.

D. Excavations for subdrains shall be filled as required to fill voids and prevent settlement without damaging the subdrain pipe. Alternatively, excavations for subdrains may be filled with Class 1 permeable material (as defined in Section 2.06) wrapped in Filter Fabric (as defined in Section 2.05).

3.09 AGGREGATE DRAINAGE FILL

A. ENGEO shall approve finished subgrades before aggregate drainage fill is installed.

B. Pipes, drains, conduits, and any other mechanical or electrical installations shall be in place before any aggregate drainage fill is placed. Backfill at walls to elevation of drainage fill shall be in place and compacted.

C. Aggregate drainage fill under slabs and concrete paving shall be the minimum uniform thickness after compaction of dimensions indicated on Drawings. Where not indicated, minimum thickness after compaction shall be 4 inches.

D. Aggregate drainage fill shall be rolled to form a well-compacted bed.

E. The finished aggregate drainage fill must be observed and approved by ENGEO before proceeding with any subsequent construction over the compacted base or fill.

3.10 SAND CUSHION

A. A sand cushion shall be placed over the vapor retarder membrane under concrete slabs on grade. Sand cushion shall be placed in uniform thickness as indicated on the Drawings. Where not indicated, the thickness shall be 2 inches.

3.11 FINISH GRADING

A. All areas must be finish graded to elevations and grades indicated on the Drawings. In areas to receive topsoil and landscape planting, finish grading shall be performed to a uniform 6 inches below the grades and elevations indicated on the Drawings, and brought to final grade with topsoil.

3.12 DISPOSAL OF WASTE MATERIALS

A. Excess earth materials and debris shall be removed from the site and disposed of in a legal manner. Location of dump site and length of haul are the Contractor's responsibility.

GEOTECHNICAL EXPLORATION REPORT

Dear Mr. Minard:

At your request and with your authorization, ENGEO Incorporated has prepared this geotechnical exploration report for the proposed Sutter Medical Center hospital building in Santa Rosa, Sonoma County, California. The accompanying report presents our field and laboratory exploration results, together with our conclusions and recommendations regarding the planned development. Our findings indicate that the site is suitable for the proposed development provided that the recommendations of this report are incorporated into the project design.

In general, subsurface conditions indicate that soils in the upper 30 feet at the building location are compressible. Based on this finding, we recommend that the hospital be supported by a deep foundation system consisting of pre-cast concrete piles. Our recommendations pertaining to these items, as well as other geotechnical design issues, are discussed in this report.

We are pleased to be of service to you on this project and look forward to consulting further with you and your design team.

Very truly yours,

ENGEO INCORPORATED

INTRODUCTION

Purpose

The purpose of this study is to gather design-level information on the distribution and variation of subsurface conditions within the proposed hospital building footprint for the purpose of planning, design and construction. ENGEO Incorporated previously performed a preliminary geotechnical study at this site. Our recommendations were presented in our report entitled "Preliminary Geotechnical Report, Sutter Medical Center of Santa Rosa / Luther Burbank Center for the Arts" dated November 29, 2004.

We prepared this geotechnical exploration report in accordance with the requirements established by the Hospital Facilities Seismic Safety Act (SB 1953), the California Building Code (CBC), and the Engineering Geology and Seismology for Pubic Schools and Hospitals in California prepared by the California Geological Survey.

Scope of Services

The scope of our services for this phase of study included:

1. Drilling 11 exploratory rotary wash borings and advancing 28 cone penetration test holes within the location of the proposed hospital building.

2. Laboratory testing on selected materials.

3. Analysis of the geological and geotechnical data.

4. Preparation of this report summarizing our preliminary findings and recommendations.

Once detailed plans have been prepared, ENGEO should be provided the opportunity to review these for conformance with the intent of our recommendations. During that time, ENGEO may need to perform additional evaluation and/or modify the recommendations contained herein (as deemed appropriate). ENGEO prepared this report for the exclusive use of the Sutter Medical Center and their design team consultants. In the event that any changes are made in the character, design, or layout of the development, the conclusions and recommendations contained in this report should be reviewed by ENGEO to determine whether modifications to the report are necessary. This document may not be reproduced in whole or in part by any means whatsoever, nor may it be quoted or excerpted without the express written consent of ENGEO Incorporated.

Site Location and Description

The subject site is located at 50 Mark West Springs Road in Santa Rosa, Sonoma County, California (Latitude of 38.4964 degrees North; Longitude of 122.7506 degrees South). The approximate site location is shown on both the Site Coordinate and Site Location Maps, Figures 1 and 2, respectively.

The existing site topography is shown on Figure 3. Currently, the planned hospital footprint is situated mainly within the open-space used as pasture area. The pasture area is relatively flat, having estimated elevations ranging from 156 to 159 feet above mean sea level (MSL) from south to north. The pasture area is currently covered with grass and has a few mature trees.

The proposed hospital south wing extends into an area occupied by a waste water treatment plant. A fence encloses the wastewater treatment ponds and this area is at a higher elevation than the adjacent pasture area. The top embankment elevation that surrounds the ponds is approximately 165 feet above MSL, with side slopes of approximately 2:1 (horizontal: vertical). We understand that the treatment ponds are approximately 8 feet deep. Additionally, the treatment ponds have associated facilities including pumps and buried pipes in the fenced area.

Proposed Development

Jonathan Bailey Associates prepared the current hospital development plans, dated July 2005, which include: a main hospital tower with a 157,000 square feet building footprint; a helipad at the top of the hospital building; and pavements and landscaping surrounding the building. The details regarding building loads have not been finalized at this time; preliminary loads provided by the Structural Engineer are range up to 600 kips for column loads. The hospital building is planned to be constructed within the west portion of the site. Moreover, medical office and administrative buildings ranged from 1 to 5 stories high will be constructed near the proposed hospital footprint. Geotechnical recommendation for nearby administrative structures will be provided in a separate report.

Previous Work

ENGEO previously explored the site, as referenced in our report titled "Preliminary Geotechnical Report, Sutter Medical Center of Santa Rosa / Luther Burbank Center for the Arts" dated November 29, 2004 for the SMC/LBC. Our previous study included drilling 21 exploratory borings (B-1 to B-21), laboratory testing, and report preparation which presented our findings, conclusions and recommendations for site development. As a part of this current study, ENGEO reviewed the previous work and incorporated pertinent data, as deemed appropriate.

ENGEO also conducted a Phase 1 - Environmental Site Assessment (ESA) at the property and presented the results in a report dated December 28, 2004. In summary, the Phase One ESA identified a number of items of concern within the property. Subsequently, ENGEO performed a limited Phase 2

ESA to sample and test for a number of the constituents recommended in our December 28, 2004 report. The finding presented in the report dated February 24, 2005 indicate that no further ESA work is required; however, the ESA studies assessed that existing structures and LBC facilities were not included, and that the waste water treatment facilities associated with LBC use should be decommissioned in accordance with regulatory requirements.

FIELD EXPLORATION

We conducted the field exploration for this study between May 19 and June 27, 2005 to gather additional information on the distribution and variation of subsurface conditions within the proposed hospital building area for planning, design and construction. Our current exploration included drilling 11 exploratory borings (2-B1 to 2-B11), and advancing 28 cone penetration test holes (CPTs) to a maximum depth of about 106½ feet below the existing ground surface. Figure 3 presents the approximate boring and CPT locations, as well as our previous boring locations. We located the exploratory borings and CPTs for the current study by survey stakes as provided by Breje & Race, Civil Engineer.

A truck-mounted rotary drill rig was used to drill Borings 2-B1 through 2-B8, and a barge-mounted CME-45 drill rig equipped for rotary drilling to drill Borings 2-B9 through 2-B11, located within one of the treatment ponds. We retrieved soil samples recovered during drilling using a 3-inch O.D. California-type split-spoon sampler fitted with 6-inch-long brass liners, and a 2-inch O.D. standard penetration test split-spoon sampler. The samplers were advanced with a 140-pound automatic trip safety hammer with a 30-inch drop. The penetration of the sampler into the native materials is field recorded as the number of blows needed to drive the sampler 18 inches in 6-inch increments. Appendix A presents the report borelogs developed from the field logs. The boring logs report blow counts as the number of blows required for the last one foot of penetration. The blow counts presented on the borelogs do not include correction factors.

A 20-ton compression-type cone with a 15-square-centimeter (cm^2) base area, (an apex angle of 60 degrees) and a friction sleeve with a surface area of 225 cm^2 were used to perform the 28 CPT soundings. The cone, connected with a series of rods, is pushed into the ground at a constant rate. Cone readings are taken at approximately 2.5-cm intervals with a penetration rate of 2 cm per second in accordance with ASTM D-3441. Measurements include the tip resistance to penetration of the cone "Qc", the resistance of the surface sleeve "Fs", and pore pressure "U" (Robertson and Campanella, 1988). The CPT logs were included in Appendix B.

Laboratory Testing

We performed laboratory tests on selected soil samples to determine their engineering properties. We list the tests and test result locations below.

Characteristic	Test Method	Location of Results Within this Report
Natural Unit Weight and Moisture Content	ASTM D-2216	Appendix A*
Unconfined Compressive Strength	ASTM D-2166	Appendix C
Gradation, Percent Passing No. 200 Sieve and Hydrometer	ASTM D-422	Appendix C
Atterberg Limits	ASTM D-4318	Appendix C
Consolidation Test and Time Rate	ASTM D-4186	Appendix C
Swell Test Method B	ASTM D-4546	Appendix C
Triaxial Compression Test (UU)	ASTM D-2850	Appendix C
Soluble Sulfate Content	CalTrans Test Method 417	Appendix C

* The boring logs presented in Appendix A contain the moisture and density test results.

GEOLOGY AND SEISMICITY

Regional and Local Geology

ENGEO previously provided detailed discussions on regional and local geology as referenced in our report titled "Preliminary Geotechnical Report, Sutter Medical Center of Santa Rosa / Luther Burbank Center for the Arts" dated November 29, 2004. The following section utilizes information presented in the November 2004 report and provides additional information, as deemed necessary.

Subsurface Conditions

We encountered the following general subsurface conditions at the exploratory boring and CPT locations within the proposed hospital building:

- Existing fills extending to depths of approximately 7 feet (which correspond to approximate Elev. 158 feet) at 2-B7, 2-CPT5, 2-CPT17 and 2-CPT18, within the waste water treatment facility area. The existing fills typically consist of stiff to very stiff clays, and silty clays with various amounts of gravel and rock fragments. The existing fills are associated with the previous grading activities of the waste water treatment facility. Natural alluvial soil deposits underlie the fills.

- Alluvial soil deposits were also encountered at 2-B1 to 2-B6, 2-B8, 2-CPT1 to 2-CPT 4, 2-CPT6 to 2-CPT 16, 2-CPT19 to 2-CPT28, within the pasture area of the site at approximately Elev. 158 feet. The alluvial deposits generally consist of inter-layered clayey sand, sandy clay, silty clay and clays. The soils above groundwater levels (which correspond to approximate Elev.153 to 155 ft) were generally medium stiff to stiff. Below this depth, the alluvial deposits become soft and/or loose to depths of about 30 to 35 feet. Beneath the soft/loose zone, stiff/medium dense sandy soils exist at approximately 30 to 35 feet bgs in our borings and CPTs that extend beyond 30 feet. At 2-CPT9, 2-CPT10 and 2-CPT11, dense sand lenses exist between depths of about 7 to 25 feet. At approximately 40 feet, medium stiff clay deposits about 5 feet in thickness exist at 2-B1, 2- B2, 2-B4 and 2-B6.

- A consistent layer of hard to very dense clayey silts and clayey gravels within each boring and CPT that extends beyond 40 feet to approximately 45 feet. This hard layer extends to the refusal depths of 101½ and 106½ feet in Borings 2-B3 and 2-B8, respectively. Based on two deeper borings, very dense clayey gravel extends to approximately 65 feet deep, underlain by very stiff to hard silty clay and sandy silt deposits to 90 feet. Below this layer, dense gravels exist to approximately 105 feet. At the bottom of 2-B8, we encountered hard silty clay deposits. The alluvial deposits extended to the maximum depth of borings advanced for this study, to depths of at least 106½ feet.

Appendix A contains the borehole logs that present more specific soil descriptions within the building area. The logs describe soil conditions in general accordance with the Unified Soil Classification System. Figures 6 present interpretive geologic cross sections depicting subsurface conditions within the building area. We emphasize that these cross sections have been derived based on an interpolation between similar strata encountered among various boring and CPT locations; as such, variations in actual subsurface conditions should be expected.

Groundwater Conditions

The rotary wash boring method restricted our ability to accurately evaluate groundwater depth during drilling. However, the site CPT data collected indicates groundwater levels ranging from approximately 3 to 5 feet bgs within the pasture area and approximately 9 to 10 feet bgs within the waste water treatment plant area. Fluctuations in the level of groundwater may occur due to variations in rainfall and other factors not evident at the time measurements were made.

Regional Faulting and Seismicity

The site is not located within the State of California Fault Hazard Zone; however, it is situated in a region that contains numerous active[1] and potentially active earthquake faults. The active Rodgers Creek fault is located approximately 0.7 miles east of the project area. The Rodgers Creek fault is capable of creating earthquakes with a moment magnitude of M7.0 (Blake, 1996). The Maacama Fault is located 6.3 miles east of the site, and the San Andreas Fault is located 19.5 miles west of the site. Figure 5 presents the Regional Faulting and Seismicity Map, which shows regional proximity of major active faults and significant historic earthquakes with respect to the site.

The regional seismicity of the Bay Area was recently evaluated by the Working Group on Northern California Earthquake Probabilities (WGEP 2003). The Working Group periodically attempts to summarize seismic risk in the Bay Area by presenting probabilities of 6.7 Mw or greater earthquakes on active Bay Area faults for a 30-year return interval (2003-2032); the most recent summary gives a 62 percent aggregate probability for the entire Bay Area. The active Rodgers Creek fault system is estimated to have a 30-year probability of 27 percent for a M6.7 or greater earthquake. The San Andreas Fault system was assigned a 30-year probability of 21 percent. It should therefore be expected that the site will experience one or more episodes of strong ground shaking during the design life of the proposed improvements.

[1] An active fault is defined by the State Mining and Geology Board as one that has had surface displacement within Holocene time (about the last 11,000 years) (Hart, 1997).

Seismic Hazards

Potential seismic hazards resulting from a nearby moderate to major earthquake may include primary ground rupture, ground shaking, lurching, liquefaction, dynamic densification, lateral spreading, inundation due to embankment failure, and earthquake-induced landsliding. These hazards were discussed in detail with regards to the site in our November 2004 study. In conclusion, risks from seiches, tsunamis, and volcanic eruption are currently considered negligible at the subject project site. Risk for ground rupture at the site is generally low; however, strong ground shaking is expected at the site.

Ground Motion. A preliminary probabilistic seismic hazard analysis for the site was previously provided in our November 2004 report based on current California fault data. In conjunction with this current study, downhole shear wave velocities were recorded at 2-CPT8, advanced to 40 feet below the ground surface (bgs), and 2-CPT27, advanced to 48½ feet bgs, to provide a site specific shear wave profile. We input the shear wave velocities, recorded in 5 foot intervals, into the computer program, EZ-FRISK, to model the seismic setting of the region and evaluate the following:

- Earthquake magnitude
- Rupture length
- Location of rupture
- Maximum possible earthquake magnitude; and
- Recurrence interval of earthquake events.

The program calculates, by summation from earthquake sources, the total average annual expected number of occurrences of acceleration greater than each of several specified values. Once the annual probability is obtained, the probability of the level of ground acceleration being exceeded over a specified time period is calculated. Using this method and the shear wave velocity data, a horizontal ground surface acceleration of 0.87g is predicted to have a 10 percent probability of being exceeded in a 100-year design life, and a horizontal ground surface acceleration of 0.67g is predicted to have a

10 percent probability of being exceeded in a 50-year design life. The probabilistic ground surface acceleration was derived using attenuation relationships developed by Boore-Joyner-Fumal (1997), Sadigh (1997) and Abrahamson and Silva (1997). Figure 9 shows the normalized spectral acceleration. The EZ-FRISK Probabilistic Seismic Hazard Analysis is provided in Appendix F.

To mitigate the ground shaking effects, all structures should be designed using sound engineering judgment and the latest Uniform Building Code (UBC) requirements as a minimum, taking into consideration that the proposed medical facilities are considered special occupancy structures. In accordance with the 1997 UBC, the site is located within Seismic Zone 4, with a seismic zone factor Z of 0.4, as given in Figure 16-2 and Table 16-I in the UBC. Based on site conditions, the soil profile at the site can be classified as a S_D profile as defined in Table 16-J. According to Tables 16-S and 16-T, near-source factors, N_a of 1.5 and N_v of 2.0, are based on the Rodgers Creek fault being a seismic source type A, approximately 0.7 miles (1.1 km) away. The UBC parameters for the site are presented in the following table:

1997 UNIFORM BUILDING CODE - Chapter 16

ITEM	DESIGN VALUE	SOURCE
Seismic Zone	4	Figure 16-2
Seismic Zone Factor	0.40	Table 16-I
Soil Profile Type	S_D	Table 16-J
Seismic Source Type	A	Table 16-U
Near Source Factor, N_a	1.5	Table 16-S
Near Source Factor, N_v	2.0	Table 16-T
Seismic Coefficient, C_a	0.66	Table 16-Q
Seismic Coefficient, C_v	1.28	Table 16-R

Seismic design provisions of current building codes generally prescribe minimum lateral forces, applied statically to the structure, combined with the gravity forces of dead-and-live loads. The prescribed lateral forces are generally considered to be substantially smaller than the actual peak forces that would be associated with a major earthquake. The Structural Engineers Association of California has also developed performance-based engineering guidelines in their report entitled Vision 2000 (SEAOC, 1995). The conceptual framework for performance-based engineering guidelines is defined as a full range of seismic engineering issues to be addressed in designing structures for predictable and definable seismic performance within established levels of risk. The performance levels are defined as follows:

- Fully Operational – Facility continues in operation with negligible damage.
- Operational – Facility continues in operation with minor damage and minor disruption in nonessential services.
- Life Safe – Life safety is substantially protected, damage is moderate to extensive.
- Near Collapse – Life safety is at risk, damage is severe, structural collapse is prevented.

Vision 2000 includes four levels of earthquake risk as shown below.

Vision 2000 Event	Probability of Exceedance (%)	Design Life (years)	Recurrence Interval (years)
Frequent	50	30	43
Occasional	50	50	72
Rare	10	50	475
Very rare	10	100	970

As shown in Figure 9, essential and safety-critical buildings, such as hospitals and nuclear power facilities, would be expected to meet the basic objective to be fully operational in a rare earthquake and satisfy a life-safety performance level for a very rare earthquake.

Liquefaction. Liquefaction is a phenomenon in which saturated cohesionless soils are subject to a temporary, but essentially total loss of shear strength because of pore pressure build-up under the reversing cyclic shear stresses associated with earthquakes. We performed an assessment using the new CPT data and borings drilled at the site to determine the liquefaction potential of site soils based on the methods of Youd et al. (2001) and Seed et al. (2003). We calculated the Cyclic Resistance Ratio (CRR) and the Cyclic Stress Ratio (CSR) using SPT blow counts obtained from the rotary wash borings. The CRR represents the loading at which a given soil stratum will liquefy. It is further scaled using the Magnitude Scaling Factor (MSF) that adjusts the CRR to the maximum credible seismic event from the M7.5 event of which the CRR formula is based. The CSR represents the loading that is generated within the given soil profile layer during the seismic event. The scaled CRR is divided by the CSR to determine the factor of safety (F.S.) of liquefaction resistance within the given soil profile layer. According to recent liquefaction research performed by Seed et al. (2003), the soil layer is not considered liquefiable if it meets any of the following criteria:

- The factor of safety is greater than 1.0.
- The layer is above the water table.
- The fines content (FC) is greater than 20 percent, Plasticity Index (PI) is greater than 12 percent, and water content (w_c) is less than 80 percent of the liquid limit (LL).
- The FC is greater than 35 percent, PI is less than 12 percent, and w_c is less than 0.85 of the LL.

According to the above cited criteria, the soft saturated clayey sand layers encountered from beneath the bottom of the treatment pond are considered potentially liquefiable. These clayey sand layers extend from the bottom of the pond to approximately 7 feet below (corresponding to approximate Elev. 159 to 152 feet) as encountered in Borings 2-B9 and 2-B10.

Local zones of soft, saturated sands and silts encountered at borings and CPTs within the pasture area corresponding to approximately Elev. 123 to 153 feet (5 to 35 feet bgs) are considered marginally liquefiable. Although soil in this layer contains moderately plastic fines, the high water content relative to their liquid limit (over 85 percent of the LL) suggest that this layer has a potential to hold the water and dissipate excess pore pressures slowly, resulting in a postponed liquefaction condition. The fines in this layer are not classified as sensitive soils and therefore are not susceptible to significant loss of strength if sheared, or remolded during an earthquake event. In addition, these marginally liquefiable soil layers do not appear to be continuous within the proposed hospital building footprint. The gravel encountered in this site contains significant amount of plastic fines and exist in a very dense matrix, as such, the risk of liquefaction in the gravelly deposits is considered low.

In addition to analyses on soils samples collected from the rotary wash borings, we characterized the liquefaction potential based on CPT data using guidelines of Seed et al. (2003), and Robertson and Wride (1997). Based on the results, lenses of potentially liquefiable sandy and silty zones, typically less than 12 inches thick, are present between Elev. 133 to 153 feet (5 to 25 feet bgs) within the central area of the proposed hospital footprint. These soils are not present at the northern portion of the hospital footprint, and appear to thin out towards the south. In general, the potential liquefiable lenses are thin (less than 6 inches thick) and we believe that they are unlikely to be contiguous.

In conclusion, based on our analysis, it is our overall assessment that, in general, the soils within the hospital footprints have low liquefaction potential, with the exception of an 11-feet thick zone of soft sandy deposits located immediately beneath the existing waste water pond. On this basis, support of elements for the building should derive resistance at depths below these deposits. In addition, remedial grading should be performed within the bottom of the ponds to reduce the effect of liquefaction on structural elements to be supported on grade, i.e. floors, pavements, etc..

Earthquake-Induced Densification. Densification of loose to medium-dense clean sand above and below the groundwater level during earthquake shaking could cause settlement. As previously stated, we did not encounter loose to medium-dense clean sands during the subsurface exploration. Therefore, we expect a low probability of densification induced by earthquake shaking.

Lateral Spreading. Lateral spreading is a failure within a nearly horizontal soil zone (possibly due to liquefaction), which causes the overlying soil mass to move toward a free face or down a gentle slope. No free face or slopes are present near the hospital footprint; therefore, the potential for lateral spreading is considered low.

Earthquake-Induced Landsliding. No landslides have been mapped within or immediately adjacent to the site; therefore, the potential for earthquake-induced landsliding to occur is considered low.

Inundation Due to 100-Year Flood. The project site is not located within the 100-year flood inundation area; therefore, risk of flooding is considered low. However, the Civil Engineer should review pertinent information relating to possible flood levels for the subject site based on final hospital pad elevations and provide appropriate design measures for development of the project, if necessary.

Corrosion Potential. An evaluation of possible corrosion impacts to site improvement should be conducted after mass grading of the site. We collected representative samples of the near-surface soils during our field exploration to determine the potential for sulfate attack on foundation concrete and to provide recommended concrete design parameters in accordance with the guidelines presented in Chapter 19 of the Uniform Building Code (1997). We transported the samples with an appropriate Chain of Custody to our laboratory for concentrations of water-soluble sulfate (SO4) in accordance with Caltrans Test Method 417. As reported in the analytical results contained in Appendix C, the sulfate concentration of the tested site soil ranged from 6 is 33 mg/kg. In accordance with the criteria presented in Table 19-A-4 of the 1997 Uniform Building Code, the soil is classified in the negligible sulfate exposure range. Cement type, water-cement ratio and concrete strength are not specified by the UBC for this range. We recommend that Type II cement be used in foundation concrete for structures within the project site. Additionally, concrete should incorporate a maximum water cement ratio of 0.5 and a minimum compressive strength of 3,000 psi. It should be noted, however, that the structural engineering design requirements for concrete might result in more stringent concrete specifications.

Expansive Soils. Expansive soils shrink and swell as a result of moisture changes. These soils may cause heaving, cracking and related distress to structures and shallow site improvements if not properly mitigated. Based on lab testing results on the current and previous study, the Plasticity Index (PI) of near surface soils range from 13 to 26 indicating that site soils have low to moderate expansion potential. Successful development on expansive soils requires special attention during construction. It is imperative that exposed subgrade materials be kept moist at all times during construction due to the extreme difficulty to re-moisturize the soil without excavating, moisture conditioning, and recompaction. Long-term mitigation measures should also include the prevention of moisture variation, and the use of a layer of low expansive "select" materials below lightly loaded structural elements.

CONCLUSIONS AND RECOMMENDATIONS

Based on the findings from this subsurface exploration, laboratory test results and analyses, it is our opinion that the planned project development is feasible from a geotechnical standpoint, provided that the recommendations contained in this report, along with sound engineering practices, are incorporated in the design and construction of the project. If significant changes to the hospital footprint or design loadings are made, the recommendations should be refined and modified, as deemed appropriate by the Geotechnical Engineer during project development. Geotechnical matters addressed in this report include: foundation design recommendations, site preparation and grading, retaining walls, pavements, underground utilities, and drainage.

ENGEO should be retained to provide supplemental recommendations and modifications to geotechnical recommendations presented herein during the plan development and the review process, as necessary. This may include revised grading and foundation design recommendations and remedial grading plan preparation. Additional recommendations may be necessary during site grading, depending on the actual subsurface conditions exposed.

Main considerations for the planned development include the following:

- The compressibility of soft sandy and silty soils at depths between 5 to 35 feet bgs, susceptible to excessive total and differential settlement due to loads anticipated for the planned hospital structure;

- Presence of local zones of sandy material that are considered susceptible to seismic settlements (liquefaction) within the existing pond areas when subject to strong ground shaking;

- Presence of existing fill within the waste water treatment facility susceptible to excessive settlement;

- Grading considerations for removal of the ponds within the waste water treatment facility; and

- The presence of low to moderately expansive soil underlying the site which may undergo significant volume changes (swell and compression) when subjected to varying moisture contents.

Settlement Considerations

The alluvial deposits underlying the site are considered susceptible to compression from loads imposed by future fills and heavy structural loads. Soft and compressible silty and clayey deposits exist from 5 feet to 35 feet bgs. To provide necessary support to the moderate to heavy structural loads of the hospital, we recommend that the building be supported on driven pre-cast pre-stressed concrete piles. The piles should be interconnected by utilizing a system of grade-beams and/or a structural floor slab. We believe that such deep foundation system will provide the necessary support and minimize settlement due to soft soil and liquefaction of thin sand lenses for the proposed hospital tower.

In addition, increasing site grades surrounding the building should be minimized to reduce excessive settlement. If future site grades are to be raised greater than two feet above existing site grades, special mitigation measures such as surcharging may be necessary to reduce soil settlement to within acceptable levels. ENGEO should review final grading for conformance with the recommendations contained herein to determine whether preconsolidation measures are necessary.

Foundation Design

As indicated in the previous section, the structural loads of the hospital should be supported on driven pre-cast pre-stressed concrete piles. Based on preliminary discussions with the Structural Engineer, Mr. Kan Patel with John A. Martin & Associates, we understand that 14-inch square pre-cast concrete piles will be used to support the hospital building. To derive the necessary pile support, we recommend piles extend into the dense gravelly deposits encountered at approximately

45 feet bgs, corresponding to approximate Elev. 113 feet). Practical refusal can be expected when the piles are driven about 5 feet into the gravel layer. It is our opinion that piles driven to practical refusal in this gravel layer can support an allowable capacity of approximately 100 to 120 tons. At the time of this study, we were not provided with design loads. ENGEO should be consulted to work with the Structural Engineer regarding design considerations. Pile spacing should be not less than 3 times the pile diameter, center-to-center.

We recommend driving indicator piles at several locations within the building footprint to determine the actual penetration depth into the supporting stratum, as discussed in the following section. If practical refusal does not occur in the gravel stratum, piles designed as friction piles may be considered. For this condition, we anticipate 14-inch-square piles, penetrating 60 feet below the ground floor of the proposed building structures to develop a design capacity of 60 tons. Additional piles may be required in this situation.

Typically, 14-inch-square pre-stressed concrete piles may be driven continuously with a hammer developing at least 40,000 foot-pounds of energy until achieving practical refusal. Refusal blow count criteria may be determined during construction given the hammer size and evaluated efficiency. However, for planning purposes, we suggest that the following refusal blow count criteria:

REFUSAL BLOW COUNT CRITERIA

Actual Hammer Energy (foot-lbs/blow)	Practical Refusal Blow Count
40,000	60 blows per foot
60,000	40 blows per foot

Uplift Resistance. Resistance to uplift loads will be developed in friction along the face of the pile. We recommend an allowable uplift frictional resistance of 150 psf along the sides of the pile. The upper 10 feet of the pile should be neglected in calculating uplift resistance.

Lateral Loading. Lateral resistance to wind and seismic loads can be developed by passive pressure on the soil against the pile caps and grade-beams as well as by bending resistance of the pile foundation. In general, passive resistance against the pile caps could be evaluated using a triangular pressure distribution modeled as an equivalent fluid weight of 250 pounds per cubic foot provided that the pile cap is embedded in engineered fill material. Based upon our exploration, we were also able to develop representative soil criteria for the required variables used in the applied L-Pile program for lateral passive pressure calculations. We present a tabular summary of the L-Pile soil parameters below.

Table 1: Generalized L-Pile Soil Parameters

Elevation(ft)	Generalized Soil Profile	L-Pile Soil Type	Soil Strength	Soil Strength	K (pci)	E50 (%)	Effective Unit Weight (pcf)
153 to 158	Silty Clay to Sandy Clay	3. CLAY	---	2,000 psf	500	0.7	115
128 to 153	Sandy Clay / Sandy Silt / Silty Clay	1. CLAY	---	500 psf	30	2.0	37.6
123 to 128	Silty Clay / Gravelly Clay	2. CLAY	---	2,000 psf	800	0.5	47.6
118 to 123	Silty Clay	1. CLAY	---	1,000 psf	100	1.5	47.6
98 to 118	Clayey Gravel / Clayey Silt	4. SAND	26°	5,000psf	125	0.4	67.5

The following tabulated information summarizes our lateral pile analysis results. Additionally, Appendix E provides the relationships between pile displacement and moment with depth for 14-inch-square pre-stressed concrete pile.

Table 2: Allowable Lateral Capacities (Single Pile)

Pile Diameter (inch)	Axial Loading (tons)	Pile Condition	Allowable Lateral Capacity (tons)	
			¼-inch Top of Pile Deflection	½-inch Top of Pile Deflection
14	60	Pinned-Head	8	11
		Fixed-Head	15	20
14	150	Pinned-Head	8	12
		Fixed-Head	15	20

The above lateral capacities represent the probable response of a single pile under short-term loading conditions and include a factor of safety of 3.0. The Structural Engineer should select other suitable factors of safety based on the type of loading.

We estimated maximum bending moments and points of fixity of a 14-inch square pre-cast pre-stressed concrete pile for ¼- and ½-inch pile top deflection given fixed-head and pined-head condition. The Structural Engineer should be consulted to determine the maximum allowable bending moment for the piles. As referenced in Table 3 below, "point of fixity" is defined as a point of zero lateral deflection.

Table 3: Load Deflection Characteristics (14-inch Square Pile)

Pile Head Condition	Deflection Characteristic	Pile Deflection	
		¼-inch	½-inch
Pinned-Head	Maximum Bending Moment (in-kips)	490	750
	*Depth to Maximum Bending Moment (feet)	4.5	5.0
	*1st Point of Fixity (feet)	8.5	10.5
	*2nd Point of Fixity (feet)	22	25
Fixed-Head	Maximum Bending Moment (in-kips)	590	910
	*Depth to Maximum Bending Moment (feet)	0	0
	*1st Point of Fixity (feet)	15-1/2	17-1/2
	*2nd Point of Fixity (feet)	26-1/2	30

*Below Top of Pile

The foundations should be designed by a licensed Structural Engineer. Once details regarding the structural designs of the hospital building and related development have been determined, ENGEO should review such designs for appropriate changes and/or modifications to these preliminary foundation recommendations as deemed necessary.

Indicator Pile Program For this foundation system, we recommend a minimum of 8 indicator piles be driven prior to the casting of the production piles. The piles should be driven at the corners and around the center of the hospital tower, and should be located to serve as functional foundation piles. The primary purpose of the indicator pile driving will be to determine if practical refusal will occur in the gravel layer, or if the piles could be embedded at least 5 feet into the gravel layer. In addition, the information obtained during indicator pile driving can be used to estimate the production pile lengths, and provide blow count data to correlate with information obtained from the test borings. Indicator piles should be driven with the same equipment that will be used to drive production piles. We recommend that indicator piles be long enough to allow them to be driven at least 65 feet below the proposed foundation elevation of the building structures.

The Geotechnical Engineer should review the final foundation plans when they become available to check for conformance with these recommendations. In addition, all pile-driving operations should be conducted under the observation of the Geotechnical Engineer, and the blow counts should be recorded by a representative of the Geotechnical Engineer.

Grade Beam Design. All foundation piles supporting bearing walls should be interconnected by well-reinforced grade beams. We do not recommend the use of isolated piers. All grade-beams should be reinforced to maximize their moment capacity. The grade beam reinforcement will be dependent on the pile spacing and the structural loads to be supported, but in no case should less than four (4), No. 5 rebars, two in the top and two in the bottom of the beam. Grade beams should be kept to the minimum width that is structurally practical to avoid uplift forces associated with swelling soils. The grade-beam reinforcement should be designed by the Structural Engineer.

Due to the expansive potential of some of the soil in the area of the building, grade beams should be raised off the ground. Provide a void or a pad of degradable or compressible material at least 3 inches thick between the bottom of the grade beam and the ground. In this case, provide for rapid removal of any water that may flow under the hospital. Place at least 7 inches of soil, and compact soil on the outside of exterior grade beams. Provide a minimum 3 to 5 percent slope away from the foundation at right angles to the grade beams to provide for rapid removal of surface water runoff.

Structural Floor Slab. The floor of the hospital building may be pile supported and be designed structurally to span between pile caps and/or grade beams. We recommend floor slab construction consist of a concrete slab at least 6 inches thick underlain by a capillary break consisting of a minimum 6-inch-thick layer of Class 2 Permeable Material. The floor slab reinforcing should be designed by the Structural Engineer. As a minimum, provide No. 4 bars spaced 16 inches on center each way for the slab reinforcement. Anticipate minor cracking and distress in the structure and the slabs-on-grade as a result of concrete shrinkage. Provide frequent control joints to control cracking as recommended by the American Concrete Institute (Publication ACI 302.1R-89).

Resistance to short duration (earthquake-induced) lateral loads may be provided by frictional resistance between the foundation concrete slab and the bearing soils and by passive earth pressure acting against the side of the foundation. A coefficient of friction of 0.35 can be used between concrete and the subgrade. A uniform pressure of 1,000 psf can be used to evaluate the passive resistance that can be developed on the foundation elements for transient loads. For static loads, passive resistance should be evaluated using a triangular pressure distribution modeled as an equivalent fluid weight of 250 pounds per cubic foot. The upper one foot of soil should be excluded from passive pressure computations unless it is confined by pavement or a concrete slab. A combination of both friction and passive pressure may be used if one of the values is reduced by 50 percent.

Underfloor Subdrain

We understand that the elevation of the lowest level of structures has not yet been determined. If structural portions are planned below the water level, provide appropriate subdrainage in order to minimize the amount of water penetration to the lower levels of the structure. Utilize one or more of the following measures to reduce moisture infiltration for these areas:

- Provide a permanent dewatering system under the lowest floor slabs to collect water and reduce water infiltration. The system may consist of a minimum 6-inch-thick layer of Class 2 permeable material or free draining gravel surrounded by synthetic filter fabric graded to drain to a sump. Depending on the amount of water infiltration, multiple sump pumps may be required.

- Provide seal-tight water-proofing for foundation elements anticipated to be within the free water levels. Design for hydrostatic pressure conditions.

Exterior Slab-on-Grade

This section provides guidelines for secondary slabs such as walkways, driveways, and steps. Construct secondary slabs-on-grade structurally independent of the foundation system, to allow slab movement to occur with a minimum of foundation distress. Where slabs-on-grade construction is anticipated, care must be exercised in attaining a near-saturation condition of the subgrade soil before concrete placement. Due to the expansion potential of the near surface soils, we recommend that slabs-on-grade be supported on non-expansive fill to reduce the likelihood of slab damage from heave or shrinkage. To reduce the effects of expansive soil on interior slabs, we recommend the following:

1. Provide a minimum concrete thickness of 4 inches.
2. Reinforce slabs with No. 3 rebar on 16-inch centers, each way, placed within the middle third of the slab.
3. Pre-saturate the upper 10 inches of slab subgrade as described above.

The Structural Engineer should provide final design thickness and additional reinforcement, if necessary, for the intended structural loads. As a minimum requirement, reinforce slabs-on-grade to control cracking. Provide frequent control joints to reduce the cracking. In our experience, welded wire mesh is not sufficient to control slab cracking. Provide a thickened edge extending at least 6 inches into compacted soil to minimize water infiltration. Place a 4-inch-thick layer of clean crushed rock or gravel, which conforms to the requirement listed in Section 2.04 of Part I of the Guide Contract Specifications, under all secondary concrete slabs. Slope slabs away from the buildings at a slope of at least 2 percent to prevent water from flowing toward the building.

Grading Considerations

Coordinate all grading and study area development plans with the Geotechnical Engineer to modify the plans to mitigate any known soil and geologic hazards, as necessary. Notify ENGEO at least 48 hours prior to grading to coordinate our schedule with the grading contractor. Grading operations should meet the requirements of the Guide Contract Specifications included in the Appendix H and must be observed and tested by ENGEO's field representatives.

Ponding of storm water should not be permitted at the site except within engineered sediment detention basins, particularly during cease of work for rainy weather. Before the grading is halted by rain, provide positive slopes to carry the surface runoff to storm drainage structures in a controlled manner to prevent erosion damage.

Demolition and Stripping

Begin grading with the removal of existing structures and associated foundations, buried pipes, septic tanks, leach fields, irrigation lines, water well systems, designated fences, trees and associated root systems, and any other deleterious materials. Remove underground structures that will be abandoned or are expected to extend below proposed finished grades from the project site. Remove tree roots to a depth of at least 3 feet below original grades. The organically contaminated materials should not be used in proposed building pads or pavement areas. Strip and stockpile the organics and use in landscape areas subject to the approval of the Landscape Architect or off haul. Remove any debris found within any areas to be graded.

The planned hospital footprint encroaches into the existing waste water treatment plant location. Prior to site grading, the waste water treatment facility should be decommissioned in accordance with regulatory requirements. Additionally, the bottom 11 feet of the ponds should be overexcavated and replaced with engineered fill under observation of the Geotechnical Engineer and/or by a representative of the Geotechnical Engineer. Grading for the pond area should include:

- Temporary dewatering of the ponds and removal of soft material beneath ponds;
- Excavating and off-hauling the soft and liquefiable material at the pond bottom;
- Overexcavating any undocumented fill within the waste water facility area; and
- Removing underground pipelines and buried foundations.

A representative of ENGEO should determine the actual removal depth in the field based on conditions encountered during the site grading. Clean excavations resulting from demolition and stripping below design grades to a firm undisturbed, non-yielding soil surface as determined by the Geotechnical Engineer. Following clearing and grubbing, scarify, moisture-condition and backfill all depressions with compacted engineered fill. The requirements for backfill materials and placement procedures are the same as those for engineered fill as described in the "Fill Placement" section.

Remove all existing non-engineered fill, vegetation and soft or compressible soils in areas to be graded as necessary for project requirements. The Geotechnical Engineer or qualified representative should determine the material removal depth in the field at the time of grading. Evaluation of unsuitable deposits should be performed during grading and may include sampling and laboratory analyses.

Site Preparation

After the site has been properly cleared and stripped, and necessary excavations have been made, scarify the surface at least 12 inches, moisture condition, and compact in accordance with the recommendations presented below in the "Fill Placement" section, prior to replacing and recompacting overlying soils as engineered fill. The compaction requirements for existing soil used for fill placement are the same as those for engineered fill, as described in a subsequent section of this report.

Materials Selection. With the exception of organic-laden soils, we anticipate engineered fill to consist of the on-site soil materials in connection with the planned grading and site improvements. Organic laden soils contain more than 3 percent organic content above typical background levels in soil. It is our experience that organic laden soils can be blended with general fill material at a ratio not greater than 10:1.

Import materials must be free of organic material, debris and fragments larger than 6 inches in greatest dimension. Import material should meet the requirements contained in Section 2.02B, Part I of the Guide Contract Specifications in Appendix H. Submit a sample of the proposed import material to the Geotechnical Engineer for evaluation by laboratory testing prior to study area delivery.

Fill Placement. Scarify, moisture-condition and recompact the exposed surface area to 12 inches in depth, to provide adequate bonding with the initial fill lift. Place all fills in thin lifts. Avoid lift thicknesses exceeding 6 inches or the compaction equipment penetration depth, whichever is less. Generally apply the following compaction control requirements to granular fills:

Test Procedure:	ASTM D-1557 (most recent).
Required Moisture Content:	A minimum of 3 percent above optimum moisture content.
Required Relative Compaction:	A minimum of 90 percent for non-expansive soil.

Relative compaction refers to in-place dry density of the fill material expressed as a percentage of the maximum dry density based on ASTM D-1557. Optimum moisture is the moisture content corresponding to the maximum dry density.

Monitoring and Testing It is important that all site preparations for mass grading be done under the observation of a Geotechnical Engineer or his/her qualified field representative. Allow the Geotechnical Engineer or his/her field representative to observe all graded area preparation, including demolition and stripping, following the recommendations contained in the Guide Contract Specifications in Appendix H. We also recommend the Geotechnical Engineer or his/her qualified representative be present full time during all phases of the mass grading operations to observe grading procedures and test for soil compaction. Submit the final grading plans to the Geotechnical Engineer for review.

Temporary Dewatering

Based on the boring and CPT data, groundwater levels at this site are as shallow as 5 feet below the ground surface, corresponding to approximate Elev.153 feet in the proposed hospital building area. If excavations extend below this elevation, anticipate the need for temporary dewatering measures. The Contractor should select the dewatering equipment. We recommend dewatering procedures maintain groundwater at a minimum of 2 feet below the bottom of the excavation.

Retaining Walls Criteria

Conventional retaining walls (i.e. concrete, masonry, etc.) that are drained and less than 10 feet in vertical height should be designed to resist the following earth pressures. Design retaining walls that are free to deflect with active earth pressures and walls not free to deflect with at-rest earth pressures.

DRAINED LATERAL EARTH PRESSURES
(Working Stress Loads)

Backfill Slope Condition (horizontal: vertical)	Active Pressure (pcf)	At-Rest Pressure (pcf)
Level	50	85
4:1	55	90
3:1	60	100
2:1	70	110

For walls greater than 10 feet, additional support will be needed to minimize the amount of rotational movement. The final plans should be reviewed by ENGEO, and large walls should be evaluated on a case-by-case basis. ENGEO should work together with the Structural Engineer. Provide backdrain facilities at the base of the foundation for all walls. Backfill of walls should be performed under the observation and testing of ENGEO and according to the recommendations provided in this and the referenced reports.

Preliminary Pavement Design

The following recommendations for preliminary asphalt pavement sections are intended as a conceptual guide for planning. We based the preliminary pavement sections on an estimated R-Value of 5. Actual R-Value samples should be collected for testing after grading to approximate rough grades and installation of underground utilities. The preliminary pavement sections are based on the estimated R-Value, the Caltrans "Design Method for Flexible Pavements", and Traffic Indices (T.I.) ranging from 4 to 8. However, T.I. values should be determined by the Civil Engineer or appropriate public agency.

Traffic Index	Asphalt Concrete (in.) (Type B)	Aggregate Base (in.) (Class 2)
4.0	2½	7½
5.0	3	10
6.0	3½	13
7.0	4	16
8.0	4	17½

Pavement materials and construction should comply with the specifications and requirements of the Standard Specifications by the State of California Division of Highways, City of Santa Rosa requirements and the following minimum requirements.

- Scarify pavement subgrades to a minimum depth of 12 inches below finished subgrade elevation; moisture condition to 3 percent above optimum, and compact to at least 95 percent relative compaction and in accordance with city requirements.

- Subgrade soils should be in a stable, non-pumping condition at the time aggregate baserock materials are placed and compacted.

- Adequate provisions must be made such that the subgrade soils and aggregate baserock materials are not allowed to become saturated.

- Aggregate baserock materials should meet current Caltrans specifications for Class 2 Aggregate Baserock, and should be compacted to at least 95 percent of maximum dry density.

- Asphalt paving materials should meet current Caltrans specifications for asphalt concrete.

- All concrete curbs separating pavement and irrigated landscaped areas should extend into the subgrade and below the bottom of adjacent aggregate baserock materials.

Utilities

It is recommended that all utility trench backfill be done under the observation of a Geotechnical Engineer, in accordance with both the City of Santa Rosa and utility agency requirements. Pipe zone backfill (i.e. material beneath and immediately surrounding the pipe) may consist of a well-graded import or native material less than ¾ inch in maximum dimension compacted in accordance with the recommendations provided above for engineered fill. Trench zone backfill (i.e. material placed between the pipe zone backfill and the ground surface) may consist of native soil compacted in accordance with recommendations for engineered fill.

LIMITATIONS AND UNIFORMITY OF CONDITIONS

This report is issued with the understanding that it is the responsibility of the owner to transmit the information and recommendations of this report to developers, owners, buyers, architects, engineers, and designers for the project so that the necessary steps can be taken by the contractors and subcontractors to carry out such recommendations in the field. The conclusions and recommendations contained in this report are solely professional opinions.

The professional staff of ENGEO Incorporated strives to perform its services in a proper and professional manner with reasonable care and competence, but is not infallible. There are risks of earth movement and property damages inherent in land development. We are unable to eliminate all risks or provide insurance; therefore, we are unable to guarantee or warrant the results of our work.

This report is based upon field and other conditions discovered at the time of preparation of ENGEO's work. This document must not be subject to unauthorized reuse, which is, reusing without written authorization of ENGEO. Such authorization is essential because it requires ENGEO to evaluate the document's applicability given new circumstances, not the least of which is passage of time. If actual field or other conditions necessitate clarifications, adjustments, modifications or other changes to ENGEO's work, ENGEO must be engaged to prepare the necessary clarifications, adjustments, modifications or other changes before construction activities commence or further activity proceeds. If ENGEO's scope of services does not include on-site construction observation, or if other persons or entities are retained to provide such services, ENGEO cannot be held responsible for any or all claims arising from or resulting from the performance of such services by other persons or entities, and from any or all claims arising from or resulting from clarifications, adjustments, modifications, discrepancies or other changes necessary to reflect changed field or other conditions.

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = .884E-08 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = -.219E-08 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .181E+00 IN
COMPUTED SLOPE AT PILE HEAD = -.334E-02
MAXIMUM BENDING MOMENT = .327E+06 LBS-IN
MAXIMUM SHEAR FORCE = .130E+05 LBS
NO. OF ITERATIONS = 29
NO. OF ZERO DEFLECTION POINTS = 12

LOADING NUMBER 2

BOUNDARY CONDITION CODE = 1
LATERAL LOAD AT THE PILE HEAD = .140E+05 LBS
MOMENT AT THE PILE HEAD = .000E+00 IN-LBS
AXIAL LOAD AT THE PILE HEAD = .120E+06 LBS

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = -.840E-07 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = .827E-08 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .216E+00 IN
COMPUTED SLOPE AT PILE HEAD = -.384E-02
MAXIMUM BENDING MOMENT = .362E+06 LBS-IN
MAXIMUM SHEAR FORCE = .140E+05 LBS
NO. OF ITERATIONS = 29
NO. OF ZERO DEFLECTION POINTS = 11

LOADING NUMBER 3

BOUNDARY CONDITION CODE = 1
LATERAL LOAD AT THE PILE HEAD = .150E+05 LBS
MOMENT AT THE PILE HEAD = .000E+00 IN-LBS
AXIAL LOAD AT THE PILE HEAD = .120E+06 LBS

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = -.141E-07 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = -.322E-08 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .300E+00 IN
COMPUTED SLOPE AT PILE HEAD = -.495E-02
MAXIMUM BENDING MOMENT = .434E+06 LBS-IN
MAXIMUM SHEAR FORCE = .160E+05 LBS
NO. OF ITERATIONS = 30

NO. OF ZERO DEFLECTION POINTS = 10

LOADING NUMBER 5

BOUNDARY CONDITION CODE = 1
LATERAL LOAD AT THE PILE HEAD = .170E+05 LBS
MOMENT AT THE PILE HEAD = .000E+00 IN-LBS
AXIAL LOAD AT THE PILE HEAD = .120E+06 LBS

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = .543E-07 IN-LBS

THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = .599E-08 LBS

OUTPUT SUMMARY

```
PILE-HEAD DEFLECTION           =   .347E+00 IN
COMPUTED SLOPE AT PILE HEAD    =  -.556E-02
MAXIMUM BENDING MOMENT         =   .470E+06 LBS-IN
MAXIMUM SHEAR FORCE            =   .170E+05 LBS
NO. OF ITERATIONS              =        31
NO. OF ZERO DEFLECTION POINTS  =        10
```

LOADING NUMBER 6

```
BOUNDARY CONDITION CODE              =          1
LATERAL LOAD AT THE PILE HEAD        =   .180E+05 LBS
MOMENT AT THE PILE HEAD              =   .000E+00 IN-LBS
AXIAL LOAD AT THE PILE HEAD          =   .120E+06 LBS
```

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = .495E-07 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = .525E-08 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .400E+00 IN
COMPUTED SLOPE AT PILE HEAD = -.622E-02
MAXIMUM BENDING MOMENT = .509E+06 LBS-IN
MAXIMUM SHEAR FORCE = .180E+05 LBS
NO. OF ITERATIONS = 31
NO. OF ZERO DEFLECTION POINTS = 10

LOADING NUMBER 7

BOUNDARY CONDITION CODE = 1
LATERAL LOAD AT THE PILE HEAD = .190E+05 LBS
MOMENT AT THE PILE HEAD = .000E+00 IN-LBS
AXIAL LOAD AT THE PILE HEAD = .120E+06 LBS

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = -.178E-07 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = -.572E-08 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .458E+00 IN
COMPUTED SLOPE AT PILE HEAD = -.690E-02
MAXIMUM BENDING MOMENT = .548E+06 LBS-IN
MAXIMUM SHEAR FORCE = .190E+05 LBS
NO. OF ITERATIONS = 32
NO. OF ZERO DEFLECTION POINTS = 9

LOADING NUMBER 8

BOUNDARY CONDITION CODE = 1
LATERAL LOAD AT THE PILE HEAD = .200E+05 LBS
MOMENT AT THE PILE HEAD = .000E+00 IN-LBS
AXIAL LOAD AT THE PILE HEAD = .120E+06 LBS

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = .568E-07 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = .880E-08 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .519E+00 IN
COMPUTED SLOPE AT PILE HEAD = -.763E-02
MAXIMUM BENDING MOMENT = .588E+06 LBS-IN
MAXIMUM SHEAR FORCE = .200E+05 LBS
NO. OF ITERATIONS = 32
NO. OF ZERO DEFLECTION POINTS = 9

LOADING NUMBER 9

BOUNDARY CONDITION CODE = 1
LATERAL LOAD AT THE PILE HEAD = .210E+05 LBS
MOMENT AT THE PILE HEAD = .000E+00 IN-LBS
AXIAL LOAD AT THE PILE HEAD = .120E+06 LBS

SOILS INFORMATION

X AT THE GROUND SURFACE = .00 IN

SLOPE ANGLE AT THE GROUND SURFACE = .00 DEG.

5 LAYER(S) OF SOIL

LAYER 1
THE SOIL IS A STIFF CLAY WITH NO FREE WATER
X AT THE TOP OF THE LAYER = .00 IN
X AT THE BOTTOM OF THE LAYER = 60.00 IN
MODULUS OF SUBGRADE REACTION = .500E+03 LBS/IN**3

LAYER 2
THE SOIL IS A SOFT CLAY
X AT THE TOP OF THE LAYER = 60.00 IN

X AT THE BOTTOM OF THE LAYER = 360.00 IN
MODULUS OF SUBGRADE REACTION = .300E+02 LBS/IN**3

LAYER 3
THE SOIL IS A STIFF CLAY WITH WATER-INDUCED EROSION
X AT THE TOP OF THE LAYER = 360.00 IN
X AT THE BOTTOM OF THE LAYER = 420.00 IN
MODULUS OF SUBGRADE REACTION = .800E+03 LBS/IN**3

LAYER 4
THE SOIL IS A SOFT CLAY
X AT THE TOP OF THE LAYER = 420.00 IN
X AT THE BOTTOM OF THE LAYER = 480.00 IN
MODULUS OF SUBGRADE REACTION = .100E+03 LBS/IN**3

LAYER 5
THE SOIL IS A SAND - P-Y CRITERIA BY REESE ET AL, 1974
X AT THE TOP OF THE LAYER = 480.00 IN
X AT THE BOTTOM OF THE LAYER = 720.00 IN
MODULUS OF SUBGRADE REACTION = .125E+03 LBS/IN**3

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = -.244E-07 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = -.243E-08 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .191E+00 IN
COMPUTED SLOPE AT PILE HEAD = -.352E-02
MAXIMUM BENDING MOMENT = .343E+06 LBS-IN
MAXIMUM SHEAR FORCE = .130E+05 LBS
NO. OF ITERATIONS = 29
NO. OF ZERO DEFLECTION POINTS = 12

LOADING NUMBER 2

BOUNDARY CONDITION CODE = 1
LATERAL LOAD AT THE PILE HEAD = .140E+05 LBS
MOMENT AT THE PILE HEAD = .000E+00 IN-LBS
AXIAL LOAD AT THE PILE HEAD = .250E+06 LBS

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = .555E-07 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = -.506E-08 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .230E+00 IN
COMPUTED SLOPE AT PILE HEAD = -.406E-02
MAXIMUM BENDING MOMENT = .380E+06 LBS-IN
MAXIMUM SHEAR FORCE = .140E+05 LBS
NO. OF ITERATIONS = 30
NO. OF ZERO DEFLECTION POINTS = 11

LOADING NUMBER 3

BOUNDARY CONDITION CODE = 1
LATERAL LOAD AT THE PILE HEAD = .150E+05 LBS
MOMENT AT THE PILE HEAD = .000E+00 IN-LBS
AXIAL LOAD AT THE PILE HEAD = .250E+06 LBS

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = .153E-06 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = -.126E-07 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .272E+00 IN
COMPUTED SLOPE AT PILE HEAD = -.465E-02
MAXIMUM BENDING MOMENT = .419E+06 LBS-IN
MAXIMUM SHEAR FORCE = .150E+05 LBS
NO. OF ITERATIONS = 30
NO. OF ZERO DEFLECTION POINTS = 10

LOADING NUMBER 4

BOUNDARY CONDITION CODE = 1
LATERAL LOAD AT THE PILE HEAD = .160E+05 LBS
MOMENT AT THE PILE HEAD = .000E+00 IN-LBS
AXIAL LOAD AT THE PILE HEAD = .250E+06 LBS

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = -.581E-07 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = -.584E-08 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .321E+00 IN
COMPUTED SLOPE AT PILE HEAD = -.528E-02
MAXIMUM BENDING MOMENT = .458E+06 LBS-IN
MAXIMUM SHEAR FORCE = .160E+05 LBS
NO. OF ITERATIONS = 31

NO. OF ZERO DEFLECTION POINTS = 10

LOADING NUMBER 5

BOUNDARY CONDITION CODE = 1
LATERAL LOAD AT THE PILE HEAD = .170E+05 LBS
MOMENT AT THE PILE HEAD = .000E+00 IN-LBS
AXIAL LOAD AT THE PILE HEAD = .250E+06 LBS

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = .125E-07 IN-LBS

THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = .282E-08 LBS

OUTPUT SUMMARY

```
PILE-HEAD DEFLECTION              =   .374E+00 IN
COMPUTED SLOPE AT PILE HEAD       =  -.596E-02
MAXIMUM BENDING MOMENT            =   .499E+06 LBS-IN
MAXIMUM SHEAR FORCE               =   .170E+05 LBS
NO. OF ITERATIONS                 =        32
NO. OF ZERO DEFLECTION POINTS     =        10
```

LOADING NUMBER 6

```
BOUNDARY CONDITION CODE                  =         1
LATERAL LOAD AT THE PILE HEAD            =   .180E+05 LBS
MOMENT AT THE PILE HEAD                  =   .000E+00 IN-LBS
AXIAL LOAD AT THE PILE HEAD              =   .250E+06 LBS
```

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = .125E-06 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = .129E-07 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .432E+00 IN
COMPUTED SLOPE AT PILE HEAD = -.668E-02
MAXIMUM BENDING MOMENT = .542E+06 LBS-IN
MAXIMUM SHEAR FORCE = .180E+05 LBS
NO. OF ITERATIONS = 30
NO. OF ZERO DEFLECTION POINTS = 9

LOADING NUMBER 7

BOUNDARY CONDITION CODE = 1
LATERAL LOAD AT THE PILE HEAD = .190E+05 LBS
MOMENT AT THE PILE HEAD = .000E+00 IN-LBS
AXIAL LOAD AT THE PILE HEAD = .250E+06 LBS

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = .162E-06 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = -.143E-07 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .497E+00 IN
COMPUTED SLOPE AT PILE HEAD = -.745E-02
MAXIMUM BENDING MOMENT = .586E+06 LBS-IN
MAXIMUM SHEAR FORCE = .190E+05 LBS
NO. OF ITERATIONS = 33
NO. OF ZERO DEFLECTION POINTS = 9

LOADING NUMBER 8

BOUNDARY CONDITION CODE = 1
LATERAL LOAD AT THE PILE HEAD = .200E+05 LBS
MOMENT AT THE PILE HEAD = .000E+00 IN-LBS
AXIAL LOAD AT THE PILE HEAD = .250E+06 LBS

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = .860E-07 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = .749E-08 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .566E+00 IN
COMPUTED SLOPE AT PILE HEAD = -.827E-02
MAXIMUM BENDING MOMENT = .631E+06 LBS-IN
MAXIMUM SHEAR FORCE = .200E+05 LBS
NO. OF ITERATIONS = 32
NO. OF ZERO DEFLECTION POINTS = 9

LOADING NUMBER 9

BOUNDARY CONDITION CODE = 1
LATERAL LOAD AT THE PILE HEAD = .210E+05 LBS
MOMENT AT THE PILE HEAD = .000E+00 IN-LBS
AXIAL LOAD AT THE PILE HEAD = .250E+06 LBS

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = -.880E-07 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = .785E-08 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .183E+00 IN
COMPUTED SLOPE AT PILE HEAD = -.286E-02
MAXIMUM BENDING MOMENT = .437E+06 LBS-IN
MAXIMUM SHEAR FORCE = .160E+05 LBS
NO. OF ITERATIONS = 26
NO. OF ZERO DEFLECTION POINTS = 10

LOADING NUMBER 2

BOUNDARY CONDITION CODE = 1
LATERAL LOAD AT THE PILE HEAD = .170E+05 LBS
MOMENT AT THE PILE HEAD = .000E+00 IN-LBS
AXIAL LOAD AT THE PILE HEAD = .150E+06 LBS

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = .773E-07 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = .825E-08 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .212E+00 IN
COMPUTED SLOPE AT PILE HEAD = -.322E-02
MAXIMUM BENDING MOMENT = .475E+06 LBS-IN
MAXIMUM SHEAR FORCE = .170E+05 LBS
NO. OF ITERATIONS = 30
NO. OF ZERO DEFLECTION POINTS = 9

LOADING NUMBER 3

BOUNDARY CONDITION CODE = 1
LATERAL LOAD AT THE PILE HEAD = .180E+05 LBS
MOMENT AT THE PILE HEAD = .000E+00 IN-LBS
AXIAL LOAD AT THE PILE HEAD = .150E+06 LBS

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = .118E-07 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = .124E-08 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .245E+00 IN
COMPUTED SLOPE AT PILE HEAD = -.360E-02
MAXIMUM BENDING MOMENT = .514E+06 LBS-IN
MAXIMUM SHEAR FORCE = .180E+05 LBS
NO. OF ITERATIONS = 30
NO. OF ZERO DEFLECTION POINTS = 9

LOADING NUMBER 4

BOUNDARY CONDITION CODE	=	1
LATERAL LOAD AT THE PILE HEAD	=	.190E+05 LBS
MOMENT AT THE PILE HEAD	=	.000E+00 IN-LBS
AXIAL LOAD AT THE PILE HEAD	=	.150E+06 LBS

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = -.259E-06 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = .203E-07 LBS

OUTPUT SUMMARY

```
PILE-HEAD DEFLECTION             =    .280E+00 IN
COMPUTED SLOPE AT PILE HEAD      =   -.399E-02
MAXIMUM BENDING MOMENT           =    .552E+06 LBS-IN
MAXIMUM SHEAR FORCE              =    .190E+05 LBS
NO. OF ITERATIONS                =          28
NO. OF ZERO DEFLECTION POINTS    =           9
```

LOADING NUMBER 5

```
BOUNDARY CONDITION CODE                  =          1
LATERAL LOAD AT THE PILE HEAD            =    .200E+05 LBS
MOMENT AT THE PILE HEAD                  =    .000E+00 IN-LBS
AXIAL LOAD AT THE PILE HEAD              =    .150E+06 LBS
```

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = -.207E-06 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = .196E-07 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .318E+00 IN
COMPUTED SLOPE AT PILE HEAD = -.441E-02
MAXIMUM BENDING MOMENT = .592E+06 LBS-IN
MAXIMUM SHEAR FORCE = .200E+05 LBS
NO. OF ITERATIONS = 30
NO. OF ZERO DEFLECTION POINTS = 8

LOADING NUMBER 6

BOUNDARY CONDITION CODE = 1
LATERAL LOAD AT THE PILE HEAD = .210E+05 LBS
MOMENT AT THE PILE HEAD = .000E+00 IN-LBS
AXIAL LOAD AT THE PILE HEAD = .150E+06 LBS

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = .148E-06 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = .152E-07 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .359E+00 IN
COMPUTED SLOPE AT PILE HEAD = -.486E-02
MAXIMUM BENDING MOMENT = .632E+06 LBS-IN
MAXIMUM SHEAR FORCE = .210E+05 LBS
NO. OF ITERATIONS = 30
NO. OF ZERO DEFLECTION POINTS = 8

LOADING NUMBER 7

BOUNDARY CONDITION CODE = 1
LATERAL LOAD AT THE PILE HEAD = .220E+05 LBS
MOMENT AT THE PILE HEAD = .000E+00 IN-LBS
AXIAL LOAD AT THE PILE HEAD = .150E+06 LBS

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = -.105E-06 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = .805E-08 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .404E+00 IN
COMPUTED SLOPE AT PILE HEAD = -.532E-02
MAXIMUM BENDING MOMENT = .672E+06 LBS-IN
MAXIMUM SHEAR FORCE = .220E+05 LBS
NO. OF ITERATIONS = 31
NO. OF ZERO DEFLECTION POINTS = 8

LOADING NUMBER 8

BOUNDARY CONDITION CODE = 1
LATERAL LOAD AT THE PILE HEAD = .230E+05 LBS
MOMENT AT THE PILE HEAD = .000E+00 IN-LBS
AXIAL LOAD AT THE PILE HEAD = .150E+06 LBS

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = -.319E-06 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = .304E-07 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .452E+00 IN
COMPUTED SLOPE AT PILE HEAD = -.581E-02
MAXIMUM BENDING MOMENT = .713E+06 LBS-IN
MAXIMUM SHEAR FORCE = .230E+05 LBS
NO. OF ITERATIONS = 31
NO. OF ZERO DEFLECTION POINTS = 8

LOADING NUMBER 9

BOUNDARY CONDITION CODE = 1
LATERAL LOAD AT THE PILE HEAD = .240E+05 LBS
MOMENT AT THE PILE HEAD = .000E+00 IN-LBS
AXIAL LOAD AT THE PILE HEAD = .150E+06 LBS

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = -.198E-06 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = .180E-07 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .503E+00 IN
COMPUTED SLOPE AT PILE HEAD = -.632E-02
MAXIMUM BENDING MOMENT = .756E+06 LBS-IN
MAXIMUM SHEAR FORCE = .240E+05 LBS
NO. OF ITERATIONS = 31
NO. OF ZERO DEFLECTION POINTS = 8

LOADING NUMBER 10

```
BOUNDARY CONDITION CODE              =        1
LATERAL LOAD AT THE PILE HEAD        =    .250E+05 LBS
MOMENT AT THE PILE HEAD              =    .000E+00 IN-LBS
AXIAL LOAD AT THE PILE HEAD          =    .150E+06 LBS
```

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = .453E-07 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = -.507E-08 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .191E+00 IN
COMPUTED SLOPE AT PILE HEAD = -.299E-02
MAXIMUM BENDING MOMENT = .453E+06 LBS-IN
MAXIMUM SHEAR FORCE = .160E+05 LBS
NO. OF ITERATIONS = 28
NO. OF ZERO DEFLECTION POINTS = 9

LOADING NUMBER 2

BOUNDARY CONDITION CODE = 1
LATERAL LOAD AT THE PILE HEAD = .170E+05 LBS
MOMENT AT THE PILE HEAD = .000E+00 IN-LBS
AXIAL LOAD AT THE PILE HEAD = .300E+06 LBS

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = -.224E-07 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = -.427E-08 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .223E+00 IN
COMPUTED SLOPE AT PILE HEAD = -.336E-02
MAXIMUM BENDING MOMENT = .494E+06 LBS-IN
MAXIMUM SHEAR FORCE = .170E+05 LBS
NO. OF ITERATIONS = 29
NO. OF ZERO DEFLECTION POINTS = 9

LOADING NUMBER 3

BOUNDARY CONDITION CODE = 1
LATERAL LOAD AT THE PILE HEAD = .180E+05 LBS
MOMENT AT THE PILE HEAD = .000E+00 IN-LBS
AXIAL LOAD AT THE PILE HEAD = .300E+06 LBS

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = -.125E-06 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = .160E-07 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .257E+00 IN
COMPUTED SLOPE AT PILE HEAD = -.377E-02
MAXIMUM BENDING MOMENT = .535E+06 LBS-IN
MAXIMUM SHEAR FORCE = .180E+05 LBS
NO. OF ITERATIONS = 30
NO. OF ZERO DEFLECTION POINTS = 9

LOADING NUMBER 4

BOUNDARY CONDITION CODE = 1
LATERAL LOAD AT THE PILE HEAD = .190E+05 LBS
MOMENT AT THE PILE HEAD = .000E+00 IN-LBS
AXIAL LOAD AT THE PILE HEAD = .300E+06 LBS

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = -.923E-07 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = -.695E-08 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .296E+00 IN
COMPUTED SLOPE AT PILE HEAD = -.420E-02
MAXIMUM BENDING MOMENT = .577E+06 LBS-IN
MAXIMUM SHEAR FORCE = .190E+05 LBS
NO. OF ITERATIONS = 30

NO. OF ZERO DEFLECTION POINTS = 9

LOADING NUMBER 5

BOUNDARY CONDITION CODE = 1
LATERAL LOAD AT THE PILE HEAD = .200E+05 LBS
MOMENT AT THE PILE HEAD = .000E+00 IN-LBS
AXIAL LOAD AT THE PILE HEAD = .300E+06 LBS

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = -.265E-06 IN-LBS

THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = .225E-07 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .337E+00 IN
COMPUTED SLOPE AT PILE HEAD = -.465E-02
MAXIMUM BENDING MOMENT = .619E+06 LBS-IN
MAXIMUM SHEAR FORCE = .200E+05 LBS
NO. OF ITERATIONS = 31
NO. OF ZERO DEFLECTION POINTS = 8

LOADING NUMBER 6

BOUNDARY CONDITION CODE = 1
LATERAL LOAD AT THE PILE HEAD = .210E+05 LBS
MOMENT AT THE PILE HEAD = .000E+00 IN-LBS
AXIAL LOAD AT THE PILE HEAD = .300E+06 LBS

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = .517E-07 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = .787E-08 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .382E+00 IN
COMPUTED SLOPE AT PILE HEAD = -.514E-02
MAXIMUM BENDING MOMENT = .662E+06 LBS-IN
MAXIMUM SHEAR FORCE = .210E+05 LBS
NO. OF ITERATIONS = 30
NO. OF ZERO DEFLECTION POINTS = 8

LOADING NUMBER 7

BOUNDARY CONDITION CODE = 1
LATERAL LOAD AT THE PILE HEAD = .220E+05 LBS
MOMENT AT THE PILE HEAD = .000E+00 IN-LBS
AXIAL LOAD AT THE PILE HEAD = .300E+06 LBS

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = -.613E-07 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = -.600E-08 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .430E+00 IN
COMPUTED SLOPE AT PILE HEAD = -.564E-02
MAXIMUM BENDING MOMENT = .706E+06 LBS-IN
MAXIMUM SHEAR FORCE = .220E+05 LBS
NO. OF ITERATIONS = 32
NO. OF ZERO DEFLECTION POINTS = 8

LOADING NUMBER 8

BOUNDARY CONDITION CODE = 1
LATERAL LOAD AT THE PILE HEAD = .230E+05 LBS
MOMENT AT THE PILE HEAD = .000E+00 IN-LBS
AXIAL LOAD AT THE PILE HEAD = .300E+06 LBS

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = .107E-06 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = -.144E-07 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .482E+00 IN
COMPUTED SLOPE AT PILE HEAD = -.618E-02
MAXIMUM BENDING MOMENT = .752E+06 LBS-IN
MAXIMUM SHEAR FORCE = .230E+05 LBS
NO. OF ITERATIONS = 31
NO. OF ZERO DEFLECTION POINTS = 8

LOADING NUMBER 9

BOUNDARY CONDITION CODE = 1
LATERAL LOAD AT THE PILE HEAD = .240E+05 LBS
MOMENT AT THE PILE HEAD = .000E+00 IN-LBS
AXIAL LOAD AT THE PILE HEAD = .300E+06 LBS

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = -.250E-07 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = -.287E-08 LBS

OUTPUT SUMMARY

```
PILE-HEAD DEFLECTION              =   .212E+00 IN
COMPUTED SLOPE AT PILE HEAD       =  -.925E-17
MAXIMUM BENDING MOMENT            =  -.807E+06 LBS-IN
MAXIMUM SHEAR FORCE               =   .240E+05 LBS
NO. OF ITERATIONS                 =        27
NO. OF ZERO DEFLECTION POINTS     =        10
```

LOADING NUMBER 2

```
BOUNDARY CONDITION CODE               =          2
LATERAL LOAD AT THE PILE HEAD         =   .250E+05 LBS
SLOPE AT THE PILE HEAD                =   .000E+00 IN/IN
AXIAL LOAD AT THE PILE HEAD           =   .120E+06 LBS
```

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = .214E-07 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = .267E-08 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .236E+00 IN
COMPUTED SLOPE AT PILE HEAD = -.116E-16
MAXIMUM BENDING MOMENT = -.857E+06 LBS-IN
MAXIMUM SHEAR FORCE = .250E+05 LBS
NO. OF ITERATIONS = 28
NO. OF ZERO DEFLECTION POINTS = 10

LOADING NUMBER 3

BOUNDARY CONDITION CODE = 2
LATERAL LOAD AT THE PILE HEAD = .260E+05 LBS
SLOPE AT THE PILE HEAD = .000E+00 IN/IN
AXIAL LOAD AT THE PILE HEAD = .120E+06 LBS

X DEFLECTION MOMENT SHEAR SLOPE TOTAL FLEXURAL SOIL

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = -.770E-07 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = .624E-08 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .261E+00 IN
COMPUTED SLOPE AT PILE HEAD = -.185E-16
MAXIMUM BENDING MOMENT = -.907E+06 LBS-IN
MAXIMUM SHEAR FORCE = .260E+05 LBS
NO. OF ITERATIONS = 28
NO. OF ZERO DEFLECTION POINTS = 9

LOADING NUMBER 4

BOUNDARY CONDITION CODE = 2
LATERAL LOAD AT THE PILE HEAD = .330E+05 LBS
SLOPE AT THE PILE HEAD = .000E+00 IN/IN
AXIAL LOAD AT THE PILE HEAD = .120E+06 LBS

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = .231E-07 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = .335E-08 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .480E+00 IN
COMPUTED SLOPE AT PILE HEAD = .000E+00
MAXIMUM BENDING MOMENT = -.129E+07 LBS-IN
MAXIMUM SHEAR FORCE = .330E+05 LBS
NO. OF ITERATIONS = 30
NO. OF ZERO DEFLECTION POINTS = 9

LOADING NUMBER 5

BOUNDARY CONDITION CODE = 2
LATERAL LOAD AT THE PILE HEAD = .340E+05 LBS
SLOPE AT THE PILE HEAD = .000E+00 IN/IN
AXIAL LOAD AT THE PILE HEAD = .120E+06 LBS

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = .173E-06 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = .170E-07 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .518E+00 IN
COMPUTED SLOPE AT PILE HEAD = .925E-16
MAXIMUM BENDING MOMENT = -.135E+07 LBS-IN
MAXIMUM SHEAR FORCE = .340E+05 LBS
NO. OF ITERATIONS = 30
NO. OF ZERO DEFLECTION POINTS = 9

LOADING NUMBER 6

BOUNDARY CONDITION CODE	=	2
LATERAL LOAD AT THE PILE HEAD	=	.350E+05 LBS
SLOPE AT THE PILE HEAD	=	.000E+00 IN/IN
AXIAL LOAD AT THE PILE HEAD	=	.120E+06 LBS

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = .207E-06 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = .170E-07 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .557E+00 IN
COMPUTED SLOPE AT PILE HEAD = .555E-16
MAXIMUM BENDING MOMENT = -.141E+07 LBS-IN
MAXIMUM SHEAR FORCE = .350E+05 LBS
NO. OF ITERATIONS = 31
NO. OF ZERO DEFLECTION POINTS = 9

SOILS INFORMATION

X AT THE GROUND SURFACE = .00 IN

SLOPE ANGLE AT THE GROUND SURFACE = .00 DEG.

5 LAYER(S) OF SOIL

LAYER 1
THE SOIL IS A STIFF CLAY WITH NO FREE WATER
X AT THE TOP OF THE LAYER = .00 IN
X AT THE BOTTOM OF THE LAYER = 60.00 IN
MODULUS OF SUBGRADE REACTION = .500E+03 LBS/IN**3

LAYER 2
THE SOIL IS A SOFT CLAY
X AT THE TOP OF THE LAYER = 60.00 IN
X AT THE BOTTOM OF THE LAYER = 360.00 IN
MODULUS OF SUBGRADE REACTION = .300E+02 LBS/IN**3

LAYER 3
THE SOIL IS A STIFF CLAY WITH WATER-INDUCED EROSION
X AT THE TOP OF THE LAYER = 360.00 IN
X AT THE BOTTOM OF THE LAYER = 420.00 IN
MODULUS OF SUBGRADE REACTION = .800E+03 LBS/IN**3

LAYER 4
THE SOIL IS A SOFT CLAY
X AT THE TOP OF THE LAYER = 420.00 IN
X AT THE BOTTOM OF THE LAYER = 480.00 IN
MODULUS OF SUBGRADE REACTION = .100E+03 LBS/IN**3

LAYER 5
THE SOIL IS A SAND - P-Y CRITERIA BY REESE ET AL, 1974
X AT THE TOP OF THE LAYER = 480.00 IN

```
X AT THE BOTTOM OF THE LAYER        =     720.00 IN
MODULUS OF SUBGRADE REACTION        =   .125E+03 LBS/IN**3
```

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = -.187E-07 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = -.250E-08 LBS

OUTPUT SUMMARY

```
PILE-HEAD DEFLECTION            =   .217E+00 IN
COMPUTED SLOPE AT PILE HEAD     =  -.231E-17
MAXIMUM BENDING MOMENT          =  -.817E+06 LBS-IN
MAXIMUM SHEAR FORCE             =   .240E+05 LBS
NO. OF ITERATIONS               =         28
NO. OF ZERO DEFLECTION POINTS   =         10
```

LOADING NUMBER 2

```
BOUNDARY CONDITION CODE                   =         2
LATERAL LOAD AT THE PILE HEAD             =   .250E+05 LBS
SLOPE AT THE PILE HEAD                    =   .000E+00 IN/IN
AXIAL LOAD AT THE PILE HEAD               =   .250E+06 LBS
```

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = -.763E-07 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = .850E-08 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .241E+00 IN
COMPUTED SLOPE AT PILE HEAD = -.139E-16
MAXIMUM BENDING MOMENT = -.868E+06 LBS-IN
MAXIMUM SHEAR FORCE = .250E+05 LBS
NO. OF ITERATIONS = 28
NO. OF ZERO DEFLECTION POINTS = 10

LOADING NUMBER 3

BOUNDARY CONDITION CODE = 2
LATERAL LOAD AT THE PILE HEAD = .260E+05 LBS
SLOPE AT THE PILE HEAD = .000E+00 IN/IN
AXIAL LOAD AT THE PILE HEAD = .250E+06 LBS

X DEFLECTION MOMENT SHEAR SLOPE TOTAL FLEXURAL SOIL

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = .157E-06 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = -.156E-07 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .267E+00 IN
COMPUTED SLOPE AT PILE HEAD = .231E-16
MAXIMUM BENDING MOMENT = -.920E+06 LBS-IN
MAXIMUM SHEAR FORCE = .260E+05 LBS
NO. OF ITERATIONS = 28
NO. OF ZERO DEFLECTION POINTS = 9

LOADING NUMBER 4

BOUNDARY CONDITION CODE = 2
LATERAL LOAD AT THE PILE HEAD = .320E+05 LBS
SLOPE AT THE PILE HEAD = .000E+00 IN/IN
AXIAL LOAD AT THE PILE HEAD = .250E+06 LBS

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = .809E-07 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = -.732E-08 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .456E+00 IN
COMPUTED SLOPE AT PILE HEAD = .231E-16
MAXIMUM BENDING MOMENT = -.125E+07 LBS-IN
MAXIMUM SHEAR FORCE = .320E+05 LBS
NO. OF ITERATIONS = 30
NO. OF ZERO DEFLECTION POINTS = 9

LOADING NUMBER 5

BOUNDARY CONDITION CODE = 2
LATERAL LOAD AT THE PILE HEAD = .330E+05 LBS
SLOPE AT THE PILE HEAD = .000E+00 IN/IN
AXIAL LOAD AT THE PILE HEAD = .250E+06 LBS

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = .162E-07 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = .288E-08 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .494E+00 IN
COMPUTED SLOPE AT PILE HEAD = -.370E-16
MAXIMUM BENDING MOMENT = -.131E+07 LBS-IN
MAXIMUM SHEAR FORCE = .330E+05 LBS
NO. OF ITERATIONS = 31
NO. OF ZERO DEFLECTION POINTS = 9

LOADING NUMBER 6

BOUNDARY CONDITION CODE = 2
LATERAL LOAD AT THE PILE HEAD = .340E+05 LBS
SLOPE AT THE PILE HEAD = .000E+00 IN/IN
AXIAL LOAD AT THE PILE HEAD = .250E+06 LBS

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = .227E-06 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = .211E-07 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .239E+00 IN
COMPUTED SLOPE AT PILE HEAD = .231E-16
MAXIMUM BENDING MOMENT = -.117E+07 LBS-IN
MAXIMUM SHEAR FORCE = .300E+05 LBS
NO. OF ITERATIONS = 28
NO. OF ZERO DEFLECTION POINTS = 8

LOADING NUMBER 2

BOUNDARY CONDITION CODE = 2
LATERAL LOAD AT THE PILE HEAD = .330E+05 LBS
SLOPE AT THE PILE HEAD = .000E+00 IN/IN
AXIAL LOAD AT THE PILE HEAD = .150E+06 LBS

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = -.951E-07 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = .662E-08 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .305E+00 IN
COMPUTED SLOPE AT PILE HEAD = -.324E-16
MAXIMUM BENDING MOMENT = -.134E+07 LBS-IN
MAXIMUM SHEAR FORCE = .330E+05 LBS
NO. OF ITERATIONS = 28
NO. OF ZERO DEFLECTION POINTS = 7

LOADING NUMBER 3

BOUNDARY CONDITION CODE = 2
LATERAL LOAD AT THE PILE HEAD = .320E+05 LBS

SLOPE AT THE PILE HEAD = .000E+00 IN/IN
AXIAL LOAD AT THE PILE HEAD = .150E+06 LBS

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = .187E-06 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = .157E-07 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .282E+00 IN
COMPUTED SLOPE AT PILE HEAD = .925E-17
MAXIMUM BENDING MOMENT = -.128E+07 LBS-IN
MAXIMUM SHEAR FORCE = .320E+05 LBS
NO. OF ITERATIONS = 28
NO. OF ZERO DEFLECTION POINTS = 7

LOADING NUMBER 4

BOUNDARY CONDITION CODE = 2
LATERAL LOAD AT THE PILE HEAD = .340E+05 LBS
SLOPE AT THE PILE HEAD = .000E+00 IN/IN
AXIAL LOAD AT THE PILE HEAD = .150E+06 LBS

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = .859E-07 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = -.619E-08 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .329E+00 IN
COMPUTED SLOPE AT PILE HEAD = .463E-17
MAXIMUM BENDING MOMENT = -.141E+07 LBS-IN
MAXIMUM SHEAR FORCE = .340E+05 LBS
NO. OF ITERATIONS = 28
NO. OF ZERO DEFLECTION POINTS = 7

LOADING NUMBER 5

BOUNDARY CONDITION CODE = 2
LATERAL LOAD AT THE PILE HEAD = .380E+05 LBS
SLOPE AT THE PILE HEAD = .000E+00 IN/IN
AXIAL LOAD AT THE PILE HEAD = .150E+06 LBS

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = -.112E-06 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = .109E-07 LBS

OUTPUT SUMMARY

```
PILE-HEAD DEFLECTION            =  .437E+00 IN
COMPUTED SLOPE AT PILE HEAD     =  .925E-17
MAXIMUM BENDING MOMENT          = -.166E+07 LBS-IN
MAXIMUM SHEAR FORCE             =  .380E+05 LBS
NO. OF ITERATIONS               =        29
NO. OF ZERO DEFLECTION POINTS   =         6
```

```
LOADING NUMBER   6

BOUNDARY CONDITION CODE               =          2
LATERAL LOAD AT THE PILE HEAD         =   .400E+05 LBS
SLOPE AT THE PILE HEAD                =   .000E+00 IN/IN
AXIAL LOAD AT THE PILE HEAD           =   .150E+06 LBS
```

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = -.350E-06 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = .285E-07 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .497E+00 IN
COMPUTED SLOPE AT PILE HEAD = -.370E-16
MAXIMUM BENDING MOMENT = -.179E+07 LBS-IN
MAXIMUM SHEAR FORCE = .400E+05 LBS
NO. OF ITERATIONS = 30
NO. OF ZERO DEFLECTION POINTS = 6

LOADING NUMBER 7

BOUNDARY CONDITION CODE = 2
LATERAL LOAD AT THE PILE HEAD = .420E+05 LBS
SLOPE AT THE PILE HEAD = .000E+00 IN/IN
AXIAL LOAD AT THE PILE HEAD = .150E+06 LBS

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = -.522E-07 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = .943E-08 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .562E+00 IN
COMPUTED SLOPE AT PILE HEAD = .111E-15
MAXIMUM BENDING MOMENT = -.192E+07 LBS-IN
MAXIMUM SHEAR FORCE = .420E+05 LBS
NO. OF ITERATIONS = 30
NO. OF ZERO DEFLECTION POINTS = 5

SOILS INFORMATION

X AT THE GROUND SURFACE = .00 IN

SLOPE ANGLE AT THE GROUND SURFACE = .00 DEG.

5 LAYER(S) OF SOIL

LAYER 1
THE SOIL IS A STIFF CLAY WITH NO FREE WATER
X AT THE TOP OF THE LAYER = .00 IN
X AT THE BOTTOM OF THE LAYER = 60.00 IN
MODULUS OF SUBGRADE REACTION = .500E+03 LBS/IN**3

LAYER 2
THE SOIL IS A SOFT CLAY
X AT THE TOP OF THE LAYER = 60.00 IN
X AT THE BOTTOM OF THE LAYER = 360.00 IN
MODULUS OF SUBGRADE REACTION = .300E+02 LBS/IN**3

LAYER 3
THE SOIL IS A STIFF CLAY WITH WATER-INDUCED EROSION
X AT THE TOP OF THE LAYER = 360.00 IN
X AT THE BOTTOM OF THE LAYER = 420.00 IN
MODULUS OF SUBGRADE REACTION = .800E+03 LBS/IN**3

LAYER 4
THE SOIL IS A SOFT CLAY
X AT THE TOP OF THE LAYER = 420.00 IN
X AT THE BOTTOM OF THE LAYER = 480.00 IN
MODULUS OF SUBGRADE REACTION = .100E+03 LBS/IN**3

LAYER 5
THE SOIL IS A SAND - P-Y CRITERIA BY REESE ET AL, 1974
X AT THE TOP OF THE LAYER = 480.00 IN

X AT THE BOTTOM OF THE LAYER = 720.00 IN
MODULUS OF SUBGRADE REACTION = .125E+03 LBS/IN**3

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = -.104E-06 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = .920E-08 LBS

OUTPUT SUMMARY

```
PILE-HEAD DEFLECTION            =   .204E+00 IN
COMPUTED SLOPE AT PILE HEAD     =  -.324E-16
MAXIMUM BENDING MOMENT          =  -.107E+07 LBS-IN
MAXIMUM SHEAR FORCE             =   .280E+05 LBS
NO. OF ITERATIONS               =        27
NO. OF ZERO DEFLECTION POINTS   =         9

LOADING NUMBER   2

BOUNDARY CONDITION CODE                   =          2
LATERAL LOAD AT THE PILE HEAD             =    .300E+05 LBS
SLOPE AT THE PILE HEAD                    =    .000E+00 IN/IN
AXIAL LOAD AT THE PILE HEAD               =    .300E+06 LBS
```

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = .242E-06 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = .230E-07 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .244E+00 IN
COMPUTED SLOPE AT PILE HEAD = .116E-16
MAXIMUM BENDING MOMENT = -.118E+07 LBS-IN
MAXIMUM SHEAR FORCE = .300E+05 LBS
NO. OF ITERATIONS = 28
NO. OF ZERO DEFLECTION POINTS = 8

LOADING NUMBER 3

BOUNDARY CONDITION CODE = 2
LATERAL LOAD AT THE PILE HEAD = .330E+05 LBS
SLOPE AT THE PILE HEAD = .000E+00 IN/IN
AXIAL LOAD AT THE PILE HEAD = .300E+06 LBS

X DEFLECTION MOMENT SHEAR SLOPE TOTAL FLEXURAL SOIL

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = -.125E-06 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = .129E-07 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .311E+00 IN
COMPUTED SLOPE AT PILE HEAD = -.370E-16
MAXIMUM BENDING MOMENT = -.136E+07 LBS-IN
MAXIMUM SHEAR FORCE = .330E+05 LBS
NO. OF ITERATIONS = 29
NO. OF ZERO DEFLECTION POINTS = 7

LOADING NUMBER 4

BOUNDARY CONDITION CODE = 2
LATERAL LOAD AT THE PILE HEAD = .380E+05 LBS
SLOPE AT THE PILE HEAD = .000E+00 IN/IN
AXIAL LOAD AT THE PILE HEAD = .300E+06 LBS

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = .321E-06 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = .271E-07 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .447E+00 IN
COMPUTED SLOPE AT PILE HEAD = .879E-16
MAXIMUM BENDING MOMENT = -.168E+07 LBS-IN
MAXIMUM SHEAR FORCE = .380E+05 LBS
NO. OF ITERATIONS = 30
NO. OF ZERO DEFLECTION POINTS = 6

LOADING NUMBER 5

BOUNDARY CONDITION CODE = 2
LATERAL LOAD AT THE PILE HEAD = .400E+05 LBS
SLOPE AT THE PILE HEAD = .000E+00 IN/IN
AXIAL LOAD AT THE PILE HEAD = .300E+06 LBS

OUTPUT VERIFICATION

THE MAXIMUM MOMENT IMBALANCE FOR ANY ELEMENT = -.575E-07 IN-LBS
THE MAX. LATERAL FORCE IMBALANCE FOR ANY ELEMENT = .116E-07 LBS

OUTPUT SUMMARY

PILE-HEAD DEFLECTION = .510E+00 IN
COMPUTED SLOPE AT PILE HEAD = -.925E-17
MAXIMUM BENDING MOMENT = -.182E+07 LBS-IN
MAXIMUM SHEAR FORCE = .400E+05 LBS
NO. OF ITERATIONS = 30
NO. OF ZERO DEFLECTION POINTS = 6

LOADING NUMBER 6

BOUNDARY CONDITION CODE = 2
LATERAL LOAD AT THE PILE HEAD = .420E+05 LBS
SLOPE AT THE PILE HEAD = .000E+00 IN/IN
AXIAL LOAD AT THE PILE HEAD = .300E+06 LBS

CALCULATIONAL PARAMETERS
- Fault Seismic Sources -
  - Vertical integration increment : 1 km
  - Horizontal integration increment : 2 km
  - Number rupture length per EarthQuake : 4
  - Include Near-SourceDirectivity : NO
- Area Seismic Sources -
  - Number area integration steps : 100
  - Vertical integration increment : 3 km
  - Number rupture azimuths : 3
- Background Seismic Sources -
  - Maximum Inclusion Distance : 200 km
- Both Fault and Area Sources -
  - Magnitude integration step : 0.1 M
  - Apply magnitude scaling : NO

AMPLITUDES (Acceleration, (g))

APPENDIX G

Guide Contract Specifications

GUIDE CONTRACT SPECIFICATIONS

PART I - EARTHWORK

PREFACE

These specifications are intended as a guide for the earthwork performed at the subject development project. If there is a conflict between these specifications (including the recommendations of the geotechnical report) and agency or code requirements, it should be brought to the attention of ENGEO and Owner prior to contract bidding.

PART 1 - GENERAL

1.01 WORK COVERED

A. Grading, excavating, filling and backfilling, including trenching and backfilling for utilities as necessary to complete the Project as indicated on the Drawings.

B. Subsurface drainage as indicated on the Drawings.

1.02 CODES AND STANDARDS

A. Excavating, trenching, filling, backfilling, and grading work shall meet the applicable requirements of the Uniform Building Code and the standards and ordinances of state and local governing authorities.

1.03 SUBSURFACE SOIL CONDITIONS

A. The Owners' Geotechnical Exploration report is available for inspection by bidder or Contractor. The Contractor shall refer to the findings and recommendations of the Geotechnical Exploration report in planning and executing his work.

1.04 DEFINITIONS

A. Fill: All soil, rock, or soil-rock materials placed to raise the grades of the site or to backfill excavations.

B. Backfill: All soil, rock or soil-rock material used to fill excavations and trenches.

C. On-Site Material: Soil and/or rock material which is obtained from the site.

D. Imported Material: Soil and/or rock material which is brought to the site from off-site areas.

E. Select Material: On-site and/or imported material which is approved by ENGEO as a specific-purpose fill.

F. Engineered Fill: Fill upon which ENGEO has made sufficient observations and tests to confirm that the fill has been placed and compacted in accordance with specifications and requirements.

G. Degree of Compaction or Relative Compaction: The ratio, expressed as a percentage, of the in-place dry density of the fill and backfill material as compacted in the field to the maximum dry density of the same material as determined by ASTM D-1557 or California 216 compaction test method.

H. Optimum Moisture: Water content, percentage by dry weight, corresponding to the maximum dry density as determined by ASTM D-1557.

I. ENGEO: The project geotechnical engineering consulting firm, its employees or its designated representatives.

J. Drawings: All documents, approved for construction, which describe the Work.

1.05 OBSERVATION AND TESTING

A. All site preparation, cutting and shaping, excavating, filling, and backfilling shall be carried out under the observation of ENGEO, employed and paid for by the Owners. ENGEO will perform appropriate field and laboratory tests to evaluate the suitability of fill material, the proper moisture content for compaction, and the degree of compaction achieved. Any fill that does not meet the specification requirements shall be removed and/or reworked until the requirements are satisfied.

B. Cutting and shaping, excavating, conditioning, filling, and compacting procedures require approval of ENGEO as they are performed. Any work found unsatisfactory or any work disturbed by subsequent operations before approval is granted shall be corrected in an approved manner as recommended by ENGEO.

C. Tests for compaction will be made in accordance with test procedures outlined in ASTM D-1557, as applicable. Field testing of soils or compacted fill shall conform with the applicable requirements of ASTM D-2922.

D. All authorized observation and testing will be paid for by the Owners.

1.06 SITE CONDITIONS

A. Excavating, filling, backfilling, and grading work shall not be performed during unfavorable weather conditions. When the work is interrupted by rain, excavating, filling, backfilling, and grading work shall not be resumed until the site and soil conditions are suitable.

B. Contractor shall take the necessary measures to prevent erosion of freshly filled, backfilled, and graded areas until such time as permanent drainage and erosion control measures have been installed.

PART 2 - PRODUCTS

2.01 GENERAL

A. Contractor shall furnish all materials, tools, equipment, facilities, and services as required for performing the required excavating, filling, backfilling, and grading work, and trenching and backfilling for utilities.

2.02 SOIL MATERIALS

A. Fill

1. Material to be used for engineered fill and backfill shall be free from organic matter and other deleterious substances, and of such quality that it will compact thoroughly without excessive voids when watered and rolled. Excavated on-site material will be considered suitable for engineered fill and backfill if it contains no more than 3 percent organic matter, is free of debris and other deleterious substances and conforms to the requirements specified above. Rocks of maximum dimension in excess of two-thirds of the lift thickness shall be removed from any fill material to the satisfaction of ENGEO.

2. Excavated earth material which is suitable for engineered fill or backfill, as determined by ENGEO, shall be conditioned for reuse and properly stockpiled as required for later filling and backfilling operations. Conditioning shall consist of spreading material in layers not to exceed 8 inches and raking free of debris and rubble. Rocks and aggregate exceeding the allowed largest dimension, and deleterious material shall be removed from the site and disposed off site in a legal manner.

3. ENGEO shall be immediately notified if potential hazardous materials or suspect soils exhibiting staining or odor are encountered. Work activities shall be discontinued within the area of potentially hazardous materials. ENGEO environmental personnel will conduct an assessment of the suspect hazardous material to determine the appropriate response and mitigation. Regulatory agencies may also be contacted to request concurrence and oversight. *ENGEO will rely on the Owner, or a designated Owner's representative, to make necessary notices to the appropriate regulatory agencies. The Owner may request ENGEO's assistance in notifying regulatory agencies, provided ENGEO receives Owner's written authorization to expand its scope of services.*

4. ENGEO shall be notified at least 48 hours prior to the start of filling and backfilling operations so that it may evaluate samples of the material intended for use as fill and backfill. All materials to be used for filling and backfilling require the approval of ENGEO.

B. Import Material: Where conditions require the importation of fill material, the material shall be an inert, nonexpansive soil or soil-rock material free of organic matter and meeting the following requirements unless otherwise approved by ENGEO.

Gradation (ASTM D-421):	Sieve Size	Percent Passing
	2-inch	100
	#200	15 - 70
Plasticity (ASTM D-4318):	Liquid Limit	Plasticity Index
	< 30	< 12
Swell Potential (ASTM D-4546B): (at optimum moisture)	Percent Heave	Swell Pressure
	< 2 percent	< 300 psf
Resistance Value (ASTM D-2844):	Minimum 25	
Organic Content (ASTM D-2974):	Less than 2 percent	

A sample of the proposed import material should be submitted to ENGEO for evaluation prior to delivery at the site.

2.03 SAND

A. Sand for sand cushion under slabs and for bedding of pipe in utility trenches shall be a clean and graded, washed sand, free from clay or organic material, suitable for the intended purpose with 90 to 100 percent passing a No. 4 U.S. Standard Sieve, not more than 5 percent passing a No. 200 U.S. Standard Sieve, and generally conforming to ASTM C33 for fine aggregate.

2.04 AGGREGATE DRAINAGE FILL

A. Aggregate drainage fill under concrete slabs and paving shall consist of broken stone, crushed or uncrushed gravel, clean quarry waste, or a combination thereof. The aggregate shall be free from fines, vegetable matter, loam, volcanic tuff, and other deleterious substances. It shall be of such quality that the absorption of water in a saturated surface dry condition does not exceed 3 percent of the oven dry weight of the samples.

B. Aggregate drainage fill shall be of such size that the percentage composition by dry weight as determined by laboratory sieves (U. S. Series) will conform to the following grading:

Sieve Size	Percentage Passing Sieve
1½-inches	100
1-inch	90 - 100
#4	0 - 5

2.05 SUBDRAINS

A. Perforated subdrain pipe of the required diameter shall be installed as shown on the drawings. The pipe(s) shall also conform to these specifications unless otherwise specified by ENGEO in the field.

Subdrain pipe shall be manufactured in accordance with one of the following requirements:

<u>Design depths less than 30 feet</u>

- Perforated ABS Solid Wall SDR 35 (ASTM D-2751)
- Perforated PVC Solid Wall SDR 35 (ASTM D-3034)
- Perforated PVC A-2000 (ASTM F949)
- Perforated Corrugated HDPE double-wall (AASHTO M-252 or M-294, Caltrans Type S, 50 psi minimum stiffness)

Design depths less than 50 feet

- Perforated PVC SDR 23.5 Solid Wall (ASTM D-3034)
- Perforated Sch. 40 PVC Solid Wall (ASTM-1785)
- Perforated ABS SDR 23.5 Solid Wall (ASTM D-2751)
- Perforated ABS DWV/Sch. 40 (ASTM D-2661 and D-1527)
- Perforated Corrugated HDPE double-wall (AASHTO M-252 or M-294, Caltrans Type S, 70 psi minimum stiffness)

Design depths less than 70 feet

- Perforated ABS Solid Wall SDR 15.3 (ASTM D-2751)
- Perforated Sch. 80 PVC (ASTM D-1785)
- Perforated Corrugated Aluminum (ASTM B-745)

B. Permeable Material (Class 2): Class 2 permeable material for filling trenches under, around, and over subdrains, behind building and retaining walls, and for pervious blankets shall consist of clean, coarse sand and gravel or crushed stone, conforming to the following grading requirements:

Sieve Size	Percentage Passing Sieve
1-inch	100
¾-inch	90 - 100
$^{3}/8$-inch	40 - 100
#4	25 - 40
#8	18 - 33
#30	5 - 15
#50	0 - 7
#200	0 - 3

C. Filter Fabric: All filter fabric shall meet the following Minimum Average Roll Values unless otherwise specified by ENGEO.

Grab Strength (ASTM D-4632) ....180 lbs
Mass Per Unit Area (ASTM D-4751)....................................6 oz/yd^2
Apparent Opening Size (ASTM D-4751) ....70-100 U.S. Std. Sieve
Flow Rate (ASTM D-4491) ....80 gal/min/ft^2
Puncture Strength (ASTM D-4833).......................................80 lbs

D. Vapor Retarder: Vapor Retarders shall consist of PVC, LDPE or HDPE impermeable sheeting at least 10 mils thick.

2.06 PERMEABLE MATERIAL (Class 1; Type A)

A. Class 1 permeable material to be used in conjunction with filter fabric for backfilling of subdrain excavations shall conform to the following grading requirements:

Sieve Size	Percentage Passing Sieve
¾-inch	100
½-inch	95 - 100
3/8-inch	70 - 100
#4	0 - 55
#8	0 - 10
#200	0 - 3

PART 3 - EXECUTION

3.01 STAKING AND GRADES

A. Contractor shall lay out all his work, establish all necessary markers, bench marks, grading stakes, and other stakes as required to achieve design grades.

3.02 EXISTING UTILITIES

A. Contractor shall verify the location and depth (elevation) of all existing utilities and services before performing any excavation work.

3.03 EXCAVATION

A. Contractor shall perform excavating as indicated and required for concrete footings, drilled piers, foundations, floor slabs, concrete walks, and site leveling and grading, and provide shoring, bracing, underpinning, cribbing, pumping, and planking as required. The bottoms of excavations shall be firm undisturbed earth, clean and free from loose material, debris, and foreign matter.

B. Excavations shall be kept free from water at all times. Adequate dewatering equipment shall be maintained at the site to handle emergency situations until concrete or backfill is placed.

C. Unauthorized excavations for footings shall be filled with concrete to required elevations, unless other methods of filling are authorized by ENGEO.

D. Excavated earth material which is suitable for engineered fill or backfill, as determined by ENGEO, shall be conditioned for reuse and properly stockpiled for later filling and backfilling operations as specified under Section 2.02, "Soil Materials."

E. Abandoned sewers, piping, and other utilities encountered during excavating shall be removed and the resulting excavations shall be backfilled with engineered fill as required by ENGEO.

F. Any active utility lines encountered shall be reported immediately to the Owner's Representative and authorities involved. The Owner and proper authorities shall be permitted free access to take the measures deemed necessary to repair, relocate, or remove the obstruction as determined by the responsible authority or Owner's Representative.

3.04 SUBGRADE PREPARATION

A. All brush and other rubbish, as well as trees and root systems not marked for saving, shall be removed from the site and legally disposed of.

B. Any existing structures, foundations, underground storage tanks, or debris must be removed from the site prior to any building, grading, or fill operations. Septic tanks, including all drain fields and other lines, if encountered, must be totally removed. The resulting depressions shall be properly prepared and filled to the satisfaction of ENGEO.

C. Vegetation and organic topsoil shall be removed from the surface upon which the fill is to be placed and either removed and legally disposed of or stockpiled for later use in approved landscape areas. The surface shall then be scarified to a depth of at least eight inches until the surface is free from ruts, hummocks, or other uneven features which would tend to prevent uniform compaction by the equipment to be used.

D. After the foundation for the fill has been cleared and scarified, it shall be made uniform and free from large clods. The proper moisture content must be obtained by adding water or aerating. The foundation for the fill shall be compacted at the proper moisture content to a relative compaction as specified herein.

3.05 ENGINEERED FILL

A. Select Material: Fill material shall be "Select" or "Imported Material" as previously specified.

B. Placing and Compacting: Engineered fill shall be constructed by approved and accepted methods. Fill material shall be spread in uniform lifts not exceeding 8 inches in uncompacted thickness. Each layer shall be spread evenly, and thoroughly blade-mixed to obtain uniformity of material. Fill material which does not contain sufficient moisture as specified by ENGEO shall be sprinkled with water; if it contains excess moisture it shall be aerated or blended with drier material to achieve the proper water content. Select material and water shall then be thoroughly mixed before being compacted.

C. Unless otherwise specified in the Geotechnical Exploration report, each layer of spread select material shall be compacted to at least 90 percent relative compaction at a moisture content of at least three percent above the optimum moisture content. Minimum compaction in all keyways shall be a minimum of 95 percent with a minimum moisture content of at least 1 percentage point above optimum.

D. Unless otherwise specified in the Geotechnical Exploration report or otherwise required by the local authorities, the upper 6 inches of engineered fill in areas to receive pavement shall be compacted to at least 95 percent relative compaction with a minimum moisture content of at least 3 percentage points above optimum.

E. Testing and Observation of Fill: The work shall consist of field observation and testing to determine that each layer has been compacted to the required density and that the required moisture is being obtained. Any layer or portion of a layer that does not attain the compaction required shall be reworked until the required density is obtained.

F. Compaction: Compaction shall be by sheepsfoot rollers, multiple-wheel steel or pneumatic-tired rollers or other types of acceptable compaction equipment. Rollers shall be of such design that they will be able to compact the fill to the specified compaction. Rolling shall be accomplished while the fill material is within the specified moisture content range. Rolling of each layer must be continuous so that the required compaction may be obtained uniformly throughout each layer.

G. Fill slopes shall be constructed by overfilling the design slopes and later cutting back the slopes to the design grades. No loose soil will be permitted on the faces of the finished slopes.

H. Strippings and topsoil shall be stockpiled as approved by Owner, then placed in accordance with ENGEO's recommendations to a minimum thickness of 6 inches and a maximum thickness of 12 inches over exposed open space cut slopes which are 3:1 or flatter, and track walked to the satisfaction of ENGEO.

I. Final Prepared Subgrade: Finish blading and smoothing shall be performed as necessary to produce the required density, with a uniform surface, smooth and true to grade.

3.06 BACKFILLING

A. Backfill shall not be placed against footings, building walls, or other structures until approved by ENGEO.

B. Backfill material shall be Select Material as specified for engineered fill.

C. Backfill shall be placed in 6-inch layers, leveled, rammed, and tamped in place. Each layer shall be compacted with suitable compaction equipment to 90 percent relative compaction at a moisture content of at least 3 percent above optimum.

3.07 TRENCHING AND BACKFILLING FOR UTILITIES

A. Trenching:

1. Trenching shall include the removal of material and obstructions, the installation and removal of sheeting and bracing and the control of water as necessary to provide the required utilities and services.

2. Trenches shall be excavated to the lines, grades, and dimensions indicated on the Drawings. Maximum allowable trench width shall be the outside diameter of the pipe plus 24 inches, inclusive of any trench bracing.

3. When the trench bottom is a soft or unstable material as determined by ENGEO, it shall be made firm and solid by removing said unstable material to a sufficient depth and replacing it with on-site material compacted to 90 percent minimum relative compaction.

4. Where water is encountered in the trench, the contractor must provide materials necessary to drain the water and stabilize the bed.

B. Backfilling:

1. Trenches must be backfilled within 2 days of excavation to minimize desiccation.

2. Bedding material shall be sand and shall not extend more than 6 inches above any utility lines.

3. Backfill material shall be select material.

4. Trenches shall be backfilled as indicated or required and compacted with suitable equipment to 90 percent minimum relative compaction at the required moisture content.

3.08 SUBDRAINS

A. Trenches for subdrain pipe shall be excavated to a minimum width equal to the outside diameter of the pipe plus at least 12 inches and to a depth of approximately 2 inches below the grade established for the invert of the pipe, or as indicated on the Drawings.

B. The space below the pipe invert shall be filled with a layer of Class 2 permeable material, upon which the pipe shall be laid with perforations down. Sections shall be joined as recommended by the pipe manufacturer.

C. Rocks, bricks, broken concrete, or other hard material shall not be used to give intermediate support to pipes. Large stones or other hard objects shall not be left in contact with the pipes.

D. Excavations for subdrains shall be filled as required to fill voids and prevent settlement without damaging the subdrain pipe. Alternatively, excavations for subdrains may be filled with Class 1 permeable material (as defined in Section 2.06) wrapped in Filter Fabric (as defined in Section 2.05).

3.09 AGGREGATE DRAINAGE FILL

A. ENGEO shall approve finished subgrades before aggregate drainage fill is installed.

B. Pipes, drains, conduits, and any other mechanical or electrical installations shall be in place before any aggregate drainage fill is placed. Backfill at walls to elevation of drainage fill shall be in place and compacted.

C. Aggregate drainage fill under slabs and concrete paving shall be the minimum uniform thickness after compaction of dimensions indicated on Drawings. Where not indicated, minimum thickness after compaction shall be 4 inches.

D. Aggregate drainage fill shall be rolled to form a well-compacted bed.

E. The finished aggregate drainage fill must be observed and approved by ENGEO before proceeding with any subsequent construction over the compacted base or fill.

3.10 SAND CUSHION

A. A sand cushion shall be placed over the vapor retarder membrane under concrete slabs on grade. Sand cushion shall be placed in uniform thickness as indicated on the Drawings. Where not indicated, the thickness shall be 2 inches.

3.11 FINISH GRADING

A. All areas must be finish graded to elevations and grades indicated on the Drawings. In areas to receive topsoil and landscape planting, finish grading shall be performed to a uniform 6 inches below the grades and elevations indicated on the Drawings, and brought to final grade with topsoil.

3.12 DISPOSAL OF WASTE MATERIALS

A. Excess earth materials and debris shall be removed from the site and disposed of in a legal manner. Location of dump site and length of haul are the Contractor's responsibility.

Subject: Proposed Hospital Building
Sutter Medical Center of Santa Rosa
Sonoma County, California

SUPPLEMENTAL GEOTECHNICAL EXPLORATION

Dear Mr. Minard:

This report contains the results of our supplemental geotechnical exploration and presents our updated conclusions and recommendations for the current planned Sutter Medical Center hospital project in Santa Rosa, Sonoma County, California. ENGEO previously performed a geotechnical exploration at the site for a previous conceptual hospital development as presented in our report dated May 22, 2006.

Since the time of our previous report, the proposed hospital development plans have been modified. The current plans include: a 2-story Medical Center Bed Tower and Diagnostic and Treatment (D&T) structure, a 3-story Joint Venture (JV) Bed Tower and Surgery Wing structure. It is anticipated that both structures will have pavements and landscaping surrounding the building. This supplemental report has been performed to address the current planned hospital development. Where deemed appropriate subsurface information obtained in our previous studies have been incorporated into this report; the conclusions and recommendations presented herein supersede those presented in our earlier report.

Based on the finding of this study, it is our opinion that the proposed development is feasible from a geotechnical standpoint provided that the conclusions and recommendations by ENGEO Incorporated, are incorporated into project plans, and implemented during construction. We are pleased to be of service to you on this project and will continue to consult with you and your design team as project planning progresses.

Very truly yours,

ENGEO Incorporated

INTRODUCTION

ENGEO Incorporated previously performed a geotechnical exploration at the subject site and presented the results in a report dated May 22, 2006. As a result of planned development modifications including both building type and layout for the proposed Sutter Medical facility, additional exploration and analysis was undertaken to provide updated conclusions and recommendation for the proposed project.

The purpose of this report is to provide updated recommendations for planned building foundations, site grading and pavements for the proposed Sutter Medical Center Hospital Building and associated facilities.

We prepared this geotechnical exploration update report in accordance with the requirements established by the Hospital Facilities Seismic Safety Act (SB 1953), the California Building Code (CBC), and the Engineering Geology and Seismology for Pubic Schools and Hospitals in California prepared by the California Geological Survey. Additionally, for convenience, a copy of **California Geologic Survey – Note 48 "*Checklist for Review of Engineering Geology and Seismologic Reports for California Public Schools, Hospitals and Essential Services Buildings, Updated October 2007*"** is provided in Appendix E with reference to specific inclusions in this report.

Scope of Services

The scope of our services for this study has included:

1. Supplemental field exploration which included drilling 3 exploratory rotary wash borings and advancing 10 cone penetration test holes to augment previous borings and CPTs covering the current footprint of the proposed hospital building.

2. Laboratory testing on selected materials obtained during this study.

3. Analysis of the geological and geotechnical data.

4. Preparation of this report updating our preliminary findings and recommendations.

Once design plans have been prepared, ENGEO should review them for conformance with the intent of our recommendations. During that time, ENGEO may need to perform additional evaluation and/or modify the recommendations contained herein. ENGEO prepared this report for the exclusive use of the Sutter Medical Center and their design team consultants. In the event that any changes are made in the character, design, or layout of the development, the conclusions and recommendations contained in this report should be reviewed by ENGEO to determine whether modifications to the report are necessary. This document may not be reproduced in whole or in part by any means whatsoever, nor may it be quoted or excerpted without the express written consent of ENGEO Incorporated.

Site Location and Description

The subject site is located at 50 Mark West Springs Road in Santa Rosa, Sonoma County, California (Latitude of 38.4953 degrees North; Longitude of 122.7520 degrees West). The approximate site location is shown on both the Site Coordinate and Site Location Maps, Figures 1 and 2, respectively.

The existing site topography is shown on Figure 3. Currently, the planned hospital footprint is situated mainly within the open-space used as pasture area. The pasture area is relatively flat, having estimated elevations ranging from 156 to 159 feet above mean sea level (MSL) from south to north. The pasture area is currently covered with grass and has a few mature trees.

A fence encloses the wastewater treatment ponds and the pond embankments are several feet higher in elevation than the adjacent pasture area. The top embankment elevation that surrounds the ponds is approximately 165 feet above MSL, with side slopes of approximately 2:1 (horizontal:vertical). We understand that the treatment ponds are approximately 8 feet deeper than the average elevation at the site. Additionally, the treatment ponds have associated facilities including pumps and buried pipes in the fenced area.

Proposed Development

Hammel, Green and Abrahamson (HGA) Architects and Engineers, Inc., prepared the current hospital development plans which include: a 2-story Medical Center Bed Tower and Diagnostic and Treatment (D&T) structure, and a 3-story Joint Venture (JV) Bed Tower and Surgery Wing structure. The proposed D&T and JV structures have approximate building footprints of 97,500 ft^2 and 58,500 ft^2, respectively. It is anticipated that both structures will have pavements and landscaping surrounding the building. The proposed hospital Joint Venture (JV) Bed Tower and Surgery Wing extends into an area occupied by the waste water treatment ponds.

The details regarding building loads have not been finalized at this time. However, preliminary maximum column loads provided by the Structural Engineer are anticipated to range up to 140 kips for dead load, 50 kips for live load in the 2-story D&T structure; for columns in the 3-story (JV) structure maximum loads are anticipated to range up to 210 kips for dead load, 75 kips for live load.

The hospital buildings are planned to be constructed within the west portion of the site. It is also our understanding that a 3-story medical office and administrative building is to be located in the east portion of the site; however the location had not been determined at the time of this report. Geotechnical recommendation for the nearby administrative structure will be provided in a separate report.

Previous Geotechnical Studies

ENGEO previously published both a "Preliminary Geotechnical Report" (November 2004), and a "Geotechnical Exploration Report" (May 2006) for the site. Our previous studies combined included drilling 32 exploratory borings (B-1 to B-21 and 2-B01 to 2-B11), the advancement of 28 CPT's (2-CPT01 to 2-CPT28), laboratory testing, analysis and report preparation which presented our findings, conclusions and recommendations for site development. The previous boring logs, CPT data and laboratory testing are included as Appendix A-2 to this report. As a part of this current study, ENGEO reviewed the previous work and incorporated pertinent data, as deemed appropriate.

In addition, ENGEO previously conducted a Phase 1 - Environmental Site Assessment (ESA) at the property and presented the results in a report dated December 28, 2004. In summary, the Phase One ESA identified a number of items of concern within the property. Subsequently, ENGEO performed a limited Phase 2 ESA to sample and test for a number of the constituents recommended in our December 28, 2004 report. The findings presented in the report dated February 24, 2005, indicate that no further ESA work is required; however, the ESA studies assessed that existing structures and Luther Burbank Center (LBC) facilities were not included, and that the waste water treatment facilities associated with LBC use should be decommissioned in accordance with regulatory requirements.

GEOTECHNICAL EXPLORATION

Field Exploration

For this supplemental exploration, we drilled 3 rotary-wash borings on October 15 through 17, 2008. Also, we advanced 10 cone penetration test holes (CPTs) on October 15, 2008. Borings and CPTs were advanced to depths of up to 51 feet below the existing ground surface (bgs). Figure 3 presents the approximate boring and CPT hole locations advanced for this supplemental study, and previous borings and CPTs are depicted as well.

We drilled the rotary-wash borings using a truck-mounted CME 750 drill rig equipped with 6-inch-diameter tri-cone bit. Borings ranged in depth from about 43½ to 51 feet bgs. An ENGEO Geologist logged the boring holes in the field and collected soil samples using a 2½-inch-inside-diameter (I.D.) California-type split-spoon sampler fitted with 6-inch-long brass liners, a 2-inch-outside-diameter (O.D.) Standard Penetration Test split-spoon sampler, and Shelby tube.

The penetration of the California-type and the SPT sampler into the native materials was field recorded as the number of blows needed to drive the sampler 18 inches in 6-inch increments. Blow count results on the boring logs are recorded as the number of blows required for the last one foot of penetration. The samplers were driven with a 140-pound safety hammer falling a distance of 30 inches. We utilized the field logs to develop the report boring logs presented in Appendix A1. The soils are described in accordance with the Unified Soil Classification System (USCS).

A CPT rig was used to push the cone penetrometer, which has a 20-ton capacity cone with a 15-square-centimeter (cm^2) tip area and a friction sleeve with a surface area of 225 cm^2. The cone, connected with a series of rods, is pushed into the ground at a constant rate. CPT readings are taken at 5 cm intervals with soundings conducted in accordance with the revised (2002) ASTM D-5778-95. Measurements include the tip resistance to penetration of the cone (q_c), the resistance of the surface sleeve (f_s), and pore pressure (u_2). The CPT logs are presented in Appendix A-1. All previous Boring logs and CPT soundings from our previous explorations are included in Appendix A-2. In addition, shear wave velocity measurements were acquired from 2-CPT27 and 2-CPT8 during our previous study. The shear wave velocity profiles are reported in Appendix C.

The logs depict subsurface conditions within the borings at the time of exploration. The report boring logs represent the actual field blow counts for the last one foot of penetration and have not been subjected to conversion factors to achieve representative SPT results. Subsurface conditions at other locations may differ from conditions occurring at these boring locations. The passage of time may result in altered subsurface conditions. All ENGEO boreholes were backfilled on the day of drilling with approved backfill material in accordance with Solano County requirements.

Laboratory Testing

We tested samples recovered during drilling to determine the following soil characteristics:

Test	Test Method	Location of Results Within this Report
Natural Unit Weight and Moisture Content	ASTM D-2216	Appendix A-1
Atterberg Limits	ASTM D-4318	Appendix B-1
Hydrometer Analysis and Fines Content	ASTM D-422-63	Appendix B-1
Consolidation	ASTM D-2435-90	Appendix B-1

The laboratory test results are shown on the boring logs (Appendix A-1). Individual test results are presented in Appendix B-1.

GEOLOGY AND SEISMICITY

Regional Geology

The site is located within the Coast Ranges geologic province of California, a series of northwest-trending ridges and valleys. Bedrock in the province has been folded and faulted during regional uplift beginning in the Pliocene period, about 4 million years before present. Locally, the site is mapped as underlain by Holocene-Pleistocene Alluvium (Wagner and Bortugno, 1982). This alluvium consists of unconsolidated deposits of sand, silt, gravel and clay likely derived from the bedrock uplands and older unconsolidated deposits. The alluvial deposits extend at least 106 ½ feet below ground surface (depth of our deepest boring).

Subsurface Conditions

Subsurface conditions encountered during this exploration are generally consistent with those from previous explorations at the site. We encountered the following general subsurface conditions at the exploratory boring and CPT locations:

- Existing fill was encountered within the embankments of the waste water treatment ponds extending to a depth of approximately 7 feet (which correspond to approximate Elevation 158 feet). The embankment fills consist of stiff to very stiff clays, and silty clays with various amounts of gravel and rock fragments. Natural alluvial soil deposits underlie the fill.

- With the exception of the wastewater pond area, alluvial soils were encountered from ground surface to the depth explored. The alluvial deposits generally consist of inter-layered sandy clay, silty clay and clayey sand. Generally the soil deposits encountered above groundwater (13 to 14 feet deep) consist of medium stiff to very stiff clays; below groundwater the soil deposits consist of soft to medium stiff clays with thin layers of loose to medium dense silty and clayey sand that extend to depths of about 30 to 35 feet. Beneath this depth stiff to very stiff clays and dense to very dense sands were encountered to approximately 50 feet bgs in our borings and CPTs.

- A consistent layer of hard to very dense clayey silts and clayey gravels was encountered within each boring and CPT that extended beyond 40 feet to approximately 50 feet. Based on our previous explorations at the site, this hard layer extended to depths of 101½ and 106½ feet within Borings 2-B3 and 2-B8, respectively.

Figure 7 present interpretive geologic cross sections depicting subsurface conditions at the site. These cross sections have been derived based on an interpolation between similar strata encountered among various boring and CPT locations; as such, variations in actual subsurface conditions should be expected.

Groundwater Conditions

Groundwater levels were encountered during our supplemental exploration at depths ranging from approximately 13 to 14 feet. At the time of our May 2006 study, the groundwater levels generally varied from 3 to 5 feet below the ground surface, with the exception for borings adjacent to the waste water treatment ponds where groundwater was about 9 to 10 feet deep. During our supplemental field exploration in September 2008, groundwater levels appeared be lower, typically at or below about 10 feet below ground surface. It should be noted that fluctuations in the level of groundwater may occur due to variations in rainfall and other factors not evident at the time measurements were made.

Regional Faulting and Seismicity

The site is not located within the State of California Fault Hazard Zone; however, it is situated in a region that contains numerous active[1] and potentially active earthquake faults. The active Rodgers Creek fault is located approximately 0.7 miles east of the project area. The Rodgers Creek fault is capable of creating earthquakes with a moment magnitude of M7.0 (Blake, 1996).

[1] An active fault is defined by the State Mining and Geology Board as one that has had surface displacement within Holocene time (about the last 11,000 years) (Hart, 1997).

The Maacama Fault is located 6.3 miles east of the site, and the San Andreas Fault is located 19.5 miles west of the site. Figure 5 presents the Regional Faulting and Seismicity Map, which shows regional proximity of major active faults and significant historic earthquakes with respect to the site. A map of potentially active faults and Alquist-Priolo Zone in vicinity of the site is provided on Figure 5A. Historically, the San Francisco Bay Area has been subjected to strong ground shaking from several large earthquakes. Figure 8 shows approximate epicentral locations of historic earthquakes of magnitude M5 or greater that may have generated strong ground motions at the site. The following list (Bakun 1999) contains historical earthquakes that may have generated strong ground motions in the vicinity of the subject site.

1838 Mw 6.8 (San Andreas Fault)
1868 Mw 6.8 (Hayward Fault)
1906 Mw 7.8 San Francisco (San Andreas Fault)
1923 Mg-r 7.3 Off-shore Cape Mendocino
1969 ML 5.6 and 5.7 Santa Rosa (Healdsburg Fault)
1989 Mw 6.8 Loma Prieta (San Andreas Fault Zone)

The regional seismicity of the Bay Area was recently evaluated by the Working Group on Northern California Earthquake Probabilities (WGEP 2007). The Working Group periodically attempts to summarize seismic risk in the Bay Area by presenting probabilities of 6.7 Mw or greater earthquakes on active Bay Area faults for a 30-year return interval (2007-2036); the most recent summary gives a 63 percent aggregate probability for the entire Bay Area. The active Rodgers Creek fault system is estimated to have a 30-year probability of 31 percent for a M6.7 or greater earthquake. According to the Working Group the likelihood of an even more powerful earthquake (magnitude 7.5M or greater) the probability for the Bay Area is 15 percent in the next 30 years (WGCEP 2007). It should therefore be expected that the site will experience one or more episodes of strong ground shaking during the design life of the proposed improvements.

Site Class

The Site Class was evaluated using the procedures outlined in the 2007 California Building Code (CBC) Section 1613.5.5 and Table 1613.5.2. The results of the seismic CPT and shear strength tests from the deeper test boring (greater than 50 feet) were correlated with the criteria presented in Table 1613.5.2. The seismic CPT measurements indicate that the shear wave velocities in the upper 50 feet range from about 551 to 1515 feet per second (fps) with the majority of the velocity measurements greater than 600 fps. From a depth of 50 to 100 feet the boring logs indicate stiffer alluvial material which are judged to have undrained shear strengths in the range of 1000 to 2000 pounds per square foot. For the given soil properties, we conclude that Site Class D (S_D) is appropriate for seismic design.

Seismic Hazards

The ground motions were developed in accordance with the 2007 CBC with the exception of the requirements outlined in Code Application Notice for File No. 2-1802A.6.2-1 draft date March 24, 2008. CBC Section 1614A.1.2 requires that a ground motion hazard analysis be performed in accordance with Section 21.1 of ASCE 7 Chapter 21.1, where the subject site is closer than 10 km of an active fault. Since the site is located within 10 km of several active faults, we performed site-specific ground motion hazard analyses, as outlined below.

In preparing the spectra, we utilized the following methodology:

Probabilistic MCE – We developed site specific probabilistic spectra response accelerations defined as 5 percent damped acceleration response spectra with a 2 percent chance of exceedance in a 50 year period. To perform this probabilistic analysis, we utilized the computer software EZFrisk (Version 7.25). We performed our analyses using faults within a 200 kilometer radius. We utilized recently published Next Generation Attenuation (NGA) relationships for shallow crustal earthquakes on the West Coast which have been used by the USGS in their recent 2008 seismic mapping project. Specifically, we utilized NGA relationships by Boore and Atkinson (2007), Campbell and Bozorgnia (2008) and Chiou and Youngs (2006). The results of the three NGA relationships were averaged for use in our analyses. We then scaled these results to estimate the ground motions in the maximum direction of response using scaling factors published by Huang et al. (2008a, 2008b). We also performed a deaggregation of the PSHA analysis and the controlling fault parameters for the Probabilistic MCE spectra are a Moment Magnitude of 6.85 with a modal distance of 1.25 km from the project site.

Deterministic MCE – We also developed a Deterministic MCE for 5 percent damping using the 84th percentile spectral response acceleration calculated for faults within the same radius and using the same NGA relationships as with the Probabilistic MCE. We performed this search using EZFrisk. We scaled this spectra to represent the direction of maximum ground motion as with the Probabilistic MCE. The highest spectral response values calculated by EZFrisk were for shaking on the Hayward-Rodgers Creek System Fault with a Moment Magnitude of 7.26. This spectra was then compared to the minimum deterministic values as discussed in Chapter 21.2.2 of Reference 2.

Recommended MCE – We developed our recommended Design Spectra by comparing the lesser of the Probabilistic MCE and the Deterministic MCE spectra and by taking 2/3 of the controlling spectra. The lowest of the two spectra was then compared to 80 percent of the mapped spectra developed in accordance with Chapter 11 of Reference 2; where necessary, the design spectral acceleration was increased so that it is never less than 80 percent of the mapped spectra. The "Recommended Design Spectra" shown on Figure 9 shows the spectra developed as discussed above.

Liquefaction

As discussed in our previous study, localized discontinuous thin layers of potentially liquefiable zones were encountered within the project area. Based on our analysis, we conclude that the general site conditions have a low potential for liquefaction; however there are isolated, discontinuous, relatively thin, inter-layers of “marginally liquefiable” soils; these marginally susceptible deposits were encountered at various depths ranging 5 to 35 feet. As part of this current study, we have further refined our characterization and analyses related to liquefaction potential, as well as our assessment of potential seismically induced settlement as it relates to the planned development. We have considered both classical liquefaction of sands containing varying amounts of fines, as well as “seismic softening” of low plasticity clays and silts. Based on our assessment, we estimated that the potential seismically induced settlement (in the event that liquefactions were to occur) during a strong earthquake would generally be less than 2 inches.. A detailed discussion of the susceptibility to and the consequences of liquefaction/seismic softening with supporting calculations are provided in Appendix D. As discussed in the subsequent sections of this report, the potential for and consequences of seismically induced settlements will be mitigated by surcharging to reduce static settlements and overexcavation for shallow foundations, or alternatively by the use of deep foundations that deriving support below the potentially susceptible material.

Earthquake-Induced Densification. In addition to potential seismic settlement related to liquefaction/seismic softening below the groundwater levels, there is a potential of settlement from densification of loose to medium-dense sands above the groundwater level if the site is subject to strong earthquake ground shaking. As previously stated, we did not encounter loose to medium-dense sands above the groundwater level during the subsurface exploration, and therefore we believe the risk of densification induced by earthquake shaking is considered low at this site.

Lateral Spreading. Lateral spreading is a failure within a nearly horizontal soil zone (possibly due to liquefaction), which causes the overlying soil mass to move toward a free face or down a gentle slope. No free face or slopes are present near the hospital footprint; therefore, the potential for lateral spreading is considered low.

Earthquake-Induced Landsliding. No landslides have been mapped within or immediately adjacent to the site; therefore, the potential for earthquake-induced landsliding to occur is considered low.

Inundation Due to 100-Year Flood

The project site is not located within the 100-year flood inundation area; therefore, risk of flooding is considered low. However, the Civil Engineer should review pertinent information relating to possible flood levels for the subject site based on final hospital pad elevations and provide appropriate design measures for development of the project, if necessary.

Corrosion Potential

An evaluation of possible corrosion impact to site improvement was previously performed. Soil samples were selected from the soil profile and tested for water soluble sulfates in accordance with the 2007 California Building Code. Results show water soluble sulfate concentrations ranging from 6 to 36 mg/kg. The results are attached in Appendix B2. Based on these results, site surface soils would be classified in the negligible range with respect to sulfate exposure for design of foundation concrete. ENGEO has provided recommendations for foundation concrete in a later section of this report.

With regard to pipelines and other buried elements, high chloride concentrations and low resistivity soil conditions can produce corrosive conditions according to the latest Caltrans Corrosion Guidelines (September 2003, Version 1.0). Based on the proximity of the site to the

San Francisco Bay and our experience on projects with similar site conditions, high chloride and low resistivity conditions are anticipated. A corrosion consultant may be retained to provide site-specific design recommendations in order to protect buried pipelines and other elements against corrosion.

Expansive Soils

Expansive soils shrink and swell as a result of moisture changes. These soils may cause heaving, cracking and related distress to structures and site improvements if not properly mitigated. Based on lab testing results on the current and previous study, the Plasticity Index (PI) of near surface soils range from 13 to 26 indicating that site soils have low to moderate expansion potential. Successful development on expansive soils requires special attention during construction. Exposed subgrade materials should be kept moist at all times during construction. Long-term mitigation measures should also include the prevention of moisture variation, and the use of a layer of low expansive “select” materials below lightly loaded structural elements.

CONCLUSIONS AND RECOMMENDATIONS

Based on the findings from this subsurface exploration, laboratory test results and analyses, it is our opinion that the planned project development is feasible from a geotechnical standpoint, provided that the recommendations contained in this report along with sound engineering practices are incorporated in the design and construction of the project. It is our opinion, from a geotechnical perspective, that the main considerations for the current planned development include:

1. The presence of a zone comprised of soft to medium stiff alluvial soil deposits. These deposits consist of intermixed clays, silts and lesser sands between depths of 5 to 35 feet, and are considered potentially compressible when subject to increased loads. Additionally, these fine-grained alluvial deposits are classified as low plasticity and may potentially be susceptible to “seismic softening” and incrementally small amounts of seismically induced settlements. Therefore, to reduce potential settlements adversely impacting the planned hospital several options may be considered as follows:

   - The building may be supported on shallow foundation systems provided the compressible soil layer is mitigated to reduce potential excessive total and differential settlements resulting from the increased loads. The increased loads are anticipated to result from raising site grades as well as loads induced by foundations. To mitigate the susceptible soils it is recommended that pre-consolidation measures by surcharging be performed as discussed in the following sections of this report. While the potential for seismically induced settlements within these soft to medium stiff fine-grained soils is relatively small, surcharging will additionally reduce the risk of potential seismically-induced settlements affecting the planned building. To promote uniform load support underlying the foundation elements for this option it is recommended that the building pad be overexcavated to a depth of 5 feet below pad grade and restored with engineered.

   - Alternatively, the building may be supported by deep foundations deriving support at depths below the compressible soils. Of the available deep foundation systems driven piles would be suitable for this site, not to the exclusion of other systems. This report provides design criteria for driven piles systems for this alternative.

2. The presence of moderately expansive soil underlying the site which may undergo significant volume changes (swell and compression) when subjected to varying moisture contents. Measures to mitigate adverse effects of expansive soils, such as selective moisture conditioning and compaction are presented in the following sections of this report.

3. The presence of existing undocumented fills extending to depths of about 7 feet in exploratory borings. These fills are associated with the existing embankment. These fills should be completely overexcavated and removed within the planned development areas and replaced with properly compacted engineered fill in order to reduce potential excessive total and differential settlement.

If there are significant changes to the hospital plans including layout, grading or design loads, the recommendations presented herein may need to be refined and modified, as deemed appropriate by the Geotechnical Engineer. Geotechnical engineering recommendations contained in this report include: site preparation and grading, foundation design criteria, retaining walls, pavements, underground utilities, and drainage.

Treatment of Compressible Soils

As previously discussed, soft to medium stiff, fine-grained alluvial soils are present between depths of 5 to 35 feet, and these are potentially compressible when subject to increased loads. Also, some of the layers within this zone are considered marginally susceptible to seismic softening which could result in settlement. If shallow foundation systems are desired for the planned building, in order to reduce potential settlement pre-consolidation measures are recommended; the recommended pre-consolidation measures are also anticipated to increase strength of the soils thereby reducing the risk of seismically induced settlement from softening. Therefore, if shallow foundations are to be used, it is recommended that surcharge fills be placed over the building footprint until consolidation of these fine grained soils significantly diminishes.

Surcharge Procedure. Surcharging involves the placement of a uniform thickness of surplus fills extending beyond limits of areas to be surcharged. Based on grading concept and preliminary structural loads for the buildings, we estimate surcharge fills may be on the order of 5 to 8 feet above design grades, depending on timeline allowance for surcharge duration, and rate of consolidation of soils, and settlement monitoring program. The surcharge program should include the following:

- Prepare site surface by stripping surface vegetation and removing all debris. Prepare stripped and grubbed areas in accordance to the recommendations provided in the "Placement of Fill" sections of this report. Stake limits of area to be surcharged.

- Install settlement monitoring instruments or monuments.

- Placement of uniform surcharge fill materials.

- Provide on-going monitoring and readings of settlement measurement. It is estimated that this can be accomplished using the following general procedure: obtain readings weekly for the first month, every two weeks for at least the next 2 months, and monthly thereafter, or until the desired settlement has occurred.

- Determine the completion of the pre-consolidation by surcharge and allow for removal of the surcharge fills based on the monitoring program.

It is our experience that the consolidation may occur relatively rapidly in the low plasticity and sandy fine-grained soils as are on this site; the actual rate of consolidation depends on amount of surcharge load and dissipation of excess pore water pressure which may be variable at this site. Therefore, to refine an overall surcharge program with estimated timelines for project, it may be practical to perform a reduced scale surcharge test. ENGEO should be consulted regarding the recommendations and monitoring of such a test if desired. Also, if it is necessary to accelerate rate of pre-consolidation given schedule constraints to within a few months, added measures may include the use of "wick drains" or vertical drains beneath surcharge fill areas to accelerate consolidations, as deemed necessary.

<u>Surcharge and Settlement Monitoring</u>. In order to develop uniform surcharge pressure, settlement monitoring during surcharge construction is necessary. To establish a uniform stress distribution in the soft compressible material, the surcharge fill should extend beyond the actual building footprints. After the desired degree of consolidation has occurred, the surcharge fill above building pad grades is removed. Once the settlement has occurred, the use of shallow foundation systems, such as spread footing foundations would be appropriate for the planned hospital structures.

It is recommended that temporary settlement monuments or vibrating wire settlement cells be installed to monitor surcharge related consolidation at locations selected by the Geotechnical Engineer. The monuments or cells should be monitored periodically during the placement of surcharge grades and thereafter until the desired degree of settlement has been achieved as determined by the Geotechnical Engineer. All readings of settlement should be tied to bench marks established well beyond the zone of surcharge influence. The settlement data is used to assess when the desirable degree of consolidation is achieved and determine when the surcharge can be removed. Settlement monitoring can be terminated thereafter.

Demolition and Stripping

Begin grading with the removal of existing structures and associated foundations, buried pipes, septic tanks, leach fields, irrigation lines, water well systems, designated fences, trees and associated root systems, and any other deleterious materials. Remove underground structures that will be abandoned or are expected to extend below proposed finished grades from the project site. Remove tree roots to a depth of at least 3 feet below original grades. The organically contaminated materials should not be used in proposed building pads or pavement areas. Strip and stockpile the organics and use in landscape areas subject to the approval of the Landscape Architect or off haul. Remove any debris found within any areas to be graded.

The planned hospital footprint encroaches into the existing waste water treatment plant location. Prior to site grading, the waste water treatment facility should be decommissioned in accordance with regulatory requirements. Additionally, the bottom 11 feet of the ponds should be overexcavated and replaced with engineered fill under observation of the Geotechnical Engineer and/or by a representative of the Geotechnical Engineer. Grading for the pond area should include:

- Temporary dewatering of the ponds and removal of soft material beneath ponds.
- Excavating and off-hauling the soft and liquefiable material at the pond bottom.
- Overexcavating any undocumented fill within the waste water facility area.
- Removing underground pipelines and buried foundations.

A representative of ENGEO should determine the actual removal depth in the field based on conditions encountered during the site grading. Clean excavations resulting from demolition and stripping below design grades to a firm undisturbed, non-yielding soil surface as determined by the Geotechnical Engineer. Following clearing and grubbing, scarify, moisture-condition and backfill all depressions with compacted engineered fill. The requirements for backfill materials and placement procedures are the same as those for engineered fill as described in the "Fill Placement" section.

Remove all existing non-engineered fill, vegetation and soft or compressible soils in areas to be graded, as necessary, for project requirements. The Geotechnical Engineer or qualified representative should determine the material removal depth in the field at the time of grading. Evaluation of unsuitable deposits should be performed during grading and may include sampling and laboratory analyses.

After the site has been properly cleared and stripped, and necessary excavations have been made, scarify the surface at least 12 inches, moisture condition, and compact in accordance with the recommendations presented below in the "Fill Placement" section, prior to replacing and recompacting overlying soils as engineered fill. The compaction requirements for existing soil used for fill placement are the same as those for engineered fill, as described in a subsequent section of this report.

<u>Grading</u>

If surcharging and shallow foundation are used, we recommend that the building envelope areas (including areas 5 feet beyond the building perimeters) be overexcavated to a minimum depth of 5 feet below final floor levels, and then grades restored with properly recompacted engineered fill, per specifications presented in this report. If deep foundations systems are employed, deep overexcavation requirement will not be necessary provided that floor slabs are structurally supported. However, even with a deep foundation and supported floors, the slab should be underlain by non-expansive fill as recommended in a subsequent section of this report titled "Slab on Grade Floors".

Within parking and access roadway areas, it is recommended that overexcavation and recompaction should consist of a minimum of 2 feet below pavement subgrade levels. Additionally, existing undocumented fills encountered within the planned building and site improvement areas should be overexcavated in their entirety and replaced with properly compacted engineered fill.

Notify ENGEO at least 48 hours prior to grading to coordinate our schedule with the grading contractor. Grading operations should meet the requirements of the Guide Contract Specifications included in the Appendix G and must be observed and tested by ENGEO's field representatives. Ponding of stormwater should not be permitted at the site except within engineered sediment detention basins, particularly during cease of work for rainy weather. Before the grading is halted by rain, provide positive slopes to carry the surface runoff to storm drainage structures in a controlled manner to prevent erosion damage.

Materials Selection. With the exception of organic-laden soils, we anticipate engineered fill to consist of the on-site soil materials in connection with the planned grading and site improvements. Organic-laden soils contain more than 3 percent organic content above typical background levels in soil. It is our experience that organic laden soils can be blended with general fill material at a ratio not greater than 10:1.

Import materials must be free of organic material, debris and fragments larger than 6 inches in greatest dimension. Import material should meet the requirements contained in Section 2.02B, Part I of the Guide Contract Specifications in Appendix G. Submit a sample of the proposed import material to the Geotechnical Engineer for evaluation by laboratory testing prior to study area delivery.

Fill Placement. Scarify, moisture-condition and recompact the exposed surface area to 12 inches in depth, to provide adequate bonding with the initial fill lift. Place all fills in thin lifts. Avoid lift thicknesses exceeding 6 inches or the compaction equipment penetration depth, whichever is less. Generally apply the following compaction control requirements to granular fills:

Test Procedure:	ASTM D-1557 (most recent).
Required Moisture Content:	A minimum of 3 percent above optimum moisture content.
Required Relative Compaction:	A minimum of 90 percent for non-expansive soil.

Relative compaction refers to in-place dry density of the fill material expressed as a percentage of the maximum dry density based on ASTM D-1557. Optimum moisture is the moisture content corresponding to the maximum dry density.

Monitoring and Testing. It is important that all site preparations for mass grading be done under the observation of a Geotechnical Engineer or his/her qualified field representative. Allow the Geotechnical Engineer or his/her field representative to observe all graded area preparation, including demolition and stripping, following the recommendations contained in the Guide Contract Specifications in Appendix G. We also recommend the Geotechnical Engineer or his/her qualified representative be present full time during all phases of the mass grading operations to observe grading procedures and test for soil compaction. Submit the final grading plans to the Geotechnical Engineer for review.

Temporary Dewatering

Based on the boring and CPT data, groundwater levels at this site are as shallow as 5 feet below the ground surface in the area of the existing ponds, corresponding to approximate Elevation 153 feet. If excavations extend below groundwater levels temporary construction dewatering measures should be anticipated. We recommend dewatering procedures maintain groundwater at a minimum of 2 feet below the bottom of the excavation.

Foundation Recommendations

As previously discussed, several options for foundation may be suitable for the support the proposed building depending on planned mitigation measures for the project. If surcharging is undertaken along with overexcavation and reworking of the soils are described in this report, then it is anticipated that conventional shallow footing combined with floor slabs on grade would be suitable. Alternatively, if surcharging is not performed then it is recommended that the building be supported on deep foundations systems. Design criteria for the two foundation systems are provided below:

Shallow Foundations. Provided building areas are mitigated as recommended in this report, the use of continuous "strip" and isolated "column" footings are suitable for the support of the proposed buildings. Structural loadings, footing dimensions and embedment depth for the proposed shallow foundation system have not been determined at the time of this report. For planning purposes provided below are preliminary design criteria for typical shallow footings:

Maximum Allowable Bearing Pressure:	3,500 psf for dead plus live loads based on a Factor of Safety of 3. This value can be increased by one third to include seismic or wind loads.
Minimum Depth of Footing:	At least 24 inches below the lowest adjacent grade.

We understand that various footing configuration will be considered to support structural loads, as such, bearing capacity other than those provided above may be considered. Analysis of bearing capacity for propose footings will be conducted during the design phase of this project.

Lateral Loading. An ultimate passive resistance pressure of 400 pounds per cubic foot (pcf), equivalent fluid weight, may be used to evaluate resistance to lateral loading from short duration seismic and wind loading if the area in front of the footing is level for at least 8 feet, where the upper 1 foot of footing embedment should be neglected for passive resistance pressure. A base friction factor of 0.35 may be used. The recommended passive resistance and skin friction are ultimate values; appropriate safety factors should be included. If passive resistance and base friction are combined, it is recommended that base friction resistance be reduced by 50 percent. Foundation plans should be reviewed by the Geotechnical Engineer when they become available. Footing trenches should be cleared of all loose materials, and soils exposed in footing excavations should not be allowed to desiccate prior to placing concrete. The Geotechnical Engineer or his/her field representative should observe the footing trenches prior to concrete placement.

Slab on Grade Floors. Slabs should be underlain with 12 inches of "select fill" consisting of low to non expansive material. For slabs constructed on native, undisturbed material, overexcavate the slab-on-grade subgrade to a minimum 12 inch depth below the subgrade level and replace with "select fill." The overexcavated exposed grades should be scarified a depth of 12 inches, moisture conditioned to at least 4 percentage points above optimum moisture, and recompacted to at least 90 percent relative compaction. Restore grades in the slab area using low- to non-expansive select engineered fill compacted to 90 percent relative compaction at least 2 percentage points above optimum moisture. Import engineered fill should consist of low- to non-expansive soil having a Plasticity Index less than 12. For interior floor slabs on grade abutting strip footing stemwalls, the edge of the slabs do not require thickening; for all other cases the edges of the slab on grade should be increased by 2-inches greater than slab section.

Slab Moisture Vapor Reduction. When buildings are constructed with concrete slabs-on-grade, water vapor from beneath the slab will migrate through the slab and into the building. This water vapor can be reduced but not stopped. Vapor transmission can negatively affect floor coverings and lead to increased moisture within a building. When water vapor migrating through the slab would be undesirable, we recommend the following to reduce, but not stop, water vapor transmission upward through the slab on grade.

1. Install a vapor retarder membrane directly beneath the slab. Seal the vapor retarder at all seams and pipe penetrations. Vapor retarders shall conform to Class A vapor retarder per ASTM E 1745-97 "Standard Specification for Plastic Water Vapor Retarders used in Contact with Soil or Granular Fill under Concrete Slabs."

2. Concrete shall have a concrete water-cement ratio of no more than 0.5.

3. Provide inspection and testing during concrete placement to check that the proper concrete and water cement ratio are used.

4. Consider adequate moist cure of slabs.

The Structural Engineer should be consulted as to the use of a layer of clean sand (less than 5 percent passing the U.S. Standard No. 200 Sieve) placed on top of the vapor retarder membrane to assist in concrete curing. Protect foundation subgrade soils from seepage by providing impermeable plugs within utility trenches as described in the "Utilities" section.

Deep Foundations. If deep foundations are selected, surcharging will not be required. Of the available systems, it is our opinion that driven concrete pre-stressed piles are suitable for the subsurface condition at this site. For planning purposes we have provided parameters for driven 14-inch square pre-cast pre-stressed concrete piles, not to the exclusion of others.

Based on the results of our field exploration, it is recommended that piles extend into the dense gravelly deposits encountered at depths exceeding approximately 45 feet bgs, corresponding to approximate Elevation 113 feet. Practical refusal can be expected when the piles are driven about 5 feet into the gravel layer. It is our opinion that piles driven to practical refusal in this gravel layer can support an allowable capacity of approximately 100 to 120 tons. Based on a transmittal provided to us from HGA, dated September 16, 2008, maximum loading conditions of 210 kips for dead load and 75 kips of live load is expected. Pile spacing should be not less than 3 times the pile diameter, center-to-center.

Typically, 14-inch-square pre-stressed concrete piles may be driven continuously with a hammer developing at least 40,000 foot-pounds of energy until achieving practical refusal. Refusal blow count criteria may be determined during construction given the hammer size and evaluated efficiency. However, for planning purposes, we suggest that the following refusal blow count criteria:

REFUSAL BLOW COUNT CRITERIA

Actual Hammer Energy (foot-lbs/blow)	Practical Refusal Blow Count
40,000	60 blows per foot
60,000	40 blows per foot

If driven piles are selected for foundations of the building, then we recommend driving indicator piles at several locations within the building footprint to determine the actual penetration depth into the supporting stratum, as discussed in the following section. If practical refusal does not occur in the gravel stratum, piles designed as friction piles may be considered. For this condition, we anticipate 14-inch-square piles, penetrating 60 feet below the ground floor of the proposed building structures to develop a design capacity of 60 tons. Additional piles may be required in this situation.

Uplift Resistance. Resistance to uplift loads will be developed in friction along the face of the pile. We recommend an allowable uplift frictional resistance of 200 psf along the sides of the pile. The upper 10 feet of the pile should be neglected in calculating uplift resistance.

Lateral Loading. Lateral resistance to wind and seismic loads can be developed by passive pressure on the soil against the pile caps and grade-beams as well as by bending resistance of the pile foundation. In general, ultimate passive resistance against the pile caps could be evaluated using a triangular pressure distribution modeled as an equivalent fluid weight of 400 pounds per cubic foot provided that the pile cap is embedded in engineered fill material provided that the area in front of the footing is level for at least 8 feet, where the upper 1 foot of footing embedment should be neglected for passive resistance pressure. Based upon our exploration, we were also able to develop representative soil criteria for the required variables used in the L-Pile program for lateral passive pressure calculations. We present a tabular summary of the L-Pile soil parameters below.

Table 1: Generalized L-Pile Soil Parameters

Elevation(ft)	Generalized Soil Profile	L-Pile Soil Type	Soil Strength	Soil Strength	K (pci)	E50 (%)	Effective Unit Weight (pcf)
153 to 158	Silty Clay to Sandy Clay	3. CLAY	---	2,000 psf	500	0.7	115
128 to 153	Sandy Clay / Sandy Silt / Silty Clay	2. CLAY	---	800 psf	100	1.0	37.6
123 to 128	Silty Clay / Gravelly Clay	2. CLAY	---	2,000 psf	800	0.5	47.6
118 to 123	Silty Clay	1. CLAY	---	1,000 psf	100	1.5	47.6
98 to 118	Clayey Gravel / Clayey Silt	4. SAND	26^{o}	5,000psf	125	0.4	67.5

The following tabulated information summarizes our lateral pile analysis results. Additionally, Appendix F provides the relationships between pile displacement and moment with depth for 14-inch-square pre-stressed concrete pile.

Table 2: Ultimate Lateral Capacities (Single Pile)

Pile Diameter (inch)	Axial Loading (tons)	Pile Condition	Ultimate Lateral Capacity (tons)	
			¼-inch Top of Pile Deflection	½-inch Top of Pile Deflection
14	60	Pinned-Head	10	14
		Fixed-Head	19.5	27
14	150	Pinned-Head	10	14
		Fixed-Head	19.5	27

The above lateral capacities represent the probable response of a single pile under short-term loading conditions. The ultimate lateral resistance of the soil can be increased by one-third for the short-term effects of wind or seismic loading provided piles are spaced at least 3 pile diameters on center. The above values provided are considered ultimate capacities. The Structural Engineer should select other suitable factors of safety based on the type of loading.

We estimated maximum bending moments and points of fixity of a 14-inch square pre-cast pre-stressed concrete pile for ¼- and ½-inch pile top deflection given fixed-head and pined-head condition. The Structural Engineer should be consulted to determine the maximum allowable bending moment for the piles. As referenced in Table 3 below, "point of fixity" is defined as a point of zero lateral deflection.

Table 3: Load Deflection Characteristics (14-inch Square Pile)

Pile Head Condition	Deflection Characteristic	Pile Deflection	
		¼-inch	½-inch
Pinned-Head	Maximum Bending Moment (in-kips)	620	900
	*Depth to Maximum Bending Moment (feet)	5.5	5.5
	*1st Point of Fixity (feet)	8.5	9
	*2nd Point of Fixity (feet)	20	20
Fixed-Head	Maximum Bending Moment (in-kips)	425	700
	*Depth to Maximum Bending Moment (feet)	9	10
	*1st Point of Fixity (feet)	12	14
	*2nd Point of Fixity (feet)	23	23

*Below Top of Pile

The foundations should be designed by a licensed Structural Engineer. Once details regarding the structural designs of the hospital building and related development have been determined, ENGEO should review such designs for appropriate changes and/or modifications to these preliminary foundation recommendations as deemed necessary.

Group Pile Affects. Group reduction on axial pile capacity for friction pile groups with individual piles spaced at least 3 pile diameters apart is not considered necessary. If closer pile spacing is required, the following group reduction factors on axial pile capacity can be applied.

Spacing in Pile Diameter (feet)	Group Reduction Factor*
3	1
2.5	0.8
2.0	0.6

* Group reduction factors for 3 by 3 pile group (9 piles)

It should be noted that pile spacing less than 2 pile diameters are not recommended.

Research (Brown, 1988) has shown that the lateral capacity of a group of piles is generally less than that of a single pile for center to center spacing less than 6 to 8 pile diameters. For 3 by 3 pier groups (9 piles) with a spacing of 3 pile diameters, we recommend reducing the single pile allowable lateral capacities by 35 percent.

Indicator Piles. We recommend a minimum of eight indicator piles be installed to determine pile driving resistance characteristics and whether the piles can be driven to the design depths. The piles should be driven at the corners and around the center of the hospital tower and should be located to serve as functional foundation piles. This information will allow us to evaluate the pile load carrying capacity based on the recorded driving resistance. The information obtained during indicator pile driving will be used to confirm the production pile lengths, and provide blow count data to correlate with information obtained from the test borings and CPTs. Indicator piles should be driven with the same equipment that will be used to drive production piles.

During the installation of the indicator piles, we recommend using a Pile Driving Analyzer (PDA) to evaluate pile stresses during driving, soil skin friction, and end bearing. The PDA should be operated by experienced and qualified personnel. If the results indicate driving stresses (tension or compression) could damage the piles, the PDA operator should immediately notify the contractor and Geotechnical Engineer.

We recommend that an indicator pile program be implemented as follows:

- The lengths for the piles to be used for the indicator pile program should include an additional 10 feet to account for variations in driving resistance encountered during indicator pile installation (55 feet).
- The piles should be first driven to the elevation that corresponds to 5 feet of penetration into the dense layer
- If PDA measurements during initial driving do not confirm the design capacities, pile re-strike should take after a week period and the piles should be driven all the way to the final tip elevation .
- The PDA measurements will then be used to develop final pile lengths.

The Geotechnical Engineer should review the final foundation plans when they become available to check for conformance with these recommendations. In addition, all pile-driving operations should be conducted under the observation of a representative of the Geotechnical Engineer, and the blow counts should be recorded by a representative of the Geotechnical Engineer.

Grade Beam Design. All foundation piles supporting bearing walls should be interconnected by well-reinforced grade beams. We do not recommend the use of isolated piers. Based on the near surface soil encountered during our exploration, the follow modulus of subgrade reaction should be used for design of the grade beams:

	Modulus of Subgrade Reaction k, (pci)	
	Static Loads	Total Loads (Seismic and Static)
Founded on at least 2 ft of Engineered Fill	150	200
Founded on Native material	100	150

All grade beams should be reinforced to maximize their moment capacity. The grade-beam reinforcement should be designed by the Structural Engineer.

Due to the expansive potential of some of the soil in the area of the building, design of the grade beam should consider proper reinforcements to resist uplift pressure of up to 1,000 psf. In order to reduce the risk of soil swelling rapid removal of any water that may infiltrate into the soils under the structures should be provided. Place at least 7 inches of soil, and compact soil on the outside of exterior grade beams. Provide a minimum 3 to 5 percent slope away from the foundation at right angles to the grade beams to provide for rapid removal of surface water runoff.

Structural Floor Slab. If pile foundations are selected, the ground floor slab should be designed structurally to span between pile caps and/or grade beams. We recommend floor slab construction consist of a concrete slab at least 6 inches thick underlain by a capillary break consisting of a minimum 6-inch-thick layer of Class 2 Permeable Material. The floor slab reinforcing should be designed by the Structural Engineer.

Exterior Slab-on-Grade

This section provides guidelines for secondary slabs such as walkways, driveways, and steps. Construct secondary slabs-on-grade structurally independent of the foundation system, to allow slab movement to occur with a minimum of foundation distress. Where slabs-on-grade construction is anticipated, care must be exercised in attaining a near-saturation condition of the subgrade soil before concrete placement. Due to the expansion potential of the near surface soils, we recommend that slabs-on-grade be supported on non-expansive fill to reduce the likelihood of slab damage from heave or shrinkage. To reduce the effects of expansive soil on interior slabs, we recommend the following:

1. Provide a minimum concrete thickness of 4 inches.
2. Reinforce slabs with No. 3 rebar on 16-inch centers, each way, placed within the middle third of the slab.
3. Pre-saturate the upper 10 inches of slab subgrade as described above.

The Structural Engineer should provide final design thickness and additional reinforcement, if necessary, for the intended structural loads. As a minimum requirement, reinforce slabs-on-grade to control cracking. Provide frequent control joints to reduce the cracking. In our experience, welded wire mesh is not sufficient to control slab cracking. Provide a thickened edge extending at least 6 inches into compacted soil to minimize water infiltration. Place a 4-inch-thick layer of clean crushed rock or gravel, which conforms to the requirement listed in Section 2.04 of Part I of the Guide Contract Specifications, under all secondary concrete slabs. Slope slabs away from the buildings at a slope of at least 2 percent to prevent water from flowing toward the building.

Retaining Walls Criteria

Conventional retaining walls (i.e. concrete, masonry, etc.) that are drained and less than 10 feet in vertical height should be designed to resist the following earth pressures. Design retaining walls that are free to deflect with active earth pressures and walls not free to deflect with at-rest earth pressures.

LATERAL EARTH PRESSURES

Backfill Slope Condition (horizontal: vertical)	Active Pressure (pcf)	At-Rest Pressure (pcf)
Level	50	85
4:1	55	90
3:1	60	100
2:1	70	110

Because the site is in a seismically active area, the design should be checked for seismic condition, in which the wall pressure is determined by adding the earth pressure due to earthquake shaking to the active earth pressure. The incremental seismic pressure is approximated by a uniform pressure, in psf, of 15 times the height of the wall in feet.

For wall in excess of 10 feet high, ENGEO should work together with the Structural Engineer. Provide backdrainage at the base of the foundation for all walls. Backfill of walls should be performed under the observation and testing of ENGEO and according to the recommendations provided in this and the referenced reports.

Drainage Requirements

Ponding of water under floors or seepage toward foundation systems at any time during or after construction must be prevented.

As a minimum requirement, provide finished grades at a minimum 3 percent slope gradient within 5 feet from exterior walls (perpendicular the wall alignment) to allow surface water to drain positively away from the structures. For paved areas, the slope gradient can be reduced to

1 percent. Ensure that landscape mounds will not interfere with these requirements. Provide sufficient area drains around the buildings to remove excess surface water.

Convey stormwater from roof downspouts in closed drain systems to a drainage facility. If planting adjacent to a building is desired, use drought-tolerant plants that require very little moisture. Avoid sprinkler systems installation which may cause ponding or foundation soil saturation. Such ponding or saturation could result in undesirable soil swell, loss of compaction and consequent foundation and slab movements. Strictly limit landscape area irrigation to that necessary for plant growth.

Preliminary Pavement Design

The following recommendations for preliminary asphalt pavement sections are intended as a conceptual guide for planning. We based the preliminary pavement sections on an estimated R-Value of 5. Actual R-Value samples should be collected for testing after grading to approximate rough grades and installation of underground utilities. The preliminary pavement sections are based on the estimated R-Value, the Caltrans "Design Method for Flexible Pavements", and Traffic Indices (T.I.) ranging from 4 to 8. However, T.I. values should be determined by the Civil Engineer or appropriate public agency.

Traffic Index	Asphalt Concrete (in.) (Type B)	Aggregate Base (in.) (Class 2)
4.0	2½	7½
5.0	3	10
6.0	3½	13
7.0	4	16
8.0	4	17½

Pavement materials and construction should comply with the specifications and requirements of the Standard Specifications by the State of California Division of Highways, City of Santa Rosa requirements and the following minimum requirements.

- Scarify pavement subgrades to a minimum depth of 12 inches below finished subgrade elevation; moisture condition to 3 percent above optimum, and compact to at least 95 percent relative compaction and in accordance with city requirements.
- Subgrade soils should be in a stable, non-pumping condition at the time aggregate baserock materials are placed and compacted.
- Adequate provisions must be made such that the subgrade soils and aggregate baserock materials are not allowed to become saturated.
- Aggregate baserock materials should meet current Caltrans specifications for Class 2 Aggregate Baserock, and should be compacted to at least 95 percent of maximum dry density.
- Asphalt paving materials should meet current Caltrans specifications for asphalt concrete.
- All concrete curbs separating pavement and irrigated landscaped areas should extend into the subgrade and below the bottom of adjacent aggregate baserock materials.

Utilities

It is recommended that all utility trench backfill be done under the observation of a Geotechnical Engineer, in accordance with both the City of Santa Rosa and utility agency requirements. Pipe zone backfill (i.e. material beneath and immediately surrounding the pipe) may consist of a well-graded import or native material less than ¾ inch in maximum dimension compacted in accordance with the recommendations provided above for engineered fill. Trench zone backfill (i.e. material placed between the pipe zone backfill and the ground surface) may consist of native soil compacted in accordance with recommendations for engineered fill.

LIMITATIONS AND UNIFORMITY OF CONDITIONS

This report is issued with the understanding that it is the responsibility of the owner to transmit the information and recommendations of this report to developers, owners, buyers, architects, engineers, and designers for the project so that the necessary steps can be taken by the contractors and subcontractors to carry out such recommendations in the field. The conclusions and recommendations contained in this report are solely professional opinions.

The professional staff of ENGEO Incorporated strives to perform its services in a proper and professional manner with reasonable care and competence, but is not infallible. There are risks of earth movement and property damages inherent in land development. We are unable to eliminate all risks or provide insurance; therefore, we are unable to guarantee or warrant the results of our work.

This report is based upon field and other conditions discovered at the time of preparation of ENGEO's work. This document must not be subject to unauthorized reuse, which is, reusing without written authorization of ENGEO. Such authorization is essential because it requires ENGEO to evaluate the document's applicability given new circumstances, not the least of which is passage of time. If actual field or other conditions necessitate clarifications, adjustments, modifications or other changes to ENGEO's work, ENGEO must be engaged to prepare the necessary clarifications, adjustments, modifications or other changes before construction activities commence or further activity proceeds. If ENGEO's scope of services does not include on-site construction observation, or if other persons or entities are retained to provide such services, ENGEO cannot be held responsible for any or all claims arising from or resulting from the performance of such services by other persons or entities, and from any or all claims arising from or resulting from clarifications, adjustments, modifications, discrepancies or other changes necessary to reflect changed field or other conditions.

Cone penetration testing and soil sampling methods description.

Rig Description

Our services are based on the state-of-the-art, Geoprobe Model 6625CPT rig, a limited-access, self-anchoring, 20-ton push capacity, track-mounted push platform for dedicated Geotechnical CPT applications with the unique and valuable added ability to quickly perform intermittent or continuous soil sampling.

Weight = ~ 9,500 pounds
Surface load = ~ 4.5 psi
Push capacity = ~ 20 tons; self-anchoring achieved using 10- or 15-inch diameter helical soil anchors driven 4- to 10-feet into the soil
Sampling hammer percussion rate = 32 Hz & 20,000 lbs force/blow
Length = ~ 12 feet; Width = ~ 7 feet
Height (folded) = 7 feet; Height (unfolded) = 14 feet

CPT Description

Our Geoprobe 6625CPT incorporates the Swedish-made Geotech AB Cone Penetration Testing tools which meet the ASTM D-5778 Standard Test Method for Performing Electronic Friction Cone and Piezocone Penetration Testing of Soils. Cones have 10 cm^2 tips and 150 cm^2 friction sleeves, and include a porous filter and pressure sensor located in the u_2 position directly behind the cone. The cone and porous filter are saturated under vacuum with glycerin to promote rapid equilibration with in-situ pore pressures. Cones are advanced at the ASTM standard rate of 2 cm/second. Baseline readings are performed both before and after each push to check for load cell drift. The cone measures bearing (max load = 100 MPa ~ 1044 TSF), friction sleeve (max load = 1.0 MPa ~ 10.4 TSF), and dynamic pore pressure (max load = 2.5 MPa ~ 363 psi) at 2 cm or 4 cm intervals (client's choice) and this data is plotted in real-time and recorded on a laptop computer adjacent to the push platform. Holes are grouted upon completion of each push, or at the end of each day, as site conditions and regulations warrant.

The basic equation to determine the depth to the free water surface from the pore pressure dissipation test is;

Depth to phreatic surface = [Dissipation depth] – [equilibrium pore pressure / unit weight of H2O x unit conversation factor]

…where;

1) Surface elevation is always assumed to be 0 feet
2) Dissipation depth = the depth (feet) below surface elevation where the cone advancement was paused while waiting for equilibrium pore pressure to be achieved
3) Equilibrium pore pressure = the pore pressure after an elapsed time where no increase or decrease in pore pressure is occurring, in pounds per square inch (psi)
4) Unit weight of water = 62.3 pounds per cubic foot (lb/ft^3)
5) Unit conversion factor (for dimensional analysis): 1 psi = 144 lb/ft^3

From the dissipation plots, simply read the dissipation depth and dissipated pressure for the values to plug into the equation above. On the plots, pore pressure (psi) is on the abscissa and log time (seconds) is on the ordinate.

Sampling Description

Geoprobe® brand Dual Tube Sampling Systems are efficient methods of collecting continuous soil cores with the added benefit of a cased hole. Dual tube sampling uses two sets of probe rods to collect continuous soil cores. One set of rods is driven into the ground as an outer casing (2.2 or 3.25 inches in diameter). These rods receive the driving force from the hammer and provide a sealed hole from which soil samples may be recovered without the threat of cross contamination. The second, smaller set of rods are placed inside the outer casing. The smaller rods hold a sample liner in place as the outer casing is driven one sampling interval. The small rods are then retracted to retrieve the filled liner. Soil samples are collected in 1.85-inch diameter or 1.125-inch diameter clear PVC sample sheaths.

Interpretations

Soil behavior type (SBT), SPT N60 energy ratio, undrained shear strength, OCR, and unit weights are calculated and/or are interpretations generated by the CPT-Pro software based on empirical relationships derived in the following references;

P.K. Robertson, R.G. Campanella, D. Gillespie, and J. Greig, 1986, Use of Piezometer Cone Data, Proceedings of the ASCE Specialty Conference In Situ '86: Use of In Situ Tests in Geotechnical Engineering; pp. 1263-1280.

P.K. Roberston, 1990, Soil Classification Using the Cone Penetration Test, Canadian Geotechnical Journal, 27(1), pp. 151-158.

T. Lunne, P.K. Robertson, and J.J.M. Powell, 1997, Cone Penetration in Geotechnical Practice, Taylor and Francis Publishing.

CPT Inc. makes no recommendation on which soil behavior type analysis is "most-correct". The engineer should be aware of the limitations of using CPT data to derive soil behavior type and other engineering parameters and is encouraged to review the above references to better understand the applicability and limitations of CPT data. It is sometimes not possible to determine soil type based solely on tip resistance, sleeve friction, and dynamic pore pressure response, and confirmatory samples may be required.

Please do not hesitate to contact CPT Inc. if you have questions.

Sincerely,
John Rogie

President
California Push Technologies, Inc.
