Earthquake Vulnerability of Emergency Service Facilities

Vulnerable Areas Data
- Extremely Vulnerable
- Severe
- High
- Moderate
- Slight
- Least Vulnerable

Emergency Facilities Data
- Hospital
- Police Station
- Fire Station

Map Scale and Reproduction methods (i.e. precision in physical features displayed). This map is for illustrative purposes only and is not intended to be used for any specific decision making. The parcels colored red are not intended to represent surveyed data. Site-specific studies are required to draw parcel-specific conclusions.

The Earthquake Vulnerability was calculated from accessing the potential for liquefaction, landslides, liquefied soils, seismic shaking, and soils that have the potential for breaking highly and easily saturated areas. Map shows the relative value of the active earthquake faults.

The Active Fault layer was obtained from the California Department of Conservation, Division of Mines and Geology. ©2003-2011.
