Peak Hour Delay Signal Warrant Report

Intersection #4 Highway 101 sb at Lytton Springs Road

Base Volume Alternative: Peak Hour Warrant NOT Met

Approach:	North Bound			South Bound			East Bound			West Bound		
Movement:	L	T	R	L	T	R	L	T	R	L	T	R
Control:	Stop Sign			Stop Sign			Uncontrolled			Uncontrolled		
Lanes:	0 0 0 0 0			0 1 0 0 1			0 0 0 1 0			0 1 0 0 0		
Initial Vol:	0	0	0	94	0	10	0	23	9	73	25	0
ApproachDel:	xxxxxx			10.5			xxxxxx			xxxxxx		

Approach[southbound][lanes=2][control=Stop Sign]
Signal Warrant Rule #1: [vehicle-hours=0.3]
FAIL - Vehicle-hours less than 5 for two or more lane approach.
Signal Warrant Rule #2: [approach volume=104]
FAIL - Approach volume less than 150 for two or more lane approach.
Signal Warrant Rule #3: [approach count=3][total volume=234]
FAIL - Total volume less than 650 for intersection
with less than four approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Signal Warrant Rule #1: [vehicle-hours=0.6]
   FAIL - Vehicle-hours less than 4 for one lane approach.
Signal Warrant Rule #2: [approach volume=188]
   SUCCEED - Approach volume greater than or equal to 100 for one lane approach.
Signal Warrant Rule #3: [approach count=3][total volume=426]
   FAIL - Total volume less than 650 for intersection
          with less than four approaches.
--------------------------------------------------------------------------------
SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an
"indicator" of the likelihood of an unsignalized intersection warranting
a traffic signal in the future.  Intersections that exceed this warrant
are probably more likely to meet one or more of the other volume based
signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace
a rigorous and complete traffic signal warrant analysis by the responsible
jurisdiction.  Consideration of the other signal warrants, which is beyond
the scope of this software, may yield different results.

Approach[southbound][lanes=1][control=Stop Sign]
Signal Warrant Rule #1: [vehicle-hours=0.2]
FAIL - Vehicle-hours less than 4 for one lane approach.
Signal Warrant Rule #2: [approach volume=81]
FAIL - Approach volume less than 100 for one lane approach.
Signal Warrant Rule #3: [approach count=3][total volume=199]
FAIL - Total volume less than 650 for intersection
with less than four approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Minor Approach Volume Threshold: 567

SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Peak Hour Delay Signal Warrant Report

ApproachDel:	xxxxxx	10.5	xxxxxx	xxxxxx

Approach[southbound][lanes=2][control=Stop Sign]
Signal Warrant Rule #1: [vehicle-hours=0.3]
FAIL - Vehicle-hours less than 5 for two or more lane approach.
Signal Warrant Rule #2: [approach volume=104]
FAIL - Approach volume less than 150 for two or more lane approach.
Signal Warrant Rule #3: [approach count=3][total volume=234]
FAIL - Total volume less than 650 for intersection
with less than four approaches.

SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Signal Warrant Rule #3: [approach count=2][total volume=353]
   FAIL - Total volume less than 650 for intersection
          with less than four approaches.
-------------------------------------------------------------------------------
SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an
"indicator" of the likelihood of an unsignalized intersection warranting
a traffic signal in the future.  Intersections that exceed this warrant
are probably more likely to meet one or more of the other volume based
signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace
a rigorous and complete traffic signal warrant analysis by the responsible
jurisdiction.  Consideration of the other signal warrants, which is beyond
the scope of this software, may yield different results.

Approach[northbound][lanes=1][control=Stop Sign]
Signal Warrant Rule #1: [vehicle-hours=0.2]
FAIL - Vehicle-hours less than 4 for one lane approach.
Signal Warrant Rule #2: [approach volume=89]
FAIL - Approach volume less than 100 for one lane approach.
Signal Warrant Rule #3: [approach count=3][total volume=312]
FAIL - Total volume less than 650 for intersection
with less than four approaches.

SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Approach:	North Bound			South Bound			East Bound			West Bound		
Movement:	L	T	R	L	T	R	L	T	R	L	T	R
Control:	Stop Sign			Stop Sign			Stop Sign			Stop Sign		
Lanes:	0 0	1!	0 0	0 0	1!	0 0	0 0	1!	0 0	0 0	1!	0 0
Initial Vol:	64	2	2	5	3	33	15	25	82	7	21	3

Major Street Volume: 153
Minor Approach Volume: 68
Minor Approach Volume Threshold: 720

SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Peak Hour Volume Signal Warrant Report [Urban]

Intersection #32 River Road/Moody Lane/State Route 128

Base Volume Alternative: Peak Hour Warrant NOT Met

Approach:	North Bound			South Bound			East Bound			West Bound		
Movement:	L	T	R	L	T	R	L	T	R	L	T	R
Control:	Stop Sign			Stop Sign			Stop Sign			Stop Sign

ApproachDel:	xxxxxx	10.5	xxxxxx	xxxxxx

Approach[southbound][lanes=2][control=Stop Sign]

Signal Warrant Rule #1: [vehicle-hours=0.3]

FAIL - Vehicle-hours less than 5 for two or more lane approach.

Signal Warrant Rule #2: [approach volume=104]

FAIL - Approach volume less than 150 for two or more lane approach.

Signal Warrant Rule #3: [approach count=3][total volume=234]

FAIL - Total volume less than 650 for intersection with less than four approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Signal Warrant Rule #2: [approach volume=114]
FAIL - Vehicle-hours less than 4 for one lane approach.

Signal Warrant Rule #3: [approach count=3][total volume=388]
SUCCEED - Approach volume greater than or equal to 100 for one lane approach.

FAIL - Total volume less than 650 for intersection
-----------------------------------------------------------------------------
SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an
"indicator" of the likelihood of an unsignalized intersection warranting
a traffic signal in the future.  Intersections that exceed this warrant
with less than four approaches.
are probably more likely to meet one or more of the other volume based
signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace
a rigorous and complete traffic signal warrant analysis by the responsible
jurisdiction.  Consideration of the other signal warrants, which is beyond
the scope of this software, may yield different results.

Approach[southbound][lanes=1][control=Stop Sign]
Signal Warrant Rule #1: [vehicle-hours=0.0]
FAIL - Vehicle-hours less than 4 for one lane approach.
Signal Warrant Rule #2: [approach volume=8]
FAIL - Approach volume less than 100 for one lane approach.
Signal Warrant Rule #3: [approach count=3][total volume=244]
FAIL - Total volume less than 650 for intersection
with less than four approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Peak Hour Delay Signal Warrant Report

Intersection #4 Highway 101 sb at Lytton Springs Road

Base Volume Alternative: Peak Hour Warrant NOT Met

Approach:	North Bound			South Bound			East Bound			West Bound		
Movement:	L	T	R	L	T	R	L	T	R	L	T	R
Control:	Stop Sign			Stop Sign			Uncontrolled			Uncontrolled		
Lanes:	0 0	0	0 0	0 1	0	0 1	0 0	0	1 0	0 1	0	0 0
Initial Vol:	0	0	0	94	0	10	0	23	9	73	25	0
ApproachDel:	xxxxxx			10.5			xxxxxx			xxxxxx		

Approach[southbound][lanes=2][control=Stop Sign]
Signal Warrant Rule #1: [vehicle-hours=0.3]
FAIL - Vehicle-hours less than 5 for two or more lane approach.
Signal Warrant Rule #2: [approach volume=104]
FAIL - Approach volume less than 150 for two or more lane approach.
Signal Warrant Rule #3: [approach count=3][total volume=234]
FAIL - Total volume less than 650 for intersection
with less than four approaches.

SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Major Street Volume: 255
Minor Approach Volume: 73
Minor Approach Volume Threshold: 722

SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Major Street Volume: 329
Minor Approach Volume: 104
Minor Approach Volume Threshold: 516

SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Peak Hour Volume Signal Warrant Report [Urban]

Intersection #34 Lytton Station Road at Alexander Valley Road

Base Volume Alternative: Peak Hour Warrant NOT Met

Approach:	North Bound	South Bound	East Bound	West Bound
Movement:	L - T - R	L - T - R	L - T - R	L - T - R

Peak Hour Delay Signal Warrant Report

Intersection #4 Highway 101 sb at Lytton Springs Road

Base Volume Alternative: Peak Hour Warrant NOT Met

Approach:	North Bound			South Bound			East Bound			West Bound		
Movement:	L	T	R	L	T	R	L	T	R	L	T	R
Control:	Stop Sign			Stop Sign			Uncontrolled			Uncontrolled		
Lanes:	0 0 0 0 0			0 1 0 0 1			0 0 0 1 0			0 1 0 0 0		
Initial Vol:	0	0	0	94	0	10	0	23	9	73	25	0
ApproachDel:	xxxxxx			11.6			xxxxxx			xxxxxx		

Approach[southbound][lanes=2][control=Stop Sign]
Signal Warrant Rule #1: [vehicle-hours=0.3]
FAIL - Vehicle-hours less than 5 for two or more lane approach.
Signal Warrant Rule #2: [approach volume=104]
FAIL - Approach volume less than 150 for two or more lane approach.
Signal Warrant Rule #3: [approach count=3][total volume=234]
FAIL - Total volume less than 650 for intersection
with less than four approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

ApproachDel:	xxxxxx	xxxxxx	xxxxxx	10.4

Approach[westbound][lanes=1][control=Stop Sign]
Signal Warrant Rule #1: [vehicle-hours=0.1]
FAIL - Vehicle-hours less than 4 for one lane approach.
Signal Warrant Rule #2: [approach volume=20]
FAIL - Approach volume less than 100 for one lane approach.
Signal Warrant Rule #3: [approach count=3][total volume=291]
FAIL - Total volume less than 650 for intersection
with less than four approaches.

SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Peak Hour Delay Signal Warrant Report

Intersection #4 Highway 101 sb at Lytton Springs Road

Base Volume Alternative: Peak Hour Warrant NOT Met

Approach:	North Bound			South Bound			East Bound			West Bound		
Movement:	L	T	R	L	T	R	L	T	R	L	T	R
Control:	Stop Sign			Stop Sign			Uncontrolled			Uncontrolled		
Lanes:	0 0	0	0 0	0 1	0	0 1	0 0	0	1 0	0 1	0	0 0
Initial Vol:	0	0	0	94	0	10	0	23	9	73	25	0
ApproachDel:	xxxxxx			11.6			xxxxxx			xxxxxx		

Approach[southbound][lanes=2][control=Stop Sign]
Signal Warrant Rule #1: [vehicle-hours=0.3]
FAIL - Vehicle-hours less than 5 for two or more lane approach.
Signal Warrant Rule #2: [approach volume=104]
FAIL - Approach volume less than 150 for two or more lane approach.
Signal Warrant Rule #3: [approach count=3][total volume=234]
FAIL - Total volume less than 650 for intersection
with less than four approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

FAIL - Approach volume less than 100 for one lane approach.
Signal Warrant Rule #3: [approach count=3][total volume=373]
FAIL - Total volume less than 650 for intersection
with less than four approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Peak Hour Delay Signal Warrant Report

Intersection #23 Highway 101 sb ramp at Healdsubrg Avenue

Base Volume Alternative: Peak Hour Warrant NOT Met

Peak Hour Delay Signal Warrant Report

Intersection #4 Highway 101 sb at Lytton Springs Road

Base Volume Alternative: Peak Hour Warrant NOT Met

Approach:	North Bound			South Bound			East Bound			West Bound		
Movement:	L	T	R	L	T	R	L	T	R	L	T	R
Control:	Stop Sign			Stop Sign			Uncontrolled			Uncontrolled		
Lanes:	0 0 0 0 0			0 1 0 0 1			0 0 0 1 0			0 1 0 0 0		
Initial Vol:	0	0	0	94	0	10	0	23	9	73	25	0
ApproachDel:	xxxxxx			11.6			xxxxxx			xxxxxx		

Approach[southbound][lanes=2][control=Stop Sign]
Signal Warrant Rule #1: [vehicle-hours=0.3]
FAIL - Vehicle-hours less than 5 for two or more lane approach.
Signal Warrant Rule #2: [approach volume=104]
FAIL - Approach volume less than 150 for two or more lane approach.
Signal Warrant Rule #3: [approach count=3][total volume=234]
FAIL - Total volume less than 650 for intersection
with less than four approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Peak Hour Volume Signal Warrant Report [Urban]

Intersection #12 Geyserville Avenue at Banti Lane

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Peak Hour Volume Signal Warrant Report [Urban]

Intersection #32 River Road/Moody Lane/State Route 128

Base Volume Alternative: Peak Hour Warrant NOT Met

Approach:	North Bound			South Bound			East Bound			West Bound

ApproachDel:	xxxxxx			11.6			xxxxxx			xxxxxx		

Approach[southbound][lanes=2][control=Stop Sign]
Signal Warrant Rule #1: [vehicle-hours=0.3]
FAIL - Vehicle-hours less than 5 for two or more lane approach.
Signal Warrant Rule #2: [approach volume=104]
FAIL - Approach volume less than 150 for two or more lane approach.
Signal Warrant Rule #3: [approach count=3][total volume=234]
FAIL - Total volume less than 650 for intersection
with less than four approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

with less than four approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Signal Warrant Rule #2: [approach volume=20]
   FAIL - Approach volume less than 100 for one lane approach.
Signal Warrant Rule #3: [approach count=3][total volume=291]
   FAIL - Total volume less than 650 for intersection
          with less than four approaches.
--------------------------------------------------------------------------------
SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an
"indicator" of the likelihood of an unsignalized intersection warranting
a traffic signal in the future.  Intersections that exceed this warrant
are probably more likely to meet one or more of the other volume based
signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace
a rigorous and complete traffic signal warrant analysis by the responsible
jurisdiction.  Consideration of the other signal warrants, which is beyond
the scope of this software, may yield different results.

SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Peak Hour Delay Signal Warrant Report

Intersection #23 Highway 101 sb ramp at Healdsubrg Avenue

Movement:	L	T	R	L	T	R	L	T	R	L	T	R
Control:	Stop Sign			Stop Sign			Uncontrolled			Uncontrolled		
Lanes:	0 0 0 0 0			0 1 0 0 1			0 0 0 1 0			0 1 0 0 0		
Initial Vol:	0	0	0	94	0	10	0	23	9	73	25	0
ApproachDel:	xxxxxx			11.6			xxxxxx			xxxxxx		

Approach[southbound][lanes=2][control=Stop Sign]
Signal Warrant Rule #1: [vehicle-hours=0.3]
FAIL - Vehicle-hours less than 5 for two or more lane approach.
Signal Warrant Rule #2: [approach volume=104]
FAIL - Approach volume less than 150 for two or more lane approach.
Signal Warrant Rule #3: [approach count=3][total volume=234]
FAIL - Total volume less than 650 for intersection
with less than four approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Approach[southbound][lanes=2][control=Stop Sign]
Signal Warrant Rule #1: [vehicle-hours=0.3]
FAIL - Vehicle-hours less than 5 for two or more lane approach.
Signal Warrant Rule #2: [approach volume=73]
FAIL - Approach volume less than 150 for two or more lane approach.
Signal Warrant Rule #3: [approach count=3][total volume=328]
FAIL - Total volume less than 650 for intersection
with less than four approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Signal Warrant Rule #2: [approach volume=8]
FAIL - Approach volume less than 100 for one lane approach.
Signal Warrant Rule #3: [approach count=3][total volume=244]
FAIL - Total volume less than 650 for intersection
with less than four approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Major Street Volume: 55
Minor Approach Volume: 0
Minor Approach Volume Threshold: 993

SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

1.0 Introduction

This health risk assessment (HRA) has been performed to evaluate potential health risks from emissions from the proposed Syar Industries, Inc. (Syar)'s mining operation at the Alexander Valley in Sonoma county, California. The HRA evaluates the maximum individual cancer risk (MICR) and non-cancer acute and chronic impacts to determine the potential significance of health impacts.

This HRA is prepared in support of an environmental impact analysis required under California Environmental Quality Act (CEQA) for assessing potential impacts of Syar's request for an Aggregate Resource Management Plan (ARM Plan) amendment, Sonoma County Surface Mining and Reclamation Ordinance (SMARO) amendment, use permit and approval of a reclamation plan to mine up to 15 gravel bars along a 6.5-mile stretch of the Russian River. The proposed action would allow for continued commercial extraction of aggregate from the specified gravel bars of the Russian River within the Alexander Valley reach in Sonoma County, California.

1.1 Project Background

Syar proposes in-stream gravel mining within the Russian River located in the Alexander Valley near Healdsburg, California in northern Sonoma County. The Alexander Valley reach extends from the confluence of Big Sulphur Creek near Cloverdale (approximately 8.5 miles upstream of the study area) to the Alexander Valley Road Bridge (approximately 1.5 miles downstream of the study area). The study area includes approximately 6.5 miles of river (upstream bar to downstream bar) and is at the southern extent of the Alexander Valley, generally located southeast of Gill Creek and northwest of the Jimtown Bridge. The 6.5-mile reach of the Russian River where gravel bars are proposed to be mined is surrounded by vineyards, riparian vegetation, and scattered rural residential sites. Figure 1 shows the location of the entire study area in the context of its regional vicinity.

Syar proposes to extract sand and gravel from the site within a proposed 15-year use permit period. Mining operations would consist of relocation of large woody debris only in areas where mining would occur, removal of giant reed (Arundo donax), transplanting activities, skimming (excavation and loading of sand and gravel) activities, salvage and reuse of soil, and removal of equipment. The primary extraction method would be the horseshoe skim, with supplemental skimming methods (i.e., alcove, oxbows, floodplain skim, and effective discharge stage height), used where opportunities for habitat enhancement exist. Skimming under all methods would involve the use of mechanical equipment and would be limited to non-wetted areas. The project includes the loading of sand and gravel onto trucks and hauling to the Healdsburg processing facility. Diesel-fuel equipment will be used to perform the mining operation and to transport the gravel and sands to the processing plant. Syar proposes to conduct mining operations during the dry season from June 1st through November 1st for 100 to 110 days. The mining operations will be conducted Monday through Friday, during daylight hours only (starting from 6 a.m. and ending as late as 9:30 p.m. as daylight allows).

2.0 Health Risk Assessment Methodology

This HRA includes three quantitative determinations: hazard identification, exposure assessment and risk characterization. DPM emissions from the operation of off-road and on-road equipments were estimated using emission factors for off-road and on-road diesel engines. Exposure calculations were performed using air dispersion modeling analysis to predict ground-level air concentrations for DPM. Results of the air modeling exposure predictions were then applied with respective cancer potency factors to characterize cancer risk associated with predicted levels of exposure.

At the request of the Northern Sonoma County Air Pollution Control District (NSCAPCD), the regional air quality agency for the area of the Syar project, emission of acrolein were included in the HRA for evaluating potential short term and chronic non-cancer health impacts. Acrolein concentrations were estimated from the predicted DPM concentrations based on California Air Resources Board (CARB) reported acrolein to diesel ratio of 0.013 (CARB, 2008). The estimated acrolein concentrations were compared to existing and proposed Office of Environmental Health Hazard Assessment (OEHHA) chronic and acute reference exposure levels (REL) to determine if the project resulted in significant chronic and/or short-term acute impact.

The methods used to assess potential human health risks from the proposed project are consistent with those prepared by The Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments (OEHHA, 2003) which describes algorithms, exposure methods, and cancer and non-cancer health values needed to perform a HRA under the Air Toxics Hot Spots Information and Assessment Act of 1987 (Hot Spots or AB 2588, Health and Safety Code Section 44360 et seq.). This manual is generally considered the best available reference for conducting human health risk assessment in California.

2.1 Hazard Identification

Hazard identification refers to the identification of substances as carcinogens, reproductive toxins, chronic toxins, or acute toxins, or to the identification of a type of exposure as hazardous. For this proposed project, DPM designated as a Toxic Air Contaminant (TAC) by CARB in 1998 is the pollutant of concern. In 1990, the State of California administratively listed under Proposition 65 the particulates formed in the exhaust of diesel-powered equipment as a chemical known to the State to cause cancer. For estimating risks due to diesel particulate matter exhaust, the risk assessment methodology used was consistent with that employed by the CARB in the document entitled Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel-Fueled Engines and Vehicles (ARB, 2000). Acrolein, another designated TAC and a constituent of the diesel emissions, has non-cancer chronic and short-term acute impacts and is therefore also evaluated in this HRA. The 1-hour and annual average acrolein concentrations are compared against state regulatory levels.

2.1.1 Sources of DPM Emissions

The TAC evaluated for potential health risks from operation of the proposed project is particulate emissions from off-road and on-road diesel-fueled engines. Two discrete areas of DPM sources identified for modeling include the proposed mining gravel bars and the haul roads used by trucks to transport raw materials, sand and gravel to the processing plant. Off-road diesel engines are used in the gravel bar mining operations whereas on-road heavy duty haul trucks are operated between the gravel bars and the processing facility.

DPM Emissions from Gravel Bar Mining Equipment

The equipment types and number were based on information supplied by Syar and include one motor grader, one dozer, one loader and one water truck. Daily emissions of DPM from diesel-fueled gravel bar mining equipments were quantified using Equation 1 below and are presented in Table 1. Based on Equation 1 a total DPM emission for the equipments is calculated as 1.9 lb/day.

$$\mathbf{DPM = EF1 \times HP \times T} \qquad \textbf{Eq. 1}$$

Where,

EF1 = Emission factor, gram/hp-hour
HP = Effective horsepower of equipment, HP
T = Hours of operation, hours/day

Table 1: DPM Emission - Off-road Mining

Source	PM10 Emission Factor(1)		Operating Hours per Day	DPM Emission Rate		
	lbs/day	g/day		g/s	lb/yr	lb/hr

(1) Emissions calculated based on off-road emission factor in Construction Emissions Model (Version 5.2) (Sacramento Metropolitan Air Quality Management District, SMAQMD) as provided in Draft EIR.

DPM Emissions from Haul Trucks

DPM emissions from haul trucks include both running and idling emissions as shown in Tables 2 and 3. Equations 2 and 3 below were used to estimate the DPM emissions from haul trucks:

$$DPM_{running} = EF2 \times M \times Trip \qquad \textbf{Eq. 2}$$

Where

EF2 = Emission factor, g/mile
M = Miles traveled per trip for various routes
Trip = Trips per day

$$DPM_{idling} = EF3 \times IT \times Trip \qquad \textbf{Eq. 3}$$

Where

EF3 = Emission factor, g/idling-hour (from EMFAC2007 model run)
IT = Idling Time
Trip = Trips per day

Table 2: DPM Emission - Haul Truck Running

Route No.	Length (mi.)	Emission Factor[1] (g/mi)	Trips per Day	Hours per Day	DPM Emissions		
					g/s	lb/yr	lb/hr
2A	3.38	0.24	480	12	9.03E-03	9.46E+01	7.16E-02

Trips per Day	Idle Emission Factor[1] (g/s)	Idle Time Per Trip (min.)	Total Idle Time (min.)	Hours per Day	DPM Emissions		
					g/s	lb/yr	lb/hr
480	0.00048	10	4800	12	3.20E-03	3.35E+01	2.54E-02

(1) EMFAC2007 Emission Factors

Detailed emission calculations are provided in Appendix A. Because of the lack of specific acrolein emission rates in the CARB database, CARB reported acrolein to DPM ratio of 0.013 was used to estimate acrolein concentrations from the model predicted DPM concentrations (CARB 2008). The calculated DPM emission rates from Equations 1, 2 and 3 were inputs to the air dispersion model to estimate the annual ground level concentrations.

2.2 Exposure Assessment

Exposure assessment is the identification and quantification of all routes of human exposure to the substances of concern. Exposure assessment is performed using air dispersion model. The Industrial Source Complex Short Term (ISCST3) Version 02035 air dispersion model was used to determine ground-level DPM concentrations. ISCST3 was used in the rural mode with all model option switches set to regulatory-default settings. ISCST3 was used exclusively for the evaluation of cancer risk impacts from DPM emissions. Because DPM emissions were evaluated as a single pollutant in ISCST3, actual emission rates from each emission source were modeled in the dispersion analysis. As discussed earlier annual and 1-hour acrolein concentrations were estimated from model predicted DPM concentrations using CARB reported “acrolein to DPM” ratio (CARB 2008). The estimated concentrations were then compared against OEHHA’s proposed acceptable acute and chronic exposure levels.

2.2.1 Emission Source

Emission Rate

The proposed gravel bar mining is scheduled to occur in several phases. Each phase will include activities that use diesel-fueled off-road and on-road equipments and trucks that generate DPM emissions. Emission rates are determined based on methods presented in Sections 2.1.1.

Modeling Phases

Syar proposes to mine the bars in a phased manner so the skimming of the bars would occur on an approximately six-year cycle over the proposed 15-year life of the use permit. The phasing was developed to produce a maximum of 350,000 tons of sand and gravel annually. Only one, or at most two, instream bars would be skimmed in one season. Syar has identified certain bars to be skimmed during the first six phases, including bars SD-4, SD-5, S-4, S-7, S-8, S-9a, S-13, and S-14. These bars were selected because they have been identified as depositional areas, or as areas with lateral erosion issues, thus necessitating mining to remove the aggregate. Syar proposes to mine the additional eight bars if resource agencies determine that mining of these bars is necessary to meet river management goals. The phasing of the mining operations is tentative and would depend on the conditions of the bars, which would be confirmed annually prior to mining operations as part of the Adaptive Management Strategy (AMS).

For the purposes of modeling and risk calculations, six tentative phases are identified with specific emission sources in each phase as shown in Table 4. The individual emission sources within each phase are grouped together during the dispersion modeling to obtain ground level concentrations for each phase at the modeled receptors. Cancer risk is then calculated for all the six phases using the predicted annual DPM concentration to identify the worst-case mining phase.

In addition, Syar has grouped the gravel bars and associated haul routes along the 6.5 mile stretch of the Russian River into three regions (Reach 1, 2 and 3) based on their relative locations as shown in Table 5. Reach 1 contains 7 gravel bars; Reach 2 contains 6 gravel bars, and Reach 3 contains 2 gravel bars. The operations in each of the three reaches were also grouped together during dispersion modeling to predict DPM concentrations. The emissions modeled from each of group will be higher due to the assumption that all the equipments in each of the reach are operated simultaneously (which is unlikely) and therefore the each group represents a worst-case concentration and risk scenario.

Table 4: Tentative Phasing of the Gravel Bar Mining Operations			
Phase	**Emission Source**		
	Gravel Bar	**Haul Truck - Running**	**Haul Truck - Idling**

Reach 2	S4, S5, SD-4, SD-5, S6, S7	RTE2A, RTE2B, RTE3, RTE4, RTE5	IDLE3&4, IDLE5
Reach 3	SD-1, SD-2	RTE2A, RTE2B	IDLE2A, IDLE2B

Modeling Areas

Dimensions and configuration of the areas near each bar and each haul truck route were digitized using aerial photographs. The digitized dimensions for each bar and each truck routes are inputs to the ISCST3 domain. Modeling was performed using a Universal Transverse Mercator (UTM), zone 10 NAD83 datum coordinate system.

Modeled Source Release Parameters

DPM emissions from the mining equipment exhaust and haul truck exhaust were modeled as line source represented by a string of adjacent volume sources. Haul truck idling emissions were modeled as volume sources. The vertical dimension of volume source was assumed to be 5 meters with the initial vertical dimension of the volume source calculated as the vertical dimension divided by 4.3. The release height for all the sources was assumed to at half the vertical dimension of the volume source, i.e., 2.5 meters. Because there were no point sources in the modeling analysis, no building downwash was required. Also, because all receptors are located in terrain at or below the source release height with no point sources with plume rise, elevated terrain was not applicable to the air dispersion modeling analysis. Figure 2 shows the emissions sources modeled for this HRA.

2.2.3 Terrain

Because all receptors are located in terrain at or below the source release height with no point sources with plume rise, elevated terrain was not applicable to the air dispersion modeling analysis.

2.2.4 Meteorological Data

The ISCST3 air dispersion model used in this HRA requires at least one complete year of regional sequential hourly meteorological data. The NSCAPCD recommended that meteorological data from the Healdsburg monitoring station be used in this HRA because weather patterns in Healdsburg are unique and that local meteorological data would produce the most realistic results. Meteorological data approved for use in a prior risk assessment in the area were used for this analysis. Healdsburg meteorological data was used in the emissions modeling analysis to determine the highest annual and 1-hour concentrations. A wind rose for the meteorological station for the year 1999 is presented in Figure 3.

2.2.5 Receptors

This HRA evaluated health risks to sensitive receptors (residents) near the mining areas and along the truck routes. To determine maximum impacts at actual receptor locations, sensitive receptors (residents) located within the areas from the gravel bars to the US FWY101 including truck routes were identified using aerial photographs. The shortest distance between a potential receptor and the gravel bar was 91 meters (located near Bar S9a). Figure 2 shows modeled receptors around the mining area and haul trucks routes.

2.3 Risk Characterization

Risk characterization is the final step of the HRA. It quantifies the human health risk based on the exposure assessment and dose-response relationships. Potential health impacts were determined using the estimation of dose and exposure through inhalation methods described in Section 5.4 of the OEHHA HRA Guidelines. The chief exposure assumption for cancer risk is one of continuous exposure to DPM concentrations produced by continuous emissions at the maximum emission rates over a 70-year period at each receptor location. Actual risks are not expected to be any higher than the 70-year predicted risks and are likely to be substantially lower.

Potential cancer risks due to toxic emissions from the proposed mining operations were calculated as the individual excess lifetime cancer risk. The individual excess lifetime cancer risk is a probability that, due to a lifetime exposure to the chemicals of concern, an individual may get cancer. Cancer risk is computed based on Equation 4:

$$\textbf{Risk} = \textbf{C x DBR x EF x ED x SF/AT} \qquad \textbf{Eq. 4}$$

Where

C = DPM ground-level Conc. at the receptor ug/m^3

DBR = Daily Breathing rate (L/kg BW – day)

EF = Exposure frequency – number of days per year an exposure occurs (days/yr)

ED = Exposure duration – number of years of a lifetime during which an exposure occurs (years)

SF = DPM inhalation cancer slope factor (mg/kg-day)-1

AT = Averaging time – number of days in a 70-year lifespan (days)

According to the OEHHA guidance, the risk analysis should be performed based on available site-specific data to provide an accurate estimate of risk. Since the proposed mining operation will last only 15 years, a 15-year exposure duration was used instead of the default 70-year exposure duration. In addition, since the mining operation will occur for about 110 operating days per year, this was used as the exposure frequency rather than the 350 days per year used in the Tier 1 70-yr risk analysis. Table 6 shows the parameters for the risk calculations.

Table 6: HRA Input Parameters	
Parameters	**Values**
DPM Ground-level Concentration at each receptors, ug/m^3	**Outputs from ISCST3 model**
Inhalation Rate (L/kg-BW-day)	393
Exposure frequency (days/yr)	110
Exposure duration (years)	15
DPM slope factor (mg/kg-day)-1	1.1
Days in lifetime (days)	25,550

Risk impacts from DPM emissions were evaluated in this analysis using health values approved and published by the OEHHA and the CARB for use in facility HRA's conducted for the AB 2588 Air Toxics Hot Spots Program (CARB, 2008). Table 7 lists the OEHHA adopted inhalation slope factors, non-cancer acute and chronic RELs. The cancer potency factors and RELs used are the most recent values updated in July 2008.

Table 7: Risk Assessment Health Values for Substances of Potential Concern				
Compound (CAS Number)	**Cancer Risk**		**Non-cancer Effects**	
	Inhalation Cancer Potency $(mg/kg\text{-}day)^{-1}$	**Inhalation Unit Risk $(\mu g/m^3)^{-1}$**	**Chronic Inhalation Reference Exposure Level $(\mu g/m^3)$**	**Acute Inhalation Reference Exposure Level $(\mu g/m^3)$**
Acrolein	--	--	6.0E-02	1.9E-01
Diesel Particulate Matter (9901)	1.1E+00	3.0E-04	5.0 E+00	--
Source: OEHHA, 2008				
1. Benzo(a)pyrene (CAS number shown) was modeled as a surrogate carcinogen for all PAH emissions.				

For inhalation of non-carcinogen acrolein, the OEHHA guidance compares the estimated exposure concentrations directly to the REL to see if they are exceeded. For acrolein, the 1-hour maximum concentrations (DPM concentrations adjusted for acrolein) were compared to the Acute REL, and the annual averages were compared to the Chronic REL. Because OEHHA has proposed changing both the acute and chronic RELS (OEHHA, 2007), the concentrations were compared to both the existing and proposed RELS. For 1-hour exposures, the existing acute REL is 0.19 ug/m^3 and the proposed is 2.3. For long-term exposures, the existing chronic REL is 0.06 ug/m^3 and the proposed is 0.10 ug/m^3.

3.0 Health Risk Assessment Results

This report presents an evaluation of the potential cancer risks from DPM emissions associated with proposed gravel mining at the Alexander Valley in Sonoma County, California. In addition, non-cancer impacts from acrolein were evaluated by comparing 1-hour maximum and average annual concentrations of acrolein to their respective acute and chronic RELs.

DPM Cancer Risk

The mining of the gravel bars will be conducted in six phases with a specific emission signature for each phase. In addition, based on relative locations, Syar has grouped the gravel bars and associated haul routes along the 6.5 mile stretch of the Russian River into three regions (Reach 1, 2 and 3). Cancer risks were calculated for each of 6 phases and each of the three reaches at the maximum impacted receptor (identified from dispersion modeling). The ISCST3 predicted DPM concentrations for the 3 reaches represent worst-case scenario as each reach is modeled for the simultaneous operation of all the emission sources within the reach. Annual average ground-level diesel concentrations predicted for each of the six phases and the three reaches are presented in Table 8.

Table 8: Modeled DPM Maximum Concentrations

Source	Maximum DPM Concentration (ug/m^3)			
	Annual	Receptor Number (UTME,UTMN)	1-hr	Receptor Number (UTME,UTMN)
All Sources	0.16397	164 (508458.19, 4285894.00)	12.78974	164 (508458.19, 4285894.00)
Phase 1	0.03846	16 (511141.38, 4279346.50)	5.07008	197 (512027.63, 4281054.00)
Phase 2	0.05443	203 (506503.41, 4286049.50)	3.71609	201 (506126.41, 4286277.00)
Phase 3	0.03794	16 (511141.38, 4279346.50)	3.44221	84 (510361.06, 4282869.00)
Phase 4	0.06567	149 (509166.09, 4285306.50)	9.16475	150 (509121.25, 4285340.50)
Phase 5	0.04714	207 (508685.75, 4284000.50)	4.34482	150 (509121.25, 4285340.50)
Phase 6	0.05636	126 (508749.00, 4284601.00)	4.74613	139 (508612.22, 4285057.00)
Reach 1	0.15443	164 (508458.19, 4285894.00)	9.16475	150 (509121.25, 4285340.50)
Reach 2	0.0794	210 (509029.38, 4283700.00)	7.5082	165 (508478.91, 4285884.00)
Reach 3	0.057834	53 (511917.31, 4281165.00)	3.57961	214 (514093.78, 4281071.50)

The estimated DPM average concentrations were then used to calculate theoretical lifetime cancer risks for receptor with the greatest potential for exposure based on the OEHHA algorithm presented in Section 2.3. The calculated maximum cancer risk is referred to as the individual cancer risk to the maximum exposed individual (MEI). Risk is expressed as the number of cancer cases per million populations that may result from exposure to DPM over a lifetime. Calculated risk estimates for DPM were compared to the risk “threshold” of 10-in-a-million to determine their significance. Risks less than this threshold would be considered insignificant. This threshold is used by several regulatory and permitting agencies (California EPA, Bay Area Air Quality Management District, and NSCAPCD) to evaluate the incremental risk associated with release of compounds from a new source.

Theoretical lifetime risks were estimated based on a 15-year operating cycle based on the proposed operating period. Table 9 presents the MEI cancer risks for the 15-year exposure duration. A 9-year analysis was also run to account for any child exposures and the results are presented in Table 10.

As shown in Table 9, the highest MEI cancer risk among the six phases occurs during Phase 4 of the project. This risk is 1.8-in-a-million, which does not exceed the 10-in-a-million threshold. The cancer risk from the simultaneous operation of all the emission sources in each of the reaches resulted in a maximum of 4.3-in-a-million for Reach 1. The maximum cancer risk of 4.6-in-a-million results when all the emission sources in the entire mining stretch are operated simultaneously, a situation which is highly unlikely.

Table 9: DPM Cancer Risk – 15 Year Exposure

Cancer Risk = (Slope factor x Cair x DBR x A x EF x ED x 10^-6)/AT

Source Groups	Annual Concentration (ug/m^3)	Maximum Impacted Receptor (UTME, UTMN)	Cancer Risk	
			SF (mg/kg/day)$^{-1}$	RISK (per million)
All Sources	0.16397	164 (508458.19, 4285894.00)	1.1E+00	4.6E-06

Reach 3	0.05783	53 (511917.31, 4281165.00)	1.1E+00	1.6E-06

Exposure factors used to calculate contaminant intake:

DPM Slope Factor (mg/kg-day) =	1.1
Exposure Frequency EF (days/year) =	110
Exposure Duration ED (years) =	15
Daily Breathing Rate (liters/kg-day) =	393
Averaging time AT (days) =	25550
A =	1

A 9-year analysis was also run to account for any child exposures and the results are presented in Table 10. As can be seen, the maximum cancer risks estimated at the maximum impacted receptor at each phase and reach do not exceed cancer significance thresholds. Thus the operations at Alexander Valley mining do not result in cancer risk greater than the cancer significance threshold.

Table 10: DPM Cancer Risk - 9 Year Exposure

Cancer Risk = (Slope factor x Cair x DBR x A x EF x ED x 10^-6)/AT

Source Groups	Annual Concentration (ug/m^3)	Maximum Impacted Receptor (UTME, UTMN)	Cancer Risk

Impact of Acrolein Emissions

This HRA also evaluated the maximum and average acrolein concentrations in relationship to California Regulatory Levels. For inhalation of acrolein, the OEHHA guidance compares the estimated exposure concentrations directly to the REL to see if they are exceeded. For acrolein, the 1-hour maximums were compared to the Acute REL, and the annual average was compared to the Chronic REL. Because OEHHA has proposed changing both the acute and chronic RELs (OEHHA, 2007), the concentrations were compared to both the existing and proposed RELS. For 1-hour exposures, the existing AREL is 0.19 ug/m^3 and the proposed AREL is 2.3. For long-term exposures, the existing CREL is 0.06 ug/m^3 and the proposed CREL is 0.10 ug/m^3. Acrolein's impact is mainly as a powerful irritant to the eyes and inhalation pathways, including the throat and lungs. The proposed acute REL of 2.3 ug/m^3 is set at a level to protect against eye irritation. The proposed chronic REL of 0.10 ug/m^3 is set at a level to prevent lesions of the lung due to long-term exposure. OEHHA's proposed acceptable acute and chronic exposure levels for acrolein are considered as appropriate and are used in this assessment.

Table 11 summarizes the estimated annual average and 1-hr DPM air concentrations and estimated acrolein concentrations at the maximum exposed receptor locations for all the phases and reaches modeled in this study. These results demonstrate that the estimated annual average and maximum 1-hr acrolein concentrations associated with the proposed activities at the Syar operations are much less than the pre-existing statewide ambient air background level of 1.2 ug/m^3 (0.53 ppbv) (OEHHA 2007) that has been measured in California. In short, acrolein emissions from proposed activities at the Syar facility would result in lower concentrations than found in ambient air throughout the state. None of the concentrations exceed either the existing chronic REL of 0.06 ug/m^3 or the proposed value of 0.10 or the existing acute REL of 0.19 ug/m^3 or the proposed value of 2.3 ug/m^3. Even the highly unlikely operating scenario including simultaneous operation of all the emission sources in all three reaches do not exceed the regulatory levels.

Table 11: Estimated Annual and 1-hr Maximum Acrolein Concentrations

	DPM Concentration (ug/m^3)		Acrolein Concentration(1) (ug/m^3)		REL (ug/m^3)

(1) Acrolein concentrations are estimated as DPM concentration multiplied by 0.013. The factor 0.013 is the ratio of acrolein to DPM reported by CARB (CARB 2008). The concentrations reported for each source group are for the highest impacted receptor location as presented in the previous tables.

4.0 Conclusion

The HRA concludes that the proposed mining operations at the Syar Alexander Instream Mining facility will not result in a significant cancer risk or non-cancer health impacts. The operations will also not cause receptors to be exposed to acrolein concentrations exceeding the regulatory chronic and acute RELs.

(1) DPM Concentrations obtained from ISC modeling of DPM emissions for each source group listed. The concentration shown for each source group is the concentration at the maximum impacted receptor as shown in previous tables.

(2) Acrolein concentrations are estimated as DPM concentrations multiplied by 0.013. The factor 0.013 is the ratio of acrolein to DPM reported by CARB (CARB 2008).

Appendix C

ISC Modeling Files

Appendix C: ISC File Index

- SY_HRA folder includes the following files:

  SY_HRA.IS
  SY_HRA.dat
  SY_HRA.ini
  SY_HRA.inp
  SY_HRA.isc
  SY_HRA.out

- Met_Data folder includes the meteorological file “OK_HLB99.met”.

APPENDIX J

TRAFFIC NOISE ANALYSIS

Appendix J

Project-Generated Haul Truck Trip Source Noise Prediction Model

Syar Industries-Instream Mining Project

EDAW | AECOM

Assumptions:

Mean SEL Reference Level	84.0	84.0
Assumed Haul Truck Speed (mph)	15.0	15.0
Number of Hours for Hauling per Day	12.0	12.0
Number of Trips per Hour-one way	40.0	80.0
Leq for Haul Trips at 50 feet	56.6	59.6

		Resulting Noise Level (dBA, L_{eq})[1]	
Receptor[2]	Distance (feet)[2]	40 Trips per Hour	80 Trips per Hour
A	585	40.6	43.6
B	760	38.8	41.9
C	385	43.3	46.3
D	130	50.4	53.4
E	80	53.5	56.5
F	60	55.4	58.4
G	90	52.7	55.8
H	85	53.1	56.1
I	45	57.3	60.3
J	175	48.4	51.4
K	175	48.4	51.4
L	160	49.0	52.0
M	115	51.2	54.2
N	95	52.4	55.4
O	75	53.9	56.9
P	150	49.4	52.4
Q	170	48.6	51.6
R	120	50.9	53.9
S	180	48.2	51.2
T	325	44.4	47.4
U	1050	36.7	39.8
V	390	43.2	46.2
W	135	50.1	53.1
X	210	47.2	50.2
Y	100	52.1	55.1
Z	85	53.1	56.1
CC	100	52.1	55.1
DD	320	44.5	47.5
EE	220	46.9	49.9

APPENDIX K

STATIONARY NOISE ANALYSIS

Appendix K

Project-Generated Construction Source Noise Prediction Model

Syar Industries-Instream Mining Project

EDAW | AECOM

Receptor[4]	Proposed Bar [4]	Distance to Receptor in feet	Modeled Noise Level (dBA) L_{eq}	L_{10}	L_{max}
1	S-10	450	61.7	58.7	65.4
2	S-10	720	56.4	53.4	60.1
3	S-10	1,050	52.2	49.2	55.9
4	S-9	1,015	52.6	49.6	56.3
5	S-9	500	60.5	57.5	64.2
6	S-9	715	56.5	53.5	60.2
7	S-9	530	59.8	56.8	63.6
8	S-9	925	53.6	50.6	57.3
9	S-9	900	53.9	50.9	57.6
10	S-9	1,050	52.2	49.2	55.9
11	S-8	1,500	48.2	45.2	51.9
12	S-8	1,480	48.4	45.4	52.1
13	S-7	2,275	43.6	40.6	47.3
14	S-7	1800	46.2	43.2	49.9
15	S-7	1,950	45.3	42.3	49.0
16	S-6	2,700	41.6	38.6	45.4
17	S-5	2300	43.4	40.4	47.2
18	S-4	2080	44.6	41.6	48.3
19	S-4	2000	45.0	42.0	48.7
20	SD-4	1775	46.3	43.3	50.1
21	SD-4	3560	38.6	35.6	42.3
22	SD-2	1500	48.2	45.2	51.9
23	SD-2	2265	43.6	40.6	47.3
24	SD-1	2590	42.1	39.1	45.8
25	SD-1	2600	42.1	39.1	45.8

Assumptions:	Reference Emission Noise Levels (L_{max}) at 50	Usage Factor[2]
Grader	85	0.48
Dozer	85	0.54
Front End Loader	80	0.43
Water Truck	84	0.2

Ground Type	Soft
Source Height	8
Receiver Height	12
Ground Factor	0.57

Predicted Noise Level[3]	L_{eq} dBA at 50 feet[3]
Grader	81.8
Dozer	82.3
Front End Loader	76.3
Water Truck	77.0

Combined Predicted Noise Level (L_{eq} dBA at 50 feet)
86.2
